Oostanauia rivers, which here form the Coosa. Pop. (1900) 7291, of whom 2830 were negroes; (1910) 12,099. It is served by the Central of Georgia, the Western & Atlantic (leased by the Nashville, Chattanooga & St. Louis), the Southern and the Rome & Northern railways, and the Coosa river is navigable from this point to the falls of the river in Alabama. The city is the seat of Shorter College (for women), which was established in 1873 as the Cherokee Female College, and received its present name in 1877, when it was rebuilt and endowed by Colonel Alfred Shorter; and of the Berry Industrial School (1902), for mountain boys. Rome is situated in a rich agricultural region producing cotton, cereals, vegetables and fruits, for which it is a trading centre, and is a shipping point for bauxite, mined in the vicinity. Other mineral products of this region are iron, limestone, cement rock, fire-brick clay, coal, slate and marble. Rome's principal manufactures are cotton, cotton-seed oil, lumber, foundry and machine-shop products, bricks and agricultural implements. Its site was originally within the territory of the Cherokee, and on the other side of the Oostanauia river there is said to have been at one time an Indian village, which, like several other Creek villages, was called Chiaha (or Chehaw). Here, in October 1793, in his Etowah campaign, John Sevier, with militia from Tennessee, crushed a party of marauding Indians; the battle is commemorated by a monument in Myrtle Hill cemetery. Floyd county was erected in 1833. The first settlement of Rome was made in 1834, and immediately afterwards it became the county-seat. Rome was first chartered as a city in 1847. In 1863 there were brilliant cavalry manoeuvres in its vicinity, which resulted in the capture (May 3) of Colonel Abel D. Streight (Federal) with 1800 men by General Nathan B. Forrest (Confederate), with a force one-third the size of that of his opponent. On the 19th of May 1864 the city was captured by a detachment of the Federal Army of General William T. Sherman, then conducting his Atlanta campaign. In 1848-75 Rome was the home of Charles Henry Smith (1826-1903), a popular humorist, who wrote under the name "Bill Arp." In 1906 East Rome (pop. 671 in 1900) and North Rome (pop. 906 in 1900), which was formerly called Forestville, were annexed to the city.

**ROME**, a city of Oneida county, New York, U.S.A., on the Mohawk river and Wood Creek, and the Erie and the Black river canals, 14 m. W.N.W. of Utica. Pop. (1890) 14,992; (1900) 15,343, of whom 2527 were foreign-born; (1910, census) 20,497. Rome is served by the New York Central & Hudson River, the Rome, Watertown & Ogdensburg (controlled by the New York Central), the New York, Ontario & Western, and the Utica & Mohawk Valley (electric) railways. It is about 450 ft. above sea-level. The city is the seat of the Academy of the Holy Names (opened in 1865 as St Peter's Academy), of the State Custodial Asylum for unteachable idiots, of the Central New York Institution for Deaf Mutes (1875), and of the Oneida County Home. The Jervis Public Library (1895), founded by John Bloomfield Jervis (1795-1885), a famous railway engineer, had in 1900 about 15,000 volumes. The surrounding country is devoted largely to farming, especially vegetable gardening, and to dairying. Among the manufactures are brass and copper work, wire for electrical uses, foundry and machine-shop products, locomotives, knit goods, tin cans and canned goods (especially vegetables). In 1905 the value of the factory products was \$8,631,427 (55.6% more than in 1900).

The portage at this place between the Mohawk river and Wood Creek, which are about 1 m. apart, gave the site its Indian name, De-o-wain-sta, "place where canoes are carried from one stream to another," and its earliest English name, "The Great (or Oneida) Carrying-Place," and gave it strategic value as a key between the Mohawk Valley and Lake Ontario. About 1725 there were built, to protect the carrying-place here, Fort Bull, on Wood Creek, which was surprised and taken by French and Indians in March 1756, and Fort Williams, on the Mohawk, which, like Fort Craven, also on the Mohawk, was destroyed by Colonel Daniel Webb after the reduction of Oswego by the French

In August 1756. General John Stanwix built Fort Stanwix here at an expense of £60,000, and the first permanent settlement dates from about this time. In October-November 1768, Sir William Johnson and representatives of Virginia and Pennsylvania met 3000 Indians of the Six Nations here and made a treaty with them, under which, for £10,400 in money and provisions, they surrendered to the crown their claims to what is now Kentucky and West Virginia and the western part of Pennsylvania. Of this cession the part which lay in Pennsylvania was secured by purchase from the Indians for the proprietors Richard and Thomas Penn (see PITTSBURG). The fort was dismantled immediately afterward. After 1776, when it was partly repaired by Colonel Elias Dayton, it was called by the continentals Fort Schuyler, in honour of General Philip Schuyler, and so is sometimes confused with (old) Fort Schuyler at Utica. The third regiment of the New York line under Colonel Peter Gansevoort occupied the fort in April 1777 and completed the repairs begun in 1776; on the 3rd of August in the same year (one month before the official announcement by Congress of the design of the flag) the first flag of the United States, made according to the enactment of the 14th of June and used in battle, was raised here: it was made from various pieces of cloth. On the 2nd of August an advance party of Colonel Barry St Leger's forces coming from the west arrived before the fort, and the main body (altogether about 650 whites, including loyalists—the Royal Greens—under Sir John Johnson, and more than 800 Indians, some led by Joseph Brant) arrived soon afterwards. The fort then contained about 750 men under Colonel Gansevoort, with Lieut.-Colonel Marinus Willett as second in command. The danger to the fort roused General Nicholas Herkimer to gather a force of between 700 and 1000 men (including some Oneida Indians), who during their advance on the 6th of August were ambuscaded in a ravine near Oriskany (q.v.), about 8 m. E. of the fort; after heavy losses to both sides, about 250 men from the fort under Willett attacked the camp of the Indians who were supporting St Leger, thus relieved Herkimer through the falling back of the British and Indians to save their supplies, captured five ensigns of the Royal Greens, and seized large quantities of stores from the enemy's camp. The siege now lost force, the Indians straggled away after the loss of their camp supplies, and on the 23rd of August, St Leger, bearing exaggerated reports of the immediate approach of large reinforcements under General Benedict Arnold, withdrew, abandoning his camp and stores. The successful resistance here to St Leger contributed greatly to the American success at Saratoga. Fort Stanwix was the headquarters of Colonel Gozen Van Schaick (1736-1789) in 1779 when he destroyed the Onondaga villages. At the fort, on the 22nd of October 1784, a treaty was made by Oliver Wolcott, Richard Butler and Arthur Lee, commissioners for the United States, with the chiefs of the Six Nations. In 1796 a canal was built across the old portage between Wood Creek and the Mohawk river. In 1796 the township of Rome was formed, receiving its name, says Schoolcraft, "from the heroic defence of the republic made here." The village of Rome, in the centre of the township, was incorporated in 1819; and Rome was chartered as a city in 1870.

See Pomroy Jones, *Annals and Recollections of Oneida County* (Rome, 1851); W. M. Willett, *A Narrative of the Military Actions of Col. Marinus Willett* (New York, 1831); and *Orderly Book of Sir John Johnson during the Oriskany Campaign* (Albany, 1882), with notes by W. L. Stone and J. W. de Peyster.

**ROMÉ DE L'ISLE, JEAN BAPTISTE LOUIS** (1736-1790), French mineralogist, was born on the 26th of August 1736 at Gray, in Haute-Saône. As secretary of a company of artillery he visited the East Indies, and was taken prisoner by the English in 1761 and held in captivity for three years. Subsequently he became distinguished for his researches on mineralogy and crystallography. He was the author of *Essai de Cristallographie* (1772), the second edition of which, regarded as his principal work, was published as *Cristallographie* (3 vols. and atlas, 1783). He died at Paris on the 7th of March 1790.

**ROMESH CHANDRA MITRA, SIR** (1840-1899), Indian judge, was born in 1840. When the East India Company's charter was renewed in 1853, the old supreme courts and sadr courts in the presidency towns were changed into high courts, and Rama Prasad Roy, son of the great reformer Raja Ram Mohan Roy, was the first Indian who was appointed a judge of the new high court of Calcutta. He did not live, however, to take his seat on the bench, and was succeeded by Sambhū Nath Pandit, and then by Dwarka Nath Mitra, perhaps the most talented judge that India produced in the 19th century. Dwarka Nath's great ability and thorough insight into cases were universally recognised in India; his decisions were valued and often quoted; and his name was often mentioned as an illustration of the judicial capacity of the natives of India. Anukul Chandra Mukerji also sat on the bench for a time; and on his death in 1871, Romesh Chandra Mitra was appointed judge in his place. He maintained the high reputation of his predecessors, and for a period of nearly twenty years, down to 1890, he performed his judicial duties with credit and distinction. When the post of chief justice was temporarily vacant in 1882, the marquis of Ripon, then viceroy of India, appointed Romesh Chandra to officiate in that post—the highest judicial position in the Indian empire. Lord Dufferin, who succeeded Lord Ripon as viceroy of India, appointed Romesh Chandra a member of the Public Service Commission, and in this capacity he did valuable work. Failing health compelled him to retire from the high court in 1890, and he was then knighted and appointed a member of the viceroy's legislative council. Till he died in 1899, he continued to take interest in all social, educational and political reforms in India.

**ROMFORD**, a market town in the Romford parliamentary division of Essex, England; on the small river Rom, which flows into the Thames; 1½ m. E.N.E. from London by the Great Eastern railway. Pop. of urban district (1901) 13,656. The ancient church of St Edward the Confessor was replaced in 1850 by a structure in Decorated style. There is a large brewery in the town, and extensive market gardens in the neighbourhood. A grant of a market was obtained in 1247, and this is still of importance as regards both cattle and corn. Romford was included in the liberty of Havering-atte-Bower, which until 1802 had a jurisdiction of its own distinct from that of the county, with a high steward, magistrates, clerk of the peace, coroner and quarter sessions. The name of Bower was derived from a queen's residence attached to the ancient royal hunting-lodge in the vicinity.

The fact that Romford (*Rumford*, *Rompford*) lies on the high road between Colchester and London has determined its history. Bronze implements have been found here, but no notice of Romford occurs till the 12th century. It was included in the liberty of Havering, and the chief business of the liberty was conducted there. But the corporation which is mentioned in medieval records is not that of the town of Romford, but of the liberty of Havering. Romford has only had a separate constitution since a local board of health was formed in 1894, under the act of 1875, after the abolition of the liberty in 1892. In the middle ages Romford was rather a meeting-place for merchants than an industrial centre. Brewing, however, is mentioned in 1331, and one tanner at least carried on business in Hare Street in 1467.

**ROMILLY, JOHN ROMILLY, 1ST BARON** (1802-1874), English judge, was the second son of Sir Samuel Romilly, and was born on the 10th of January 1802. He was educated at Trinity College, Cambridge, and was called to the bar at Gray's Inn in 1827. He first entered parliament in 1832 as member for Bridport, and in 1843 he became a queen's counsel. He was elected M.P. for Devonport in 1847, and was appointed solicitor-general in 1848 in Lord John Russell's administration and attorney-general in 1850. In 1851 he was appointed master of the rolls, and continued to sit for Devonport till the general election in 1852, when he was defeated. He was the last master of the rolls to sit in parliament. Romilly was raised to the peerage as Baron Romilly of Barry in 1866, and

retired from the mastership of the rolls in 1873. He did much to remove the restrictions which had long hampered research among the public records and state papers. Lord Romilly died in London on the 33rd of December 1874.

**ROMILLY, SIR SAMUEL** (1757-1818), English legal reformer, was the second son of Peter Romilly, a watchmaker and jeweller in London, whose father had emigrated from Montpellier after the revocation of the edict of Nantes, and who had married Margaret Garnault, a Huguenot refugee like himself, but of a far wealthier family. Samuel Romilly was born in Frith Street, Soho, on the 1st of March 1757. He served for a time in his father's shop; but his education was not neglected, and he became a good classical scholar and particularly conversant with French literature. A legacy of £3000 from one of his mother's relations led to his being articled to a solicitor and clerk in chancery with the idea of qualifying himself to purchase the office of one of the six clerks in chancery. In 1778, however, he determined to go to the bar, and entered himself at Gray's Inn. He went to Geneva in 1781, where he made the acquaintance of the chief democratic leaders, including Étienne Dumont. Called to the bar in 1783, he went the midland circuit, but was chiefly occupied with chancery practice. On the publication of Madan's *Thoughts on Executive Justice*, advocating the increase of capital punishments, he at once wrote and published in 1786 *Observations on Madan's book*. Of more general interest is his intimacy with the great Mirabeau, to whom he was introduced in 1784. Mirabeau saw him daily for a long time and introduced him to Lord Lansdowne, who highly appreciated him, and, when Mirabeau became a political leader, it was to Romilly that he applied for an account of the procedure used in the English House of Commons. He visited Paris in 1789, and studied the course of the Revolution there; and in 1790 he published his *Thoughts on the Probable Influence of the Late Revolution in France upon Great Britain*, a work of great power. His practice at the chancery bar continued largely to increase, and in 1800 he was made a K.C. In 1798 he married Anne, daughter of Francis Garbett of Knill Court, Herefordshire; and in 1805 he was appointed chancellor of the county palatine of Durham. His great abilities were thoroughly recognized by the Whig party, to which he attached himself; and in 1806, on the accession of the ministry of "All the Talents" to office, he was offered the post of solicitor-general, although he had never sat in the House of Commons. He accepted the office, and was knighted and brought into parliament for Queenborough. He went out of office with the government, but remained in the House of Commons, sitting successively for Horsham, Wareham and Arundel. It was now that Sir Samuel Romilly commenced the greatest labour of his life, his attempt to reform the criminal law of England, then at once cruel and illogical. By statute law innumerable offences were punished by death, but, as such wholesale executions would be impossible, the larger number of those convicted and sentenced to death at every assizes were respited, after having heard the sentence of death solemnly passed upon them. This led to many acts of injustice, as the lives of the convicts depended on the caprice of the judges, while at the same time it made the whole system of punishments and of the criminal law ridiculous. Romilly saw this, and in 1808 he managed to repeal the Elizabethan statute, which made it a capital offence to steal from the person. This success, however, raised opposition, and in the following year three bills repealing equally sanguinary statutes were thrown out by the House of Lords under the influence of Lord Ellenborough. Year after year the same influence prevailed, and Romilly saw his bills rejected; but his patient efforts and his eloquence ensured victory eventually for his cause by opening the eyes of Englishmen to the barbarity of their criminal law. The only success he had was in securing the repeal, in 1812, of a statute of Elizabeth making it a capital offence for a soldier or a mariner to beg without a pass from a magistrate or his commanding officer. Sir Samuel Romilly's efforts made his name famous not only in England but all over Europe, and in 1818 he had the honour of being returned at the head of the

poll for the city of Westminster. He did not long survive his triumph. On the 29th of October 1818 Lady Romilly died in the Isle of Wight. Her husband's grief was intense, and he committed suicide in a fit of temporary insanity on the 2nd of November. No man of his time was more loved than Sir Samuel Romilly; his singularly sweet nature, his upright manliness, his eloquence and his great efforts on behalf of humanity secured him permanent fame.

See the *Memoirs of the Life of Sir Samuel Romilly written by himself, with a selection from his Correspondence, edited by his Son* (2 vols., 1802); *The Speeches of Sir Samuel Romilly in the House of Commons* (2 vols., 1820); "Life and Work of Sir Samuel Romilly," by Sir W. J. Collins, in *Trans. of the Huguenot Society* (1908).

**ROMILLY-SUR-SEINE**, a town of north-central France, in the department of Aube, a mile from the left bank of the Seine and 24 m. N.W. of Troyes, on the Paris-Belfort line. Pop. (1906) 9177.

Romilly is an important industrial town, with extensive manufactures of cotton and woollen hosiery, and of the special machinery and appliances required for the industry. The Eastern Railway Company has large workshops here.

**ROMINTZEN**, a village of Germany, in the province of East Prussia, 22 m. N.E. from Goldap, situated in the Rominter Heide, a fine tract of heath and forest country, 90 sq. m. in extent, well stocked with game and affording excellent sport. Here is a favourite hunting-box of the German emperor, with a church adjacent, both in the Norwegian style. Pop. 1200.

See K. E. Schmidt, *Die Rominter Heide* (Danzig, 1896).

**ROMNEY, GEORGE** (1734-1802), English historical and portrait painter, was born at Dalton-in-Furness, Lancashire, on the 26th of December 1734. His father was a builder and cabinet-maker of the place, and the son, having manifested a turn for mechanics, was instructed in the latter craft, showing considerable dexterity with his fingers, executing carvings of figures in wood, and constructing a violin, which he spent much time in playing. He was also busy with his pencil; and some of his sketches of the neighbouring rustics having attracted attention, his father was at length induced to apprentice the boy, at the age of nineteen, to an itinerant painter of portraits and domestic subjects named Steele, an artist who had studied in Paris under Vanloo; but the erratic habits of his instructor prevented Romney from making great progress in his art. In 1756 he impulsively married a young woman who had nursed him through a fever, and started as a portrait painter on his own account, travelling through the northern counties, executing likenesses at a couple of guineas, and producing a series of some twenty figure compositions, which were exhibited in Kendal, and afterwards disposed of by means of a lottery.

Having, at the age of twenty-seven, saved about £100, he left a portion of the sum with his wife and family, and started to seek his fortune in London, never returning, except for brief visits, till he came, a broken-down and aged man, to die. Credit must, however, be given him for recognizing to some extent his family responsibilities. He did not allow his wife and children to fall into poverty, and he gave help to his brother, who seem to have resembled him in a kind of shiftlessness of temperament. In London he rapidly rose into popular favour. His "Death of General Wolfe" was judged worthy of the second prize at the Society of Arts, but a word from Reynolds in praise of Mortimer's "Edward the Confessor" led to the premium being awarded to that painter, while Romney had to content himself with a donation of £50, an incident which led to the subsequent coldness between him and the president which prevented him from exhibiting at the Academy or presenting himself for his honours.

In 1764 he paid a brief visit to Paris, where he was befriended by Joseph Vernet; and his portrait of Sir Joseph Yates, painted on his return, bears distinct traces of his study of the works of Rubens then in the Luxembourg Gallery. In 1766 he became a member of the Incorporated Society of Artists, and three years later he seems to have studied in their school.

Soon he was in the full tide of prosperity. He removed to Great Newport Street, near the residence of Sir Joshua, whose fame in portraiture he began to rival in such works as "Sir George and Lady Warren" and "Mrs Yates as the Tragic Muse"; and his professional income rose to £1200 a year. But this marked increase in his popularity had the effect of enlarging his ambitions, and he became anxious to attempt subjects which required more experience than he possessed. Realizing as he did the need for more thorough knowledge, he was seized with a longing to study in Italy; and in the beginning of 1773 he started for Rome in company with Ozias Humphrey, the miniature painter. On his arrival he separated himself from his fellow-traveller and his countrymen, and devoted himself to solitary study, raising a scaffold to examine the paintings in the Vatican, and giving much time to work from the undraped model, of which his painting of a "Wood Nymph" was a fine and graceful result. At Parma he concentrated himself upon the productions of Correggio, which fascinated him and greatly influenced his practice.

In 1775 Romney returned to London, establishing himself in Cavendish Square, and resuming his extensive and lucrative employment as a portrait painter, which in 1785, according to the estimate of his pupil Robinson, yielded him an income of over £3600. The admiration of the town was divided between him and Reynolds. "There are two factions in art," said Lord Thurlow, "and I am of the Romney faction"—and the remark, and the rivalry which it implied, caused much annoyance to Sir Joshua, who was accustomed to refer contemptuously to the younger painter as "the man in Cavendish Square." After his return from Italy Romney formed two friendships which powerfully influenced his life. He became acquainted with Hayley, his future biographer, then in the zenith of his little-merited popularity as a poet. His influence on the painter seems to have been far from salutary. Weak himself, he flattered the weaknesses of Romney, encouraged his excessive and morbid sensibility, disturbed him with amateurish fancies and suggestions, and tempted him to expend on slight rapid sketches, and ill-considered, seldom-completed paintings of ideal and poetical subjects, talents which would have found siter exercise in the steady pursuit of portraiture. About 1783 Romney was introduced to Emma Hart, afterwards celebrated as Lady Hamilton, and she became the model from whom he worked incessantly. Her bewitching face smiles from numerous canvases; he painted her as a Magdalene and as a Joan of Arc, as a Circe, a Bacchante, a Cassandra; and he has himself confessed that she was the inspirer of what was most beautiful in his art. But her fascinations seem to have been too much for the more than middle-aged painter, and they had their own share in aggravating that nervous restlessness and instability, inherent in his nature, which finally ruined both health and mind.

In 1786 Alderman Boydell started his great scheme of the Shakespeare Gallery, apparently at the suggestion of Romney. The painter at least entered heartily into the plan, and contributed his scene from the *Tempest*, and his "Infant Shakespeare attended by the Passions," the latter characterized by the Redgraves as one of the best of his subject pictures. Gradually he began to withdraw from portrait painting, to limit the hours devoted to sitters, and to turn his thoughts to mighty schemes of the ideal subjects which he would execute. Already, in 1792, he had painted "Milton and his Daughters," which was followed by "Newton making Experiments with the Prism." He was to paint the Seven Ages, Visions of Adam with the Angel, "six other subjects from Milton—three where Satan is the hero, and three from Adam and Eve,—perhaps six of each." Having planned and erected a large studio in Hampstead, he removed thither in 1797, with the fine collection of casts from the antique which his friend Flaxman had gathered for him in Italy. But his health was now irremediably shattered, and the man was near his end. In the summer of 1799, suffering from great weakness of body and the profoundest depression of mind, he returned to the north, to Kendal, where

his deserted but faithful and long-suffering wife received and tended him. He died on the 15th of November 1802.

The art of Romney, especially his figure subjects, suffered greatly from the waywardness and instability of the painter's disposition, from his want of fixed purpose and sustained energy. He lacked the steadfast perseverance needful to the accomplishment of a great picture. Afflicted as he was throughout his life by an unreasonable timidity and by a self-consciousness which led him at one moment into assertive affectations and at another into exaggerated humility, he avoided the society of his brother artists and lost many opportunities of receiving that frank professional criticism which might have stimulated him to more serious effort. In unwholesome surroundings he steadily deteriorated. His imagination flashed and flickered fitfully upon him, like April sunshine. His fancy would be captivated by a subject, which was presently embodied in a sketch, but the toil of elaborating it into the finished completeness of a painting too frequently overtaxed his powers; he became embarrassed by technical difficulties which, through defective early training, he was unable to surmount, and the half-covered canvas would be turned to the wall. Even in the pictures he finished he was unable to keep to any consistent level of achievement. He produced some fine things, very personal in style and very skilful in handling; but much that he did seems too tentative and too plainly deficient in shrewdness of insight to deserve serious consideration. His colour, too, was often unpleasant, hot and monotonous, and his composition was apt to be stilted and artificial. It is in the best of his portraits that we feel the painter's real ability. These, especially his female portraits, are full of grace, charm, distinction, and sweetness. When we examine his heads of Cowper and Wilkes, his delicate and dignified full-length of William Beckford, his "Parson's Daughter" in the National Gallery, and his group of the Duchess of Gordon and her Son, we cannot deny his claim to rank as one of the notable portrait painters of 18th-century England.

See the *Memoirs* by William Hayley (1809) and by the artist's son, the Rev. John Romney (1830); Cunningham's *Lives of the Painters; George Romney and his Art*, by Hilda Gamlin (1894). In the fully illustrated *George Romney*, by Lord Ronald Sutherland Gower (1904), pictures, mainly studies, are reproduced not elsewhere to be found. But the great work upon the artist is *Romney*, by Humphry Ward and W. Roberts (1904), a monograph of real importance, containing 70 illustrations, a biographical and critical essay, and a *catalogue raisonné* of the painter's works. Arthur B. Chamberlain's *Romney* (1910) has 73 plates.

**ROMNEY, HENRY SIDNEY, EARL OF (1641-1704)**, fourth son of Robert, 2nd earl of Leicester, was born in Paris in 1641. He and his nephew, Robert Spencer, afterwards 2nd earl of Sunderland, his senior by a few months, were sent to travel on the continent of Europe in charge of a Calvinist divine, Dr Thomas Pierce. Sidney's handsome face helped his advancement at court, but the favour in which he was held by the duchess of York, to whom he was master of the robes, led to his dismissal in 1666. His disgrace, however, was short-lived. He was promoted captain in 1667, and colonel in 1678. In 1672 he was sent on a mission of congratulation to Louis XIV., and in 1677 became master of the robes to Charles II. He entered parliament as member for Bramber in 1679, and became a close political ally of his nephew Sunderland, with whose wife he carried on an intrigue which caused considerable scandal. Sunderland made this intimacy a means to further his political ends, while Sidney's social reputation and his apparent frivolity partly concealed his real capacity for intrigue. Sidney was sent by Sunderland and others in 1679 on a special mission to urge William of Orange to visit England, a task that he was able to discharge while acting as the official envoy of Charles II. at the Hague. He was recalled in 1682, but was again sent on a special mission to Holland in the year of the accession of James II. He returned to England in the spring of 1688, and set to work, at William's desire, to obtain promises of support for the prince of Orange in the event of his landing. He was presently allowed to leave England on giving his word not to visit the

Hague, but he broke his promise on getting clear of England, and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state obtained through the countess of Sunderland. He landed with William at Torbay, and received substantial rewards for his undoubted services. Sworn of the privy council in 1689, Sidney was made gentleman of the bedchamber and colonel of the king's regiment of footguards, and received the titles of Baron Milton and Viscount Sidney of Sheppey. In 1690 he received considerable grants of land from the confiscated estates of the Irish supporters of James II., much of which he lost, however, on the parliamentary investigation in 1699 into the distribution of the Irish lands. William made him secretary of state in 1690, pending the discovery of a better person. He was soon asked to resign, but was compensated by his appointment, in 1692, as lord-lieutenant of Ireland. His inability to cope with the difficulties of this position led to his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694, and he retained William's confidence to the last, but on Anne's accession he was dismissed from his various offices. He never married, and his titles became extinct on his death on the 8th of April 1704.

In 1801 the title of earl of Romney was revived in the family of Marsham. Sir Robert Marsham, Bart. (1688-1724), of Cuxton in Kent, was a member of parliament from 1708 to 1716, when he was created Baron of Romney. His grandson Charles, the 3rd Baron (1774-1811), was created earl of Romney in 1801, and from him the present earl is descended.

**ROMNEY (NEW ROMNEY)**, a municipal borough and one of the Cinque Ports in the Ashford parliamentary division of Kent, England, 75 m. S.E. by E. of London by the South-Eastern & Chatham railway. Pop. (1901) 1328. It lies in the open, flat and low tract of Romney Marsh, part of a level extending from Winchelsea in the south-west to Hythe in the north-east, which was within historic times in great part covered by an estuarine inlet of the sea. The river Rother, which now has its mouth at Rye Harbour, formerly entered the sea here, but had its course wholly changed during a great storm in 1287, and the gradual accretion of land led to the decay, not only of Romney, but of Winchelsea and Rye as seaports. Romney Marsh itself, which extends north of New Romney, is protected by a seawall of great thickness, and its guardianship and drainage is in the hands of a special ancient corporation. The level affords pasturage for vast flocks of sheep. New Romney, which is now over a mile from the sea, has large sheep farms, but little other trade. Of the five churches mentioned here in the Domesday Survey only one remains, but this, dedicated to St Nicholas, is a rich Norman building with later additions. Its Norman west tower is among the finest in England, and it has a beautiful decorated east window with reticulated tracery. New Romney, the name of which distinguishes it from the decayed village of Old Romney, 2 m. W., is governed by a mayor, 4 aldermen and twelve councillors. Area, 1351 acres. **LITTLESTONE-ON-SEA**, on the coast E. of New Romney, is in some favour as a seaside resort and has excellent golf-links.

Its fine harbour was the cause of the early importance of Romney (Romenal, Romenhall). The annual assembly of the Cinque Ports, called the Brodhull, was held here owing to its central position. At the time of Domesday the archbishop of Canterbury and the bishop of Bayeux were joint lords. Romney also owed maritime service to the king, which consisted of supplying five ships to serve for fifteen days in the year. A confirmation of liberties was granted by John in 1205. The town, which was a borough by prescription, was governed "from time immemorial" by twelve jurors; a bailiff was appointed by the archbishop, but the rights of the overlord seem to have been small, and in 1521 the inhabitants denied the bailiff the right of presiding with the jurors over their court. Elizabeth changed the style of incorporation to the mayor, jurors and commonalty, and another charter was granted by James II. in 1686, which remained the governing charter until 1835. The Cinque Ports

were first summoned to parliament in 1265; the first returns for Romney are for 1266; it returned two members until it was disfranchised in 1835.

**ROMORANTIN**, a town of central France, capital of an *arrondissement* in the department of Loir-et-Cher, 31 m. S.E. of Blois by rail. Pop. (1906) town, 6836; commune, 8374. The town is situated on the Sauleire at its confluence with the Morantia, whence its name (*Roms Morantia*). A church dating mainly from the 12th century, a gateway of the 16th century and some old houses are the chief objects of interest. The remains of a chateau rebuilt by Francis I. in the Renaissance style are used as the sub-prefecture. Tribunals of first instance and of commerce, and a communal college are among the public institutions. The manufacture of flannel and cloth especially for army clothing is carried on, together with trade in wine, live stock, agricultural produce and the asparagus of the vicinity.

In 1560 Romorantia gave its name to an edict which prevented the introduction of the Inquisition into France. The industrial importance of the town dates from the later middle ages.

**ROMSDAL**, the valley of the river Rauma, in Norway. The Rauma is a torrent descending from Lake Lesjökogen to the Romsdal Fjord on the west coast (62° 30' N.). The nearest port is Molde, from which steamers run to Vebjungsnes (30 m.) at the foot of the valley. A good road traverses the valley, which is one of the finest in southern Norway, flanked by steep mountains terminating in abrupt peaks—Vengotinder (5960 ft.), Romsdalshorn (5105), Troldtinder ("witch-peaks" 6010) and others. Several waterfalls are seen, such as the Mongefos, the Værmofos, falling nearly 2000 ft., and the Settsafos. Lake Lesjökogen also drains from the opposite end by the Laagen or Lougen river to the Glommen, and so to the Skagerrack, and the road follows its valley, the Gudbrandsdal. The Romsdal gives its name to an *os* (county) extending from the promontory of Stadt in the south to Ram Fjord in the north, including the Stor, Molde, Halse and their branch fjords, the ports of Alesund, Molde and Christiansund, and reaching inland to the Dovrefjeld.

**ROMSEY**, a market town and municipal borough in the New Forest parliamentary division of Hampshire, England, 7 m. N.W. of Southampton by the London & South-Western railway. Pop. (1901) 4365. It is pleasantly situated in the rich valley of the Test. The abbey church of SS. Mary and Eufleda is one of the finest examples in England of a great Norman church little altered by later builders. Its history is not clear, but a house was founded here by Edward the elder (c. 910), and became a Benedictine monastery. The church, which is the only important relic of the foundation, is cruciform, with a low central tower. Building evidently began in the first half of the 12th century, and continued through it, as the western part of the nave shows the transition to the Early English style, which appears very finely in the west front. Decorated windows occur in the east end, beyond which a chapel in this style formerly extended. Perpendicular insertions are insignificant. The nave and choir have aisles, triforium and clerestory. The transepts have eastern apsidal chapels, as have the choir aisles, though the walls of these last are square without. Foundations of the apex of a large pre-Norman church have been discovered below the present building. In Romney there are tanyards, ironworks and works of the Berthon Boat Company. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 533 acres.

Romsey (*Romsay, Romassie*) probably owed its origin, as it did its early importance, to the abbey. At the time of the Domesday Survey it was owned by the abbey, which continued to be the overlord until the dissolution. There is no evidence to show that Romsey was a borough before the charter of incorporation granted by James I. in 1608. This was confirmed by William III. in 1692, and the corporation was reformed in 1835. Romsey has never been represented in parliament. The right to hold a fair was granted to the abbey by Henry III.

in 1271, and fairs were held on Easter Monday, on August 26 and November 8. The market now held on Thursday, formerly on Saturday, dates from 1272. Every alternate Thursday is a great market. In medieval times Romsey had a considerable share of the woolen trade of Hampshire, but by the end of the 17th century this manufacture began to decline, and the introduction of machinery and the adoption of steam led to its subsequent transference to the northern coal centres. The clothing trade was replaced by the manufacture of paper, an industry which still exists.

**ROMULUS**, the legendary eponymous founder and first king (753-716P) of Rome, represented as the son of Mars by the Vestal Rhea Silvia or Ilia, daughter of Numitor, who had been dispossessed of the throne of Alba by his younger brother Amulius. Romulus and Remus, the twin sons of Silvia, were placed in a trough and cast into the Tiber by their granduncle. The trough grounded in the marshes where Rome afterwards stood, under the wild fig tree (*figus ruminalis*), which was still holy in later days. The babes were suckled by a she-wolf and fed by a woodpecker, and then fostered by Acca Larentia, wife of the shepherd Faustulus. They became leaders of a warlike band of shepherds on the Palatine, and in course of time were recognized by their grandfather, whom they restored to his throne, slaying the usurper Amulius. They now proposed to found a city on the site where they had been nurtured; but a quarrel for precedence broke out and Remus was slain. Romulus strengthened his band by offering an "asylum" to outcasts and fugitives, found wives for them by capture and waged war with their kinsmen. His most formidable foe was Titus Tatius (q.v.), king of the Sabines, but after an obstinate struggle he and Romulus united their forces and reigned side by side till Tatius was slain at Lavinium in the course of a blood-feud with Laurentum. Romulus then reigned alone till he suddenly disappeared in a storm. He was thereafter worshipped as a god under the name of Quirinus, which, however, is really a Sabine form of Mars. The story of Romulus, best preserved in the first book of Livy (see also Dion. Halic. i. 75-ii. 56; Plutarch, *Romulus*; Cicero, *de Republica*, ii. 2-10), belongs throughout to legend. This was felt in later times by the Romans themselves, who gave a rationalistic explanation of the miraculous incidents. Thus, Mars was converted into a stranger disguised as the god of war, and the she-wolf into a woman of ill-fame (*hæpe*); Romulus was not taken up into heaven, but put to death and carried away piecemeal by the patricians under their cloaks.

The whole story, probably first given by the annalists Fabius Pictor and Cincius Alimentus, contains religious and aetiological elements. The foundation of the city by twins may be explained by the worship of the Lares, who are generally represented as a pair of brothers, especially as the mother of Romulus and Remus was connected with the worship of the hearth of the state. The introduction of the wolf may be of Greek or eastern origin; it may have a totemistic significance; or may be due to the *figus ruminalis*, the fig tree near the Lupercal on the Palatine, where the twins were first exposed. This tree was sacred to a goddess Rumina (*ruma*, "breast," whence the suckling incident), and the resemblance between Romulus and *ruminalis* led to the fig tree and the founder of the city being subsequently connected by the Roman antiquarians. The wolf would then be suggested by the proximity of the Lupercal, the grotto of Faunus Lupercus, with whom the shepherd Faustulus is identical. According to Professor Ducati of Bologna, in a paper on an old Etruscan stele, on which a she-wolf is represented suckling a child, the wolf legend is an importation from Etruria, the original home of which was Crete. Miletus, son of Apollo and a daughter of Minos, having been exposed by his mother, was suckled by she-wolves, being afterwards found and brought up by shepherds. To escape the designs of Minos, Miletus fled to Asia Minor, and founded the city called after him, where the Etruscans first became acquainted with the legend. The opening of the "asylum" is a Greek addition (as the name itself suggests). Down to imperial times, the Romans seem to have

been ignorant of the Greek custom of taking sanctuary; further, the idea was entirely opposed to the exclusive spirit of the ancient Italians. The story was probably invented to give an explanation of the sacred spot named "Inter duos lucos" between the arx and the Capitol. Another Greek touch is the deification of an eponymous hero. Therape of the Sabine women is clearly aetiological, invented to account for the custom of marriage by capture. Consus, at whose festival the rape took place, was a god of the earth and crops, the giver of fruitfulness in plants and animals. It is generally agreed that the capture of the Capitol by Titus Tatius may contain an historical element, pointing to an early conquest of Rome by the Sabines, of which there are some indications. Subsequently, to efface the recollection of an event so distasteful to Roman vanity and national pride, Sabine names and customs were accounted for by a supposed union of Romans and Sabines during the regal period, the result of a friendly league concluded between Romulus and Tatius. According to E. Pais, Romulus is merely the eponym of Roma; his life is nothing but the course of the sun, and the institutions ascribed to him are the result of long historical development.

Romulus, like his double Tullus Hostilius, is regarded as the founder of the military and political (see *ROMÆ*), as Numa and his counterpart Ancus Marcius of the religious institutions of Rome.

For a critical examination of the story, see Schwieger, *Römische Geschichte*, bk. viii.-x.; Sir George Cornewall Lewis, *Credibility of early Roman History*, chap. 11; W. Ihne, *History of Rome*, i.; Sir J. Seeley, Introduction to his edition of Livy, bk. i.; E. Pais, *Storia di Roma* (1898), i. pt. 1, and *Ancient Legends of Roman History* (Eng. trans., 1906); also O. Gilbert, *Geschichte und Topographie der Stadt Rom im Altertum* (1883-1885).

**RONCESVALLES** (Fr. *Roncevaux*), a village of northern Spain, in the province of Navarre; situated on the small river Urrobi, at an altitude of 3220 ft. among the Pyrenees, and within 5 m. from the French frontier. Pop. (1900) 152. Roncevalles is famous in history and legend for the defeat of Charlemagne and the death of Roland (q.v.) in 778. The small collegiate church contains several curious relics associated with Roland, and is a favourite place of pilgrimage. The battle is said to have been fought in the picturesque valley known as Val Carlos, which is now occupied by a hamlet bearing the same name, and in the adjoining defile of Ibaneta. Both of these are traversed by the main road leading north from Roncevalles to St Jean Pied de Port, in France.

**RONCONI, GIORGIO** (1810-1890), Italian baritone vocalist, was born in 1810. He learnt singing from his father Domenico, who had been a celebrated tenor in his time, and made his début in 1831 at Pavia. After singing in Italy for some years with ever-growing success, he appeared for the first time in England, in 1842, as Henry Ashton in *Lucia di Lammermoor*. His success was immediate, and he continued to be one of the most popular artists on the lyric stage until his retirement in 1866. His voice was neither extensive in compass nor fine in quality, but the genius of his acting and the strength of his personality fully atoned for his vocal defects. He was equally at home in comedy and tragedy, and the two parts by which he is best remembered, Rigoletto and Figaro, show conclusively the range of his talent. In his later years Ronconi founded a school of singing at Granada, and he also accepted the post of professor of singing at the Madrid Conservatoire. He died in 1890.

**RONDA**, a town of southern Spain, in the province of Malaga; on the river Guadiaro and on the Algeciras-Bobadilla railway. Pop. (1900) 20,995. Ronda is built on a high rock nearly surrounded by the Guadiaro, which flows through an abrupt chasm 530 ft. deep and 300 ft. wide, by which the old town is separated from the new. Of the three bridges, one is said to have been built by the Romans, another by the Moors; the most modern (1761) spans the stream in a single arch at a height of about 255 ft. On the edge of the chasm is the alameda or public promenade, commanding a wide and beautiful prospect of the fertile valley or vega and the sierras beyond. The old

part of the town has a Moorish aspect, with narrow, steep and crooked lanes, and still retains some Moorish towers and other medieval buildings. The Ronda bull-ring is one of the finest in Spain, and can accommodate 10,000 spectators. Ronda has a considerable trade in leather, saddlery, horses, soap, flour, chocolate, wine and hats.

Some remains of an aqueduct and theatre, about 7 m. N. of Ronda, are supposed to represent the *Acinipo* or *Arunda* of ancient geographers. Ronda was taken from the Moors in 1485. It gives its name to the Sierra or Serranía de Ronda, one of the main sections of the coast mountains which rise between the great plain of Andalusia and the Mediterranean.

**RONDEAU** (Ital. *Rondo*), a structural form in poetry and (in the form of "rondo") in music. In poetry the rondeau is a short metrical structure which in its perfect form consists of thirteen eight- or ten-syllabled verses divided into three strophes of unequal length, and knit together by two rhymes and a refrain. In Clement Marot's time the laws of the rondeau were laid down, and, according to Voiture, in the 17th century, the following was the type of the approved form of the rondeau:—

"Ma foy, c'est fait de moy, car Isabelle  
M'a conjuré de luy faire un Rondeau:  
Cela me met en une peine extrême.  
Quoy treize vers, huit en son, cinq en *ans*.  
Je luy ferois aussi-tôt un bateau!

En voilà cinq pourtant en un nouveau:  
Faisons en huit, en invoquant Brodeau,  
En puis mettons, par quelque stratagème,  
Ma foy, c'est fait!

Si je pouvois encore de mon cerveau  
Tirer cinq vers, l'ouvrage seroit beau;  
Mais cependant, je suis dedans l'onzième,  
Et si je croy que je fais le douzième  
En voilà treize ajustez au niveau.  
Ma foy, c'est fait!"

All forms of the rondeau, however, are alike in this, that the distinguishing metrical emphasis is achieved by a peculiar use of the refrain. Though we have a set of rondeaux in the *Rolliad* (written by Dr. Lawrence the friend of Burke, according to Edmund Gosse, who has given us an admirable essay upon exotic forms of verse), it was not till recent years that the form had any real vogue in England. Considerable attention, however, has lately been given in England to the form. Some English rondeaux are as bright and graceful as Voiture's own. Swinburne, who in his *Century of Rondels* was perhaps the first to make the refrain rhyme with the second verse of the first strophe, has brought the form into high poetry. In German, rondeaux have been composed with perfect correctness by Weckherlin, and with certain divergences from the French type by Götz and Fischart; the German name for the form is *rundum* or *ringel-gedicht*.

Although the origin of the refrain in all poetry was no doubt the improvisator's need of a rest, a time in which to focus his forces and recover breath for future flights, the refrain has a distinct metrical value of its own; it knits the structure together, and so intensifies the emotional energy, as we see in the Border ballads, in the *Oriana* of Lord Tennyson, and in the *Sister Helen* of Rossetti. The suggestion of extreme artificiality—of "difficulty overcome"—which is one great fault of the rondeau as a vehicle for deep emotion, does not therefore spring from the use of the refrain, but from the too frequent recurrence of the rhymes in the strophes—for which there is no metrical necessity as in the case of the Petrarchan sonnet. The rondeau is, however, an inimitable instrument of gaiety and grace in the hands of a skillful poet.

**RONDEL**, a form of verse closely allied to the rondeau (*q.v.*) but distinguished from it by containing fourteen instead of thirteen lines, and by demanding a slightly different arrangement of rhymes. Moreover, the initial couplet is repeated in the middle and again at the close. The arrangement of rhymes is as follows: a, b b, a; a, b, a; b, a, b; a, b, a, b. This form, which was invented in the 14th century, was largely used in

later medieval French poetry, but particularly by Charles d'Orléans (1391–1465), the very best of whose graceful creations are all rondels. One of the most famous of this prince's rondels may be given here as a type of their correct construction:—

"Le temps a laissé son manteau  
De vent, de froidure et de pluie,  
Et s'est vestu de broderie  
De soleil luisant, cler et beau.  
Il n'y a beste ne oiseau  
Qu'en son jargon ne chante ou crie:  
Le temps a laissé son manteau  
De vent, de froidure et de pluie.  
Rivière, fontaine et ruisseau  
Portent, en livrée jolie,  
Gouttes d'argent d'or faverie;  
Chascun s'abille de nouveau;  
Le temps a laissé son manteau  
De vent, de froidure et de pluie."

The rondel, in French, may begin with either a masculine or a feminine rhyme, but its solitary other rhyme must be of the opposite kind. The rondel was introduced into English in the 15th century, but the early specimens of it are very clumsy. It was revised in the 19th century, but it appears to suit the French better than any other language. Correct examples are found in the poems of Robert Bridges, Dobson, Gosse and Henley. The following, by Austin Dobson, gives an exact impression of what an English rondel should be in all technical respects:—

"Love comes back to his vacant dwelling,—  
The old, old Love that we knew of yore!  
We see him stand by the open door,  
With his great eyes sad, and his bosom swelling.  
He makes as though in our arms repelling  
He fain would lie as he lay before,—  
Love comes back to his vacant dwelling,—  
The old, old Love that we knew of yore!  
Ah! who shall help us from over-spelling  
That sweet, forgotten, forbidden lore?  
E'en as we doubt, in our hearts once more,  
With a rush of tears to our eyelids welling,  
Love comes back to his vacant dwelling,  
The old, old Love that we knew of yore!"

Théodore de Banville remarks that the art of the rondel consists in the gay and natural reintroduction of the refrain, which should always seem inevitable, while slightly changing the point of view of the reader. If this is not successfully achieved, "on ne fera que de la marqueterie et du placage, c'est-à-dire, on fait de poésie,—rien!" In Germany, the rondel was introduced, in the 18th century, under the name of *ringel-gedicht*, by Johann Nikolaus Götz (1731–1781), and was occasionally used, in the course of the 19th century, by German poets.

**RONDO**, a musical form originally derived from the rondel in verse; as may be seen, long before the development of instrumental forms, in some of the *chansons* of Orlando di Lasso. The *rondos* in *couplets* of Couperin and his contemporaries shows both in name and form the same connexion with verse. It consists of the alternation between a single neatly rounded phrase and several slightly contrasted episodes (the *couplets*) without any important change of key. Bach enriched it with his wealth of epigram, but did not expand its range.

The later sense of the term covers an important series of the sonata forms (*q.v.*), chiefly found in finales; but *rondo-form* sometimes occurs in slow movements (e.g. Mozart, *Haydn Serenade*, String Quintet in E flat; Beethoven, Fourth Symphony; Quartet, *Op. 74*, &c.). The single-phrase *riformis* and short *couplets* of the old form are in the sonata style replaced by a broadly designed melody and well-contrasted episodes in different keys.

If the form of a Bach or Couperin rondo may be represented by *A B A C A D A*, &c., the various forms of the later rondo may be represented somewhat as follows: placing on a horizontal line those parts that are in the main key, and representing other keys by differences of level:—

(i) *Sectional rondos*; i.e. with little or no development &

transition between episode and main theme; very characteristic of Haydn, who, however, often gives it more organization

B

than appears on the surface—A A A coda; very rarely  
C

with no change of key except between tonic major and minor, as in Haydn's famous *Gipsy Rondo*. Frequently the episodes are increased in number or made to recur. Beethoven most clearly shows the influence of Haydn in his frequent use of modifications of this type of rondo in his earlier works, e.g. finales of Sonatas, *Op. 10*, No. 3, *Op. 14*, Nos. 1 and 2. He also applied it very successfully to his early slow movements, as in the Sonatas, *Op. 2*, No. 2, and *Op. 13 (Pathétique)*. The sectional rondo was modernized on a gigantic scale by Brahms in the finale of his G minor Pianoforte Quartet, *Op. 25*; and Schumann's favourite art-forms are various compounds between it and the cognate idea of the dance-tune with one or more "trios," as in the *Novellettes*, the *Arabeske*, and the *Romance* in B major.

(ii) *Rondos influenced by the form of a first movement* (for which see SONATA FORMS). The normal scheme for this, which

B

is Mozart's favourite rondo-form, is A A A B A coda,  
C

and it is easy to see how it may be applied to sectional rondos, as in the finale of Beethoven's Sonata, *Op. 13*. But it normally implies longer and weightier themes and a higher degree of organization. If the second episode (C) is transformed into an elaborate development of previous material in various keys, the resemblance to first-movement form is increased; the only external difference being the recurrence of A in full after the first episode B (which is treated exactly like the "second subject" of a first movement). As, however, many first movements that do not repeat their exposition (corresponding to A+B in the above rondo-scheme) make a feint of so doing before beginning the development, it is obvious that the blending of rondo and first-movement form may become very complete. In fact, the true criterion of a rondo is, as with all real art-forms, a matter of style rather than of external shape. The well rounded-off, self-repeating, tune-like character of the main theme, and a sense of pleasure and importance in the mere fact of its return (without absolute necessity for dramatic effect) are the distinctive evidences of rondo form and style. This rule is well proved by the case most frequently cited as an exception, the rondo of Beethoven's Sonata in D, *Op. 10*, No. 3; for nothing can be more significant than the way in which its fragmentary opening figure is built up into a self-contained musical epigram and ended with a full close, as contrasted with the way in which the most tuneful of first-movement beginnings (e.g. Beethoven's Quartet in F major, *Op. 59*, No. 1, Trio in B flat, *Op. 97*; Brahms's String Quintet in F major, *Op. 88*) expand gradually into their further course.

The following are some of the more important of many modifications and applications of this form:—

(a) Omission of return of main theme before recapitulation of B

episode—A A development in various keys, B A coda—as in Beethoven's G major Concerto, where, however, much happens between the recapitulation of B and the following return of A, and the coda is nearly as long as all that has gone before.

(b) A A B (A) like a first movement without a development. Here A will be very large and the transition to B important, while B will consist of a considerable number of themes. See the finales of Mozart's E flat String Quartet and C major Quintet, most of his greater slow movements, and many of Beethoven's.

In concertos the only modifying influence the balance between solo and orchestra shows in rondo-form is in the tendency to give the orchestra a large number of subsidiary themes at the outset, which perhaps do not reappear until the coda, where, with the aid of the solo, they can round off the design very effectively. Mozart's use of this device is not confined to concertos. (D. F. T.)

**RONSARD, PIERRE DE** (1524-1585), French poet and "prince of poets" (as his own generation in France called him), was born at the Château de la Poissonnière, near the village of

Couture in the province of Vendômois (department of Loir-et-Cher), on the 11th of September 1524. His family are said to have come from the Slav provinces to the south of the Danube (provinces with which the crusades had given France much intercourse) in the first half of the 14th century. Baudouin de Ronsard or Rossart was the founder of the French branch of the house, and made his mark in the early stages of the Hundred Years' War. The poet's father was named Loys, and his mother was Jeanne de Chaudrier, of a family not only noble in itself but well connected. Pierre was the youngest son. Loys de Ronsard was *maître d'hôtel du roi* to Francis I., whose captivity after Pavia had just been softened by treaty, and he had to quit his home shortly after Pierre's birth. The future Prince of Poets was educated at home for some years and sent to the Collège de Navarre at Paris when he was nine years old. It is said that the rough life of a medieval school did not suit him. He had, however, no long experience of it, being quickly appointed page, first to the king's eldest son François, and then to his brother the Duke of Orleans. When Madeleine of France was married to James V. of Scotland, Ronsard was attached to the king's service, and he spent three years in Great Britain. The latter part of this time seems to have been passed in England, though he had, strictly speaking, no business there. On returning to France in 1540 he was again taken into the service of the duke of Orleans. In this service he had other opportunities of travel, being sent to Flanders and again to Scotland. After a time a more important employment fell to his lot, and he was attached as secretary to the suite of Lazare de Balif, the father of his future colleague in the *Pliade* and his companion on this occasion, Antoine de Balif, at the diet of Spire. Afterwards he was attached in the same way to the suite of the cardinal du Bellay-Langey, and his mythical quarrel with Rabelais dates mythically from this period. His apparently promising diplomatic career was, however, cut short by an attack of deafness which no physician could cure, and he determined to devote himself to study. The institution which he chose for the purpose among the numerous schools and colleges of Paris was the Collège Coqueret, the principal of which was Daurat—afterwards the "dark star" (as he has been called from his silence in French) of the *Pliade*; and already an acquaintance of Ronsard's from his having held the office of tutor in the Balif household. Antoine de Balif, Daurat's pupil, accompanied Ronsard; Belleau shortly followed; Joachim du Bellay, the second of the seven, joined not much later. Muretus (Jean Antoine de Muret), a great scholar and by means of his Latin plays a great influence in the creation of French tragedy, was also a student here.

Ronsard's period of study occupied seven years, and the first manifesto of the new literary movement, which was to apply to the vernacular the principles of criticism and scholarship learnt from the classics, came not from him but from Du Bellay. The *Défense et illustration de la langue française* of the latter appeared in 1549, and the *Pliade* (or *Brigade*, as it was first called) may be said to have been then launched. It consisted, as its name implies, of seven writers whose names are sometimes differently enumerated, though the orthodox canon is beyond doubt composed of Ronsard, Du Bellay, Balif, Belleau, Pontus de Tyard (a man of rank and position who had exemplified the principles of the friends earlier), Jodelle the dramatist, and Daurat. Ronsard's own work came a little later, and a rather idle story is told of a trick of Du Bellay's which at last determined him to publish. Some single and minor pieces, an epithalamium on Antoine de Bourbon and Jeanne de Navarre (1550), a "Hymne de la France" (1549), an "Ode à la Paix," preceded the publication in 1550 of the four first books ("first" is characteristic and noteworthy) of the *Odes* of Pierre de Ronsard. This was followed in 1552 by the publication of his *Amours de Cassandre* with the fifth book of *Odes*. These books excited a violent literary quarrel. Marot was dead, but he left a numerous school, some of whom saw in the stricter literary critique of the *Pliade*, in its outspoken contempt of merely vernacular and medieval forms, in its strenuous advice

to French poetry to "follow the ancients," and so forth, an insult to the author of the *Adolescence Clémentine* and his followers. The French court, and indeed all French society, was just then much interested in literary questions, and a curious story is told of the rivalry that ensued. Mellin de Saint-Gelais, it is said, the chief of the "École Marotique" and a poet of no small merit, took up Ronsard's book and read part of it in a more or less designedly burlesque fashion before the king. It may be observed that if he did so it was a distinctly rash and uncourtier-like act, inasmuch as, from Ronsard's father's position in the royal household, the poet was personally known and liked both by Henry and by his family. At any rate, Marguerite de Valois, the king's sister, afterwards duchess of Savoy, is said to have snatched the book from Saint-Gelais and insisted on reading it herself, with the result of general applause. Henceforward, if not before, his acceptance as a poet was not doubtful, and indeed the tradition of his having to fight his way against cabals is almost entirely unsupported. His popularity in his own time was overwhelming and immediate, and his prosperity was unbroken. He published his *Hymns*, dedicated to Marguerite de Savoie, in 1555; the conclusion of the *Amours*, addressed to another heroine, in 1556; and then a collection of (*Œuvres complètes*, said to be due to the invitation of Mary Stuart, queen of Francis II., in 1560; with *Élégies, mascarades et bergeries* in 1565. To this same year belongs his most important and interesting *Abrégé de l'art poétique français*.

The rapid change of sovereigns did Ronsard no harm. Charles IX., who succeeded his brother after a very short time, was even better inclined to him than Henry and Francis. He gave him rooms in the palace; he bestowed upon him divers abbacies and priories; and he called him and regarded him constantly as his master in poetry. Neither was Charles IX. a bad poet. This royal patronage, however, had its disagreeable side. It excited violent dislike to Ronsard on the part of the Huguenots, who wrote constant pasquinades against him, strove (if a ridiculous exaggeration of the Dionysiac festival at Arcueil, in which the friends had indulged to celebrate the success of the first French tragedy, Jodelle's *Citopâtre*) to represent him as a libertine and an atheist, and (which seems to have annoyed him more than anything else) set up his follower Du Bartas as his rival. According to some words of his own, which are quite credible considering the ways of the time, they were not contented with this variety of argument, but attempted to have him assassinated. During this period Ronsard's work was considerable but mostly occasional, and the one work of magnitude upon which Charles put him, the *Françade* (1572), has never been ranked, even by his most devoted admirers, as a chief title to fame. The metre (the decasyllable) which the king chose could not but contrast unfavourably with the magnificent alexandrines which Du Bartas and Agrippa d'Aubigné were shortly to produce; the general plan is feebly classical, and the very language has little or nothing of that racy mixture of scholarliness and love of natural beauty which distinguishes the best work of the *Pléiade*. The poem could never have had an abiding success, but at its appearance it had the singular bad luck almost to coincide with the massacre of St Bartholomew, which had occurred about a fortnight before its publication. One party in the state were certain to look coldly on the work of a minion of the court at such a juncture, the other had something else to think of. The death of Charles made, indeed, little difference in the court favour which Ronsard enjoyed, but, combined with his increasing infirmities, it seems to have determined him to quit court life. During his last days he lived chiefly at a house which he possessed in Vendôme, the capital of his native province, at his abbey at Croix-Val in the same neighbourhood, or else at Paris, where he was usually the guest of Jean Galland, well known as a scholar, at the Collège de Boncourt. It seems also that he had a town house of his own in the Faubourg Saint-Marcel. At any rate his preferences made him in perfectly easy circumstances, and he seems neither to have derived nor wished for any profit

from his books. A half-jocular suggestion that his publisher should give him money to buy "du bois pour se chauffer" in return for his last revision of his *Œuvres complètes* is the only trace of any desire of the kind. On the other hand, he received not merely gifts and endowments from his own sovereign but presents from many others, including Elizabeth of England, Mary, queen of Scots, who had known him earlier, addressed him from her prison; and Tasso consulted him on the *Gerusalemme*. His last years were, however, saddened not merely by the death of many of his most intimate friends, but by constant and increasing ill-health. This did not interfere with his literary work in point of quality, for he was rarely idle, and some of his latest work is among his best. But he indulged (what few poets have wisely indulged) the temptation of constantly altering his work, and many of his later alterations are by no means for the better. Towards the end of 1585 his condition of health grew worse and worse, and he seems to have moved restlessly from one of his houses to another for some months. When the end came, which, though in great pain, he met in a resolute and religious manner, he was at his priory of Saint-Cosme at Tours, and he was buried in the church of that name on Friday, December 27.

The character and fortunes of Ronsard's works are among the most remarkable in literary history, and supply in themselves a kind of illustration of the progress of French literature during the last three centuries. It was long his fortune to be almost always extravagantly admired or violently attacked. At first, as has been said, the enmity, not altogether unprovoked, of the friends and followers of Marot fell to his lot, then the still fiercer antagonism of the Huguenot faction, who, happening to possess a poet of great merit in Du Bartas, were able to attack Ronsard in his tenderest point. But fate had by no means done its worst with him in his lifetime. After his death the classical reaction set in under the auspices of Malherbe, who seems to have been animated with a sort of personal hatred of Ronsard, though it is not clear that they ever met. After Malherbe the rising glory of Corneille and his contemporaries obscured the tentative and unequal work of the *Pléiade*, which was, moreover, directly attacked by Boileau himself, the dictator of French criticism in the last half of the 17th century. Then Ronsard was, except by a few men of taste, like La Bruyère and Fénelon, forgotten when he was not sneered at. In this condition he remained during the whole 18th century and the first quarter of the 19th. The Romantic revival, seeing in him a victim of its special *bis seire* Boileau, and attracted by his splendid diction, rich metrical faculty, and combination of classical and mediæval peculiarities, adopted his name as a kind of battle-cry, and for the moment exaggerated his merits somewhat. The critical work, however, first of Sainte-Beuve in his *Tableaux de la littérature française au 16ème siècle*, and since of others, has established Ronsard pretty securely in his right place, a place which may be defined in a few sentences.

For the general position of the *Pléiade*, see FRENCH LITERATURE. Ronsard, its acknowledged chief and its most voluminous poet, was probably also its best, though a few isolated pieces of Belleas excel him in airy lightness of touch. Several sonnets of Du Bellay exhibit what may be called the intense and voluptuous melancholy of the Renaissance more perfectly than anything of his, and the finest passages of the *Troiques* and the *Divine Sepmaine* surpass his work in command of the alexandrine and in power of turning it to the purposes of satirical invective and descriptive narration. But that work is, as has been said, very extensive (we possess at a rough guess not much short of a hundred thousand lines of his), and it is extraordinarily varied in form. He did not introduce the sonnet into France, but he practised it very soon after its introduction and with admirable skill—the famous "Quand vous serez bien vieille" being one of the acknowledged gems of French literature. His odes, which are very numerous, are also very interesting and in their best shape very perfect compositions. He began by imitating the strophic arrangement of the ancients, but very soon had the wisdom to desert this for a kind of adjustment of the Horatian ode to rhyme, instead of exact quantitative metre. In this latter kind he devised some exquisitely melodious rhythms of which, till our own day, the secret died with the 17th century. His more sustained work sometimes displays a bad selection of measures, and his occasional poetry—epitaphs, eclogues, elegies, &c.—is injured by its vast volume. But the preface to the *Françade* is a very fine piece of verse, far superior (it is in alexandrines) to the poem itself. Generally speaking, Ronsard is best in his amatory versac (the long series of sonnets and odes to Cassandre, Marie, Genèvre, Hélène—Hélène de Surgères, a later and mainly "literary" love—&c.), and in his descriptions of the country (the famous "Mignonne allow voir si la rose," the "Fontaine Bellerie," the "Forêt de Gastie," and so forth), which have an extraordinary grace and freshness. No one used with more art than he the graceful diminutives which

his school set in fashion. He knew well too how to manage the gorgeous adjectives ("marbrine," "cinarbrine," "ivoirine" and the like) which were another fancy of the Pédagogue, and in his hands they rarely become stiff or cumbersome. In short, Ronsard shows eminently the two great attractions of French 16th-century poetry as compared with that of the two following ages—magnificence of language and imagery and graceful variety of metre.

**BIBLIOGRAPHY.**—The chief separately published works of Ronsard are noted above. He produced, however, during his life a vast number of separate publications, some of them mere pamphlets or broadsheets, which from time to time he collected, often striking out others at the same time, in the successive editions of his works. Of these he himself published seven—the first in 1560, the last in 1584. Between his death and the year 1630 ten more complete editions were published, the most famous of which is the folio of 1609. A copy of this presented by Sainte-Beuve to Victor Hugo, and later in the possession of M. Maxime du Camp, has a place of its own in French literary history. The work of C. Binet in 1860, *Discours de la vie de Pierre de Ronsard*, is very important for early information, and the author seems to have revised some of Ronsard's work under the poet's own direction. From 1630 Ronsard was not again reprinted for more than two centuries. Just before the close of the second, however, Sainte-Beuve printed a selection of his poems to accompany the above-mentioned *Tableau* (1828). There are also selections by M. Noel (in the *Collection Didot*) and Beq de Fouquieres. In 1857 M. Prosper Blanchemain, who had previously published a volume of *Œuvres inédites de Ronsard*, undertook a complete edition for the *Bibliothèque Elzévirienne*. The eighth and last volume of this appeared ten years later. It is practically complete; a few pieces of a somewhat free character which are ascribed with some certainty to the poet are, however, excluded. A later and better edition still is that of Marty-Laveaux (1887-1893), and another that of B. Pitteau (1891). As for criticism, Sainte-Beuve followed up his early work by articles in the *Causeries du lundi*, and the chief later critics have dealt with him in their collected works. Of books may be mentioned those of E. Gandar (Metz, 1884), which considers him chiefly in his relation to the ancients, *Ronsard, imitateur d'Homère et de Pindare*; the marquis de Rochambeau, *La Famille de Ronsard* (1868); G. Scheffer, *Ronsard et sa réforme littéraire* (1874); G. Bizos, *Ronsard* (1891); the Abbé Froger, *Les Premières poésies de Ronsard* (1892); L. Mollier, *Lexique de Ronsard* (1893); F. Perdrizet, *Ronsard et la réforme* (1902), with a still more recent series of articles in different publications by M. Paul Lemonnier. In English Mr. A. Tilley's *Literature of the French Renaissance* (1904) may be consulted, and on Ronsard's critical standpoint Saintsbury's *History of Criticism*, vol. ii. (G. Sa.)

**RONSDORF**, a town of Germany, in the Prussian Rhine province, situated on the Morsbach, a small affluent of the Rhine, 18 m. E. of Düsseldorf and 5 m. S. of Elberfeld-Barmen by rail. Pop. (1905) 14,005. It is the seat of iron, steel and copper industries, besides carrying on extensive manufactures of ribbons, trimmings and silk goods generally. It has also breweries, distilleries and electrical works.

Founded in 1737 by the followers of Elias Eller, a religious enthusiast, Ronsdorf received civic rights in 1745. The Ronsdorf sect, the members of which called themselves Zionites, is now extinct.

**RÖNTGEN, DAVID**, sometimes called **DAVID DE LUNÉVILLE** (1743-1807), German cabinet-maker, eldest son of Abraham Röntgen, was born at Herrenhag. In 1753 his father migrated to the Moravian settlement at Neuwied, near Coblenz, where he established a furniture factory. He learned his trade in his father's workshop, and succeeded to the paternal business in 1772, when he entered into some kind of partnership with the clock-maker Kintzing. At that time the name of the firm appears already to have been well known, at all events in France; but it is a curious circumstance that although he is always reckoned as one of the little band of foreign cabinet-makers and workers in marquetry who, like Oeben and Riesener, achieved distinction in France during the superb *floraison* of the Louis Seize style, he never ceased to live at Neuwied, where apparently the whole of his furniture was made, and merely had a shop, or show-room, in Paris. We have, as it happens, a record of his first appearance there. The engraver Will enters in his journal of August 30, 1774, that "M. Röntgen, célèbre ébéniste, établi à Nieuwied, près de Coblenz, m'est venu voir, en m'apportant une lettre de recommandation de M. Zick, peintre à Cöplenz . . . Comme M. Röntgen connaissait personne à Paris, je lui fus utile en lui enseignant quelques sculpteurs et dessinateurs dont il avait besoin."

Röntgen was first and foremost an astute man of business and it is not improbable that the moving cause of this opening up of relations with Paris was the accession to the throne of Marie Antoinette, whose Teutonic sympathies were only too well known. Before very long she appointed him her *ébéniste-mécanicien*. He appears, indeed, to have acquired considerable favour with the queen, for on several occasions she took advantage of his journeys through Europe to charge him with the delivery of presents and of dolls dressed in the Paris fashions of the moment—they were intended to serve as patterns for the dressmakers—to her mother and her sisters. He appears at once to have opened a shop in Paris, but despite, and perhaps because of, the favour in which he was held at court, all was not plain sailing. The powerful trade corporation of the *mattres-ébénistes* disputed his right to sell in Paris furniture of foreign manufacture, and in 1780 he found that the most satisfactory way out of the difficulty was to get himself admitted a member of the corporation to which all his great rivals belonged. By this time he had attracted a good deal of attention by the introduction of a new style of marquetry, in which light and shade, instead of being represented as hitherto by burning, smoking or engraving the materials, were indicated by small pieces of wood so arranged as to create the impression of *pietra dura*. We have seen that Röntgen had been appointed *ébéniste-mécanicien* to Marie Antoinette, and the appointment is explained by his fondness for and proficiency in constructing furniture in which mechanical devices played a great part. The English cabinet-makers of the later eighteenth century often made what was called, with obvious allusion to his character, "harlequin furniture," especially little dressing-tables and washstands which converted into something else or held their essentials in concealment until a spring was touched. David was a past master in this kind of work, and unquestionably much of the otherwise inexplicable reputation he enjoyed among contemporaries who were head and shoulders above him is explained by his mechanical genius. The extent of his fame in this direction is sufficiently indicated by the fact that Goethe mentions him in *Wilhelm Meister*. He compares the box inhabited by the fairy during her travels with her mortal lover to one of Röntgen's desks, in which "at a pull a multitude of springs and latches are set in motion." For a desk of this kind Louis XVI. paid him 80,000 livres. Outwardly it was in the form of a commode, its marquetry panels symbolizing the liberal arts. A personification of sculpture was in the act of engraving the name of Marie Antoinette upon a column to which Minerva was hanging her portrait. Above a riot of architectural orders was a musical clock (the work of the partner Kintzing), surmounted by a cupola representing Parnassus. The interior of this monumental effort, 11 ft. high, was a marvel of mechanical precision; it disappeared during the First Empire. Röntgen did not confine his activities to Paris, or even to France. It has been said that he travelled about Europe accompanied by furniture vans, and undoubtedly his aptitude as a commercial traveller was remarkable. He had shops in Berlin and St Petersburg, and himself apparently twice went to Russia. On one of these visits he sold to the Empress Catherine furniture to the value of 20,000 roubles, to which she added a personal present of 5000 roubles and a gold snuff-box—in recognition, it would seem, of his readiness and ingenuity in surmounting a secretaire with a clock indicating the date of the Russian naval victory over the Turks at Chesme, news of which had arrived on the previous evening. This suite of furniture is believed still to be in the Palace of the Hermitage, the hiding-place of so much remarkable and forgotten art. To the protection of the queen of France and the empress of Russia David added that of the king of Prussia, Frederick William II., who in 1792 made him a *Commerzienrath* and commercial agent for the Lower Rhine district. The French Revolution and the Napoleonic Wars which so speedily followed, eclipsed Röntgen's star as they eclipsed those of so many other great cabinet-makers of the period. In 1793 the Revolutionary government, regarding him as an *émigré*, seized the contents

of his show-rooms and his personal belongings, and after that date he appears neither to have done business in Paris nor to have visited it. Five years later the invasion of Neuwied led to the closing of his workshops; prosperity never returned, and he died half ruined at Wiesbaden on the 12th of February 1807.

Röntgen was not a great cabinet-maker. His forms were often clumsy, ungraceful and commonplace; his furniture lacked the artistry of the French and the English cabinet-makers of the great period which came to an end about 1790. His bronzes were poor in design and coarse in execution—his work, in short, is tainted by commercialism. As a *marqueteur*, however, he holds a position of high distinction. His marquetry is bolder and more vigorous than that of Riesener, who in other respects soared far above him. As an adroit deviser of mechanism he fully earned a reputation which former generations rated more highly than the modern critic, with his facilities for comparison, is prepared to accept. On the mechanical side he produced, with the help of Kintzing, many long-cased and other clocks with ingenious indicating and registering apparatus. Röntgen delighted in architectural forms, and his marquetry more often than not represents those scenes from classical mythology which were the dear delight of the 18th century. He is well represented at South Kensington.

**RÖNTGEN, WILHELM KONRAD** (1845— ), German physicist, was born at Lennep on the 27th of March 1845. He received his early education in Holland, and then went to study at Zürich, where he took his doctor's degree in 1869. He then became assistant to Kundt at Würzburg and afterwards at Strassburg, becoming *privat-docent* at the latter university in 1874. Next year he was appointed professor of mathematics and physics at the Agricultural Academy of Hohenheim, and in 1876 he returned to Strassburg as extraordinary professor. In 1879 he was chosen ordinary professor of physics and director of the Physical Institute at Giessen, whence in 1885 he removed in the same capacity to Würzburg. It was at the latter place that he made the discovery for which his name is chiefly known, the Röntgen rays. In 1895, while experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he noticed that a paper screen covered with barium platinocyanide, which happened to be lying near, became fluorescent under the action of some radiation emitted from the tube, which at the time was enclosed in a box of black cardboard. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, doubt arose in his mind whether it was to be looked upon as light or not, and he was led to put forward the hypothesis that it was due to longitudinal vibrations in the ether, not to transverse ones like ordinary light; but in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal Society in 1896, jointly with Philip Lenard, who had already shown, as also had Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminium. Röntgen also conducted researches in various other branches of physics, including elasticity, capillarity, the conduction of heat in crystals, the absorption of heat-rays by different gases, piezo-electricity, the electromagnetic rotation of polarized light, &c.

**RÖNTGEN RAYS.** W. K. Röntgen discovered in 1895 (*Wied. Ann.* 64, p. 1) that when the electric discharge passes through a tube exhausted so that the glass of the tube is brightly phosphorescent, phosphorescent substances, such as potassium platinocyanide became luminous when brought near to the tube. He found that if a thick piece of metal, a coin for example, were placed between the tube and a plate covered with the phosphorescent substance a sharp shadow of the metal was cast upon the plate; pieces of wood or thin plates of aluminium cast, however, only partial shadows, thus showing that the agent which produced the phosphorescence could traverse with considerable freedom bodies opaque to ordinary light. He found that as a general rule the greater the density of the substance the greater its opacity to this agent. Thus while this effect could pass through the flesh

it was stopped by the bones, so that if the hand were held between the discharge tube and a phosphorescent screen the outline of the bones was distinctly visible as a shadow cast upon the screen, or if a purse containing coins were placed between the tube and the screen the purse itself cast but little shadow while the coins cast a very dark one. Röntgen showed that the cause of the phosphorescence, now called Röntgen rays, is propagated in straight lines starting from places where the cathode rays strike against a solid obstacle, and the direction of propagation is not bent when the rays pass from one medium to another, *i.e.* there is no refraction of the rays. These rays, unlike cathode rays or *Canalstrahlen*, are not deflected by magnetic force; Röntgen could not detect any deflection with the strongest magnets at his disposal, and later experiments made with stronger magnetic fields have failed to reveal any effect of the magnet on the rays. The rays affect a photographic plate as well as a phosphorescent screen, and shadow photographs can be readily taken. The time of exposure required depends upon the intensity of the rays, and this depends upon the state of the tube, and the electric current going through it, as well as upon the substances traversed by the rays on their journey to the photographic plate. In some cases an exposure of a few seconds is sufficient, in others hours may be required. The rays coming from different discharge tubes have very different powers of penetration. If the pressure in the tube is fairly high, so that the potential difference between its electrodes is small, and the velocity of the cathode rays in consequence small, the Röntgen rays coming from the tube will be very easily absorbed; such rays are called "soft rays." If the exhaustion of the tube is carried further, so that there is a considerable increase in the potential differences between the cathode and the anode in the tube and therefore in the velocity of the cathode rays, the Röntgen rays have much greater penetrating power and are called "hard rays." With a highly exhausted tube and a powerful induction coil it is possible to get appreciable effects from rays which have passed through sheets of brass or iron several millimetres thick. The penetrating power of the rays thus varies with the pressure in the tube; as this pressure gradually diminishes when the discharge is kept running through the tube, the type of Röntgen ray coming from the tube is continually changing. The lowering of pressure due to the current through the tube finally leads to such a high degree of exhaustion that the discharge has great difficulty in passing, and the emission of the rays becomes very irregular. Heating the walls of the tube causes some gas to come off the sides, and by thus increasing the pressure creates a temporary improvement. A thin-walled platinum tube is sometimes fused on to the discharge tube to remedy this defect; red-hot platinum allows hydrogen to pass through it, so that if the platinum tube is heated, hydrogen from the flame will pass into the discharge tube and increase the pressure. In this way hydrogen may be introduced into the tube when the pressure gets too low. When liquid air is available the pressure in the tube may be kept constant by fusing on to the discharge tube a tube containing charcoal; this dips into a vessel containing liquid air, and the charcoal is saturated with air at the pressure which it is desired to maintain in the tube. Not only do bulbs emit different types of rays at different times, but the same bulb emits at the same time rays of different kinds. The property by which it is most convenient to identify a ray is the absorption it suffers when it passes through a given thickness of aluminium or tin-foil. Experiments made by McClelland and Sir J. J. Thomson on the absorption of the rays produced by sheets of tin-foil showed that the absorption by the first sheets of tin-foil traversed by the rays was much greater than that by the same number of sheets when the rays had already passed through several sheets of the foil. The effect is just what would occur if some of the rays were much more readily absorbed by the tin-foil than others, for the first few layers would stop all the easily absorbable rays while the ones left would be those that were but little absorbed by tin-foil.

The fact that the rays when they pass through a gas ionize it and make it a conductor of electricity furnishes the best means of measuring their intensity, as the measurement of the amount of conductivity they produce in a gas is both more accurate and more convenient than measurements of photographic or phosphorescent effects. Röntgen rays when they pass through matter produce—as Perrin (*Comptes rendus*, 124, p. 455), Sagnac (*Jour. de Phys.*, 1899, (3), 8, and J. Townsend (*Proc. Camb. Phil. Soc.*, 1899, 10, p. 217, have shown—secondary Röntgen rays as well as cathodic rays. A very complete investigation of this subject has been made by Barkla and Sadler (*Barkla, Phil. Mag.*, June 1906, pp. 812-828; Barkla and Sadler, *Phil. Mag.*, October 1908, pp. 550-584; Sadler, *Phil. Mag.*, July 1909, p. 107; Sadler, *Phil. Mag.*, March 1910, p. 337). They have shown that the secondary Röntgen rays are of two kinds: one kind is of the same type as the primary incident ray and may be regarded as scattered primary rays, the other kind depends only on the matter struck by the rays—their quality is independent of that of the incident ray. When the atomic weight of the element exposed to the primary rays was less than that of calcium, Barkla and Sadler could only detect the first type of ray, i.e. the secondary radiation consisted entirely of scattered primary radiation; elements with atomic weights greater than that of calcium gave out, in addition to the scattered primary radiation, Röntgen rays characteristic of the element and independent of the quality of the primary rays. The higher the atomic weight of the metal the more penetrating are the characteristic rays it gives out. This is shown in the table, which gives for the different elements the reciprocal of the distance, measured in centimetres, through which the rays from the element can pass through aluminium before their energy sinks to 1/2.7 of the value it had when entering the aluminium; this quantity is denoted in the table by  $\lambda$ .

Element.	Atomic weight.	$\lambda$ .
Chromium . . . . .	52	367
Iron . . . . .	55.9	239
Cobalt . . . . .	59.0	193.2
Nickel . . . . .	58.7 (61.3)	159.5
Copper . . . . .	63.6	128.9
Zinc . . . . .	65.4	106.3
Arsenic . . . . .	75.0	60.7
Selenium . . . . .	79.2	51.0
Strontium . . . . .	87.6	35.2
Molybdenum . . . . .	96.0	12.7
Rhodium . . . . .	103.0	8.44
Silver . . . . .	107.9	6.75
Tin . . . . .	119.0	4.33

The radiation from chromium cannot pass through more than a few centimetres of air without being absorbed, while that from tin is as penetrating as that given out by a fairly efficient Röntgen tube. Barkla and Sadler found that the radiation characteristic of the metal is not excited unless the primary radiation is more penetrating than the characteristic radiation. Thus the characteristic radiation from silver can excite the characteristic radiation from iron, but the characteristic radiation from iron cannot excite that from silver. We may compare this result with Stokes's rule for phosphorescence, that the phosphorescent light is of longer wave-length than the light which excites it.

The discovery that each element gives out a characteristic radiation (or, as still more recent work indicates, a line spectrum of characteristic radiation) is one of the utmost importance. It gives us, for example, the means of getting homogeneous Röntgen radiation of a perfectly definite type; it is also of fundamental importance in connexion with any theory of the Röntgen rays. We have seen that there is no evidence of refraction of the Röntgen rays; it would be interesting to try if this were the case when the rays passing through the refracting substance are those characteristic of the substance.

**Secondary Cathodic Rays.**—The incidence of Röntgen rays on matter causes the matter to emit cathodic rays. The velocity of these rays is independent of the intensity of the primary Röntgen rays, but depends upon the "hardness" of the rays; it seems also to be independent of the nature of the matter exposed to the primary rays. The velocity of the cathodic rays increases as the hardness of the primary Röntgen rays increases. Innes (*Proc. Roy. Soc.* 79, p. 442) measured the velocity of the cathodic radiation excited by the rays from Röntgen tubes, and found velocities varying from  $6.2 \times 10^9$  cm./sec. to  $8.3 \times 10^9$  cm./sec. according to the hardness of the rays given out by the tube. The cathodic rays given out under the action of the homogeneous secondary Röntgen radiation characteristic of the different elements have been studied by Sadler (*Phil. Mag.*, March 1910) and Beatty (*Phil. Mag.*, August 1910). The following table giving the properties of the cathodic rays excited by the radiation from various elements is taken from Beatty's paper;  $t$  is the thickness of air at atmospheric pressure and

temperature required to absorb one-half of the energy of the cathode particles,  $t_2$  is the corresponding quantity for hydrogen.

Radiator.	$t_1$	$t_2$
Iron . . . . .	0.0804	0.410
Copper . . . . .	0.135	0.733
Zinc . . . . .	0.164	0.909
Arsenic . . . . .	0.255	
Tin . . . . .	1.672	1.37

The properties of the cathode rays excited by the radiation from tin correspond very closely with those produced in a discharge tube when the potential difference between the anode and cathode is about 30,000 volts. When Röntgen rays pass through a thin plate the cathodic radiation on the side the rays emerge is more intense than on the side they enter. Kaye (*Phil. Trans.* 209, p. 123) has shown that when cathode rays fall upon a metal two kinds of Röntgen rays are excited, one being the characteristic radiation of the metal and the other a kind independent of the nature of the metal and dependent only upon the velocity of the cathode rays. The faster the cathode rays the harder the Röntgen rays they produce. It would be interesting to see if there is any connexion between the velocity of the cathode rays required to excite Röntgen rays as hard as those given out say by tin and the velocity of the cathode rays which the radiation from tin produces when it falls upon any metal. Sadler has shown that metals can give off cathodic radiation even when the incident Röntgen rays are too soft to excite the characteristic Röntgen radiation of the metal, but that there is a large increase in the cathodic radiation as soon as the characteristic Röntgen radiation is excited. It is possible that the shock produced by the emission of these cathode particles starts the vibrations which give rise to the characteristic rays; the cathode particles emitted when the incident rays are too soft to excite the characteristic radiation coming from a different source from those tapped by the hard rays.

**Absorption of Röntgen Rays.**—The wide variations in the penetrating power of Röntgen rays from different sources is shown by the above table of the penetrating power of the characteristic rays of the different elements. Many experiments have been made on the penetration of the same rays for different substances. It is a rule to which there is no well-established exception that the greater the density of the substance the greater is its power of absorbing the rays. The connexion, however, between the absorption and the density of the substance is not in general a simple one, though there is evidence that for exceedingly hard rays the absorption is proportional to the density.

The power of any material to absorb rays is usually measured by a coefficient  $\lambda$ , the definition of which is that a plate  $1/\lambda$  centimetres thick reduces the energy of the rays when they pass through it normally to 1/e of their original value, where  $e$  is the base of the Napierian logarithms and equal to 2.71828. It has been shown that however the physical state of a substance may alter,—if, for example, it changes from the liquid to the gaseous,— $\lambda/D$ , where  $D$  is the density of the substance, remains constant. It has also been shown that if we have a mass  $M$  made up of masses  $M_1, M_2, M_3, \dots$  of substances having coefficients of absorption  $\lambda_1, \lambda_2, \lambda_3, \dots$  and densities  $D_1, D_2, D_3, \dots$  then if  $\lambda/D$  for the mixture is given by the equation

$$M\lambda/D = M_1\lambda_1/D_1 + M_2\lambda_2/D_2 + M_3\lambda_3/D_3 + \dots$$

this equation is true whether the substances are chemically combined or chemically mixed. From this equation, when we know  $\lambda/D$  for a binary compound and for one of its constituents, we can find the value of  $\lambda/D$  for the other constituent. By the use of this principle we can find the value of  $\lambda/D$  for the elements which cannot be obtained in a free state. Benoist (*Jour. de Phys.* (7), 28, p. 289) has shown that if the values of  $\lambda/D$  are plotted against the atomic weight we get a smooth curve; if we draw this curve it is evident that we have the means of determining the atomic weight of an element by measuring its transparency to Röntgen rays when in combination with elements whose transparency is known. Benoist has applied this method to determine the atomic weight of indium.

The value of  $\lambda/D$  for any one substance depends upon the type of ray used, and the ratio of the values of  $\lambda/D$  for two substances may vary very greatly with the type of ray; this is especially the case when one of the substances is hydrogen. Thus Crowther (*Proc. Roy. Soc.*, March 1909) has shown that the ratio of  $\lambda$  for air to  $\lambda$  for hydrogen varied from 100 for rays given out by a Röntgen tube at a comparatively high pressure when the rays were very soft to 5.56 when the pressure in the bulb was very low and the rays very hard. Beatty (*Phil. Mag.*, August 1910) found that this ratio was as large as 175 for the characteristic rays given out by iron, copper, zinc and arsenic, but fell to 25.0 for the rays from tin.

**Polarization of Röntgen Rays.**—A great deal of attention has been paid to a phenomenon called the polarization of the

Röntgen rays. The nature of this effect may be illustrated by fig. 1. Suppose that AB is a stream of cathode rays striking against a solid obstacle B and giving rise to Röntgen rays, let these rays impinge on a small body P, P under these conditions will emit secondary rays in all directions. Barkla (*Phil. Trans.*, 1905, A, 204, p. 467; *Proc. Roy. Soc.* 77, p. 247) found that the intensity of the secondary rays, tested by the ionization they produced in air, was less intense in the

FIG. 1.

plane ABP than in a plane through PB at right angles to this plane, the distances from P being the same in the two cases; the difference in the intensities amounting to about 15%. Haga (*Ann. d. Phys.* 28, p. 439), who tried a similar experiment but used a photographic method to measure the intensity of the secondary rays, could not detect any difference in the two planes, but experiments by Bassler (*Ann. der Phys.* 28, p. 808) and Vegard (*Proc. Roy. Soc.* 83, p. 379) have confirmed Barkla's original observations.

The "polarization" is much more marked if instead of exciting the secondary radiation in P by the Röntgen rays from a discharge tube we do so by means of secondary rays. If, for example, in the case illustrated by fig. 1 we allow a beam of Röntgen rays to fall upon B instead of the cathode rays, the difference between the intensities in the plane ABP and in the plane at right angles to it are very much increased. It is only the scattered secondary radiation which shows this "polarization"; the characteristic secondary radiation emitted by the body at P is quite unpolarized. The existence of this effect has a very important bearing on the nature of Röntgen rays. Whether Röntgen rays are or are not a form of light, i.e. are some form of electromagnetic disturbance propagated through the aether, is a question on which opinion is not unanimous. They resemble light in their rectilinear propagation; they affect a photographic plate, and Brandes and Dorn have shown, they produce an effect, though a small one, on the retina, giving rise to a very faint illumination of the whole field of view. They resemble light in not being deflected by either electric or magnetic forces, while the characteristic secondary radiation may be compared with the phosphorescence produced by ultra-violet light, and the cathodic secondary rays with the photo-electric effect. The absence of refraction is not an argument against the rays being a kind of light, for all theories of refraction make this property depend upon the relation between the natural time of vibration  $T$  of the refracting substance and the period  $t$  of the light vibrations, the refraction vanishing when  $t/T$  is very small. Thus there would be no refraction for light of a very small period, and this would also be true if instead of regular periodic undulations we had a pulse of electromagnetic disturbance, provided the time taken by the light to travel over the thickness of the pulse is small compared with the periods of vibration of the molecules of the refracting substance. Experiments on the diffraction of Röntgen rays are very difficult, for, in addition to the difficulties caused by the smallness of the wavelength or the thinness of the pulse, the secondary radiation produced when the rays strike against a photographic plate or pass through air might give rise to what might easily be mistaken for diffraction effects. Röntgen has never succeeded in observing effects which prove the existence of diffraction. Fomm (*Wied. Ann.* 59, p. 50) observed in the photograph of a narrow slit light and dark bands which looked like diffraction bands; but observation with slits of different sizes showed that they were not of this nature, and Haga and Wind (*Wied. Ann.* 68, p. 884) have explained them as contrast effects. These observers, however, noticed with a very narrow wedge-shaped slit a broadening of the image of the narrow part which they are satisfied could not be explained by the causes. Walter and Pohl (*Ann. der Phys.* 29, p. 331) could not observe any diffraction effects, though their arrangement would have enabled them to do so if the wave-length had not been smaller than  $1.5 \times 10^{-8}$  cm. Sir George Stokes (*Proc. Manchester Lit. and Phil. Soc.*, 1898) put forward the view that the disturbances which constitute the rays are not regular periodic undulations but very thin pulses. Thomson (*Phil. Mag.* 45, p. 172) has shown that when charged particles are suddenly stopped, pulses of very intense electric and magnetic disturbances are started. As the cathode rays consist of negatively electrified particles, the impact of these on a solid would give rise to these intense pulses. The electromagnetic theory therefore shows that effects resembling light, inasmuch as they are electromagnetic disturbances propagated through the aether, must be produced when the cathode rays strike against an obstacle. Since under these circumstances Röntgen rays are produced, it

seems natural, unless direct evidence to the contrary is obtained, to connect the Röntgen rays with these pulses. This view explains very simply the "polarization" of the rays; for, suppose the cathode particle moving from A to B were stopped at its first impact with the plate B (fig. 1), the electric force transmitted along BP would be in the plane ABP at right angles to BP. When this electric force reached the body at P it would accelerate any electrified particles in that body, the acceleration being parallel to AB. Each of these accelerated particles would start electric waves. The theory of such waves shows that their intensity vanishes along a line through the particle parallel to the direction of acceleration, while it is a maximum at right angles to this line; thus the intensity of the rays along a horizontal line through P would vanish, while it would be a maximum in the plane at right angles to this line. In this case there would be complete polarization. In reality the cathode particle is not stopped at its first encounter, but makes many collisions, changing its direction between each; and these collisions will send out electric disturbances which when they fall on P are able to excite waves which send some energy along PC. The polarization will therefore be only partial and will be of the kind found by Barkla.

The velocity with which the waves travel has not yet been definitely settled. Marx (*Ann. der Phys.* 20, p. 677) by an ingenious but elaborate method came to the conclusion that they travelled with the velocity of light; his interpretation of his experiments has, however, been criticized by Franck and Pohl (*Verh. d. D. Physik Ges.* 10, p. 489).

Another view of the nature of Röntgen rays has been advocated by Bragg (*Phil. Mag.* 14, p. 429); he regards them as neutral electric doublets consisting of a negative and a positive charge of electricity which are usually held together by the attraction between them, but which may be knocked asunder when the rays strike against matter and turned into cathodic rays. On this view when the rays pass through a gas only a few of the molecules of the gas are struck by the rays and so we can easily understand why so few of the molecules are ionized. On the ordinary view of an electric wave all the molecules would be affected by the wave when it passed through a gas, and to explain the small fraction ionized we must either suppose that systems sensitive to the Röntgen rays are at any time present only in a very small fraction of the molecule or else that the front of an electric or light wave is not continuous but that the energy is concentrated in patches which only occupy a fraction of the wave front.

**Apparatus for producing Röntgen Rays.**—The tube now used most frequently for producing Röntgen rays is of the kind introduced by Porter and known as a focus tube (fig. 2). The cathode is a portion of a hollow sphere, and the cathode rays come to a point on or near a metal plate A, called the anti-cathode, connected with the anode; this plate is the source of the rays. This ought to be made of a very unfusible metal such as platinum or, still better, tantalum, and kept cool by a water-cooling arrangement. The anti-cathode is generally set at an angle of  $45^\circ$  to the rays; it is probable that the action of the tube would be improved by putting the anti-cathode at right angles to the cathode rays. The walls of the tube get strongly electrified. This electrification affects the working of the tube, and the production of rays can often be improved by having an earth-connected piece of tin-foil on the outside of the bulb, and moving it about until the best position is attained. To produce the discharge an induction coil is generally employed with a mercury interrupter. Excellent results have been obtained by using an electrostatic induction machine to produce the current, the emission of rays is more uniform than when an induction coil is used. The rays are emitted pretty uniformly in all directions until the plane of the anti-cathode is approached; in the neighbourhood of this plane there is a rapid falling off in the intensity of the rays. After long use the glass of the bulb often becomes distinctly purple. This is believed to be due to the presence of manganese compounds in the glass. (J. J. T.)

FIG. 2.

**ROOD** (O.E. *rod*, a stick, another form of "rod," O.E. *rodd*, possibly cognate with Lat. *rudis*, a staff), properly a rod or pole, and so used as the name of a surface measure of land. The rood varies locally but is generally taken as = 40 square rods, poles or perches; 4 roods = 1 acre. The term was, however, particularly applied, in O.E., to a gallows or cross, especially to the Holy Cross on which Christ was crucified, the sense in which the word survives. A crucifix, often accompanied by figures of St John and the Virgin Mary, was usually placed in churches above the screen, hence known as "rood screen"

(see SCREEN), which divides the chancel or the choir from the nave. The roof was carried either on a transverse beam, the "rood beam," or by a gallery, the "rood loft." Such a gallery was also used as a place from which to read portions of the service (see JUBÉ). It was reached by the "rood stair," a small winding stair or "vice." In English churches these stairs generally run up in a small turret in the wall at the west end of the chancel; often this also leads out on to the roof. On the continent of Europe they often lead out of the interior of the church and are enclosed with tracery, as at Rouen or Strassburg. "Rood stairs" remain in many English churches where the rood loft has been destroyed. A fine example of a rood loft is at Charlton-on-Otmoor, Oxfordshire. The screen might be separate from the rood beam or rood loft. The general construction of wooden screens is close panelling beneath, on which stands screen-work composed of slender turned balusters or regular wooden mullions, supporting tracery more or less rich with cornices, crestings, &c., and often painted in brilliant colours and gilded. The central tower of a church over the intersection of the nave and chancel with the transepts is sometimes called the "rood tower"; an example is that at Notre Dame at Paris. In England rood lofts do not appear to have been introduced before the 14th century, and were not common till the 15th. The "roods" themselves were not

The simplest form is the "flat roof" consisting of horizontal wood joists laid from wall to wall as in floor construction. The roof must not be quite flat, for a slight fall is necessary in its upper surface to allow water to drain away into gutters placed at convenient points. The joists are covered with a waterproof material such as asphalt, lead, zinc or copper, the three last materials being usually laid upon boarding, which stiffens the structure and forms a good surface to fix the weatherproof covering upon. Such roofs are not suitable for cold climates, for accumulations of snow might overburden the structure and would also cause the wet to penetrate through any small crevices and under flashings. With flat roofs the pressure exerted upon the supports is directly vertical.

Forms of roof.

"Lean-to," "shed," or "pent" roofs are practically developments of the flat roof, one end of the joists (which are now called "rafters") being tipped up to form a decided slope, which enables slates, tiles, corrugated iron and other materials to be employed which cannot be used upon a "flat" roof.

Simple roofs in general use with a double slope are the "coupled rafter roofs," the rafters meeting at the highest point upon a horizontal ridge-piece which stiffens the framework and gives a level ridge-line. In some old roofs the rafters are connected without any intervening ridge-plate, with the result that after

Figs. 1 and 2.—King-post Roof Truss.

disturbed in Henry VIII.'s reign, but were generally removed under Edward VI. and Elizabeth.

The legality of rood screens or rood lofts in the Church of England depends on the law of the Church with regard to images, *i.e.* "whether they do or do not, or will or will not, encourage or lead to idolatrous or superstitious worship in the place where they are, or are to be put" (Lindley, L. 7. in *R. v. Bishop of London*, 1889, 24 Q.B.D. 213, 237; see also *St John Timberhill, Norwich*, case, 1889 Prob. 71, and article IMAGE).

**ROOFS.** A roof is a construction placed as a covering over the upper portion of a building to exclude the weather and preserve the contents dry and uninjured. Roofs are designed to throw off rain and snow, and their slope or "pitch," as it is generally termed, is governed to a great extent by the climate, as well as by the material used and manner of laying. The pitch may vary from an almost horizontal surface (as largely adopted in dry countries and also in temperate climates for roofs of metal or asphalt) to the steeply pitched roofs required for the ordinary flat tiles which to be weatherproof must be laid at an angle of from 45° to 80° with the horizon. Besides serving the useful purpose of protection against inclement weather the roof, both externally and internally, may be designed to form an architectural feature in keeping with the character of the building.

a time the ridge instead of remaining level takes on a wavy outline, due to the fact that some of the timbers have settled slightly owing to decay or other causes, whilst others have remained firm in their places. The lower ends of the rafters should pitch on a wood plate bedded on the top of the wall; this, as described under CARPENTRY, assists in spreading the weight over a large area of the wall, and provides good fixing for the timbers. The simple "couple roof" consists merely of two sets of rafters pitched from plates on the walls on either side of the building and sloping upwards to rest against a common ridge-piece. There are no ties between the feet of the rafters, which therefore exert a considerable thrust against the supporting walls. On account of this and of the lack of rigidity of the framing this form of roof should only be used to cover small spans of 10 to 12 ft. Generally the ends of the rafters are connected by ceiling joists which form a level ceiling and at the same time prevent any outward thrust on the supports. When used for spans between 12 ft. and 18 ft. a binder supported by an iron or wood "king" tie every 5 or 6 ft. should be run along across the centres of the ceiling joists and the latter spiked to it. Such roofs with the wood tie across the feet of the rafters are termed "couple close roofs." When the ties are fixed about half-way up the rafters it is called a "collar roof," and may be used for spans up to 16 ft. These are the type of roof commonly used in ordinary dwelling-houses where the

framing, usually of rough northern pine or spruce, is generally hidden from view by the ceilings. The spans usually are not great, and extra support is obtained at various points from partitions and cross walls. Where the span is large, that is, above 20 ft. without intermediate support, it is necessary to employ roofs with "principals" and "purlins," sometimes called "double rafter roofs." Principals are strong trusses of timber rigidly framed together and placed at intervals of about 10 ft. to support the weight of the roof covering. Purlins—stout timbers running longitudinally—are

In such large spans the straining beam often becomes of such a length as to require support and this is effected by continuing the principal rafters up to the ridge and introducing a short king-post to sustain the beam in the middle of its length.

Open timber roofs of various types but principally of "hammer-beam" construction were used in the middle ages where stone vaulting was not employed. Many of these old roofs still exist in good preservation and exhibit the great skill of the medieval carpenters who designed and erected them. Such forms are still used, chiefly for ecclesiastical buildings and the roofs over large halls. In the best periods of Gothic architecture the pitch

FIG. 3.—Queen-post Roof Truss; half elevation, 38' 0" span

fixed on the principal rafters with intervals of about 8 ft., and on these the common rafters are fastened. Principals, or "roof trusses" as they are more often called, are framed together in various ways, and the members may be entirely of wood or reinforced by ties of iron rods or bars; the latter are called "composite trusses."

The "king-post truss" may be used for spans up to 30 ft. and is constructed as shown in figs. 1 and 2. It has a central post sustaining the "tie-beam" in the centre with struts projecting from its base to support the principal rafters at their centres at a point where the weight of the purlins renders strutting necessary. The members are connected by wrought-iron straps and bolts; the strap connects the king-post and tie-beam and is often fitted with a gib-and-cotter arrangement (really a pair of iron folding wedges) which allows the whole truss to be tightened up should any settlement or shrinkage occur. "Queen-post trusses" have, in place of the king-post dividing the tie-beam into two, two queen-posts supporting it at two points (fig. 3). The joints between the members are made in a similar manner to those of the king-post principal with wrought-iron straps. The purlins are two in number on each slope, one supported at the top of each "queen," the other half-way between that point and the wall-plate and resting upon the principal rafter at a point where strutted from the base of the queen-post. A stout straining beam connects the heads of the queens. In fig. 4, *a* and *b* are details at the foot of the queen-post, and *c* at the head. Trusses of this type are suitable for spans up to 45 ft. In roofs of a larger span than this and up to 60 ft. the tie-beam requires to be upheld at more than two points, and additional posts called "princesses" are introduced for this purpose. This also entails extra struts and purlins.

of these roofs was made very steep, sometimes as much as 60° with the horizon. In the hammer-beam type of roof the tie-beam at the foot of the rafters is omitted, a collar being thrown across connecting the principal rafters at a point about half-way in their length, the lower portion of the principal consisting of a number of struts and braces rigidly connected in such a manner as to throw as little thrust as possible upon the walls serving as abutments. There are two kinds of hammer beams, the arched and the bracketed; the chief examples are Westminster Hall and Middle Temple Hall (Plate I. figs. 24 and 25). The "hammer beam" projects from the top of the wall and is bracketed from a corbel projecting from the wall some distance below. This form of roof has a style and dignity of its own, and gives greater height in the upper part of the building as well as being more ornamental and lighter in effect than tie-beam trusses, which have a rather heavy effect.

FIG. 4.—*a*. Detail of queen-post truss at *b*.  
*b*. Vertical section through queen-post.  
*c*. Detail of queen-post truss at head; purlin and wrought-iron straps are omitted for the sake of clearness.

The Mansard roof (fig. 5) is a useful form of construction which obtains its name from François Mansard, a distinguished French architect who lived in the 17th century. This kind of roof has been largely used, especially in France and other European countries, as well as in America in the old colonial days. It adapts itself well to some styles of architecture, but should be very carefully applied, since it

top rooms. It is a simple construction of the couple close order with the addition of a collar and struts and king-rod to every fourth rafter. Trimming is necessary for openings and where portions of the structure, such as chimney stacks, cut into the roof. The trimming rafters are made an inch thicker than the others. The dragon tie is framed in connexion with the wall-plate at the hipped corners to take the thrust of the hip rafters.

FIG. 5.—Mansard Roof Truss: detail of outline as A; other outlines at B, C, D and E.

is apt to appear ungainly in some situations. By the use of a Mansard roof extra rooms can be obtained at a small expense without adding an additional storey to the building proper. The outward thrust upon the supporting walls is not so great as with an ordinary pitched roof, the load coming practically vertically upon them. There is no recognized rule for the proportion or pitch of a roof of this description, which should be designed to suit the particular building it is intended to cover. Fig. 5, A, B, C, D and E show various forms. A similar type of curb roof is often used having a flat lead- or zinc-covered top in place of the pitched slate- or tile-covered top of the ordinary Mansard roof.

Composite roof trusses of wood and iron are frequently used for all classes of buildings, and have proved very satisfactory. They are built upon the same principles as wooden types of roof trusses. The struts—that is, those members subjected to compressional stress—are of wood, and iron bars or rods are used for the ties, which have to withstand tensile forces. When any shrinkage occurs to loosen the joints of the framing, as usually happens in large trusses, the tie-rods are tightened up by the bolts attached to them. Figs. 6, 7 and 8 are the sections and plan of a simple method of constructing the roof for an ordinary domestic building with plaster ceilings to the

Steel and iron trusses in many cases follow the wood models already described. The struts and principal rafters are usually of T section, the tensional members being rods or flat bars.

Flat plates and bolts or rivets are used to form the connexions between the members, and a means is provided in the tie-rod for tightening up the truss should any of the members "give" slightly under their load.

Large trusses for very wide spans are specially designed for their work and may be of many different types of design. Big roofs on the tie-rod principle are now being discarded as being more liable to failure, through deterioration or defect, than those built on the girder principle in one form or another. Fig. 9 is a queen-roof principal for a span of 50 ft., and shows the sizes of the different members, a line diagram of the truss and large details of the joints. Fig. 10 in a similar manner shows the roof at Cardiff railway station, which has a span of 43 ft.

The steel roof covering the great hall at Olympia, London, is an example of a carefully designed and well-built roof which combines with strength an extremely light and elegant appearance. This is due to the fact that every member of the roof is adapted to meet the particular stresses found by calculation to affect it. By careful study of conditions the sections of steelwork used for the various members have been reduced

FIGS. 6 and 7.—Roof for Domestic Building.

to the smallest size compatible with safety. In this way any unnecessary surplus of material is avoided, and so is the heavy, overwhelming effect noticeable in many roofs of large span. There is an entire absence of long wide plates and webs, the various members are composed wholly of flat bars and angle irons riveted together, and plates are introduced only where required to cover joints. Some notes on its size and construction

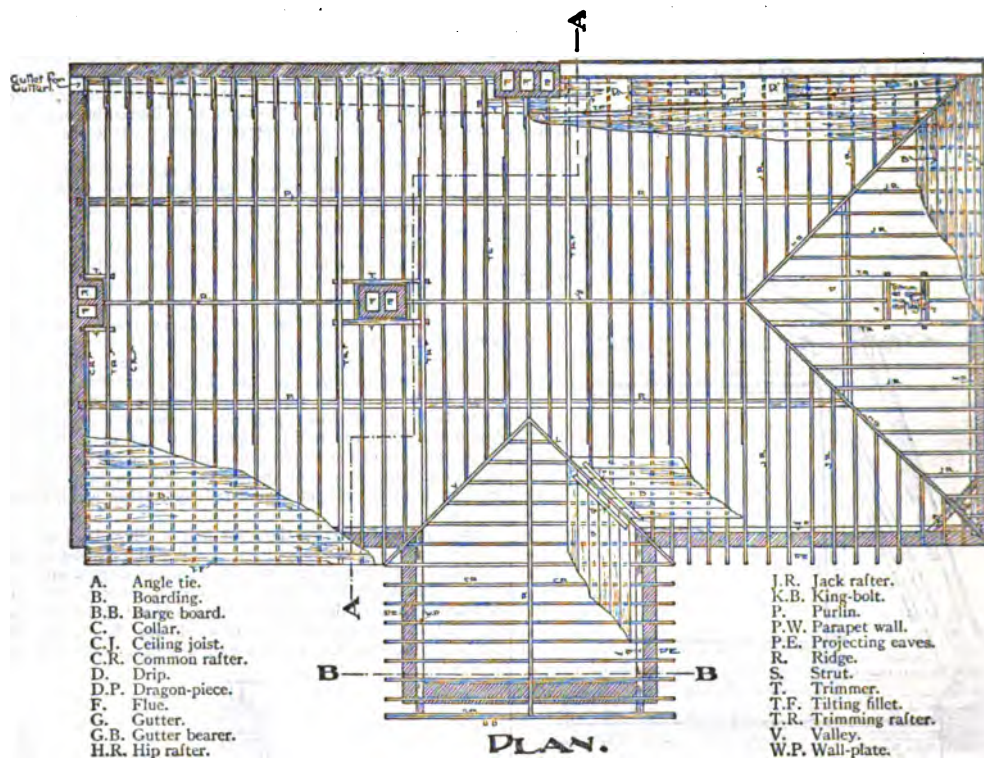

FIG. 8.

will be interesting. The dimensions of the great hall are 440 ft. long by 250 ft. wide, the height to the crown of the roof being about 100 ft. The main ribs of the roof have a clear span of 170 ft. and are placed 34 ft. apart. They are of box-girder form and measure 7 ft. deep and 2 ft. wide. The gallery around the hall is 40 ft. wide on three sides and 26 ft. wide on the remaining side. It is covered by a lean-to roof which abuts against the curved ribs on the north and south sides, and is attached to horizontal members of the screens on the east and west sides. The bricks walls of the building are not called upon to resist any portion of the thrust from the roof, as the side frames through which the gallery floor passes form a self-contained system of steelwork in which the thrust is ultimately conveyed to the ground. The screens which close the semicircular ends of the roof are of vertical ridge and furrow construction, as can be clearly seen in the illustrations, this form offering great resistance to wind pressure while at the same time requiring a minimum amount of material. Of the two illustrations, fig. 11 is a detailed cross-section showing fully the method of construction of the foot of the main rib and column, and the arrangement of the side frames above referred to is shown in fig. 12, which is a complete cross-section view, and will convey to the reader some idea of the vast size of the building and its general proportions.

The following five roofs are examples of large span: Crystal Palace (104 ft.); Olympia, London (170 ft.); St Enoch station, Glasgow (198 ft.); Central station, Manchester (210 ft.); St Pancras station, London (240 ft.).

Domes may be framed up with wood rafters cut to shape. For small spans this construction is satisfactory, but when the dome is of considerable size it is often framed in steel as being stronger and more rigid than wood, and therefore not exerting so great a thrust upon the supporting walls. The outer dome of St Paul's cathedral in London is of lead-covered wood, framed upon and supported by a conical structure of brickwork which is raised above the inner dome of brick. Concrete is a very suitable material for use in the construction of domes, and may be employed simply or with iron or steel reinforcement in the shape of wires, bars or perforated plates. One of the best modern examples of concrete vaulting and domical roofing without metal reinforcement occurs in the Roman Catholic cathedral at Westminster, a remarkable building designed by Mr J. F. Bentley. A few details of the roofs will be interesting. The circle developed by the pendentives of the nave domes is 60 ft. in diameter. The thickness of the domes at the springing is 3 ft. gradually reduced to 13 in. at the crown; the curve of equilibrium is therefore well within the material. The domes were turned on closely boarded centring in a series of superimposed rings of concrete averaging 4 ft. in width. The concrete is not reinforced in any way. The independent external covering of the domes is formed of 3 in. artificial stone slabs cast to the curve. They rest on radiating ribs 5 in. deep of similar material fixed on the concrete and rebated to receive the slabs; thus an air space of 2 in. is left between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. At the springing and at the

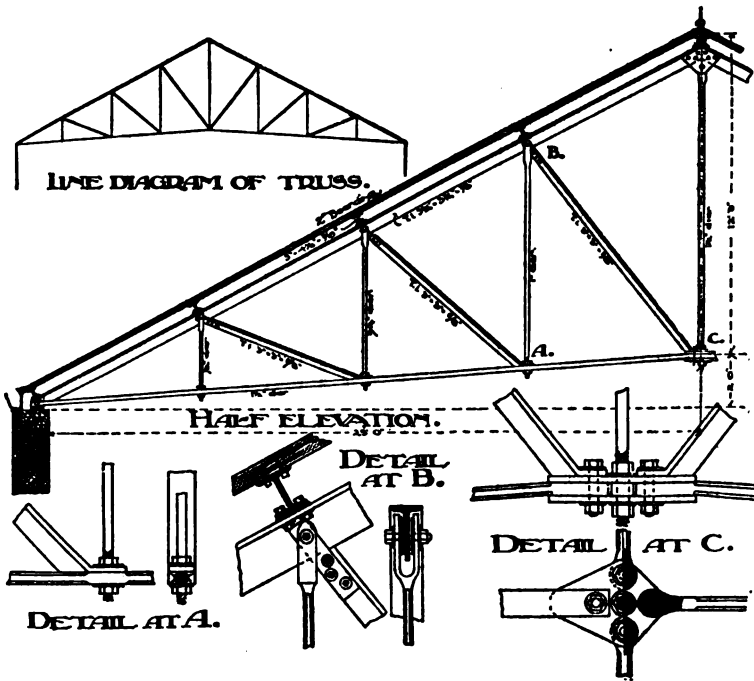

FIG. 9.—Queen-rod Roof Truss.

Roofing felt is an inexpensive fabric of animal or vegetable fibre treated with asphalt to make it capable of resisting the weather. It is largely used as a roofing material for temporary buildings. When exposed to the weather it should be treated with an application of a compound of tar and slaked lime well boiled and applied hot, the surface being sprinkled with sand before it becomes hard. Felt is also used on permanent buildings as a good non-conductor of heat under slating and other roof-covering materials. In this case it is not tarred and sanded. It is supplied in rolls containing from 25 to 35 yds. 30 in. wide. The sheets should be laid with a lap of 2 in. at the joints and secured to the boarding beneath by large-headed clout-nails driven in about 2 in. apart.

Corrugated iron is supplied either black or galvanized. It is especially suited for the roofs of out-buildings and buildings of a more or less temporary character. Being to a large extent self-supporting, it requires a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced 5 ft. to 10 ft. apart according to the stiffness and length of the sheets. In

crown the spaces between the ribs are left open for ventilation. The sanctuary dome differs in several respects from those of the nave. Unlike the latter, which seem to rest on the flat roofing of the church, the dome of the sanctuary emerges gradually out of the sub-structure, the supporting walls on the north and south being kept down so as to give greater elegance to the eastern turrets. The apsidal termination of the choir in the east is covered in with a concrete vault surmounted by a timber roof, in striking contrast to the domes covering the other portions of the structure. Fig. 13 is a section through the nave showing how the domes are buttressed, fig. 14 is a section through the sanctuary dome, and figs. 15 and 16 a section and part plan of the vaulting of the choir with its wood span roof above the concrete vault.

**Covering Materials for Roofs.**—There are a large number of different roof-covering materials in common use, of which short descriptions, giving the principal characteristics, may be useful. The nature of the material employed as the outer covering affects the details of roof construction very considerably. A light covering such as felt or corrugated iron can be safely laid upon a much lighter timber framing than is necessary for a heavy covering of tiles or slates.

FIG. 10.—Roof at Cardiff Station.

FIG. 11.—Detail of Main Rib and Column, Olympia.

pure air zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has often been found that plain ungalvanized sheets well coated with paint will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation or resulting from some defect in the coating. The stock sizes of corrugated sheets vary from 5 ft. to 10 ft. long, and from 2 ft. to 2 ft. 9 in. wide with corrugations measuring 3 in. to 5 in. from centre to centre. For roofing purposes the sheets are supplied in several thicknesses ranging from No. 16 to No. 22 Standard Wire Gauge. No. 16 is for exceptionally strong work, No. 18 and No. 20 are used for good-class work, and No. 22 for the roofs of temporary buildings. The sheets when laid should lap about 3 in. at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not so satisfactory, are frequently employed. The joints should be made along the raised corrugations to lessen the risk of leakage. Holes can be punched during the erection of the roof; their positions should first be determined by placing the sheets in position and marking the

necessary point of fixing. Sheets are usually attached to timber framework with galvanized screws, or nails with domed washers placed under their heads. Fixing to a steel framework is effected by means of galvanized hooked bolts clipping the purlins passed through the sheet and held tight by nuts

FIG. 13.—Westminster Cathedral: section through nave.

on the outside. Sheets corrugated in the Italian pattern have raised half-rounds every 15 in. or so, the portions between being flat. Such sheets have a very neat appearance and give a better effect in some positions than the ordinary corrugations.

FIG. 12.—Cross-Section of Olympia from the Drawings of the architect, A. T. Walmisley, Esq.

Zinc in sheets is a material largely used as a roof covering, and if care be taken to ensure metal of good quality, it proves itself light, strong and durable, as well as inexpensive. Zinc is stronger weight for weight than lead, slate, tile and glass, but weaker than copper, wrought-iron and steel, although with the exception of the two last mentioned it is not so durable when exposed to the weather. It is not liable to easy breakage as are slate, tile and glass. It is usually supplied in flat sheets, although it can also be had in the corrugated form similar to corrugated sheet-iron. When exposed, a thin coating of oxide is formed on the surface which

FIGS. 15 and 16.—Westminister Cathedral: choir-vaulting.

FIG. 14.—Westminister Cathedral: diagonal section through sanctuary dome.

the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when the latter warps, apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Sheet-lead forms a much heavier roof covering than zinc, but it lasts a great deal longer and more easily withstands the attacks of impure air. Lead must be laid on a close boarding, for its great ductility prevents it from spanning even the smallest spaces without bending and giving way. This characteristic of the metal, however, conduces largely to its usefulness, and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion for lead is nearly as great as that for zinc and much higher than in the case of iron, and this fact requires precautions similar to those affecting zinc to be taken when laying the roofing. The manner of laying is with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (see figs. 19, 20 and 21). Allowances must be made for expansion

FIGS. 19, 20 and 21.—Details of Lead Flats.

protects the metal beneath from any further change, and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and tacks which do not interfere with the free expansion and contraction of the sheets. The reason for this is that zinc expands freely, and sheets laid with soldered seams or fixed with nails are liable to buckle and probably break away owing to movements set up by changes of temperature. The usual sizes of zinc sheets are 7 ft. or 8 ft. long by 3 ft. wide. The thickness and weights of zinc are shown in the following table, which compares the Vieille Montagne Gauge with the Old Belgian Gauge and the British Imperial Standard Wire Gauge.

V.M.G.	O.B.G.	S.W.G.	Weight per sq. ft.
10	9	25	11½ oz.
11	10	24	13½ "
12	11	23	15 "
13	12	22	17 "
14	13	21	18½ "
15	14	20	21 "
16	15	19	24½ "

The best method of laying a zinc flat roof is with the aid of wood "rolls" of about 2 in. X 2 in. in section, spayed at sides and spaced 2 ft. 8 in. apart and fixed to the roof boarding with zinc nails. Iron nails should not be used as this metal affects the zinc. The sheets of zinc are laid between the rolls with their sides bent up 1½ in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is then slipped over each roll and fastened down by tacks about 3 in. long soldered inside it so as to hook under the same clips that hold the sheet down. Drips of about 2½ in. are made in the slope at intervals of 6 ft. or 7 ft.—that is, the length of a sheet—and special care must be taken at these points to keep the work waterproof. The lower sheet is bent up the face of the drip and under the projecting portion of the upper sheet, which is finished with a roll edge to turn off the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this in conjunction with the saddle piece of the roll beneath forms a weather-proof joint (figs. 17 and 18). The fall between the drips is usually made about 1½ in.,

FIGS. 17 and 18.—Details of Zinc Flats.

and contraction and the use of nails and solder avoided as far as possible. Contact with iron sets up corrosion in lead, and when nails are necessary they should be of copper; screws should be of brass. Lead is supplied in rolls of 25 to 35 ft. long and 6 ft. to 7 ft. 6 in. wide. That in general use varies from one-fourteenth to one-seventh of an inch in thickness. The weights most suitable for employment in roofing work are 7 or 8 lb per square foot for flats and gutters, 6 lb for ridges and hips, and 5 lb for flashings.

As a roof covering copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts much less than these metals, and although not so strong as wrought-iron and steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other non-conducting material placed beneath the metal. On exposure to the air copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface protecting it from further decomposition. Perhaps the chief disadvantage in the use of copper lies in its first cost, but against this must be set the almost imperishable nature of the metal and the fact that by reason of its light weight less substantial framework is required for its support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of about 2 ft. 4 in. It is, however, often laid with welted seams. The general stock sizes of sheets are from 4 ft. to 5 ft. 3 in. long and 2 ft. to 3 ft. 6 in. wide. The thickness almost invariably used is known as 24 S.W.G. and weighs 16 oz. per square foot. Thinner metal would suffice, but owing to the increased cost of rolling very little would be gained by adopting the thinner gauges.

In the United States of America "tin" roofs are quite commonly used. Sheets of wrought-iron coated either with tin or zinc are used of a size usually 14 in. by 20 in., though they may be had double this size. Preparation for laying is made by fixing an insulating foundation of somewhat stout paper or felt; this must be dry, else it is apt to spoil the impermeable covering laid upon it by causing it to rust. Junctions between the sheets are made by welted seams in which the four edges of the sheets are turned over so as to lock together, thus forming one large sheet of tin covering the roof. In high-class work of a permanent nature the seams in addition are soldered, rosin only being used as a flux. Each sheet also is secured to the roof with two or three tin cleats. The life of such roofs may be practically doubled by the application of a good coat of paint, which, however, adds considerably to the cost.

Slate is a strong and very impermeable material, and these qualities and the fact that it is easily split into thin plates suitable for laying, as well as its low cost, cause it to be by far the most generally used of all materials for roof covering.

Some of the best known varieties of slates, classed according to their colour, are as follows:—

- Blue . . . North Wales (Penrhyn, Festiniog, Dinorwic, &c.), France, Norway, Germany.
- Blue-grey . . . Cornwall (Delabole).
- Grey . . . North Wales (Penrhyn, Dinorwic).

but where necessary it may be less, the least permissible fall being about 1 in 80. Felt laid beneath zinc has the effect of lengthening

**Purple** . . . North Wales (Bangor, Penrhyn, Dinorwic), Newfoundland, Germany.  
**Green** . . . South Wales (Precelly), Cumberland, Westmorland, Lancashire, Ireland, Newfoundland, Norway, United States and Germany.

Slates are cut to many different sizes varying in length from 10 in. to 36 in. and in width from 5 in. to 24 in. There are perhaps thirty or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sorts is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs.

Some of the technical terms used by the slater are as follows:—  
**Bed**, the under surface of a slab when laid.  
**Back**, the upper surface of the slate.

**Gauge**, the distance between the lines of nailing. This depends on the length of the slate and equals half the length of the slate after the lap plus an inch for the nail-hole has been deducted. This is for slates nailed near the top edge; for those fixed near the middle the gauge would be half an inch more, as no allowance for nail-holes is required.

**Margin**, the width of the exposed portion of each course which equals the width apart of the nailing.

**Head and tail**, the top and bottom edges of the slate.

**Lap**, the lap of the tail of one course of slates over the head of the second course below it. The lap is made from 2½ in. to 4 in. (usually 3 in.), and for this distance there are three thicknesses of slate, namely, the tail of the top course, the middle of the next and the head of the third course.

Slates may be fixed by nailing at the head (see fig. 22) or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength. There is a small economy effected by centre nailing, as the margin is slightly larger and fewer slates are required to cover a given space; longer nails, however, are required, for as slates are laid at an angle with the pitch of the roof their centres cannot be made to approach so near

FIG. 22.—Detail of a Slated Roof.

to the slating battens or boarding as the head, which lies close to the surface to which it is fixed. Another point worth noticing is that the nail-holes in the centre nailed slating are only covered by 3 in. of the tail (the amount of the "lap") of the course of slates above, and rain is very liable to be forced under by the wind and cause the wood battens or other woodwork to rot. Head-nailed slates, on the other hand, have their holes covered by two layers of slate, and are removed from exposure by the length of the gauge plus the lap, which in the case of "countess" slating equals 11 in.

"Open slating" is an economical method of laying slates that is often adopted for the roofs of sheds and temporary buildings. The slates in the same course are not laid edge to edge as in close slating, but at a distance of two or more inches apart. This forms a roof covering light in weight and inexpensive, which, although not strictly weather-proof, is sufficiently so for the buildings upon which it is used.

Slates are laid upon open battens fixed upon the rafters or upon close boarding or upon battens fixed upon boarding. The battens are ½ in. or 1 in. thick and 1½ in. to 3 in. wide, and are spaced to suit the gauge of the slates. When close boarding is used it is often covered with inodorous asphalted felt. While taking these precautions to make the roof sound and tight it should be borne in mind that slate is liable to decay if not ventilated, and to effect this the battens are sometimes fixed vertically, ridge ventilators introduced and air inlets arranged at the eaves. The bed of slates

laid without provision for the admission of air will be found on removal after some time to have rotted so as to scale off and easily crumble into powder.

The nails used in slating are a very important item, and the durability of the work depends to a large extent upon them. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable, but are soft and expensive. Zinc nails are soft and not very durable; they will last about twenty years. Iron nails even if galvanized are objectionable in permanent work, though they may be used for temporary roofs. When the plain-iron nails are employed they should be heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° with the horizontal, while 30° is a safer angle to adopt.

Tiles for roofing purposes are made from clay and burned in a manner similar to bricks. The clay from which they are made is, however, of a specially tenacious nature and prepared with great care so as to obtain a result as strong and as nearly non-porous as possible. Tiles are obtainable in many different colours, and some of these have a very beautiful effect when fixed and improve with age. They comprise a large number of tints from yellowish red, red and brown to dark blue. As with bricks the quality depends to a large extent upon the burning; underburnt tiles are weak and porous, liable to early decay, while overburning, though improving the tiles as regards durability, will cause them to warp and will spoil colour. The usual shape is the "plain tile," but they are made in various other shapes with a view both to easier fixing and lighter weight, and to ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. The ordinary tiles are slightly curved in shape to enable them to lie close one upon the other. Some of them have small "nibs" moulded on at the head by which they may be hung upon the battens and nailing avoided (see fig. 23). Nail-holes are provided, and upon steep slopes it is advisable to make use of them. Others are made without the nibs, and are fixed either by nailing to the battens or boarding or hung by means of wooden pegs wedged in the holes to the battens, the pegs in the latter case acting in the same way as the above-mentioned nibs. Plain tiles are of rectangular form, the standard dimensions are 10½ in. long by 6½ in. wide. They are usually ½ in. thick and weigh about 2½ lb each.

FIG. 23.—Detail of a Tiled Roof.

There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of moulded square. A number of patented forms of tiles also are on the market, some of which possess considerable merit. Pantiles are suitable for temporary and inferior buildings such as sheds and outhouses. They are laid on a different principle from plain tiles, merely overlapping each other at the edges, and this necessitates bedding in mortar and pointing inside and sometimes outside with mortar or cement. This pointing plays an important part in keeping the interior of the building free from the penetration of wind and water. Pantiles are generally made to measure 13½ in. long by 9½ in. wide, and weigh from 5 lb to 5½ lb each. Moulded on at the head of each tile is a small projecting nib which serves for the purpose of hanging the tile to the lath or batten. They are laid with a lap of 3½ in., 2½ in. or 1½ in., giving a gauge (and margin) of 10 in., 11 in. and 12 in. respectively. The side lap is generally 1½ in., leaving a width of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claim to have advantages which the original form does not possess. Among such are "corrugated tiles," of the ordinary shape or with angular flutes, and also the Italian pattern "double roll tiles," "Foster's lock-wing tiles." Poole's bonding roll tiles are a development of the Italian pattern tile.

Glass as a roof covering and the different methods of fixing it are dealt with in the article GLAZING.

There are many other materials used for roof covering besides those already described, many of them of considerable value. Some have in the past enjoyed considerable vogue, but have practically died out of use owing to the development and cheapening of other forms of roofing. Among these may be included thatch and wood shingles, the use of which in these days is practically reduced to special cases. Other little used roofing materials are those of recent invention, some of which perhaps

Fig. 24.—Westminster Hall.

Fig. 25.—Hall of the Middle Temple.

Roof of Olympia, London.

have a great future before them. Plates of asbestos used as slates or tiles make a light, strong and fireproof covering. Large terracotta tiles or slabs are much used in the United States of America. A good form of flat roof is that in which concrete is used as a foundation for a waterproof layer of asphalt, laid to slight falls to allow the water to run off easily. This is the usual method adopted when a roof garden is required. Shingles or thatch look extremely well on a roof, but their use is debarred in a great many districts owing to the danger of fire. Galvanized iron tiles, zinc tiles and copper tiles may be employed on small areas with good effect. "Willden paper," often used as an insulating layer beneath slates and tiles, is also at times used as a roof covering. It is cardboard chemically treated to render it tough, waterproof and fire-resisting.

The weights of some of the various materials used in the construction and covering of roofs are given in the following table. The weights are approximate and are for a square foot of roofing. The roof trusses are taken to be spaced 10 ft. apart and include the necessary purlins.

King-post wood truss 20 ft. to 30 ft. span	2 to 2½ lb
Queen-post " 30 ft. to 50 ft.	3 to 3½ "
Wood rafters	" 2½ "
Ceiling joists and ceiling	11 "
4-in. boarding for roof covering	2½ "
1-in. "	3½ "
1½-in. "	4½ "
2½-in. X 1 in. slate battens for 8½-in. gauge	11 "
Felt	6½ "
Thatch	9 "
Slates (ordinary laid with 3-in. lap)	18 "
Tiles, plain flat	11 "
Pantiles	11 "
Zinc 12 to 16 gauge laid complete including rolls	1½ to 1¾ "
Copper 25 to 19 gauge laid complete including rolls	1½ to 2½ "
Lead weighing 6 lb per square foot laid complete including rolls	6½ "
Corrugated iron 20 S.W. gauge	2 "

Wind pressure is usually calculated at 22 to 25 lb on a roof with pitch of 30°, and 27 to 30 lb on a roof of 45° pitch.

From these particulars it is easy to calculate the weight of a square (100 superficial ft.) of roofing material, this being the usual standard of measurement for many roofing materials.

The London Building Act of 1894 and its amendments set forth with regard to roofs erected in the London district that every structure on a roof is to be covered with slate, tile, metal or other incombustible material, except wooden cornices and barge boards to dormers not exceeding 12 in. in depth, and doors and windows and their frames. Every dwelling-house or factory above 30 ft. in height and having a parapet must have means of access to the roof. The pitch of the roofs of warehouse buildings must not exceed 47°, and those of other buildings must not exceed 75°, but towers, turrets and spires are excepted. In domestic buildings not more than two storeys are to be formed in the roof, and if the floor is more than 60 ft. above the street level fireproof materials must be used throughout and a sufficient means of escape provided. The building by-laws of the municipality of Johannesburg contain several clauses affecting the designing of roofs and their method of construction. In the designing of buildings roof-slopes must be within a line drawn and produced from the ground level at the opposite side of the street to the top of the eaves, gutter or parapet. No roof in the municipal fire limit may be constructed of thatch, reed or other inflammable material. Without the fire area they may be so constructed if the building stands at least 20 ft. from the boundary of its site. Roofs having a pitch of less than 22½° must be constructed to bear safely a load of at least 28 lb per square foot of surface. Roofs of steeper pitch must be able to support a live load of 21 lb per square foot. The framing of Mansard or other roofs of more than 60° pitch on a building exceeding 45 ft high must be constructed of approved fireproof material at least 2 in. thick. No roofs except those of towers, turrets or spires shall exceed 70° pitch for a Mansard or 60° for an ordinary roof. Every fireproof roof, in addition to a door or scuttle for access from below, must have a skylight or skylights with metallic framing, having an area equal to at least one-sixteenth the area of the roof. Skylights placed over rooms or areas to which the public have access must be protected by wire netting below or be glazed with wire-weave glass.

The Building and Health Laws and Regulations and Amendments of 1905 affecting the city of New York are based, so far as the construction of roofs goes, upon the same lines as those of London, the principal exceptions being that they give very full working details, under part 24, as to the strengths of materials required to be used and the wind pressure to be provided against. In part 17 they provide that where a building exceeds three storeys or 40 ft in height and the roof has a pitch of over 60°, it shall be constructed of iron rafters and be lathed with iron or steel on the inside and plastered or be filled in with fireproof material not less than 3 in. thick and covered with metal, slate or tile. The provision as to access to roof and fire escapes therefrom adopted by the London

County Council in 1907 under the London Building Act Amendment Act 1905 were in operation in New York in 1899.

ROOK (O.E. *Hrök*, Icel. *Hrök*,<sup>1</sup> Swed. *Räka*, Du. *Roek*, Gael. *Rocas*), the *Corvus frugilegus* of ornithology, and throughout a great part of Europe the commonest and best-known of the crow-tribe, belonging to the Passerine family Corvidæ. Besides its pre-eminently gregarious habits, which did not escape the notice of Virgil (*Georg.* l. 382)<sup>2</sup> and are so unlike those of nearly every other member of the Corvidæ, the rook is at once distinguished from the rest by commonly losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin that is sufficiently visible at some distance. In the comparatively rare cases in which these feathers persist, the rook may be readily known from the black form of crow (*g.s.*) by the rich purple gloss of its black plumage, especially on the head and neck, the feathers of which are soft and not pointed. In a general way the appearance and manners of the rook are well known, and particularly its habit of forming communities in the breeding-season, which it possesses in a measure beyond that of any other land bird of the northern hemisphere. Yet each of these communities, or rookeries, seems to have some custom intrinsically its own. In a general way the least-known parts of the rook's mode of life are facts relating to its migration and geographical distribution. Though the great majority of rooks in Britain are sedentary or only change their abode to a very limited extent, it is now certain that a very considerable number arrive in or towards autumn, not necessarily to abide, but merely to pass onward, like most other kinds of birds, to winter farther southwards; and, at the same season or even a little earlier, it cannot be doubted that a large proportion of the young of the year migrate in the same direction. As a species the rook on the European continent only resides during the whole year throughout the middle tract of its ordinary range. Farther to the northward, as in Sweden and northern Russia, it is a regular summer-immigrant, while farther to the southward, as in southern France, Spain and most parts of Italy, it is, on the contrary, a regular winter-immigrant. The same is found to be the case in Asia, where it extends eastward as far as the upper Irush and the Ob. It breeds throughout Turkestan, in the cold weather visiting Afghanistan, Cashmere and the Punjab, and Sir Oliver St John found a rookery of considerable size at Casbin in Persia. In Palestine and in lower Egypt it is only a winter-visitant, and H. B. Tristram noticed that it congregates in great numbers about the mosque of Omar in Jerusalem. The same writer (*Proc. Zool Soc.*, 1864, p. 444; *Ibid.*, 1866, pp. 68, 69) considered the Palestine rook entitled to specific distinction as *Corvus Agricola*. The rook of China has also been described as a distinct species, *C. pastoralor* (*Proc. Zool Soc.*, 1845, p. 1) from having the feathers of its face only partially deciduous.

ROOKE, SIR GEORGE (1650–1709), English naval commander, was born near Canterbury in 1650. Entering the navy as a volunteer, he served in the Dutch Wars and became post-captain in 1673. After the Revolution of 1688, he commanded

<sup>1</sup> The bird, however, does not inhabit Iceland, and the language to which the name belongs would perhaps be more correctly termed Old Teutonic. From this word is said to come the French *Frenx*. There are many local German names of the same origin, such as *Roock*, *Rouch*, *Ruch* and others, but the bird is generally known in Germany as the *Saak-Krähe*, i.e. seed-(=corn)-crow.

<sup>2</sup> This is the more noteworthy as the district in which he was born and educated is almost the only part of Italy in which the rook breeds. Shelley also very truly speaks of the "legioned rooks" to which he stood listening "mid the mountains Euganean."

the squadron which raised the siege of Londonderry in 1689. He became rear-admiral in 1690, and fought at the battle of Beachy Head. In May of 1692 he served under Russell at the battle of Barfleur, and he greatly distinguished himself in a night attack on the French fleet at La Hogue, when he succeeded in burning six of their ships. Shortly afterwards he received the honour of knighthood and a reward of £1000. In 1693 he commanded the Smyrna convoy, which was scattered and partly taken by the French admiral Tourville near Lagos Bay. Till the peace of Nymwegen (1697), he continued to serve in the Channel and Mediterranean. In 1702 he commanded the expedition against Cadiz, and on the passage home destroyed the Plate fleet in Vigo. With Sir Cloudesley Shovel he took part in the capture of Gibraltar on the 21st of July 1704. On the 13th of August of the same year he attacked the French fleet off Malaga, the battle being drawn. On account of the dissatisfaction expressed indirectly at the result of the contest, he retired from the service in February 1705. He died on the 24th of January 1709.

*Roos's Journal for 1700-2* has been printed by the Navy Record Society.

**ROOM**, originally a word meaning space or accommodation; the ordinary meaning of an apartment in a building, one of the interior divisions of a house, dates from the 15th century. The word is common to Teutonic languages, cf. Du. *ruim*, Ger. *Raum*, Swed. and Dan. *rum*, with the original meaning of space. Skeat connects the word with the root seen in Lat. *rus*, open country.

**ROOM, ALBRECHT THEODOR EMIL, COUNT VON** (1803-1879), Prussian general field-marshal, was born at Pleushagen, near Colberg, in Pomerania, on the 30th of April 1803. His family was of Flemish origin, and was settled in Pomerania. His father, an officer of the Prussian army, died in poverty during the French occupation, and young von Roon was brought up, in a country ravaged in the War of Liberation and in straitened circumstances, by his maternal grandmother. He entered the corps of cadets at Kulm in 1816, whence in 1818 he proceeded to the military school at Berlin, and in January 1821 received a commission in the 14th (3rd Pomeranian) regiment quartered at Stargard in Pomerania. In 1824 he went through the three years' higher course of study at the war school in Berlin, where he also applied himself with the greatest energy to improving his general education. In 1826 he was transferred to the 15th regiment at Minden, but in the same year was appointed an instructor in the military cadet school at Berlin, where he devoted himself especially to the subject of military geography. He published in 1832 the well-known *Principles of Physical, National and Political Geography*, in three volumes (*Grundzüge der Erd-, Völker- und Staaten-Kunde*), which gained him a great reputation, and of which over 40,000 copies were sold in a few years. This work was followed in 1834 by *Elements of Geography (Anfangsgründe der Erdkunde)*, in 1837 by *Military Geography of Europe (Militärische Länderbeschreibung von Europa)*, and in 1839 by *The Iberian Peninsula (Die Iberische Halbinsel)*.

Meantime, in 1832, he rejoined his regiment, and was afterwards attached to the headquarters of General von Mülling's corps of observation at Crefeld, when he first became alive to the very inefficient state of the Prussian army. In 1833 he was appointed to the Topographical Bureau at Berlin, in 1835 he entered the General Staff, and in the following year was promoted captain and became instructor and examiner in the military academy at Berlin. In 1842, after an illness of two years brought on by overwork, he was promoted to be major and attached to the staff of the VII. corps, in which post he was again impressed with the inefficiency of the organization of the army, and occupied himself with schemes for its reform. Two years later, as tutor to Prince Frederick Charles, he attended him at Bonn university and in his European travels. In 1848 he was appointed chief of the staff of the VIII. Army Corps at Coblenz. During the disturbances of that year he served under the Crown Prince William (afterwards German emperor) in the suppression of the insurrection at Baden, and distinguished

himself by his energy and bravery, receiving the 3rd class of the order of the Red Eagle in recognition of his services. While attached to the Crown Prince's staff at that time he broached to him the subject of his schemes of army reform. In 1850 came the revelation of defective organization and efficiency which led to the humiliating treaty of Olmütz. In the same year Roon was made a lieutenant-colonel, and in 1851 full colonel. He now enjoyed the confidence of Prince William, and began active work as reorganizer of the army.

Promoted to be major-general in 1856 and lieutenant-general in 1859, Roon had held since 1850 several commands and had been employed on important missions. Prince William became regent in 1857, and in 1859 he appointed Roon a member of a commission to report on the reorganization of the army. Supported by Manteuffel and Moltke, Roon was able to get his plans seriously considered and generally adopted. His aim was to create an armed nation, to extend Scharnhorst's system and to adapt it to Prussia's altered circumstances. To attain this he proposed a universal three years' service, and a reserve (*Landwehr*) for the defence of the country when the army was actively engaged. During the Italian War he was charged with the mobilization of a division. At the end of 1859, though the junior lieutenant-general in the army, he succeeded von Bonin as war minister, and two years later the ministry of marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the chambers that, with Bismarck's aid, he carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 to convert obstinate opposition into enthusiastic support. After that von Roon, from being the best-hated man in Prussia, became the most popular, and his reforms were ultimately copied throughout continental Europe. He was promoted general of infantry at the outbreak of this war, was present at the brilliant and decisive victory of Königgratz, and received the Black Eagle at Nikolsburg on the road to Vienna. His system, adopted after 1866 by the whole North German Confederation, produced its inevitable result in the victorious war with France 1870-71, throughout which von Roon was in attendance on the German emperor. The fiftieth anniversary of his entrance into the army was celebrated at Versailles on the 19th of January 1871, when the emperor expressed his gratitude for the great services he had rendered. He was created a count, and in December 1871, having resigned the ministries of war and marine, he succeeded Bismarck as president of the Prussian ministry. Ill-health compelled him to resign in the following year. He was promoted to be field-marshal on the 1st of January 1873. He died at Berlin on the 23rd of February 1879.

After his death his son published the valuable *Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon* (2 vols., Breslau, 1892), and *Kriegsminister von Roon als Redner politisch und militärisch erläutert* (Breslau, 1895). His correspondence with his friend Professor Cl. Perthes, 1864-67, was also published at Breslau in 1895.

**ROORKEE, or RUKKI**, a town of British India, in the Saharanpur district of the United Provinces, on the Oudh & Rohilkhand railway, 22 m. E. of Saharanpur. Pop. (1901) 17,197. It is the headquarters of the workshops of the Ganges canal, and also of the Bengal Sappers and Miners. Two heavy batteries of artillery are usually stationed in the cantonment. The Thomason Civil Engineering College, founded in 1848, was transferred from the Public Works to the Education Department in 1895 and reorganized. It was instituted in order to train natives in engineering, and students originally received stipends. After 1875 the emoluments were limited, and became in the nature of scholarships, but the education of all students remained practically free till 1896, when fees began to be charged. The college works in co-operation with the workshops and foundry of the canal, and also trains in surveying, photography and other subjects, having chemical, physical, electrical and mechanical laboratories and workshops.

**ROOSEVELT, THEODORE** (1858- ), twenty-sixth president of the United States, was born in New York City on the 27th of October 1858. The Roosevelt family<sup>1</sup> has been prominent in the life of New York for many generations, and is of Dutch origin. Mr Roosevelt's mother, Martha Bullock, came from a family of Scotch-Irish and Huguenot origin equally prominent in Georgia. Each family may lay just claims to a history of more than ordinary social and political distinction. Although born in New York, Mr Roosevelt spent much of his boyhood at Oyster Bay, the country home of his father, on Long Island Sound, where he began with a distinct purpose, unusual among boys of his age, to build up a naturally frail physique by rowing and swimming in the waters of Long Island Sound, and by riding over the hills and tramping through the woods of Long Island. That his early outdoor life furnished a definite training for his later career is indicated by the fact that when he was about fourteen years of age he went with his father on a tour up the Nile as far as Luxor, and on this journey he made a collection of Egyptian birds found in the Nile valley, which is now in the Smithsonian Museum in Washington, D.C. Mr Roosevelt was educated at Harvard University, where he graduated in the class of 1880;<sup>2</sup> his record for scholarship was creditable, and his interest in sports and athletics was especially manifest in his skill as a boxer. On leaving college he made a short visit to Europe, was elected to the London Alpine Club for climbing the Jungfrau and the Matterhorn, and returning to New York studied law for a brief period in the Law School of Columbia University and in the office of his uncle Robert B. Roosevelt. Determining to enter active politics, he gave up his legal studies without qualifying for the bar, and in 1881 was elected to the New York legislature as a regular Republican, although in opposition to the "boss" of the assembly district for which he was a candidate. He was elected again in 1882 and in 1883, and at the age of twenty-four was his party's candidate for Speaker of the Assembly. In 1884 he was a delegate of the Republican party to the convention in Chicago which nominated James G. Blaine for president. In the convention he opposed the nomination of Mr Blaine, and in a speech which attracted considerable

<sup>1</sup> Claas Martenszen van Roosevelt (or Roosevelt) settled in New Amsterdam in 1649; his son Claas (or Nicholas) in 1700-1 was a New York alderman of the Leislerian party; in the next three generations, Johannes, Cornelius and Jacobus (James) were merchants and (in 1748-67, 1788-1801 and 1797-99 and 1809, respectively) aldermen of New York; in the third generation the family became allied with the Schuylers. Isaac Roosevelt was a member of the Provincial Congress in 1775-77 and of the state Senate in 1777-86 and in 1788-92; in the state Assembly were James Roosevelt (1796-97), Cornelius C. Roosevelt (1803), James I. Roosevelt, jun. (1835-40), and Clinton Roosevelt (1837-40). James I. Roosevelt, jun. (1795-1875), was a Democratic member of the national House of Representatives in 1841-43, and a justice of the state Supreme Court in 1851-59. Nicholas J. Roosevelt (1767-1854), with John Stevens, Robert R. Livingstone and Robert Fulton, was prominent in the development of steam navigation. His brother, Cornelius van Schaik Roosevelt (1794-1871), was a founder of the Chemical National Bank of New York, and the grandfather of the president. The president's uncle, Robert Barzwell Roosevelt (1829-1906), was a New York lawyer, New York state fish commissioner in 1866-68, a member of the Committee of Seventy which exposed the corruption of Tammany in New York City, a Democratic member of the national House of Representatives in 1871-73. U.S. minister to the Netherlands in 1888, and author of works on American game birds and fish. R. B. Roosevelt's brother, the president's father, Theodore Roosevelt (1831-1878), was a glass importer, prominent in city charities, an organizer of the Union League Club, and the founder of the Orthopaedic Hospital. A cousin, James Henry Roosevelt (1800-1865), was founder of the Roosevelt Hospital in New York City. The president's mother, Martha Bullock, was of an old Georgia family of Scotch-Irish and Huguenot extraction; her grandfather was Archibald Bullock (1730-1777), first president (1776-77) of Georgia; and her brother, James Dunwoody Bullock, often compared by Theodore Roosevelt to Colonel Newcome, was in the Confederate navy, and equipped in England vessels (including the "Alabama") as Confederate cruisers.

<sup>2</sup> In the same year he married Alice Hathaway Lee of Boston, who died in 1884 leaving one daughter. Later (in 1886) he married Edith Kermit Carow of New York City, and by this marriage had four sons and one daughter.

attention for its vigour and courage advocated the nomination of Senator George F. Edmunds. After Mr Blaine's nomination, however, he supported him in the campaign as the chosen candidate of the party, in spite of the fact that an important wing of the Republican party "bolted" the nomination and espoused the candidacy of Grover Cleveland, who was elected president. In 1884, partly because his political life seemed at least for the immediate present to be at an end, partly on account of the freedom and activity of out-of-door life, he bought two cattle ranches near Medora on the Little Missouri river in North Dakota, where he lived for two years, becoming intimately associated with the life and spirit of the western portion of the United States.

In 1886 he was the Republican candidate for mayor of New York City, but was defeated by Abram F. Hewitt, the Tammany candidate, and received a smaller vote than Henry George, the candidate of the United Labor party. Mr Roosevelt, however, received a larger proportion of the total vote cast than any mayoralty candidate of the Republican party had previously received in New York City. In April 1889, on the accession to the presidency of Benjamin Harrison, Mr Roosevelt, then closely identified with the work of Civil Service reform, was appointed a member of the United States Civil Service Commission. In this office, until then one of minor importance, he served for six years. He made it not only nationally prominent, but instrumental in shaping the course of legislative and executive action by introducing into the work of the Commission an entirely new spirit and new methods. The annual reports, of which he was the chief author, became controversial pamphlets; he published bold replies to criticisms upon the work of the Commission; he explained its purposes to newspaper correspondents; when Congress refused to appropriate the amount which he believed essential for the work, he made the necessary economies by abandoning examinations of candidates for the Civil Service in those districts whose representatives in Congress had voted to reduce the appropriation, thus very shrewdly bringing their adverse vote into disfavour among their own constituents; and during the six years of his commissionership more than twenty thousand positions for government *employés* were taken out of the realm of merely political appointment and added to the classified service to be obtained and retained for merit only. In 1895 he resigned from the Civil Service Commission and became President of the Board of Police Commissioners for the City of New York. After a strenuous two years in this office, he was appointed by President McKinley in 1897 assistant-secretary of the navy. He was certain that war with Spain was inevitable, and he did much to prepare the navy for hostilities, framing an important personnel bill, collecting ammunition, getting large appropriations for powder and ammunition used in improving the marksmanship of the navy by gunnery practice, buying transports and securing the distribution of ships and supplies (especially in the Pacific) in such a way that, when hostilities were declared, American naval victories would be assured. He urged upon the administration the bold policy of protesting against the sailing of Cervera's fleet, on the ground that it would be regarded as a warlike measure not against the Cuban revolutionaries, who had no navy, but against the United States; and he advised that, if Cervera sailed, an American squadron be sent to meet him and to prevent his approach to America. At the outbreak of the war with Spain he resigned from the Navy Department and raised the first volunteer regiment of cavalry, popularly known as the "Rough Riders," because many of its members were Western cowboys and ranchmen expert in the handling of the rough and often unbroken horses of the Western frontier. The regiment also included college athletes, city clubmen and members of the New York police force, every man possessing some special qualification for the work in view. Mr Roosevelt declined the colonelcy of the regiment, preferring to take the post of lieutenant-colonel under his intimate friend Dr Leonard Wood, who, while a surgeon in the United States Army, had served

in action with gallantry and skill against the Indians. On the promotion of Colonel Wood to the command of the brigade, Mr Roosevelt became colonel of the regiment, which took an especially prominent part in the storming of San Juan Hill. In this battle Colonel Roosevelt became the ranking officer and, abandoning his horse, led the charge up the hill on foot under severe fire at the head of his troops. This charge, in which many of the "Rough Riders" were killed or wounded, drove the Spaniards from the trenches and opened the way to the surrender of Santiago. At the conclusion of the war, while the troops were still in camp in the South, Mr Roosevelt joined in a "round robin" of protest against the mismanagement in the War Department, which had resulted in widespread suffering among the troops from wretched food and bad sanitary arrangements. This "round robin" created a sensation which aroused public opinion and was instrumental in bringing about some desirable reforms in the War Department.

When his regiment was mustered out of service in September 1898, Mr Roosevelt was nominated by the Republican party for the governorship of New York State and was elected in November by a substantial plurality. He was governor for two years. He reformed the administration of the state canals, making the Canal Commission non-partisan; he introduced the merit system into many of the subordinate offices of the state, and he vigorously urged the passage of and signed the Ford Franchise Act (1899), taxing corporation franchises. In various contests, in which he was almost uniformly victorious, he showed himself to be independent of "boss" control. In 1900, although he wished to serve another term as governor in order to complete and establish certain policies within the state, he was nominated for the vice-presidency of the United States on the ticket with President McKinley by the Republican National Convention in Philadelphia in spite of his protest. It was very commonly believed at the time that this nomination for the vice-presidency was participated in and heartily approved of by the machine politicians or "bosses" of the State of New York in their belief that it would result in his elimination from active political life. The office of vice-president of the United States had so far in the history of the country been almost purely a perfunctory one, and has rarely, if ever, led to political promotion. The vice-president is *ex officio* president of the Senate, but has little voice or part in shaping either legislation or the affairs of the party. Mr Roosevelt never, however, presided over the deliberations of the Senate, because before the session following his inauguration convened he had ceased to be vice-president.

Upon the assassination of McKinley, on the 14th of September 1901, he succeeded to the presidency. No previous president had entered the office at so early an age as forty-three. It was his frankly expressed wish to be nominated and elected president in 1904, and he was nominated unanimously by the Republican National Convention at Chicago, and was elected in November of that year by the largest popular majority ever given to any candidate in any presidential election. He received 7,623,486 popular votes and 336 electoral votes to 5,077,971 popular votes and 140 electoral votes cast for Judge Alton B. Parker, the nominee of the Democratic party. Immediately after his election he publicly declared that he would not accept the nomination for the presidency in 1908, and he adhered to that pledge in spite of great popular pressure brought to bear upon him to accept the nomination of the party for another term. The nomination and election of President Taft, who had been a member of Mr Roosevelt's cabinet, was very largely due to the latter's great influence in the party. On March 23rd, two weeks after he ceased to be president, Mr Roosevelt sailed for Africa, to carry out a long-cherished plan of conducting an expedition for the purpose of making a scientific collection of the fauna and flora of the tropical regions of that continent. Expert naturalists accompanied the party, which did not emerge from the wilderness until the middle of the following March, bringing with it a collection which scientists

pronounce of unusual value for students of natural history. Most of the specimens were sent to the National Museum of the Smithsonian Institution at Washington. The experiences of his African journey were recorded by Mr Roosevelt in a volume entitled *African Game Trails: The Wanderings of an American Hunter Naturalist*. The spring and early summer of 1910 were spent by Mr Roosevelt in travelling through Egypt, the continent of Europe, and England, in acceptance of invitations which he had received to make various public speeches in these countries. Honorary academic degrees were conferred upon him by the universities of Cairo, Christiania, Berlin, Cambridge and Oxford, and he was given both popular and official ovations of almost royal distinction—ovations which were repeated by his own countrymen on his return to America.

It may be said without exaggeration that no American public man in the history of the country has achieved such extraordinary popularity during his lifetime as Mr Roosevelt had attained at fifty years of age, both at home and abroad. Great popularity necessarily brings with it bitter enmity and genuine criticism. To understand clearly his career as a public man, and to appreciate the forces at work which caused both the popularity and the enmity, two facts must be kept distinctly in mind: first, that at twenty-two years of age he deliberately decided to make politics his life-work at a time when in the United States the word "politics" had a sinister sound in the ears of almost all of the so-called cultivated classes; and secondly, that in making this deliberate choice he recognized that the government of the United States is primarily a party government. He therefore allied himself with the Republican party, to which by tradition, by family association, and by political principles he was naturally drawn.

In the history of the United States the politician has been too often the man who, in connexion with some other trade or profession, has taken up politics as a tool to carve out some personal ambition or manufacture a financial profit. Mr Roosevelt from the beginning apparently believed with the lexicographers that politics is the science and practice of government. He has himself told the story of an early experience that illustrates his point of view. When in 1881 he decided to join the Republican Association of his assembly district in New York City, members of his family were shocked. "You will find at the meetings," they said, "nobody but grooms, liquor dealers and low politicians." "Well," said Mr Roosevelt in reply, "if that is so, they belong to the governing class, and you do not. I mean if I can to be one of the governing class." He forthwith became an active member of the political organization of his district. He also early determined to work with his party as being the only way in which a legislator can work. A free lance, an independent, a journalist, or a preacher, without definite political affiliations, may create public opinion, but a legislator or an administrator must belong to a party. Mr Roosevelt was severely criticized by many "independent Republicans" for having supported the presidential candidacy of James G. Blaine in 1884, when he had vigorously opposed his nomination in the convention on moral grounds. The reply to this criticism is that Mr Blaine was the choice of the majority of the party, and that while Mr Roosevelt felt free to fight within the party vigorously for reform, he did not feel that the nomination justified a schism like that which occurred in the Democratic party over the free silver issue in 1896—a schism which remained afterwards a hopeless weakness in that party. His position in the Blaine campaign, his attitude in tariff discussions and legislation, his relations with United States senators, congressional representatives, and other party leaders, his methods in making official appointments, were entirely consistent with his constantly reiterated conviction that in politics permanent good is achieved not by guerilla warfare, but by working through and within the party. He was so often accused by political purists for associating politically with men of discredited reputation that his own picturesque statement of his conversion to a belief that in legislative or administrative politics

one must work with all sorts and conditions of men is illuminating. This statement is related by his intimate friend Jacob A. Riis, to whom Mr Roosevelt made it in commenting upon his first political success in the New York legislature.

"I suppose that my head was swelled. It would not be strange if it was. I stood out for my own opinion alone. I took the best 'mugwump' stand—my own conscience, my own judgment were to decide in all things. I would listen to no argument, no advice. I took the isolated peak on every issue, and my associates left me. When I looked around, before the session was well under way, I found myself alone. I was absolutely deserted. The people didn't understand. The men from Erie, from Suffolk, from anywhere, would not work with me. 'He won't listen to anybody,' they said, and I would not. My isolated peak had become a valley; every bit of influence I had was gone. The things I wanted to do I was powerless to accomplish. I looked the ground over, and made up my mind that there were several other excellent people there, with honest opinions of the right, even though they differed from me. I turned in to help them, and they turned to and gave me a hand. And so we were able to get things done. We did not agree in all things, but we did in some, and those we pulled at together. That was my first lesson in real politics. It is just this; if you are cast on a desert island with only a screw-driver, a hatchet and a chisel to make a boat with, why, go make the best one you can. It would be better if you had a saw, but you haven't. So with men. Here is my friend in Congress who is a good man, a strong man, but cannot be made to believe in some things in which I trust. It is too bad that he doesn't look at it as I do, but he does not, and we have to work together as we can. There is a point, of course, where a man must take the isolated peak and break with all his associates for clear principle: but until that time comes he must work, if he would be of use, with men as they are. As long as the good in them overbalances the evil, let him work with them for the best that can be obtained."

In his successive offices Mr Roosevelt not merely exerted a strong influence upon the immediate community, whose official representative he was at the time being, but by reason both of his forceful personality and of the often unconventional, although always effective, methods of work which he employed he achieved a national prominence out of ordinary proportion to the importance of his official position. His record in the Assembly was such that his party nominated him for the mayoralty of the city of New York when he was absent on his ranch in Dakota. Although defeated in the mayoralty election, his work on behalf of the merit system, as opposed to the spoils system of politics, was such that he was made a Civil Service commissioner—probably the last office a politician would wish to hold who desired further promotion, for the conflict which a Civil Service commissioner must have with members of Congress and other party leaders on questions of patronage is usually, or, at any rate, has been in the past history of American politics, inevitably detrimental to further official advancement. He was taken from the Federal service in Washington to New York City by a reform mayor and put in charge of the police, because he had shown both physical and moral courage in fighting corruption of all sorts; and the New York police force at that time was thoroughly tainted with corruption, not in its rank and file, but among its superior officers, who used the power in their hands to extort money bribes chiefly from saloon-keepers, liquor-dealers, gamblers and prostitutes. As police commissioner Mr Roosevelt brought to his side every honest man on the force. By personal detective work, that is, by visiting police stations at unexpected times and by making the rounds at night of disorderly places which were suspected of violating the law, he not only displayed personal courage in positions of some danger, but aroused public opinion. The very sensation created by the novelty of his methods set standards and started reforms which have greatly improved the morale of the entire force. The hopelessly vicious policemen hated him, but no man ever had a stronger personal hold upon the great body of the honest officers—a hold which existed long after he left the police department, and was frequently expressed by members of the force as he passed through the city streets. When he became assistant-secretary of the navy, his work was not so publicly conspicuous,

in a volume entitled *Roosevelt the Citizen*, which, while it is frankly written as the enthusiastic tribute of a personal admirer, may be relied upon for accuracy in its statement of historical or biographical facts.

but in this office he gained an experience which was of great value in his administration of naval affairs during his presidency. It is doubtful if, without the experience of this secretaryship, he could have successfully originated and carried out the plan of sending the United States navy around the world in 1907. He went to the Spanish War as a volunteer against the urgent wishes of his political advisers, and in spite of the protests of some of his best and most intimate friends. The conditions in Cuba had long convinced him that war with Spain was inevitable, and that, for humane reasons alone, it was both right and necessary to drive the Spanish power out from the Caribbean Sea. Having urged this view upon the country, when war was declared he felt that it would be inconsistent for him not to share personally in the perils of a conflict which he believed to be a just one, and which he had done as much as he could to bring about. His record in the war for efficiency and personal gallantry no doubt contributed largely to his nomination and election as governor of the state of New York; but he attained the governorship not on this ground alone. There are many instances in American politics of nominations made solely on a war record which have led to hopeless defeat in election. His work in the governorship brought him still more into prominence as a national leader. His uncompromising antagonism to political blackmail and bribery, and his determination to pursue the right, as he saw the right, only in a common-sense fashion, made bitter enemies on the one hand among the corrupt politicians, and, on the other hand, among theoretical reformers, and discussions raged in the newspapers about his executive acts, his speeches, and his official messages much as they raged during his seven years in the White House. If he had never reached the presidency he would probably have been a figure long remembered in American political life. But it was his course in the presidency that gave him his international reputation, and it is as President Roosevelt that future historians of American political life must chiefly discuss him.

Mr Roosevelt entered the presidency definitely committed to two principles which profoundly affected his course as chief executive of the United States. He had a well wrought-out belief in centralized authority in government and a passionate hatred of political and commercial corruption. He believed the United States to be a unified republic, a sovereign nation, and not a federation of independent states united only for mutual benefit and protection. He not only hated corruption *per se*, but he clearly saw that as efficiency has a greater power for good, so corruption has a greater power for evil in a strongly centralized government. He understood that political materialism, selfishness and corruption in federal administration afford the strongest possible argument for those who advocate strengthening the independent power of the separate states at the expense of nationalism. At the very outset of his administration he therefore set himself to work, not only to improve the personnel of the government service, but by exhortations in his messages and public speeches to arouse a sense of civic responsibility both among office-holders and among all the citizens. His official messages to Congress, probably more frequent, certainly much longer than those of any of his predecessors, were quite as often treatises on the moral principles of government as they were recommendations of specific legislative or administrative policies. The effect of his exhortations, as well as of his personal character and public acts, upon the standards and spirit of official life in the United States, was a pronounced one in attracting to the federal service a group of men who took up their work of public office with the same spirit of enthusiasm and self-sacrifice that actuates the military volunteer in time of war. No American president has done so much to discredit and destroy the old Jacksonian theory of party government that "to the victors belong the spoils," and to create confidence in the practical success as well as the moral desirability of a system of appointments to office which rests upon efficiency and merit only. Mr Roosevelt not only attacked dishonesty in public affairs but in private business as well, asserting that "malefactors of great wealth" endeavour to

control legislation so as to increase the profits of monopolies or "trusts," and that to prevent such control it is necessary to extend the powers of the federal government. In carrying out this policy of government regulation and supervision of corporations he became involved in a great struggle with the powerful financial interests whose profits were threatened, and with those legislators who sincerely believed that government should solely concern itself with protecting life and property, and should leave questions of individual and social relations in trade and finance to be settled by the operation of so-called natural economic laws. In the struggle, although he was bitterly accused of violating the written constitution, of arresting and destroying business prosperity and of attempting a radical departure from the accepted social system of the country, he was remarkably successful. By his speeches and messages, and by his frank use of one of the greatest of modern social engines—the newspaper press—he created a public opinion which heartily supported him. Under his effective influence laws were framed which were not merely in themselves measures of stringent regulation of business and the accumulation of wealth, but which established precedents, that as time goes on will inevitably make the doctrine of federal control permanent and of wider application. The struggle against some of the most powerful financial and political influences of the time not unnaturally gave rise to the idea that his work as president was destructive—perhaps the necessarily destructive work of the reformer—but not essentially constructive. Even those friendly to him sometimes felt it necessary to defend his political course by saying that he was compelled to raze the old buildings and prepare the ground on which his successors might build new and better structures. A brief consideration of some of the constructive achievements of his administration will show that the "destructive" theory of his political activities is not sustained by the facts.

**Civil Service Reform.**—Some reference has already been made to the fact that in every office which Mr Roosevelt held he constantly dwelt upon the truism, often forgotten or ignored, that no government can accomplish any permanent good unless its administrative and legislative officers are chosen and maintained for merit only. As assemblyman, as police commissioner, as naval secretary and as president, he advocated this fundamental doctrine. When Federal Civil Service commissioner he did more than any other single public man in the United States has had either the ability or the opportunity to do, to promote the doctrine of service for merit only out of the realm of theory into the realm of governmental practice. While he was criticized by the friends of Civil Service Reform for not going far enough during his presidency to protect the encroachments of those who desire to have the offices distributed as political rewards or for partisan ends, such specific acts as his transference to the classified service of all fourth-class postmasters east of the Mississippi and north of the Ohio rivers, his insistence upon a thorough investigation of the scandals in the Post Office department, and his order forbidding federal employes to use their offices for political purposes in the campaign of 1908 are typical of his vigorous support of the merit system.

**Conservation of National Resources.**—If Mr Roosevelt did not invent this term he literally created as well as led the movement which made Conservation in 1910 the foremost political and social question in the United States. The old theory was that the general prosperity of the country depends upon the development of its natural resources—a development which can best be achieved by private capital, acting under the natural incentive of financial profits. Upon this theory public land was either given away or sold for a trifle by the nation to individual holders. While it is true that the building of railways, the opening of mines, the growth of the lumber industry and the settlement of frontier lands by hardy pioneers was rapidly promoted by this policy, it also resulted naturally in the accumulation of great wealth in the hands of a comparatively few men who were controlling lumber, coal, oil and railway transportation in a way that was believed to be a menace to the public welfare. Nor was the concentration of wealth the only danger of this policy; it led to the destruction of forests, the exhaustion of farming soils and the wasteful mining of coal and minerals, since the desire for quick profits, even when they entail risk to permanency of capital, is always a powerful human motive. Mr Roosevelt not only framed legislation to regulate this concentration of wealth and to preserve forests, water power, mines and arable soil, but organized departments in his administration for carrying his legislation into effect (see IRRIGATION; United States). His official acts and the influence of his speeches and

messages led to the adoption by both citizens and government of a new theory regarding natural resources. It is that the government acting for the people, who are the real owners of all public property, shall permanently retain the fee in public lands, leaving their products to be developed by private capital under leases which are limited in their duration and which give the government complete power to regulate the industrial operations of the lessees.

**Government Regulation of Corporations.**—The growth of the corporation as an industrial machine had in recent years been very rapid in the United States. The industrial and financial corporations had grown so powerful as to venture to contend for the first place with the authority of the government itself. As Mr Roosevelt often pointed out, no nation will live long in which the authority of government—especially in a democracy—is supplanted by the private interest of a real money power. Early in his political career, Mr Roosevelt foresaw this conflict, and as president he aroused public opinion so that the people understood it, and threw his effective influence into the framing of legislation under which the Federal government is now successfully combating the illegal acts of the powerful trusts. He established the Federal Department of Commerce and Labor, the secretary of which has a seat in the cabinet, and in which there exists a bureau of corporations possessing the specific function of inspecting and supervising interstate corporations—an entirely new feature in American government. He strengthened the interstate commission for the regulation of railroads, inaugurated successful suits against monopolies— notably the Standard Oil Company and the so-called Sugar Trust,—and achieved distinct practical results in favour of a system of "industrial democracy" where all men shall have equal rights under the law and where there shall be no privileged interests exempt from the operation of the law. Both his friends and his enemies agree that he did more than any other public man to effect these changed relations of government and industry. There is, however, a violent disagreement regarding the desirability and the results of his course. His critics assert that he simply interrupted the orderly course of business, inspired panic and dangerously arrested prosperity. Mr Roosevelt and his supporters were convinced that his policy was necessary to save the country from the social and political dangers of plutocracy, and that in establishing a definite system of government regulation not only were popular rights preserved and justice promoted but industrialism and finance were placed upon a basis of regularity and honesty that paved the way for an era of general prosperity in the United States, unhampered by feverish speculation and shrewd scheming, such as the country had so far in its history been unable to enjoy.

**The Army and Navy.**—Mr Roosevelt was a pronounced advocate of international peace but also an advocate of law and order. He believed that international controversies would ultimately be settled by judicial procedure, and in the Russo-Japanese War and the establishment of the Hague Court he took an active part in promoting the judicial settlement of disputes between nations. For his efforts leading to the settlement of the Russo-Japanese War he received the Nobel Peace Prize, and in May 1910 he delivered an address on "International Peace" before the Nobel committee in Christiania. But, with this advocacy of international peace, he also advocated the maintenance by the United States of an efficient and thoroughly equipped army and navy. To some of his critics these two positions seem inconsistent. Mr Roosevelt argued not only that they were consistent but that the one logically followed the other. In his Nobel address he said: "In any community of any size the authority of the courts rests upon actual potential force; on the existence of a police or on the knowledge that the able-bodied men of the country are both ready and willing to see that the decrees of judicial and legislative bodies are put into effect;" and he expressed the opinion that until a recognized international supreme court was firmly established, every nation must be prepared to defend itself, and when it was established all the nations must be prepared to maintain its decrees against any recalcitrant nation. On this ground during his presidential administration Mr Roosevelt was deeply concerned in many measures for improving the administrative side of the War Department and educating, training and strengthening the army. Although he himself served in the army during the Spanish War his special interest was in the navy, springing probably from his relationship with the navy during his brief term as assistant secretary. The successful and dramatic voyage of the American fleet around the world, undertaken in spite of predictions of disaster made by naval experts in Europe and the United States, was conceived and inspired by him, and this single feat would alone justify the statement that no American public man had done so much since the Civil War as he to strengthen the physical power and the moral character of the United States navy.

**The Panama Canal.**—The greatest single material achievement of Mr Roosevelt's presidency was the taking over by the United States of the project to build a Panama Canal. The project itself is nearly four centuries old; for a century Great Britain and the United States had been sometimes in friendly, sometimes in acrimonious dispute as to how this was to be accomplished; the French undertook the work and failed. Mr Roosevelt recognized the new republic of Panama, and obtained from it for

the United States, in return for a commercial and military protection advantageous to Panama, the right to build a canal and control it in perpetuity. His critics said that his course in this matter was unconstitutional, although the question of constitutionality has never been raised before any national or international tribunal. The fact remains that the construction of the Panama Canal was undertaken to the practical satisfaction to the civilized world. But for Mr Roosevelt's vigorous official action and his characteristic ability to inspire associates with enthusiasm the canal would still be a subject of diplomatic discussion instead of a physical actuality.

**Colonial Policy.**—Strictly speaking, the United States has no colonial policy, for the Philippine Islands and Porto Rico can scarcely be called colonies. It has, however, a policy of territorial expansion. Although this policy was entered upon at the conclusion of the Spanish War under the presidency of Mr McKinley it has been very largely shaped by Mr Roosevelt. He determined that Cuba should not be taken over by the United States, as all Europe expected it would be, and an influential section of his own party hoped it would be, but should be given every opportunity to govern itself as an independent republic; by assuming supervision of the finances of San Domingo, he put an end to controversies in that unstable republic, which threatened to disturb the peace of Europe; and he personally inspired the body of administrative officials in the Philippines, in Porto Rico and (during American occupancy) in Cuba, who for efficiency and unselfish devotion to duty compare favourably with any similar body in the world. In numerous speeches and addresses he expressed his belief in a strong colonial government, but a government administered for the benefit of the people under its control and not for the profit of the people at home. In this respect, for the seven years of his administration at Washington, he developed a policy of statesmanship quite new in the history of the United States.

No account of Mr Roosevelt's career is complete without a reference to his literary work, which has been somewhat overshadowed by his reputation as a man of public affairs. He was all his life an omnivorous reader of the best books in very varied fields of literature, and he developed to an unusual degree the faculty of digesting and remembering what he has read. His history of the War of 1812 between the United States and Great Britain, written when he was twenty-four years old, is still the standard history of that conflict, and his *Winning of the West* is probably the best work which has been written on American frontier life of the 19th century, a life that developed certain fundamental and distinctive American social and political traits. His *African Game Trails*, the record of his scientific hunting expedition in Africa in 1909-10, is much more than a narrative of adventures on a wild continent. It is a study of social and ethnological conditions, and contains many passages of literary charm, describing bird life, animal life and natural scenery. An appendix that gives some account of the "Pigskin Library" which he carried with him for daily reading in the heart of Africa is a surprising exposition of the wide range of his reading. As a public speaker his style was incisive, forceful and often eloquent, although he made no effort to practise oratory as an art. The volume of his African and European addresses, published in the autumn of 1910, not only presents an epitome of his political philosophy, but discloses the wide range of his interest in life and the methods by which he had striven to bring public opinion to his point of view.

Personally of great physical and mental vigour, his work was done at high pressure and he had the faculty of inspiring his colleagues or his subordinates with his own enthusiasm for doing things. The volume of his letters and his writings in books, articles for the press and speeches and official messages, is enormous, and yet this work was done in the midst of the executive labours of a long political career. Besides being famous as a hunter of big game, he was a skillful horseman and a good tennis player. Regular physical exercise in the open air contributed much to his abounding vitality. A man of decisive action when his mind was made up on any given question, his very decisiveness sometimes gave the impression that his judgments were hasty. On the contrary, few men were more deliberate in considering all sides of an important problem. His long experience, his wide reading and his thorough knowledge of all sorts and conditions of men, enabled him to act quickly at a time of crisis, but his important speeches,

or a course of political action that might be far-reaching in its effect, were not cast into their final form without careful consultation with the best advisers he could obtain. The first form of his written speeches was always painstakingly edited and revised, and not infrequently entirely rewritten. He expressed his own judgment of his success as a public man by saying that it was not due to any special gifts or genius, but to the fact that by patience and laborious persistence he had developed ordinary qualities to a more than ordinary degree. (L. F. A.)

The following is a list of his principal works:—*The Naval Operations of the War between Great Britain and the United States—1812-1815* (1882), written to correct the history of James; *Thomas Hart Benton* (1887) and *Gouverneur Morris* (1888), both in the American Statesmen Series; *New York City* (1891; revised 1895) in the Historic Towns Series; *Hero Tales, from American History* (1895) with H. C. Lodge; *Winning of the West* (4 vols., 1889-96); a part of the sixth volume of the *History of the Royal Navy of England* (1898) by W. L. Clowes; *The Rough Riders* (1899); *Oliver Cromwell* (1901); the following works on hunting and natural history, *Hunting Trips of a Ranchman* (1886), *Ranch Life and Hunting Trails* (1888), *The Wilderness Hunter* (1893), *Big Game Hunting in the Rockies and on the Plains* (1897); a republication of *Hunting Trips of a Ranchman and The Wilderness Hunter, The Deer Family* (1902), with other authors, and *African Game Trails* (1910); and the essays, *American Ideals* (2 vols., 1897) and *The Strenuous Life* (1900); and *State Papers and Addresses* (1905) and *African and European Addresses* (1910). Several of his works have been translated into French and German. Uniform editions were published in 1900 and 1903. Early in 1909 he became a "contributing editor" of the *Outlook*.

The biographical sketches by Jacob A. Riis (New York, 1904), F. E. Leupp (ibid., 1904), G. W. Douglas (ibid., 1907), James Morgan (ibid., 1907), and Murat Halstead (Akron, 1902) are personal or political eulogies. John Burroughs's *Camping and Tramping with Roosevelt* (Boston, 1907) is an appreciation of Roosevelt as a naturalist. J. W. Bennett, *Roosevelt and the Republic* (New York, 1908), is bitterly hostile. There is a sketch by F. V. Greene in *Roosevelt's American Ideals*.

**ROOT, ELIHU** (1845- ), American lawyer and political leader, was born at Clinton, New York, on the 15th of February 1845, the son of Oren Root (d. 1885), professor of mathematics at Hamilton College from 1849-81. He graduated at Hamilton College in 1864, taught at the Rome (N.Y.) Academy in 1865, and graduated at the University Law School, New York City, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican party. He was United States attorney for the Southern District of New York (1883-85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its judiciary committee. From August 1899 until February 1904 he was secretary of war in the cabinets of Presidents McKinley and Roosevelt, and in this position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under General A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of the United States troops from Cuba, and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the "instructions," in reality comprising a constitution, a judicial code and a system of laws. In 1903 he was a member of the Alaskan Boundary Tribunal. In July 1905 he re-entered President Roosevelt's cabinet as secretary of state. In the summer of 1906, during a visit to the Pan-American Conference at Rio de Janeiro, he was elected its honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in January 1909, as United States senator from New York. In 1910 he was chief counsel for the United States before the Hague tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain (see NEWFOUNDLAND). He received the degree of LL.D. from

Hamilton, 1896; Yale, 1900; Columbia, 1904; New York University, 1904; Williams, 1905; Princeton, 1906; University of Buenos Aires, 1906; University of San Marcos, of Lima, 1906; and Harvard, 1907.

**ROOT** (late O.E. *rot*, adopted from Scand., cf. Norw. and Swed. *rot*, Dan. *rod*; the true O.E. word was *wyrt*, plant, represented in Ger. *Wurz* or *Wurzel*; the ultimate root is the same in both words, and is seen in Lat. *radix*), the underground part of a plant. This is the popular meaning of the word. In its botanical use the term is more restricted (see below). The various other meanings have all developed from this, its primary, significance. Of these the principal are: the source or origin of a condition, state, quality, &c.; the base or embedded part of a structure of the body, such as a nail, tooth, the hair, &c.; in mathematics, a number, quantity or dimension which produces a given expression when multiplied by itself a requisite number of times; and in philology an ultimate element of language, incapable of further analysis. A particular extension of the primary meaning is that which applies the word generally to a class of plants, such as the turnip or carrot, whose root is fleshy, and edible either by man or domestic animals.

The embryo of a typical plant, for instance a pea plant (fig. 1), has an ascending axis which will grow into the shoot, and a descending axis or radicle which will grow into the root.

FIG. 1.—The Dicotyledonous Embryo of the Pea laid open. *c*, the two fleshy cotyledons, or seed-lobes, which remain under ground when the plant sprouts; *r*, the radicular extremity of the axis which develops into the root; *k*, the axis bearing the young stalk and leaves *g*, which lie in a depression of the cotyledons *f*.

protects it in its passage through the soil. The root also generally bears root-hairs, slender unicellular outgrowths of the outer layer, borne in the region a little behind the root-tip. It is by means of the root-hairs especially that the root is brought into close relation with the soil particles and absorbs the nutrient materials in solution in the water which surrounds these particles. The older root-hairs are continually dying off, so that they are borne only on a small part of the area behind the apex. Branches of the root, which repeat the form and structure of the main root, are developed in regular succession from above downwards (acropetal), and owing to the fact that they originate in a definite position in the interior of the root (endogenous) they develop in longitudinal rows and have to break through the overlying

tissue of the parent root (fig. 2). True forking of the root (dichotomy) occurs in the Lycopodiaceae (the shoots of which also branch dichotomously), but is unknown in the higher plants.

Roots which originate elsewhere than as acropetal outgrowths of a main root are known as *adventitious*, and may

arise on any part of a plant. They are especially numerous on underground stems, such as the under side of rhizomes, and also develop from stem nodes under favourable conditions, such as moisture and absence of light; a young shoot or a cutting placed in moist soil quickly forms adventitious roots. They may also arise from leaves under similar conditions, as, for instance, from begonia leaves when planted in soil.

The forms of roots depend on their shape and mode of branching. When the central axis goes deep into the ground in a tapering manner, without dividing, a *tap-root* is produced. This kind of root is sometimes shortened, and becomes swollen by storage of food-stuffs, forming the *conical root* of carrot, or the *fastiform* or *spindle-shaped root* of radish, or the *napiform* root of turnip. In ordinary forest trees the first root protruded continues to elongate and forms a long primary root-axis, whence secondary axes come off. In primary plants, especially Monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called *fibrous*, as in many grasses (fig. 4); when the fibrils are thick and succulent, the root is *fasciculated*, as in *Ranunculus Ficaria*, *Asphodelus luteus*, and *Oenanthe crocata*; when some of the fibrils are developed in the form of tubercules, the root is *tubercular*, as in dahlia (fig. 5); when the fibrils enlarge in certain

parts only, the root is *nodulose*, as in *Spiraea Filipendula*, or *mamiform*, as in *Polygonum trisic*, or *acaulis*, as in *Ipecacuanha*. Some of these so-called roots are formed of a stem and root combined, as in *Orchis* (fig. 6), where the tuber consists of a fleshy swollen

root bearing at the apex a stem bud. As in the case of the stem, growth in length occurs only for a short distance behind the apex, but in long-lived roots increase in diameter occurs continually in a similar manner to growth in thickness in the stem.

FIG. 6.—Base of plant of *Orchis*, showing tubercles or tuberosity roots.

contents and are now filled with air. This layer is called the *sclerenchyma*, and serves to condense the moisture contained in the air, on which

Roots are usually underground and colourless, but in some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called *aerial*. They are well seen in the screw-pine (*Pandanus*), the Banyan (*Ficus indica*, fig. 7), and many other species of *Ficus*, where they assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree-ferns they form a dense coating around, and completely concealing, the stem; such is also the case in some *Dracaenas* and palms. In *Epiphytes*, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue always aerial and greenish, and they possess stomata. Delicate hairs are often seen on these epiphytic roots, as well as a peculiar spongy investment formed by the cells of the epidermis which have lost their succulent contents and are now filled with air. This layer is called the *sclerenchyma*, and serves to condense the moisture contained in the air, on which

FIG. 7.—*Ficus indica*, the Banyan tree, sending out numerous aerial roots, which reach the soil, and prop the branches.

the plant is dependent for its water-supply. The aerial roots of the ivy are not the nutritive roots of the plant, but are only intended for mechanical support. The climbing roots of many orchids, aroids and epiphytic ferns branch and form places of lodgment for humus into which absorbent branches of the climbing roots penetrate. Some leafless epiphytic orchids, such as species of *Angraecum*, depend entirely upon their aerial roots for nourishment; the roots, which are green, perform the functions both of leaves and roots. A respiratory or aerating function is performed by roots of certain mangroves growing in swampy soil or water and sending vertical roots up into the air which are provided with aerating passages by which the root system below can communicate with true outside air.

Parasitic plants, as the mistletoe (*Viscum*), broom-rape (*Orobanchae*) and *Rafflesia*, send root-like processes into the substance of the plants whence they derive nourishment. In the dodder (*Cuscuta*), the tissue around the root swells into a kind of sucker (haustorium), which is applied flat upon the other plant, and ultimately becomes concave, so as to attach the plant by a vacuum. From the bottom of the sucker the root protrudes, and penetrates the tissue of the host plant. Leaf-buds are sometimes formed on roots, as in plum, cherry and other fruit trees, the common elm affords an excellent example, the young shoots which grow up in the neighbourhood of a tree arising from the roots beneath the soil. In some plants no roots are formed at all; thus in the orchid *Coralorhiza*, known as coral-root, a stem-structure, the shortly branched underground rhizome, performs all the functions of a true root which is absent. In aquatic plants the root acts merely as a holdfast or is altogether absent as in *Salmisna*, *Utricularia* and others.

**ROPE AND ROPE-MAKING.** All varieties of cordage having a circumference of an inch or more are known by the general name of "rope." Twisted cordages of smaller dimensions are called cords, twines and lines, and when the sectional area is still smaller, the article is known as thread or doubled yarn. All these varieties of cordage are composed of a number of separate yarns, each of which is made from some kind of textile fibre by preparing and spinning machinery. The number of separate yarns which ultimately form the rope or cord depends upon the fineness of the yarn, and also upon the circumference of the finished article. From thread and fine twine upwards the whole art of manufacture is that of twisting together fibres and yarns; but the comparative heaviness and coarseness of the materials operated on in rope-making render necessary the adoption of heavy machinery and modified processes which clearly define this manufacture as a distinct calling. The modern trade of rope-making is again divided into two distinct branches dealing with vegetable fibres and metallic wire.

Many different vegetable fibres are used for rope-making, but for the combined qualities of strength, flexibility and durability, none can compete with the common hemp, which is consequently the staple of the rope-maker. Cotton ropes are, however, much more flexible, and in addition are strong and durable; they are, therefore, much preferred for power transmission in textile and other works: Manila hemp is a fibre of remarkable tenacity, of unapproached value for heavy cordage, but too stiff for small cords and twines. After these in utility come Sial hemp of Central America (*Agave Sisalana*), Phormium hemp of New Zealand (*Phormium tenax*) and Sunn hemp of the East Indies (*Crotalaria juncea*)—all fibres of great strength, and largely used by rope-makers. Jute (*q.v.*) of India (*Corchorus capsularis* and *C. olitorius*) is now largely used by rope-makers on account of its cheapness. When used alone it is deficient in strength and durability, but when used in conjunction with proper proportions of hemp it makes a very satisfactory and useful rope. Among fibres more rarely seen in rope-works are Jubbulpore hemp (*Crotalaria tenuifolia*), boxstring hemp (*Sansevieria zeylanica*), and other hemsps of the East Indies, plantain fibre (*Musa paradisiaca*), and agave fibre (*Agave americana*) of America. Coir and many other fibres are used, but principally in the localities of their production.

A rope is composed of a certain number of "strands," the strand itself being made up of a number of single threads or yarns. Three strands laid or twisted together form a "hawser-laid" rope, and three such hawsers similarly laid make a "cable-laid" rope or "cable." A "shroud-laid" rope usually consists of four strands laid around a central strand or core. The prepared fibre is twisted or spun to the right hand to form yarn; the required number of yarns receive a left-hand twist to make a strand; three strands twisted to the right make a hawser; and three hawsers twisted to the left form a cable. Thus the twist in each operation is in a different direction from that of the preceding one, and this alternation of direction serves, to some extent, to preserve the parallelism of the fibres.

The primary object of twisting fibres together in a rope is that by mutual friction they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist. The proper degree of twist given to ropes is generally such that the rope is from three-fourths to two-thirds the length of yarn composing it.

**Rope-walk Spinning.**—The sequence of operations in this method of working is as follows: (1) hackling the fibre; (2) spinning the yarn; (3) tarring the yarn when necessary; (4) forming the strands; (5) laying the strands into ropes.

Hackling differs but slightly from the hand-hackling process used in the preparation of flax. The hackle board consists of a wooden block studded with strong, tapered and sharp-pointed steel prongs. A series of such hackle boards is used in the progressive hackling operation, the prongs diminishing

in size and being more closely set together. For the commoner kinds of ropes, however, hackling through the coarsest board is found to be sufficient, while in most other cases two hacklings are adopted.

The backler takes up a handful or "streak"<sup>1</sup> of hemp from the bundle, wraps one end firmly round his hand, and with his fingers distributes a little oil over the hemp. The oil softens the material, keeps the hackle pins in good condition, and facilitates generally the splitting up of the fibre as the streak is drawn through the pins. In the first place, only the ends of the streak are hackled; they are dashed into the pins and drawn through them in order to separate the fibres and to lay them parallel; but as the operation proceeds a gradually increasing length of the streak is thrown on and drawn through the pins. The process is indeed very similar to the combing out of a head of human hair. When half the length of the streak is thoroughly combed, the other half is treated in precisely the same manner. The hackled streak is then weighed, doubled up to prevent any entanglement, and laid aside for the process of spinning. During the hackling process a large quantity of comparatively short fibres are retained in the pins; the longest of these are separated, and the remainder used for tow yarns. The above description refers entirely to hand hackling; machine hackling of hemp is very similar to flax hackling.

The spinning is done in what is termed the "rope-walk," and from the nature of hand-spinning, and the length of the rope required, it is necessary that this walk should be from 300 to 400 yds. in length. It is sometimes completely covered in with walls and roof; at other times only a roof is built; while in exceptional cases the whole of the walk, with the exception of a small hut at each end, is without shelter of any kind. The operation of spinning is very important, as the weight of the yarn and the appearance of the finished product depend upon it. A description of spinning and laying as performed by the aid of the hand-wheel will perhaps be the best means of giving an idea of this useful branch of manufacture.

FIG. 1.

FIG. 2.

The front and end elevations of one variety of spinning-wheel are shown in figs. 1 and 2. The apparatus is fixed to some convenient part of the building, or to special supports. The wheel A, which is turned by hand, and always in the same direction, communicates motion to the rotating hooks or "whirls" B, C, D and E by means of a listing band or strap F. The arrangement of the listing shows clearly that the hook E will revolve in the opposite direction to hooks B, C, and D. The spinner takes two streaks of the hackled hemp, wraps them round his waist with the ends at his back, and keeps the fibre in position by adjusting his apron partly round it. From the middle of the streak—that is, midway between the two ends—he takes hold of a quantity of fibre and hangs it on to one of the

hooks B, C or D; the assistant at the wheel begins to turn, and thus a certain amount of twist is imparted to the material between the spinner and the hook. The spinner now walks backwards down the walk, drawing out the fibre with his left hand and adjusting it with his right. A piece of flannel or woollen cloth held in his right hand aids in the formation of the thread and protects his fingers from the rough fibre. In some cases two threads are spun simultaneously; when this is done, two of the hooks, say B and C, are used at the same time. Since the revolutions of the hook divided by the length of yarn spun give the amount of twist per inch or foot, it follows that the ratio of the walking pace of the spinner to the revolutions of the wheel A should be constant, otherwise the yarn will not be uniform. The spinner calls to the assistant when there is any irregularity in speed, or when, from any cause, he is obliged to stop walking.

At convenient intervals in the length of the walk, and projecting from posts, are short horizontal bars; the top of each bar is provided with wires or pegs to form a number of vertical partitions something like a very coarse comb. As the spinner proceeds down the walk, he throws the spun yarn into one of these partitions, thus relieving himself of the weight and keeping the yarn off the ground. When a sufficient length of yarn has been spun, he breaks off the fibres and fastens the yarn to a convenient peg or hook until he has spun a sufficient number (usually three) to form a small rope or cord. The person at the wheel hangs these three yarns one on each of the three hooks B, C and D, while the spinner attaches the other ends to a revolving hook termed a "looper." All is now ready for "laying" the yarns. For small cords, this may be done, with or without a "top." This top is a conical-shaped piece of hard wood provided with three equidistant grooves which merge towards each other at the thin end, and into which the yarns are laid. The thick end of the top is nearest the wheel, so that the yarns may be kept separate on that side. As the hooks twist the three threads, the spinner goes up the walk with the top; the twist in the yarns causes the looping hook to revolve in the opposite direction to the other hooks, and thus it twists the three threads in the opposite direction to the original twist.

FIG. 3.

Fig. 3 shows one form of top, the three yarns being shown in distinctive marks so that the path of each may be more easily followed by the reader; a plan of the thick end of the top appears to the left of the figure. If four yarns of strands are required, the top would contain four grooves, as well as a hole through the centre to admit of a core when such a thing is required. As soon as the spinner, who carries the top, arrives at the wheel, the assistant takes the yarns off hooks B, C and D (figs. 1 and 2), and puts them all on hook E. The other ends of the strands are removed from the looper and attached to a block of wood called a "drag." The wheel is then rotated as before, which puts more twist into the cord. While this operation, which is termed hardening, proceeds, a shrinkage in the length of the cord takes place, and the drag is consequently drawn up the walk. The drag, however, holds the cord taut, and serves to retain the twist which is imparted by the hook E.

If the strands require tarring before they are laid, they are separately taken off the hooks, after they have been spun, and tied at both ends to pegs to keep them taut until a sufficient number has collected to be conveniently handled at the tarring tank. The tar is heated to about 220° F., and the strands are then passed through it at a speed not greater than 15 ft. per minute. Before emerging from the tank, the strands pass between squeezing rollers which remove all superfluous tar. In a short time the strands are dry, while in the space of a few days the tar is hard enough to allow the strands to be formed into ropes.

Such is, in general, the hand process of forming ropes when they are composed of only three or four single yarns. It very often happens, however, that a number of single yarns are required to form each strand of the rope. The single yarns may be spun by hand, as described above, or by machinery. In the former case a group of yarns is usually termed a "haul," while the machine-spun yarns are formed into what is known as a "warp" or "chain." In any case, the group of yarns is stretched down the rope-walk, at each end of which is a "jack" twister. A few of the yarns taken from the group—the number depending upon the size of the yarn and also upon the required diameter of the strand—are then placed on a hook of the jack twister and twisted together. When three such strands are made they are laid into a rope in a similar manner to that explained above. A simple form of hand jack twister is illustrated in figs. 4 and 5. The wheel A gears with pinions B on the shafts of the hooks or whirls, and this imparts the necessary motion to the latter. At the other end of the walk is a similar machine which moves upon rails as the twist is put into the strands. When the hooks are empty, pinions B and wheel A (fig. 4) are out of gear, but those hooks carrying yarn are drawn out, as shown at C, until the pinion B gears with wheel A, when the hooks are rotated. The

<sup>1</sup> See note in the article on JUTE for variations of spelling.

sequence of operations is very similar to that described for the simple hand-wheel.

Figs. 4 and 5.

**Machine or Factory Rope-Making.**—The most modern methods of rope-making are far superior to the foregoing, which, as stated, have been introduced to show the principle. One of the greatest drawbacks in the formation of a strand from a haul or chain, even for a small number of yarns, is the irregularity of the tension of the yarns at different parts of the strand. If a large number of yarns be required for each strand, it would be almost impossible to make a satisfactory rope by the above system. If, however, the strand be made from bobbins, each yarn bears its proper share of the tension, and an almost perfect rope is obtained.

Two mechanical methods are in use for the spinning of long vegetable fibres—the ordinary and the special. When flax or jute yarns are required, they are almost invariably spun on the ordinary spinning frames, and the yarn rewound from the spinning bobbins on warping bobbins, or else rewound in the shape of rolls or cheeses. Hemp yarns, especially the finer kinds, are sometimes treated in the same manner, but Manila hemp, New Zealand hemp (*Phormium*), and similar fibres, are invariably spun on bobbins by special machinery. The strands for light ropes may then be made on the twisting frames, and the rope finished on what is called a "house machine." When a large rope is desired, a slightly different method is usually employed. The bobbins from the automatic spinner, or the rolls from the winding frame, are placed upon pegs in a frame which answers the same purpose as a bank or creel used in conjunction with a warping machine. If the rope is to be say  $3\frac{1}{2}$  in. in circumference, there may be, with fine yarns, 300 or more individual threads in its composition. Suppose that 300 threads are to be used, then 300 bobbins would be placed on the pegs of the bobbin bank or creel, and divided into three sets of 100 threads each for a three-strand rope. The threads are passed separately through a register plate, which is simply a plate containing a sufficient number of holes for the maximum quantity required, and arranged in a series of concentric circles. There are three sets of concentric rings used in the plate for a three-strand rope, and four sets for one of four strands. As the threads emerge from the register plate they are grouped together and passed through a tapered tube, the sectional area of the smaller end of the tube being equal to the sectional area of the strand. This operation is done for each group of 100 threads, and finally the three or four groups are attached to separate rotating hooks of the forming machine or "traveller." As the latter moves down the walk on rails, it draws the threads from the bobbins in the bank, and through

the register plate and tubes, while the hooks put in the twist. A perfectly circular strand, without slack threads, is thus formed; and, at the same time, a uniform strand is obtained, since the ratio of the speed of the traveller to the number of turns per inch of the hooks is constant. The process is continued until the desired length of strand is made—about 150 fathoms (300 yds.) of each of the three strands are required for 100 to 120 fathoms of rope—then a little more twist is introduced. Afterwards, all three strands are placed on one hook of the traveller, and the ends from the shaping tubes are cut off and put on the hooks of the fixed machine, called the "fore-turn." The carriage containing the "top" is now brought close to the traveller, and the strands are placed in the grooves of the top as explained under hand-laying. Similar means to those used in hand-spinning are adopted for keeping the rope off the ground. The two machines are now started, the three hooks of the fore-turn machine revolving in one direction and the single hook of the traveller revolving in the opposite direction. Simultaneously the carriage with the laying top moves forward towards the head of the walk.

Fig. 9, Plate I., shows many stages in the process of rope-making. The most prominent part shows the carriage with the top in position approaching the fore-turn machine at the head of the walk. The person on the right of the carriage is holding a top in his left hand, while the top in the carriage is laying a rope of four strands. At other parts of the figure appear three or four travellers, some twisting the strands, others moving up the walk as the laying proceeds, while on the extreme right one machine is laying two ropes, of three strands each, at the same time.

We have already stated that the yarns for the above machine may be prepared by two systems. When the hemp fibre is spun on the ordinary frame, the method of preparation for such a frame is somewhat similar to that employed for flax, but since the fibre is harsher than flax, it invariably requires softening. The softening machines crush the streaks as in the case of jute, but the fluted rollers are arranged to form part of a circle. The coarser fibres receive a somewhat different treatment; the first process in the preparation of Manila hemp and similar fibres used for rope yarn is illustrated in fig. 10, Plate I. The streaks are clearly shown as being led between fluted rollers on to the pins of the hackling and spreading machine; the lanterns or skeleton rollers, seen on the extreme right, press the fibres into the pins. A little oil is made to drop on to the fibre in order to soften it and to facilitate the operation. The oiling apparatus is usually of a simple character, and consists of a revolving roller partly immersed in an oil bath. The roller is driven as shown in the figure, and the oil which it draws up is scraped off its surface by a knife-edge, and led, by means of a sheet, upon the fibre between the fluted rollers and the gill-pins. A view of a similar machine is shown in fig. 11, Plate II., from which it will be seen that there are two sheets of revolving gill-pins. The sheet nearest the feed-cloth revolves slightly quicker than the surface speed of the fluted feed rollers, while the second sheet moves at a much higher rate. The difference in the speeds of the gill-pins results in the fibre being combed out and straightened, while the delivery rollers, the surface speed of which is slightly greater than that of the second sheet of gill-pins, help further to complete the process, and finally deliver the fibre in the form of a broad ribbon, termed a sliver.

In general, three such machines are used for the process; the pins in the gill-sheets are graded, those in the second machine being finer and more closely set than those in the first machine, while a still finer and closer arrangement obtains in the third machine. The slivers from the third hackling and spreading machine are now placed at the back of the first drawing frame, one type of which appears in fig. 12, Plate II. Each sliver is passed separately over a guide pulley, led upon the pins, drawn out and joined by others, and finally delivered as a sliver ready for the second drawing frame. A similar process is carried on in this machine, from which the sliver emerges ready for the spinning frame. It will thus be seen that a system of doubling, as well as of drawing, obtains in these processes as in flax-preparing; such a system is adopted in order to obtain uniformity of sliver and the correct weight.

The slivers are taken from the drawing frame to the automatic spinner—a beautiful piece of mechanism. Fig. 13, Plate II., illustrates the machine as it leaves the makers. Two sliver cans from the second drawing frame are placed behind the machine, and the slivers passed between the rollers. They are then deflected and made to enter a trumpet-mouthed conductor which guides them on to the pins of the chain-sheet. As the two slivers emerge from these pins, each enters a separate self-feeding and adjusting apparatus, the function of which is, as its name implies, to regulate the delivery of the sliver to the nippers. The delivery is increased or decreased according as the sliver is thin or thick. Consequently, a very even yarn results; indeed, it is claimed that for uniformity of yarn this system of spinning has no equal. The bobbins, which

are placed in a horizontal position, have a lateral movement, so that the finished yarn may be wound on evenly. This machine is made for ordinary rope yarn, and for binder twine for self-reaping machines. When all three spreading machines are used in conjunction with the spiral drawing frames, the automatic feeding arrangement is sometimes considered unnecessary, because of the uniformity of the slivers when delivered from the finishing drawing frame.

Figs. 14 and 15, Plate III., show two sheds filled with preparing machinery for the manufacture of binder twine. A complete system of Manila machinery, as recommended by Messrs Lawsons, Leeds, would consist of the following:—

- 1 No. 1 spreading and hackling machine.
- 1 " 2 " " "
- 1 " 3 " " "
- 1 spiral 1st drawing frame, 1 head, 88 in. reach, 4 slivers per head.
- 1 " 2nd " 2 heads, 88 in. " 6 " 2 improved automatic spinners or jennies of 2 spindles each.

The length of sliver from a given length of fibre is proportional to the drafts and inversely proportional to the doublings. Thus, if  $d_1, d_2, d_3, d_4, d_5, d_6$  = the drafts,

$s_1, s_2, s_3, s_4, s_5, s_6$  = the number of slivers,  
 $l$  = the feet per lb on the feed-table of No. 1 spreading machine,  
 $L$  = the feet per lb delivered at the automatic spinner, then:—

$$l \times \frac{d_1}{s_1} \times \frac{d_2}{s_2} \times \frac{d_3}{s_3} \times \frac{d_4}{s_4} \times \frac{d_5}{s_5} \times \frac{d_6}{s_6} = L.$$

No. 1. No. 2. No. 3. No. 1. No. 2. Auto-  
 Spreading Drawing Auto-  
 machines. frames. matic  
 spinner.

A numerical example, showing the drafts, slivers, &c., used for the production of No. 22<sup>a</sup> rope yarn of 330 ft. per lb appears below:—

$$l \times \frac{15.5}{1} \times \frac{15.5}{12} \times \frac{15.5}{12} \times \frac{7.42}{4} \times \frac{9.7}{4} \times \frac{5.74}{1} = 330 \text{ ft.}$$

Spreading Drawing Automatic  
 machines. frames. spinner.

Whence  $l = 536$  ft., say 54 ft. per lb; that is to say, 1 lb of Manila fibre, approximately 6 in. in length, spread on the feed-table of No. 1 spreading and hackling machine, and subjected to the above drafts and doublings, would produce yarn No. 22<sup>a</sup> of 330 ft. per lb from the automatic spinner.

The bobbins from these automatic spinners may be used in the bank at the rope-walk as already indicated, or they may be taken to what is termed a "house machine." These machines are of two distinct kinds—vertical and horizontal. They perform the same work as the machines in the rope-walk, but take up much less space.

Figs. 16 and 17, Plate IV., illustrate two types of horizontal machines, each of which is capable of completing a rope in one operation. The process is pretty clear in fig. 17, which shows that eighteen threads are treated at once. On the right, and driven by spur gearing, are three revolving carriages or creels, each containing six bobbins. Each group revolves as the yarns are drawn off the bobbins, and thus the threads are formed into three strands. As the strands emerge from the guides, they converge towards three other guides, are laid together, and finally the finished rope is wound on to the reel.

In principle the vertical machine is the same as the horizontal machine, and the rope is, consequently, made in one operation. Any number of bobbins, from 24 to 128, may be twisted at the same time; the machine in fig. 18, Plate IV., is for making a rope of three strands, each with 12 threads, or 36 threads in all. These machines are also made to make ropes of four strands. The strands are formed by the rotation of the carriages, from the top of which each strand passes. The three strands then converge to, and pass through, the top of the machine, where they are laid into a rope. The latter passes over a series of guide pulleys, and is ultimately wound on the large drum shown in front of the machine. Such a machine for making a 128-thread, four-strand rope, occupies only about 125 sq. ft.—8 ft. 9 in. X 14 ft. 4 in.

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. A certain number of bobbins, depending upon the capacity of the machine, are placed in a bank, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated

with this starch, but, as they emerge from the starch-box, the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers, and are finally rewound by the same machine on bobbins. These machines are termed bobbin-to-bobbin polishing machines. In some cases the hot drying cylinders are replaced by a system of hot air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

**Driving Ropes.**—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:—

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.
3. The turning movement is better; machines therefore run more steadily and production is increased.
4. Shafts may be run at higher speeds.
5. Greater range of drives; anything from 10 ft. to over 80 ft., and much greater distances when carrier pulleys are used.
6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery run, in most cases, until stopping-time.

The number of ropes to be used depends upon the power to be transmitted and upon the surface speed of the driving pulley. The speed of the rope may vary from 2000 ft. to 6000 ft. or over per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (See also POWER TRANSMISSION, § Mechanical.) Fig. 6 shows the

FIG. 6.—Rope Race of a Lancashire Cotton-Spinning Mill, with 38 Lambeth Cotton Driving Ropes, 1½ in. diameter; engine, 1700 H.P.

application of these ropes, which pass direct from the main driving pulley to the different flats of the mill. Fig. 7 shows the construction of the Lambeth four-strand cotton rope. There are two distinct systems of arranging the ropes on the driver and the driven pulleys. In the United Kingdom each rope is independent of all the others, and, as it is unlikely for more than one rope to break at a time, the stoppages are reduced to a minimum. In America, where hemp ropes are largely employed,

FIG. 7.—Lambeth Cotton Rope.

the continuous system is mostly used; here the rope is wound round and round over driver and driven, and, except in rare cases, is joined only at one place. Although the system has the great advantage of the minimum number of joinings, it requires tension pulleys to keep the ropes taut. It is also clear that when the rope breaks at any point the machinery must stand until the repair is completed.

**Wire Ropes.**—Although the manufacture of ropes is of ancient origin, the practice of making ropes from wire on a large scale is of comparatively recent date. Since 1874, however, great developments have taken place in the manufacture of ropes from different kinds of wire, and the uses to which they can be put have enormously increased. This is owing almost entirely to the introduction of flexible wire ropes which were invented about this time by Messrs Bullivant & Co. Ltd., of 72 Mark Lane, London, E.C. Prior to that date the uses at which wire ropes were put were limited to winding ropes for collieries and hauling, and to cases in which flexibility was not a great desideratum. The introduction of flexibility, however, made possible the use of wire rope for ships' hawsers and rigging, for cranes, derricks and other purposes for which hempen ropes were formerly employed.—Indeed it has almost entirely superseded hemp for marine uses. The reason is that it is much stronger for the same size than rope made from any other material, whilst for the same strength its size and weight are only about one-third that of hempen rope. Consequently, the required power may be obtained with a wire rope of comparatively small bulk.

Wire rope is specially suited for aerial ropeways which provide a means of conveying ore, metals, merchandise, &c., over ground where it would be difficult to arrange transport by ordinary means. Messrs Bullivant & Co. Ltd., to whom we are indebted for the table of strengths and other particulars, as well as for the sectional illustration of wire ropes, construct seven different systems of aerial ropeways:—

1. The endless running rope, with carriers hanging therefrom and moving with it through frictional contact.
2. An endless rope, with the carriers hanging therefrom and moving with it, being rigidly fixed in position on the rope.
3. The fixed rope, in which the carriers are drawn along and hang from a fixed rope which acts also as a rail, returning on a parallel rope.
4. The single fixed rope, in which one carrier, hanging from a fixed rope, is drawn to and fro by means of an endless hauling rope.
5. The use of two fixed ropes with an endless hauling rope, in which one carrier travels in one direction, while the other travels on a parallel rope in the opposite direction. This is a serviceable type of ropeway, capable of being used over extremely long spans, and of carrying loads up to 5 tons.
6. The use of one fixed rope placed on an incline, on which the carriers (uncontrolled by hauling ropes) with their suspended loads are allowed to run down at a high speed. This is generally called a "shoot."
7. Bullivant's system of aerial ropeway for raising, lowering, and transporting heavy loads, by means of which a load can be hoisted, traversed in either direction and deposited at one operation.

The flexibility of a wire rope depends upon the number of wires of which it is formed; consequently the use to which a rope is to be put will partly determine the number of wires used in its construction. In some cases nearly 400 individual wires are employed in making one rope. Fig. 8 shows in section ten different types of construction, the particulars of which appear below:—

1. Laid rope made of 6 strands of 7 wires each. This is the class of rope most frequently used for hauling ropes where the size of the barrel and sheave will permit; it is also the make of rope in general use for standing rigging, and is such as is required by Lloyd's regulations.
2. Hauling rope made of 6 strands, each strand being of 7 wires covering 7 smaller ones.
3. Hauling rope made of 6 strands, each of 8 wires covering 7 smaller ones.
4. Hauling rope made of 6 strands, each of 10 wires covering 7 smaller ones.
5. Formed rope made of 6 strands of 19 wires each. In larger sizes this make of rope is used for standing rigging on vessels. In smaller sizes it is sometimes used for running rigging, and it is the usual make of rope for trawl warps.
6. Flexible steel wire rope, made of 6 strands each of 12 wires, with hemp heart and hemp centre in each strand. This is the usual make of flexible steel wire rope. 4½ in. in circumference and smaller; used for hawsers, running lifts, hoists, &c.
7. Extra flexible steel wire rope made of 6 strands each of 24 wires.
8. Special extra flexible steel wire rope made of 6 strands each of 37 wires.

9. Special extra flexible steel wire rope made of 6 strands each of 61 wires. This is the make of rope usually adopted for large ropes—say over 10 in. in circumference—which are largely used for slipway and salvage purposes.
10. Cable-laid rope. This is an obsolete form of rope, which is composed of six complete ropes twisted together.

Fig. 8.

The following table supplies particulars about wire ropes which are used for general hauling purposes:—

Circumference	Diameter	Breaking Strain in Tons.				Approximate Weight per Fathom.
		"Crucible Steel.	Best Selected Improved "Crucible" Steel.	Best Selected "Mild" Plough Steel.	Best Selected "Extra Plough" Steel.	
1½ in.	3½ in.	4½	4½	5½	5½	1½ lb
1 "	" "	6	6	7	7	2 "
1 8 "	" "	8½	8½	9	10	3 1/2 "
2 "	" "	11	11½	12	14	4 "
2 2 "	" "	14	15	16	18	5 1/2 "
2 4 "	" "	17	18	20	22	6 "
2 6 "	" "	21	22	24	27	7 1/2 "
3 "	" "	24	26	29	31	9 "
3 1/2 "	1 "	29	31	35	38	10 1/2 "
3 3/4 "	1 1/4 "	34	36	40	44	13 "
3 1/2 "	1 1/2 "	39	42	46	50	14 1/2 "
4 "	1 3/4 "	45	48	53	58	16 1/2 "
4 1/2 "	1 7/8 "	52	56	61	67	17 1/2 "
4 3/4 "	1 7/8 "	57	61	67	73	20 "
4 1/2 "	1 7/8 "	65	69	76	83	22 "
5 "	1 7/8 "	72	76	83	92	25 "

The diameter of drums and sheaves should be about thirty times the circumference of the rope.

For shaft winding at high speed one-tenth of the breaking strain of a rope is sometimes taken as a fair working load. For inclines, the proportion of load to breaking strain varies according to gradient conditions, and friction should be allowed for.

The first requisite in the manufacture of wire ropes is the selection and blending of the different iron ores. The different processes through which the metal passes, and the hammering and drawing into rods, require great experience, and give to it the peculiar properties that are essential for the finished article. The same remarks apply to the annealing and hardening processes, during which the rods are drawn through dies to the required gauge. The wire is now subjected to special processes of galvanizing in order to make it proof against atmospheric and other influences. Afterwards it is wound on bobbins of suitable size, a definite number of which are mounted on the forks or frames of the stranding machine. These forks are swung or pivoted between disks, which are keyed on a hollow main shaft, through which the wires or other material

intended for the core pass. This core is of such a size that the aggregate number of wires that are mounted in the machine exactly cover it in a spiral direction.

All the wires, including the centre core, are passed through their individual hollow spindles, then led to the nose or head of the machine, and finally passed through a stationary compression block to draw-off wheels. The speed of these wheels is regulated in proportion to the speed of the machine by means of suitable gearing. During the revolutions of the machine each bobbin and fork is kept in a vertical position, and floats thus, by means of an eccentric ring behind the back disk. This ring is connected to the spindles of the bobbin forks by means of small cranks, thus preventing any torsional movement that would otherwise be imparted to the individual wires.

Each bobbin is controlled by a brake which acts as a tensioning device so that equal strain can be applied to each, allowing the wires to unwind uniformly. The finished strands are wound in turn upon large bobbins, and mounted in the flyers or disks of the rope closing machine. These machines are similar in design to the stranding machine, but are naturally much heavier in construction, and therefore revolve at a proportionate speed. The speed of the machines varies according to the weight of material, the size of the strands and the construction of the finished rope. The modern machine, or the type most generally used, makes about fifty revolutions per minute, whilst three times this speed is often obtained when spinning the strands.

The rapid strides made by electricity have furnished another large branch of what may be termed wire rope manufacture. The ropes used for electrical purposes are almost invariably termed cables, and there are many different kinds and sizes of them. The wire must necessarily possess good conducting power, and be comparatively cheap. Up to the present copper has proved to be the chief material possessing these two important properties in combination; hence it is the metal *par excellence* for electrical conduction. Aluminium and alloys have been tried with varying degrees of success.

The conductor itself consists of a strand of soft copper wires, around which the dielectric or non-conducting material is placed. The methods of forming the strands do not differ essentially from those described above. The dielectric is usually paper, spun jute fibre, vulcanized india-rubber or vulcanized bitumen. If the first two dielectrics are used, a lead sheath is necessary to enclose the insulated strand and so exclude moisture; if the cable is likely to get damaged, it is further enclosed by steel tapes or steel wires, and finally covered with yarn or braid. Vulcanized bitumen is not only a dielectric, but is also absolutely impervious to moisture. Hence in many instances where paper or fibre is employed as the principal dielectric, a sheath of vulcanized bitumen is used instead of lead to exclude moisture. Cables are also made with a single central strand of copper wires in addition to one or more concentric layers of copper wires, the layers being separated by some dielectric material; or there may be two or more strands, separately insulated, and more or less elaborately clothed with the above-mentioned substances. (T. Wo.)

**ROPES, JOHN CODMAN** (1836-1890), American military historian and lawyer, was born at St Petersburg on the 28th of April 1836, the son of a leading merchant of Boston who was engaged in business in Russia. At the age of fourteen, his family having meantime returned to Massachusetts, he developed an affection of the spine which eventually became a permanent deformity. His courage and energy, however, did not allow him to yield to his affliction. He entered Harvard in 1853, and graduated in 1857. His interests as a young man were chiefly religious, legal and historical, and these remained with him throughout life, his career as a lawyer being conspicuous and successful. But it was the outbreak of the Civil War in 1861 which fixed his attention principally on military history. He ceaselessly assisted with business and personal help and friendship the officers and men of the 20th Massachusetts regiment, in which his brother, Henry Ropes, served up to his death at Gettysburg, and after the war he devoted himself to the collection and elucidation of all obtainable evidence as to its incidents and events. In this work his clear and unprejudiced legal mind enabled him to sift the truth from the innumerable public and private controversies, and the ill-informed allotment of praise and blame by the popular historians and biographers. The focus of his work was the Military Historical Society of Massachusetts, which he founded in 1876. The work of this society was the collection and discussion of evidence relating to the great conflict. Although practically every member of this society except himself had fought through the war, and many, such as Hancock and W. F. Smith, were general officers

of great distinction, it was from first to last maintained and guided by Ropes, who presented to it his military library and his collection of prints and medals. He died at Boston on the 28th of October 1890. His principal work is an unfinished *Story of the Civil War*, to which he devoted most of his later years; this covers the years 1861-62. *The Army under Pope* is a detailed narration of the Virginia campaign of August-September 1862, which played a great part in reversing contemporary judgment on the events of those operations, notably as regards the unjustly-condemned General Fitz John Porter. Outside America, Ropes is known chiefly as the author of *The Campaign of Waterloo*, which is one of the standard works on the subject.

The greater part of his studies of the Civil War appears in the Military Historical Society's publications. Papers on the Waterloo campaign appeared in the *Atlantic Monthly* of June 1881, and in *Scribner's Magazine* of March and April 1888. Amongst his miscellaneous works is a paper on "The Likenesses of Julius Caesar" in *Scribner's Magazine* (February 1887). See *Memoir of John Codman Ropes* (Boston, privately printed, 1901).

**ROPE-WALKING**, the art of walking, dancing and performing tricks of equilibrium on a rope or wire stretched between two supports. It has been popular with most Asiatic and European peoples from the beginning of history. Before the middle of the 19th century a rope was invariably used, and was stretched as tightly as possible, on which account the art was called *Tight-rope Walking*. About the year 1875 the *sack wire*, stretched loosely from support to support, was introduced, and is now more commonly used. The performer is often aided in keeping his balance by a Chinese umbrella or a long pole.

**ROPS, FÉLICIEEN** (1833-1898), Belgian painter, designer and engraver, was born at Namur, in Belgium, on the 7th of July 1833; he spent his childhood in that town, and afterwards in Brussels, where he composed in 1856, for his friends at the university, the *Almanach Crocodilien*, his first piece of work. He also brought out two *Salons Illustrés*, and collaborated on the *Crocodile*, a magazine produced by the students. The humour shown in his contributions attracted the attention of publishers, who offered him work. He designed, among other things, frontispieces for Poulet-Malassis, and afterwards for Gay and Doucé. In 1859 he began to contribute to a satirical journal in Brussels called *Ulyenspiegel*, a sort of *Charivari*. The issue, limited unfortunately to two years, included his finest lithographs. About 1862 he went to Paris and worked at Jacquemait's. He subsequently returned to Brussels, where he founded the short-lived International Society of Etchers. In 1865 he brought out his famous "Buveuse d'Absinthe," which placed him in the foremost rank of Belgian engravers; and in 1871 the "Dame au Pantin." After 1874 Rops resided in Paris. His talent, which commanded attention by its novel methods of expression, and had been stimulated by travels in Hungary, Holland and Norway, whence he brought back characteristic sketches, now took a soaring flight. To say nothing of the six hundred original engravings enumerated in Ramiro's *Catalogue of Rops' Engraved Work* (Paris, Conquet, 1887), and one hundred and eighty from lithographs (Ramiro's *Catalogue of Rops' Lithographs*, Paris, Conquet, 1891), besides a large number of oil-paintings in the manner of Courbet, and of pencil or pen-and-ink drawings, he executed several very remarkable water-colour pictures, among which are "Le Scandale," 1876; "Une Attrapade," 1877 (now in the Brussels Museum); a "Tentation de St Antoine," 1878; and "Pornocrates," 1878. Most of these have been engraved and printed in colours by Bertrand. From 1880 to 1890 he devoted himself principally to illustrating books: *Les Rimes de joie*, by Théo Hanon; *Le Vice suprême and Curieuse*, by J. Péladan; and *Les Diaboliques*, by Barbey d'Aurevilly; *L'Amante du Christ*, by R. Darzens; and *Zadig*, by Voltaire; and the poems of Stéphane Mallarmé have frontispieces due to his fertile and powerful imagination. Before this he had illustrated the *Légendes Flamandes*, by Ch. Decoster; *Jeanne France*, by Th. Gautier;

and brought out a volume of *Cent Croquis pour réjouir les Hommes Gens*. His last piece of work, an advertisement of an exhibition, was done in November 1896. Rops died on the 23rd of August 1898, at Essonnes, Seine-et-Oise, on the estate he had purchased, where he lived in complete retirement with his family. Scorning display, Rops almost always opposed any exhibition of his works. However, he consented to join the Art Society of the "XX," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. After his death, in 1899, the *Libre Esthétique*, which in 1894 had succeeded the "XX," arranged a retrospective exhibition, which included about fifty paintings and drawings by Rops. Rops was a Chevalier of the Legion of Honour. He excelled in these three methods of artistic expression; but his engraved work is the most important, both as to mastery of technique and originality of ideas, though in all his talent was exceedingly versatile. Hardly any artist of the 19th century equalled him in the use of the dry-point and soft varnish. By his assured handling and admirable draughtsmanship, as well as the variety of his sometimes wildly fantastic conceptions, he made his place among the great artists of his time. "Giving his figures a character of grace which never lapses into limpness," says his biographer, E. Ramiro, "he has analysed and perpetuated the human form in all the elegance and development impressed on it by modern civilization."

In 1896 *Le Plume* (Paris) devoted a special number to this artist, fully illustrated, by which the public were made aware how many of his works are unsuitable for display in the drawing-room or boudoir. E. Deman, the publisher at Brussels, brought out a volume in 1897 with the title, *Félicien Rops et son œuvre*—papers by various writers. We may also mention a study of *Félicien Rops*, by Eugène Demolder (Paris, Princeboudre, 1894), and another by the same writer in *Trois Contemporains* (E. Deman, 1901); *Les Ropsiques*, by Pierre Gaume, brought out in London, 1898; and the admirable notice by T. K. Huysmans in his volume called *Certaines*. (O. M.)\*

**ROQUELAURE**, a title derived from a small commune in France (dep. of Gers), and borne by a French family of Armagnac, one member of which was Antoine, baron de Roque-laure (1544-1625), who was in the service of Henry IV. before he became king, and after his accession was made master of the wardrobe, lieutenant-general in Auvergne (1576) and Guienne (1610), and marshal of France in 1614. His son, Gaston Jean Baptiste de Roque-laure (1617-1683), a celebrated wit, was created duke and peer of France in 1652, and was appointed governor of Guienne in 1679. Gaston's son, Antoine Gaston Jean Baptiste de Roque-laure (1656-1738), carried on the family reputation for wit, and, in spite of his military incapacity, received the marshal's bâton in 1724.

**RORQUAL**, a whale of a long and elongated shape, with a small back-fin and a number of longitudinal pleatings or folds on the throat (see CETACEA). The name rorqual refers to these folds, while the alternative title of finner, or fin-whale, marks an important difference between these whales (for there are several species) and right-whales. The furrows on the throat are numerous and close-set, the flipper is comparatively small, and the dorsal fin distinct. The head is relatively small, flat and pointed in front, the whalebone short and coarse, the body long and slender, and the tail much compressed before it expands into the "flukes." Rorquals are the most abundant and widely distributed of all whales, being found in all seas, except the extreme Arctic and Antarctic regions. There are four distinct species of this genus in British seas. Firstly, Sibbald's rorqual, or blue whale (*Balaenoptera sibbaldi*), the largest of all animals, attaining a length of 80 or even sometimes 85 ft. Its colour is dark bluish grey, with small whitish spots on the breast; the whalebone is black; the flippers are larger proportionally than in other rorquals, measuring one-seventh of the total length of the body; and the dorsal fin is small and placed far back. This whale has usually 64 vertebrae, of which 16 bear ribs. Like the others, this species seems to pass the

winter in the open seas, and approaches the coast of Norway at the end of April or beginning of May. At this time its sole food is a small crustacean (*Euphausia inermis*), which swarms in the fjords. Secondly, we have the common rorqual (*B. musculus*, or *B. physalus*) with a length of from 65 ft. to 70 ft., and of a greyish slate-colour above and white underneath, and the whalebone slate-colour, variegated with yellow or brown. It has usually 62 vertebrae, of which 15 bear ribs. This is the commonest of all the large whales on the British coasts; scarcely a winter passing without the body of one being washed ashore, usually after stormy weather, and frequently on the south coast, as this species has a more southern range than the last, and enters the Mediterranean. It feeds largely on fish, and is frequently

Common Rorqual (*Balaenoptera musculus*).

seen feasting among shoals of herrings. Thirdly comes Rudolph's rorqual (*B. borealis*), a smaller species, scarcely attaining a length of 50 ft. It is bluish black above, with oblong light-coloured spots, whilst the under-parts are more or less white; the whole of the tail and both sides of the flippers are black; the whalebone is black, and the bristly ends fine, curling and white; the flippers are very small, measuring one-eleventh of the total length of the body. There are 56 vertebrae, with 14 pairs of ribs. This species, according to Dr. C. Collett, feeds chiefly on minute crustaceans, mainly *Calanus finmarchicus* and *Euphausia inermis*, and not on fish. Down to the last quarter of the 19th century it was considered the rarest of the whales of European seas, and was only known from a few individuals stranded on the coasts of northern Europe at long intervals. The most southern point at which it has been met with is Biarritz. Since the establishment of the whaling station near the North Cape it has been shown to be a regular summer visitor. Lastly, the lesser rorqual, *B. rostrata*, the sharp-nosed finner of American whalers, is the smallest species found in the northern seas, rarely exceeding 30 ft. in length. Its colour is greyish black above, whilst the under-side is white, including the whole of the lower side of the tail; the inner side of the flippers is also white, and there is a broad white band across the outer side, which is a very characteristic mark of the species; the whalebone is yellowish white. The dorsal fin in this and the preceding species is comparatively high, and placed far forwards on the body. This whale has usually 48 vertebrae, of which 11 bear ribs. It is common in summer in the fjords of Norway, and is often seen around the British Isles. It has been taken, though rarely, in the Mediterranean, and ranges as far north as Davis Strait.

Rorquals are met with in almost all seas, and nearly all the individuals carefully examined, whether from the North Pacific, the Australian seas or the Indian Ocean, come very near in structure to one or the other of the Atlantic forms described above, so much so that some zoologists believe that there are but four species, with an almost cosmopolitan range. Other naturalists, on the contrary, have described and named almost every individual specimen captured as belonging to a different species. See WHALE and HUMP-BACK WHALE. (R. L.)\*

**RORSCHACH**, a busy commercial town in the Swiss canton of St Gall, situated on the south-west shore of the Lake of Constance, and by rail 62 m. N.E. of Zürich, 10 m. S.E. of Romanshorn and 57 m. N. of Coire. In 1900 its population was 9140, mostly German-speaking, while there were 5935 Romanists to 3139 Protestants. From 1408 to 1798 it belonged to the abbot of St Gall, and then to the canton Sântis (named canton of St Gall in 1803) of the Helvetic Republic. It has always been a great commercial centre, though now superseded by Romanshorn as regards the corn trade. It has many industrial establishments, of which the chief is one for the manufacture of lace and

muslin. Above the town is the old convent of Mariaberg, originally built in the 15th century as a refuge for the monks of St Gall against the turbulent citizens of that town, but now a seminary for teachers. From Rorschach a cogwheel railway runs south-east in 4½ m. up to Heiden, a village in the canton of Appenzell well known for its goats' whey cure. (W. A. B. C.)

**ROS, or DE ROS**, the name of a noble English family. Robert de Ros (d. 1227), a son of Everard de Ros (d. 1191) of Helmsley, or Hamlake, in Yorkshire, possessed lands in Yorkshire, including Ros, or Ross, in Holderness, and also in Normandy. He served King John in several ways, both in England and abroad, and obtained lands in Northumberland, where he built a castle at Wark, or Werke. About 1215, however, he deserted the king and became one of the leaders of the baronial party, being one of the twenty-five executors of Magna-Carta and fighting against John when he repudiated this engagement. He submitted to Henry III. and became a monk before he died in 1227. His wife was Isabella, daughter of William the Lion, king of Scotland, by whom he had two sons, William and Robert. Robert de Ros the younger (d. 1274), was an itinerant justice under Henry III., but later he was one of the barons who fought against this king. He passed much of his time, however, in Scotland, where he held a barony and where he was one of the guardians of Margaret, the English bride of King Alexander III. His son Robert was summoned to parliament as Lord Ros de Werke in 1295, just afterwards he revolted against Edward I. and his lands were forfeited. William de Ros (d. 1258), the elder son of the executor of Magna Carta, had a son Robert (d. 1285), who was summoned to parliament as a baron by Simon de Montfort in 1264; he was also summoned to parliament by Edward I. His son William, 2nd baron Ros of Helmsley, or Hamlake (d. 1317), obtained Belvoir Castle in Leicestershire through his mother Isabel, daughter of William d'Albini. He was one of the minor claimants for the crown of Scotland in 1292, and soon afterwards he obtained the lands in Northumberland which had been taken from his traitorous cousin Robert de Ros. His second son, John de Ros (d. 1338), was a courtier under Edward II. Later he joined Edward's queen, Isabella, was summoned to parliament by Edward III., and distinguished himself on the sea. Another John de Ros (d. 1332), bishop of Carlisle from 1325 to 1332, was doubtless a member of this family.

The second baron's descendants retained the barony of Ros until the death of Edmund de Ros, the 11th baron, in October 1508. Edmund's nephew Sir George Manners (d. 1513), of Belvoir and Helmsley, then claimed it, and was called Lord Ros, or Roos. His son, Thomas Manners, the 13th baron (d. 1543), was created earl of Rutland in 1525, but the barony was separated from the earldom when Thomas's grandson Edward died in 1587, leaving an only child, Elizabeth (d. 1591), who, as heir general of the family, became Baroness Ros, or Roos. Elizabeth married into the Cecil family, and when her only child, William Cecil, died in 1618, the barony reverted to the Manners family, Francis Manners, 6th earl of Rutland (1578-1632), becoming the 18th baron. On his death the barony again passed to a female, his daughter Katherine, through whom it came to the family of Villiers. Then in 1806, after a long abeyance, Charlotte (1766-1831), daughter of the Hon. Robert Boyle, and a descendant of the Manners family, was declared Baroness Ros, or Roos. She married Lord Henry Fitzgerald, and their son, Henry William Fitzgérald-de-Ros (1793-1830), became the 22nd baron on his mother's death. In 1907, on her father's death, Mary Frances, wife of the Hon. Anthony Dawson, became Baroness Ros, or rather, De Ros, which is the present form of the title. For a long time after they had ceased to hold the barony the earls and dukes of Rutland continued to style themselves Lords Roos.

**ROS, SIR RICHARD** (b. 1429), English poet, son of Sir Thomas Ros, lord of Hamlake (Helmsley) in Yorkshire and of Belvoir in Leicestershire, was born on the 8th of March 1429. In Harl. MS. 372 the poem of "La Belle Dame sanz Mercy," first printed in W. Thynne's *Chaucer* (1532), has the ascription

"Translatid out of Frenche by Sir Richard Ros." "La Belle Dame sanz Mercy" is a long and rather dull poem from the French of Alain Chartier, and dates from about the middle of the 15th century. It is written in the Midland dialect, and is surprisingly modern in diction. The opening lines—

"Half in a dreme, not fully wylt awakid,  
The golden slepe me wrappid under his wing,"

have often been quoted, but the dialogue between the very long-suffering lover and the cruel lady does not maintain this high level.

See W. W. Skeat, *Chaucerian and Other Pieces* (1897); and Dr. H. Grotler, *Ueber Richard Ros' mittellenglische Uebersetzung* . . . (Breslau, 1886).

**ROSA, CARL AUGUST NICHOLAS** (1843-1886), English musical impresario, was born at Hamburg, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris, and also had considerable success as a conductor both in England and America, and it was at New York in 1867 that he met and married the famous operatic soprano Madame Parepa (1836-1874), at whose death he afterwards endowed a Parepa-Rosa scholarship at the Royal Academy of Music in London. In 1875 he started the Carl Rosa Opera Company, for producing the best operas in English versions, and both during his own life and after his death this company had much to do with popularizing good music in England, encouraging native composers and training a number of excellent singers. Carl Rosa married a second time in 1881, and died in Paris on the 30th of April 1889.

**ROSA, MONTE**, the name of a great glacier-clad mountain mass (the name comes from the Aostan patois word *roeser*, meaning a glacier) which rises S.E. of Zermatt, and on the frontier between Switzerland (canton of the Valais) and Italy. Ten summits in this huge mass are distinguished by name, of which four (the Nordend, 15,132 ft., the Zumsteinspitze, 15,004 ft., the Signalkuppe or Punta Gniffetti, 14,905 ft., and the Parrotspitze, 14,643 ft.) rise on the frontier. The five lower summits are on the Italian slope, but the highest of all, the Dufourspitze, 15,217 ft. (so named by the Swiss government in honour of General Dufour, the head of the great survey which first accurately fixed the position of these points), rises W. of the frontier ridge, on a buttress, and is thus entirely in Switzerland, of which it is the culminating peak (and not, as often stated, the Dom, 14,902 ft., in the Mischabel group). The loftiest point of the Dufourspitze was first attained in 1855 by a large English party, which included Messrs G. and C. Smyth, C. Hudson, Birkbeck and Stevenson. The Zumsteinspitze was first climbed in 1820, the Signalkuppe (on top of which there is now a club hut) in 1842, the Nordend in 1861 and the Parrotspitze in 1863. The ascent of all the points named is not difficult from the Swiss side, but excessively dangerous on the east or Italian side. (W. A. B. C.)

**ROSA, SALVATOR** (1615-1673), Italian painter of the Neapolitan school, was born in Arenella, in the outskirts of Naples, in 1615: the precise day is given as the 20th of June, and also as the 21st of July. His father, Vito Antonio de Rosa, a land surveyor, was bent upon making the youth a lawyer, or else a priest, and sent him to study in the convent of the Somaschi fathers. Here Salvator began showing a turn for art: he went in secret to his maternal uncle Paolo Greco to learn the practice of painting, but soon found that Greco had little pictorial lore to impart, so he transferred himself to his own brother-in-law Francesco Fracanzano, a pupil of Ribera, and afterwards had some practice under Ribera himself. Above all he went to nature, frequenting the Neapolitan coast, and keeping his eyes open and his hand busy. At the age of seventeen he lost his father; the widow was left unprovided for, with at least five children, and Salvator found himself immersed in a sea of troubles and perplexities, with nothing for the while to stem them except a buoyant and adventurous temperament. He obtained some instruction under the battle-painter Aniello Falcone, but chiefly painted in solitude, haunting romantic

and desolate spots, beaches, mountains, caverns, verdure-clad recesses. Hence he became in process of time the initiator of romantic landscape, with a special turn for scenes of strange or picturesque aspect—often turbulent and rugged, at times grand, and with suggestions of the sublime. He picked up scanty doles when he could get them, and his early landscapes sold for a few pence to petty dealers. The first person to discover that Rosa's work was not as trumpery as it was cheap was the painter Lanfranco, who bought some of the paintings, and advised the youth to go to Rome. Hither in 1635, at the age of twenty, Rosa betook himself; he studied with enthusiasm, but, catching fever, he returned to Naples and Falcone, and for a while painted nothing but battlepieces, and these without exciting any attention. This class of work was succeeded by the landscape art peculiarly characteristic of him—wild scenes wildly peopled with shepherds, seamen or especially soldiers. He then revisited Rome, and was housed by Cardinal Brancaccio; this prelate being made bishop of Viterbo, Rosa painted for the Chiesa della Morte a large and noticeable picture of the "Incredulity of Thomas"—the first work of sacred art which we find recorded from his hand. At Viterbo he made acquaintance with a mediocre poet named Abati, and was hence incited to try his own faculty in verse. He then returned to Naples. Here the monopolizing triumvirate—Ribera, Caracciolo and Corenzio—were still powerful. Rosa was as yet too obscure to suffer from their machinations; but, having painted a picture of "Tityus Torn by the Vulture," which went to Rome and there produced a great sensation, he found it politic to follow in the footsteps of his fame, and once more, in 1638, resought the papal city.

Rosa was a man of facile and versatile genius, and had by this time several strings to his bow. It is said that, still keeping painting steadily in view as his real objective, he resolved to secure attention first as a musician, poet, improvisatore and actor—his mother-wit and broad Neapolitan dialect (which appears to have stuck to him through life) standing him powerfully in stead. In the carnival he masqued as Formica and Capitan Coviello, and bustled about Rome distributing satirical prescriptions for diseases of the body and more particularly of the mind. As Formica he inveighed against the farcical comedies acted in the Trastevere under the direction of the celebrated Bernini. Some of the actors, in one of their performances, retaliated by insulting Rosa, but the public was with him, and he now enjoyed every form of success—social prestige, abundant commissions and any amount of money, which he was wont to throw about broadcast to the populace. In 1646 he returned to Naples, and is said to have taken an active part in the insurrection of Masaniello; certain it is that he sympathized with and admired the fisherman autocrat, for a passage in one of his satires proves this. His actual share in the insurrection is, however, dubious; it appears only in recent narratives, and the same is the case with the well-known story that at one time he herded with a band of brigands in the Abruzzi—an incident which cannot be conveniently dove-tailed into any of the known dates of his career. As regards the popular revolt against Spanish tyranny, it is alleged that Rosa, along with other painters—Coppola, Porpora, Domenico Gariguolo, Dal Po, Masturzo, the two Vaccari and Cadogna—all under the captaincy of Aniello Falcone, formed the *Compagnia della Morte*, whose mission it was to hunt up Spaniards in the streets and despatch them, not sparing even those who had sought some place of religious asylum. He painted a portrait of Masaniello—probably from reminiscence rather than from life; indeed, it is said that he painted him several times over in less than life size. On the approach of Don John of Austria the blood-stained *Compagnia* dispersed, Rosa escaping or at any rate returning to Rome. Here he painted some important subjects, showing the uncommon bent of his mind as it passed from landscape into history—"Democritus amid Tombs," the "Death of Socrates," "Regulus in the Spiked Cask" (these two are now in England), "Justice Quitting the Earth," and the "Wheel of Fortune." This last work, the tendency of which was biting satirical, raised a storm of ire and remonstrance.

Rosa, endeavouring at conciliation, published a description of its meaning (probably softened down not a little from the real facts); none the less an order for his imprisonment was issued, but ultimately withheld at the instance of some powerful friends. It was about this time that Rosa wrote his satire named *Babylon*, under which name Rome was of course indicated.

Cardinal Giancarlo de' Medici now invited the painter to leave Rome—which had indeed become too hot to hold him—for Florence. Salvator gladly assented, and remained in the Tuscan capital for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter poet, and other *beaux esprits* shared with Rosa the hospitalities of the cardinal, and they formed an academy named *I Percossi* (the Stricken), indulging in a deal of ingenious jollity—Rosa being alike applauded as painter, poet and musician. His chief intimate at this time was Lippi, whom he encouraged to proceed with the poem *Il Malmanite Racquistato*. He was well acquainted also with Ugo and Giulio Maffei, and housed with them more than once in Volterra, where he wrote other four satires—*Music, Poetry, Painting and War*. About the same time he painted his own portrait, now in the Uffizi Gallery of Florence. Finally he reverted once more to Rome, and hardly left that city again. Much enmity still brooded there against him, taking the form more especially of an allegation that the satires which he zealously read and diffused in MS. were not his own production, but filched from some one else. Rosa indignantly repelled this charge, which remains indeed quite unsubstantiated, although it is true that the satires deal so extensively and with such ready manipulation in classical names, allusions and anecdotes, that one is rather at a loss to fix upon the period of his busy career at which Rosa could possibly have imbued his mind with such a multitude of semi-erudite details. It may perhaps be legitimate to suppose that his literary friends in Florence and Volterra had coached him up to a large extent—the satires, as compositions, remaining none the less strictly and fully his own. To confute his detractors he now wrote the last of the series, entitled *Envy*. Among the pictures of his closing years were the admired "Battlepiece" now in the Louvre, painted in the short space of forty days, full of long-drawn carnage, with ships burning in the offing; "Pythagoras and the Fishermen;" the "Oath of Catiline" (Pitti Gallery); and the very celebrated "Saul and the Witch of Endor" (Louvre), which is almost his latest work. He undertook a series of satirical portraits, to be closed by one of himself; but while occupied with this project he was assailed by dropsy, which, after lasting fully half a year, brought his life to a close on the 15th of March 1673. In his last moments he married a Florentine named Lucrezia, who kept his house and had borne him two sons, one of them surviving him, and he died in a contrite frame of mind. He lies buried in the Chiesa degli Angeli, where a portrait of him has been set up. Salvator Rosa, after the hard struggles of his early youth, had always been a successful man, and he left a handsome fortune.

Rosa was indisputably a great leader in that modern tendency of fine art towards the romantic and picturesque which, developing in various directions and by diversified processes, has at last almost totally differentiated modern from olden art. He saw appearances with a new eye, and presented new images of them on his canvases, and deserves therefore all the credit due to a vigorous innovator, even if we contest the absolute value of his product. He himself courted reputation for his historical works, laying comparatively little stress on his landscapes; in portraits he was forcible. In chiaroscuro he is simple and effective; his design has energy and a certain grandeur, without any high type of form or any superior measure of correctness. His colour is too constantly of a sandy or yellowish-grey tone. Personally he was a man of high spirit, and he sold his pictures at large prices, more (it is said) to assert the honour of his art than from love of money; rather than sell them cheap he destroyed them. In his later Florentine period he etched several of his works, subjects of mythology, soldiery, &c. He was choleric, but kind and generous. Though a man of gaiety and pleasure, and a jovial boon companion, he does not appear to have been vicious in any serious degree. He was talkative, very sharp-tongued and an unblushing encomiast of his own performances. Among his pictures not already mentioned we may name, in the National

Gallery, London, "Mercury and the Dishonest Woodman," and three others; in Raynham Hall, "Bdisarius"; in the Grosvenor Gallery, "Diogenes"; in the Pitti Gallery, a grand portrait of a man in armour, and the "Temptation of St. Anthony," which contains his own portrait. This last subject appears also in St. Petersburg, and in the Berlin Gallery.

The satires of Salvator Rosa deserve more attention than they have generally received. There are, however, two recent books taking account of them—by Cesario, 1892, and Cartelli, 1899. The satires, though considerably spread abroad during his lifetime, were not published until 1719. They are all in terza rima, written without much literary correctness, but remarkably spirited, pointed and even brilliant. They are scathingly denunciatory, and from this point of view too monotonous in treatment. Rosa here appears as a very severe castigater of all ranks and conditions of men, not sparing the highest, and as a champion of the poor and down-trodden, and of moral virtue and Catholic faith. It seems odd that a man who took so free a part in the pleasures and diversions of life should be so ruthless to the ministers of these. The satire on Music exposes the insolence and profligacy of musicians, and the shame of courts and churches in encouraging them. Poetry dwells on the pedantry, imitativeness, adulation, affectation and indecency of poets—also their poverty, and the neglect with which they were treated; and there is a very vigorous scotch against oppressive governors and aristocrats. Tasso's glory is upheld; Dante is spoken of as obsolete, and Ariosto as corrupting. Painting inveighs against the pictorial treatment of squalid subjects, such as beggars (though Rosa must surely himself have been partly responsible for this misdirection of the art), against the ignorance and lewdness of painters, and their tricks of trade, and the gross indecorum of painting sprawling half-naked saints of both sexes. War (which contains the eulogy of Masaniello) derides the folly of hiring soldiers, who fight and perish while kings stay at home; the vile morals of kings and lords, heresy and unbelief also come in for a flagellation. In *Babylon* Rosa represents himself as a fisherman, Tirreno, constantly unlucky in his net-hauls on the Euphrates; he converses with a native of the country, Ergasto. (Rome) is very severely treated, and Naples much the same. Envy (the last of the satires, and generally accounted the best, although without strong apparent reason) represents Rosa dreaming that, as he is about to inscribe in all modesty his name upon the threshold of the temple of glory, the goddess or fiend of Envy obstructs him, and a long interchange of reciprocal oburgations ensues. Here occurs the highly charged portrait of the chief Roman detractor of Salvator (we are not aware that he has ever been identified by name); and the painter protests that he would never condescend to do any of the lascivious work in painting so shamefully in vogue.

As authorities for the life of Salvator Rosa, Passeri, *Vite de' Pittori*, may be consulted, and Salvini, *Satire e Vita di Salvator Rosa*; also Baldinucci and Dominici. The *Life* by Lady Morgan is a romantic treatment, mingling tradition or mere fiction with fact. The novel, *A Company of Death*, by Albert Cotton, 1904, gives an interesting picture of Salvator Rosa at Naples. (W. M. R.)

**ROSACEAE**, in botany, a large cosmopolitan family of seed-bearing plants belonging to the subclass Polypetalae of Dicotyledons and containing about 90 genera with 2000 species. The plants vary widely in manner of growth. Many are herbaceous, growing erect, as *Ceanothus*, or with slender creeping stem, as in species of *Potentilla*, sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other British fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leaf-stalks.

The leaves, which are arranged alternately, are simple, as in apple, cherry, &c., but more often compound, with leaflets palmately arranged, as in strawberry and species of *Potentilla*, or pinnately arranged, as in the brambles, roses, mountain ash, &c. A difference in this respect often occurs in one and the same genus, as in *Pyrus*, where apple (*P. Malus*), and pear (*P. communis*) have simple leaves, whereas mountain ash or rowan (*P. aucuparia*) has pinnately compound leaves. In

warm climates the leaves are often leathery and evergreen. The leaves arc stipulate, the stipules being sometimes small and short-lived, as in *Pyrus* and *Prunus* (cherry, plum, &c.), or more important structures adnate to the base of the leaf-stalk, as in roses, brambles, &c. The flowers, which are regular, generally bisexual, and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (*Rubus chamaemorus*), or few or more together in a corymbose manner, as in some roses, hawthorn and others. The inflorescence in agrimony is a raceme, in *Poterium* a dense-flowered spike, in *Spiraea* a number of cymes arranged in a corymb. The parts of the flowers are arranged on a 5-merous plan, with generally considerable increase in the number of stamens and carpels. The shape of the thalamus or floral-receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing

After Focke in *Naturl. Pflanzenfamilien*, from Strasburger's *Lehrbuch der Botanik*, by permission of Gustav Fischer.

FIG. 1.—Three flowers cut through longitudinally to show different forms of receptacles in the Rosaceae: 1, *Comarum palustre*; 2, *Alchemilla alpina*; 3, *Pyrus Malus*.

features of the different suborders, six of which may be recognized.

**Suborder I. Spiraeoideae** is characterized by a flat or slightly concave receptacle on which the carpels, frequently five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle. There are five sepals, five petals and the stamens vary from ten to indefinite. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This suborder, which is nearly allied to the order Saxifragaceae, contains 17 genera, chiefly north temperate in distribution. The largest is *Spiraea*, numerous species of which are cultivated in gardens; *S. salicifolia* occurs in Britain apparently wild in plantations, but is not indigenous. The native British meadow-sweet (*S. Ulmaria*) and dropwort (*S. Filipendula*) have been placed in a separate genus, *Ulmara*, and included in the Rosoideae on account of their one-seeded fruit. *Quillaja saponaria* is the Chilean soap tree; the bark contains saponin.

**Suborder II. Pomonoideae** is characterized by a deep cup-shaped receptacle with the inner wall of which the five or fewer carpels are united (fig. 1, 3); the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers, with five sepals and petals and indefinite stamens. The 14 genera are distributed through the north temperate zone, extending southwards in the New World to the Andes of Peru and Chile. The largest genus, *Pyrus*, with about 50 species, includes apple (*P. Malus*), pear (*P. communis*) (fig. 2), wild service (*P. torminalis*), rowan or mountain-ash (*P. aucuparia*), and white beam (*P. Aria*). *Mespilus* (medlar) and *Colomeaster* are also included. (See separate articles for most of the above.)

**Suborder III. Rosoideae** is characterized by the receptacle being convex and swollen (fig. 1, 1), as in strawberry, or cup-shaped, as in rose (fig. 4), and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indurated. The 39 genera are grouped in tribes according to the form of the receptacle and of the fruit. The *Potentilleae* bear the carpels on a large rounded or convex outgrowth of the receptacle. In the large genus *Rubus* (fig. 3) the ripe ovaries form drupelets upon the dry receptacle; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. *R. fruticosus* is blackberry, *R. Idaeus*, raspberry, and *R. Chamaemorus*, cloudberry. In the flower of *Potentilla*, *Fragaria* (strawberry) and a few allied genera an *epicalyx* is formed by stipular structures arising at the base of the sepals. The fruits consist of numerous dry achenes borne in *Fragaria* on the much-enlarged

succulent torus, which in the other genera is dry. In *Crataegus* (avens) and *Dryas* (an arctic and alpine genus) the style is persistent in the

FIG. 2.—*Pyrus communis* (pear). 1, flowering branch; 2, a flower cut through longitudinally; 3, longitudinal section of fruit; 4, floral diagram.

fruit, forming a feathery appendage (*Dryas*) or a barbed awn (*avens*), either of which is of service in distributing the fruit. The Potentillaceae are chiefly north temperate, arctic and alpine plants.

FIG. 3.—*Rubus fruticosus* (blackberry) flowering branch; 2, longitudinal section of a flower; 3, fruit; 4, floral diagram.

The Rosaceae comprise the large genus *Rosa*, characterized by a more or less urn-shaped torus (fig 4) enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-colored fleshy torus. The numerous stamens surround the mouth of the torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of *Rubus*, are extremely variable, and a great number of subspecies, varieties and forms have been described. The Sanguisorbeae are a reduced form of Rosoideae. The dry one-seeded fruit is enclosed in the urn-shaped

torus, which, however, is dry and inconspicuous, and the number of carpels is much reduced, sometimes to one (figs. 2, 5, 6). Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Poterium*, and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Poterium Sanguisorba*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles which ensure the distribution of the enclosed achenes.

Suborder IV. *Neuradoideae* contains only two genera of desert-inhabiting herbs with yellow flowers; and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruits.

Suborder V. *Prunoideae* (fig. 7) is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the five sepals, five alternating petals and the ten to indefinite stamens. The plants are deciduous or evergreen trees or shrubs with simple leaves, often

with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are five genera, the chief of which is *Prunus*, to which belong the plum (*Prunus communis*), with several well-marked subspecies—*P. spinosa* (sloe or blackthorn), *P. insititia* (bullace), *P. domestica* (wild plum), the almond (*P. Amygdalus*), with the nearly allied peach (*P. persica*), cherry (*P. Cerasus*), birdcherry (*P. Padus*) and cherry

laurel (*P. Lauruscrasus*). The tribe is distributed through the north temperate zone, passing into the tropics.

Suborder VI. *Chrysoalanoideae* resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous; the flowers are also frequently zygomorphic. The 12 genera are tropical evergreen trees or shrubs, the great majority being South American. The zygomorphic flowers indicate an affinity with the closely allied order Leguminosae.

**ROSAMOND**, known as "The Fair" (d. c. 1176), mistress of Henry II., king of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Ponce. The evidence for the paternity is, however, only an entry of a statement made by the jurors of the manor of Coriham in a Hundred Roll of the second year of the reign of Edward I. (1274), great grandson of Henry II. Rosamond is said to have been Henry's mistress secretly for several years, but was openly acknowledged by him only when he imprisoned his wife Eleanor of Aquitaine as a punishment for her encouragement of her sons in the rebellion of 1173-74. She died in or about 1176, and was buried in the nunnery church of Godstow before the high altar. The body was removed by order of St Hugh, bishop of Lincoln, in 1191, and was, seemingly, reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the labyrinth at Woodstock, and the clue which guided King Henry II. to her bower, were the inventions of story-writers of later times. There is no evidence for the belief that she was the mother of Henry's natural son William Longsword, earl of Salisbury.

**ROSARIO**, a city and river port of Argentina, in the province of Santa Fé, on the W. bank of the Paraná, 186 m. by rail N.W. of Buenos Aires. Pop. (1904, estimate) 120,000. It is accessible to ocean-going steamers of medium draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide river-bed washed out by the Paraná. It extends back a considerable distance from the river, and there are country residences and gardens of the better class along the line of the Central Argentine railway and northward toward San Lorenzo. The city is laid out with chessboard regularity, and the streets are paved (in great part with cobblestones), lighted with gas and electricity, traversed by tramway lines, and provided with sewers and water mains. The Boulevard El Santafesino is an attractive residence street with double driveways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom house, post office, municipal hall and law courts. There is a large charity hospital, and the English and German colonies maintain a well-equipped infirmary. The largest sugar refinery in Argentina is here, and there are flour-mills, breweries and some smaller manufactures. The city is chiefly commercial, being the shipping port for a large part of northern Argentina, among its exports being wheat, flour, baled hay, linseed, Indian corn, sugar, rum, cattle, hides, meats, wool, quebracho extract, &c. The railway connexions are good, including the Buenos Aires and Rosario and the Central Argentine lines to the national capital, the Buenos Aires and Rosario line northward to Tucuman, where it connects with the government line to Salta, Jujuy and the Bolivian frontier, the Central Argentine line westward to Cordoba, with connexions at Villa María for Mendoza and the Chilean frontier, and two narrow-gauge lines, one running to Santa Fé and the other to Cordoba. The port of Rosario has hitherto consisted of a deep river anchorage and wooden wharves on the lower bank for the accommodation of steamers. Since 1902 work has been in progress under a contract with a French company for the construction of 12,697 ft. of quays, 23 m. of railway tracks along the quays to connect with the several railways entering the city, drawbridges, roadways, sheds, depots, elevator, offices, electric plant, fixed and movable cranes, and other appliances, &c., for the handling of produce and merchandise. The trade of the port was officially valued at 21,276,672 Arg. gold dollars imports, and 68,503,231 gold dollars exports in 1905.

Rosario was founded in 1730 by Francisco Godoy, but it grew so slowly that it was still a small village up to the middle of the 19th century. In 1854 General Justo José de Urquiza, then at the head of the Argentine Confederation, made it the port of the ten inland provinces then at war with Buenos Aires, and in 1857 imposed differential duties on the cargoes of vessels first breaking bulk at the southern port. This gave Rosario

a start, and its trade and population have grown since then with great rapidity.

**ROSARY** (Lat. *rosarium*), a popular devotion of the Roman Catholic Church, consisting of 15 Paternosters and Glorias and 150 Aves, recited on beads. It is divided into three parts, each containing five decades, a decade comprising 1 Pater, 10 Aves and a Gloria, in addition to a subject for meditation selected from the "mysteries" of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times: Sozomen mentions (*H.E.* v. 29) the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers; and a canon of the English synod of Cealcythe in 816 (*Mansi* xiv. 366) directed *septem bellidum Paternoster* to be said for a deceased bishop. In many orders the lay brothers daily said a large number of Paternosters instead of reading the breviary; it was natural that the Paternoster should be the prayer most often repeated. The Ave Maria is first mentioned as a form of prayer in the second half of the 11th century, but it was not until the 16th century that it became general in its present form. It is not known precisely when the mechanical device of the rosary was first used. William of Malmesbury (*De gest. pont. Angl.* iv. 4) says that Godiva, who founded a religious house at Coventry in 1040, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Chantimpré, who wrote about the middle of the 13th century, first mentions the word "rosary" (*De apibus*, ii. 13), using it apparently in a mystical sense as Mary's rose-garden. There is no contemporary confirmation of the story that the rosary was given to St Dominic through revelation of the Blessed Virgin and was employed during the crusade against the Albigenses, although the story was later accepted by Leo X., Pius V., Gregory XIII., Sixtus V., Alexander VII., Innocent XI. and Clement XI. According to Benedict XIV. (*De Fest.* 160), the belief rests on the tradition of the Dominican order. Whatever may have been the origin of the rosary, the Dominicans did much to propagate the devotion. The practice of meditating on the mysteries doubtless began with a Dominican, Alanus de Rupe (born 1428), and another Dominican, Jacob Sprenger (d. 1495), grand-inquisitor in Germany, founded the first confraternity of the rosary at Cologne in 1475. This society spread rapidly, and was specially privileged by Sixtus IV., Innocent VIII. and Leo X. After the battle of Lepanto (1st Sunday in October 1571), which was won while the members of the confraternity at Rome were making supplication for Christian success, Pius V. ordered an annual commemoration of "St Mary of Victory," and Gregory XIII., by bull of the 1st of April 1583, set aside the 1st Sunday in October as the feast of the Rosary of the Blessed Virgin Mary, to be observed in such churches as maintained an altar in honour of the rosary. Clement XI., by bull of the 3rd of October 1716, directed the observance of the feast by all Christendom. The devotion has been particularly fostered by the Jesuits, St Ignatius Loyola having expressly ordered its use. It has been repeatedly indulged by various popes. Leo XIII. issued eight encyclicals on the devotion; he urged its recitation throughout October, and directed (1883) the insertion of the title *regina sacratissimi rosarii* in the Litany. There are several varieties of the rosary more or less in use by Roman Catholics: the Passionists, or rosary of the five wounds, approved by Leo XII. in 1823; the Crown of Our Lord, attributed to Michael of Florence, a Camaldolese monk (c. 1516), and consisting of 33 Pater, 5 Aves and a Credo; St Bridget's, 7 Pater and 63 Aves, in honour of the joys and sorrows of the Blessed Virgin and the 63 years of her life. The Living Rosary, in which 15 persons unite to say the rosary every month, was approved by Gregory XVI. (1832) and placed in charge of the Dominican order by Pius IX. (1877).

Similar expedients to assist the memory in repetitions of prayers occur among Buddhists and Mahomedans: in the former case the prayers are said on a string of some hundred beads, called the *libet-pren-ba* or the *ten-wo*; in the latter case,

the so-called *tasbeeh* has 33, 66 or 99 beads, and is used for the repetition of the 99 names which express the attributes of God.

See the critical dissertation in the *Acta sanctorum*, Aug. 1, 422 sqq.; Quetif and Echarid, *Script. Ord. Praed.* i. 411 sqq.; Benedict XIV olim Prospero de Lambertini, *De festis B.V.M.* i. 170 sqq.; H. Holzappel, O.F.M., *St Dominikus u. der Rosenkranz* (Munich, 1903); Pradel, *Rosenkranz-Büchel* (Trier, 1885); D. Dahm, *Die Bruderschaft vom hl. Rosenkranz* (Trier, 1902). For the indulgences attached to the devotion consult Beringer, S.J., *Die Ablass*, 11th ed. 292 ff., 354 ff. (Paderborn, 1895). For the corresponding devotion among Buddhists, consult Waddell, *The Buddhism of Tibet, or Lamaism* (London, 1895), and an article by Monier Williams in the *Athenaeum*, 9th of Feb. 1878; for that of the Mahomedans, see L. Petit, *Les Conférences musulmanes* (Paris, 1899), and E. Arnold, *Pearls of the Faith, or Islam's Rosary* (London, 1882). There is an excellent article, "Rosenkranz," by Zöckler in Herzog-Hauck, *Realencyklopädie*, 3rd ed. vol. 17, pp. 144-50. (C. H. Ha.)

**ROSAS, JUAN MANUEL** (1793-1877), tyrant of Buenos Aires, was born on the 30th of March 1793, in the city of that name. His father, Leon Ortiz de Rosas, was an owner of cattle runs (*estancias*) and a trader in hides, who took an active part in defeating the English attack on the city in 1807. Juan Rosas received so little education that he had to learn to read and write when he was already a married man and a successful cattle breeder. From a very early age he was left in charge of one of his father's establishments. When he was eighteen he married Maria de la Encarnacion Escurra. His mother having suspected him of appropriating money, he left his parents, and for some time subsisted by working as a *vaquero* or cowboy, and then as overseer on the estates of other owners; but he accumulated money, and by the help of a loan from a friend he became possessed of a cattle run of his own, Los Cerrillos. The anarchical state of the country since its independence of Spain had favoured the Indians, who had taken the offensive and raided up to within forty miles of Buenos Aires. Rosas obtained leave to arm his cowboys. Under his management Los Cerrillos became a refuge for adventurers, whom he paid and fed well, but from whom he exacted implicit obedience. His followers became a fighting force of acknowledged efficiency, and Rosas took practically the position of an independent ruler whose help was sought by contending political parties. By attending to his own interest only, and by astute intrigue, or savage fighting when necessary, he grew in power from 1820 onwards, and from 1835 to 1852 ruled as dictator (see ARGENTINA). It is probable that he would have continued to govern in Buenos Aires till his death if his ambition had not led him into wars with all his neighbours. He wished to extend the authority of the Republic over all the territory which had belonged to the Spanish viceroyalty of Buenos. This led him directly into wars with Uruguay, Paraguay and Chile, and into "warlike operations" with England and France, with whom he had other causes of quarrel arising out of the complaints of traders and bondholders. His government was overthrown in 1852 by a coalition of his neighbours and the defection of several of his generals, and even members of his own family who lived in fear of his suspicions and violence. He took refuge in England, and lived at Swaythling, near Southampton, till his death on the 14th of March 1877. A portrait taken in 1834 and reproduced by Sir Woodbine Parish in his *Buenos Ayres and Provinces of the Rio de la Plata* (London, 1852) represents Rosas as a fine-looking man of the handsome Spanish type.

See O. Martens, *Ein Caligula unseres Jahrhunderts* (Berlin, 1896), which contains a full bibliography.

**ROSCOLLINUS** (RUCELLINUS, or ROUSSELLIN) (c. 1050-c. 1122), often called the founder of Nominalism (see SCHOLASTICISM), was born at Compiègne (Compendium). Little is known of his life, and our knowledge of his doctrines is mainly derived from Anselm, Abelard and John of Salisbury. He studied at Soissons and Reims, was afterwards attached to the cathedral of Chartres, and became canon of Compiègne. It seems most probable that Roscellinus was not strictly the first to promulgate nominalistic doctrines; but in his exposition they received more definite expression, and, being applied to the dogma of the Trinity, attracted universal attention. Roscellinus maintained that it

is merely a habit of speech which prevents our speaking of the three persons as three substances or three Gods. If it were otherwise, and the three persons were really one substance or thing (*una res*), we should be forced to admit that the Father and the Holy Spirit became incarnate along with the Son. Roscellinus seems to have put forward this doctrine in perfect good faith, and to have claimed for it at first the authority of Lanfranc and Anselm. In 1092, however, a council convoked by the archbishop of Reims condemned his interpretation, and Roscellinus, who was in danger of being stoned to death by the orthodox populace, recanted his error. He fled to England, but having made himself unpopular by an attack on the doctrines of Anselm, he left the country and repaired to Rome, where he was well received and became reconciled to the Church. He then returned to France, taught at Tours and Loc-menach (Loches) in Brittany (where he had Abelard as a pupil), and finally became canon of Besançon. He is heard of as late as 1121, when he came forward to oppose Abelard's views on the Trinity.

Of the writings of Roscellinus, nothing is preserved except a letter to Abelard, mainly concerned with the doctrine of the Trinity (ed. J. A. Schmeller, Munich, 1850). See F. Picaret, *Roscellin, philosophe et théologien* (1896), and authorities quoted under SCHOLASTICISM.

**ROSCHEER, WILHELM GEORG FRIEDRICH** (1817-1894), German economist, was born at Hanover on the 21st of October 1817. He studied at Göttingen and Berlin, and obtained a professorship at Göttingen in 1844 and subsequently at Leipzig in 1848. Omitting preparatory indications and undeveloped germs of doctrine, the origin of the "historical" school of political economy may be traced to Roscheer. Its fundamental principles are dated, though with some hesitation, and with an unfortunate contrast of the historical with the philosophical method, in his *Grundriss zu Vorlesungen über die Staatswirtschaft nach geschichtlicher Methode* (1843). This short study was afterwards expanded into his great *System der Volkswirtschaft*, published in five volumes between 1854 and 1894, and arranged as follows: vol. i., *Die Grundlagen der Nationalökonomie*, 1854 (trans. by J. J. Lalor, *Principles of Political Economy*, Chicago, 1878); vol. ii., *Die Nationalökonomie des Ackerbaues und der verwandten Urproduktionszweige*, 1859; vol. iii., *Die Nationalökonomie des Handels und Gewerbetreibendes*, 1881; vol. iv., *System der Finanzwissenschaft*, 1886; vol. v., *System der Armenpflege und Armenpolitik*, 1894. His *Geschichte der Nationalökonomie in Deutschland* (1874) is a monumental work. He also published in 1842 an excellent commentary on the life and works of Thucydides. He died at Leipzig on the 4th of June 1894.

See T. Roscher, *Zur Geschichte der Familie Roscher in Niedersachsen* (Hanover, 1892); Brasch, *Wilhelm Roscher und die sozialwissenschaftlichen Strömungen der Gegenwart* (Leipzig, 1895).

**ROSCIUS GALLUS, QUINTUS** (c. 126-62 B.C.). Roman actor, was born, a slave, at Solonium, near Lanuvium. Endowed with a handsome face and manly figure, he studied the delivery and gestures of the most distinguished advocates in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with the greater effect, and Roscius wrote a treatise in which he compared acting and oratory. Q. Lutatius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession was held in contempt. Like his contemporary Aesopus, Roscius amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius Chaerea for 50,000 sesterces (about £400), and was defended by Cicero in a famous speech.

See H. H. Pflüger, *Cicero's Rede pro Q. Roscio Comedo* (1904).

**ROSCOE, SIR HENRY ENFIELD** (1833- ), English chemist, was born in London on the 7th of January 1833. After

studying at Liverpool High School and University College, London, he went to Heidelberg to work under R. W. Bunsen, of whom he became a lifelong friend. In 1857 he was appointed to the chair of chemistry at Owens College, Manchester, where he remained for thirty years, and from 1885 to 1895 he was M.P. for the south division of Manchester. He served on several royal commissions appointed to consider educational questions, in which he was keenly interested, and from 1896 to 1902 was vice-chancellor of London University. He was knighted in 1884. His scientific work includes a memorable series of researches carried out with Bunsen between 1855 and 1862, in which they laid the foundations of comparative photochemistry. In 1867 he began an elaborate investigation of vanadium and its compounds, and devised a process for preparing it pure in the metallic state, at the same time showing that the substance which had previously passed for the metal was contaminated with oxygen and nitrogen. He was also the author of researches on niobium, tungsten, uranium, perchloric acid, the solubility of ammonia, &c. His publications include, besides several elementary books on chemistry which have had a wide circulation and been translated into many foreign languages, *Lectures on Spectrum Analysis* (1866); a *Treatise on Chemistry* (the first edition of which appeared in 1877-1892); *A New View of Dalton's Atomic Theory*, with Dr A. Harden (1896); and an *Autobiography* (1906). The *Treatise on Chemistry*, written in collaboration with Carl Schorlemmer (1834-1892), who was appointed his private assistant at Manchester in 1859, official assistant in the laboratory in 1861, and professor of organic-chemistry in 1874, is a standard work.

**ROSCOE, WILLIAM** (1753-1831), English historian and miscellaneous writer, was born on the 8th of March 1753 at Liverpool, where his father, who was a market gardener, kept a publichouse known as the Bowling Green at Mount Pleasant. Roscoe was eager in the acquisition of knowledge, and at twelve he left school, having learned all that his schoolmaster could teach. He now assisted his father in the work of the garden, and gave his leisure hours to reading and study. "This mode of life," he says, "gave health and vigour to my body, and amusement and instruction to my mind; and to this day I well remember the delicious sleep which succeeded my labours, from which I was again called at an early hour. If I were now asked whom I consider to be the happiest of the human race, I should answer, those who cultivate the earth by their own hands." At fifteen it was necessary to decide upon a path in life. A month's trial of bookselling sufficed to disgust him, and in 1769, he was articled to a solicitor. Although a diligent student of law, he did not bid farewell to the Muses, but continued to read the classics, and made that acquaintance with the language and literature of Italy which became the instrument of his distinction in after life. He wrote many verses: his *Mount Pleasant* was composed when he was sixteen, and this and other verses, though now forgotten, won the esteem of good critics. In 1774 he commenced business as an attorney, and as soon as his professional gains warranted he married (1781) Jane, second daughter of William Griffies, a Liverpool tradesman, and had seven sons and three daughters. He had the courage to denounce the African-slave trade in his native town, where not a little of the wealth came from this source. He wrote the *Wrongs of Africa* (1787-1788), and entered into a controversy with an ex-Roman Catholic priest, who undertook to prove the "licitness of the slave trade" from the Bible. Roscoe was also a political pamphleteer, and like many other Liberals of the day hailed the promise of liberty in the French Revolution.

Meanwhile he had steadily pursued his Italian studies, and had made extensive collections relating to the great ruler of Florence. The result was his *Life of Lorenzo de' Medici*, which appeared in 1796, and at once placed him in the front rank of contemporary historians. The work has often been reprinted, and translations in French, German and other languages show that its popularity was not confined to its author's native land. Perhaps the most gratifying testimony was that of Fabroni,

who had intended to translate his own Latin life of Lorenzo, but abandoned the design and induced Gaetano Mecheria to undertake an Italian version of Roscoe. In 1796 Roscoe gave up practice as an attorney, and had some thought of going to the bar, but relinquished the idea after keeping a single term. Between 1793 and 1800 he paid much attention to agriculture, and helped to reclaim Chat Moss, near Manchester. He also succeeded in restoring to good order the affairs of a banking house in which his friend William Clark, then resident in Italy, was a partner. This task led to his introduction to the business, which eventually proved disastrous. His translation of Tansillo's *Nurse* appeared in 1798, and went through several editions. It is dedicated in a sonnet to his wife, who had practised the precepts of the Italian poet.

*The Life and Pontificate of Leo the Tenth* appeared in 1805, and was a natural sequel to that by which he had made his reputation. The work, whilst it maintained its author's fame, did not, on the whole, meet with so favourable a reception as the *Life of Lorenzo*. It has been frequently reprinted, and the insertion of the Italian translation in the *Index* did not prevent its circulation even in the papal states. Roscoe was elected member of parliament for Liverpool in 1806, but the House of Commons was not a congenial place, and at the dissolution in the following year he declined to be again a candidate. The commercial troubles of 1816 brought into difficulties the banking house with which he was connected, and forced the sale of his collection of books and pictures. It was on this occasion that he wrote the fine "Sonnet on Parting with his Books." Dr S. H. Spiker, the king of Prussia's librarian, gives an interesting account of a visit to Roscoe at this period of trouble. Roscoe said he still desired to write a biography of Erasmus but "wanted both leisure and youth." This project was not executed (Spiker's *Travels through England, &c.*, 1816). After a five years' struggle to discharge the liabilities of the bank, the action of a small number of creditors forced the partners into bankruptcy in 1820. For a time Roscoe was in danger of arrest, but ultimately he received honourable discharge. On the dispersal of his library, the volumes most useful to him were secured by friends and placed in the Liverpool Athenaeum. The sum of £2500 was also invested for his benefit. The independent and sensitive nature of Roscoe made both these operations difficult. Having now resigned commercial pursuits entirely, he found a pleasant task in the arrangement of the great library at Holkham, the property of his friend Coke. In 1822 he issued an appendix of illustrations to his *Lorenzo* and also a *Memoir of Richard Robert Jones of Aberdaron*, a remarkable self-taught linguist. The year 1824 was memorable for the death of his wife and the publication of his edition of the works of Pope, which involved him in a controversy with Bowles. His versatility was shown by the appearance of a folio monograph on the *Monandrian Plants*, which was published in 1828. It appeared first in numbers, and the last part came out after his recovery from a paralytic attack. He died on the 30th of June 1831.

Roscoe's character was a fine one. Under circumstances uncongenial and discouraging he steadfastly maintained the ideal of the intellectual life. Sensitive and conscientious, he sacrificed his possessions to a punctilious sense of duty. He had the courage of unpopular opinions, and, whilst promoting every good object in his native town, did not hesitate to speak out where plain dealing, as in the matter of slavery was required. He was a sincere friend and exemplary in his domestic relations. Posterity is not likely to endorse the verdict of Horace Walpole, who thought Roscoe "by far the best of our historians," but in spite of newer lights and some changes of fashion in the world of letters, his books on Lorenzo de' Medici and Leo X. remain important contributions to historical literature.

In addition to the writings already named, Roscoe wrote treatises on penal jurisprudence, and contributed to the *Transactions of the Royal Society of Literature* and of the Linnean Society. The first collected edition of his *Poetical Works* was published in 1857, and

is sadly incomplete, omitting, with other verses known to be from his pen, the *Butterfly's Ball*, a fantasy, which has charmed thousands of children since it appeared in 1807. Other verses are in *Poems for Youth*, by a *Family Circle* (1820).

The *Life* by his son Henry Roscoe (2 vols., London, 1833) contains full details of Roscoe's career, and there are references to him in the *Autobiographical Sketches* of De Quincey, and in Washington Irving's *Sketch Book*. (W. E. A. A.)

**ROSCOFF**, a maritime town and watering-place of north-western France, in the department of Finistère, on the English Channel, 17½ m. N.N.W. of Morlaix by rail. Pop. (1906) town, 1984; commune, 5054. Roscoff, separated from the Ile de Batz by a narrow channel, has a tidal port used by fishing and coasting vessels. Many of the inhabitants are engaged in the cultivation of early vegetables, to the growth of which the mild climate and fertile soil is eminently favourable. The church of Roscoff (16th century) has a fine Renaissance tower and contains interesting alabaster bas-reliefs. The ruined chapel of St Ninian commemorates the landing at Roscoff in 1548 of Mary Stuart, previous to her betrothal with the dauphin, son of Henry II. In 1746 Charles Edward, the young Pretender, landed at the port after his defeat at Culloden.

**ROSCOMMON, WENTWORTH DILLON, 4TH EARL OF** (c. 1630-1685), English poet, was born in Ireland about 1630. He was a nephew of Thomas Wentworth, earl of Strafford, and was educated partly under a tutor at his uncle's seat in Yorkshire, partly at Caen in Normandy and partly at Rome. After the Restoration he returned to England, and was well received at court. In 1649 he had succeeded to the earldom of Roscommon, which had been created in 1622 for his great-grandfather, James Dillon; and he was now put in possession by act of parliament of all the lands possessed by his family before the Civil War. As captain of the Gentleman Pensioners he found abundant opportunity to indulge the love of gambling, which appears to have been his only vice. Disputes with the Lord Privy Seal about his Irish estates necessitated his presence in Ireland, where he gave proof of some business capacity. On his return to London he was made master of the horse to the duchess of York. He was twice married, in 1662 to Lady Frances Boyle, widow of Colonel Francis Courtenay, and in 1674 to Isabella Boynton.

His reputation as a didactic writer and critic rests on his blank verse translation of the *Ars Poetica* (1680) and his *Essay on Translated Verse* (1684). The essay contained the first definite enunciation of the principles of "poetic diction," which were to be fully developed in the reign of Queen Anne. Roscommon, who was fastidious in his notions of "dignified writing," was himself a very correct writer, and quite free from the indecencies of his contemporaries. Alexander Pope, who seems to have learnt something from his carefully balanced phrases and the regular cadence of his verse, says that "In all Charles's days, Roscommon only boasts unspotted bays." He saw clearly that a low code of morals was necessarily followed by a corresponding degradation in literature, and he insists that sincerity and sympathy with the subject in hand are essential qualities in the poet. This elevated conception of his art is in itself no small merit. He has, moreover, the distinction of having been the first critic to avow his admiration for *Paradise Lost*. Roscommon formed a small literary society which he hoped to develop into an academy with authority to formulate rules on language and style, but its influence only extended to a limited circle, and the scheme fell through after its promoter's death. He was buried in Westminster Abbey on the 21st of January 1685.

The title passed to his uncle, Carey Dillon (1627-1689). In 1746, on the death of James, the 8th earl, it passed to Robert Dillon (d. 1770), a descendant of the first earl. His family became extinct in 1816, and in 1828 Michael James Robert Dillon, another descendant of the 1st earl, established his title to the earldom before the House of Lords. When he died in May 1850 it became extinct.

Roscommon's poems were collected in 1701, and are included in Anderson's and other collections of the British poets. He also translated into French from the English of Dr W. Sherlock, *Frailté touchant l'obissance passive* (1686).

**ROSCOMMON**, a county of Ireland in the province of Connaught, bounded N.E. by Leitrim, N.W. by Sligo, W. by Mayo, W. and S. by Galway, E. by Longford and E. and S. by Westmeath and King's County. The area is 629,633 acres, or about 985 sq. m. The greater part of the county belongs to the great limestone plain of central Ireland, and is either flat or very slightly undulating. In the north-east, on the Leitrim border, the Braulieve Mountains, consisting of rugged and precipitous ridges with flattened summits, attain an elevation in Cashel Mountain of 1377 ft.; and in the north-west the Curlew Mountains, of similar formation, between Roscommon and Sligo, rise abruptly to a height over 800 ft. In the east the Slievebawn range, formed of sandstone, have a similar elevation. The Shannon with its expansions forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for over 50 m. the boundary with Galway till it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon on the borders of Co. Roscommon are Loughs Allen, Boderg, Boffin, Forbes and Ree. Of the numerous other lakes within the county the most important are Lough Key in the north, very picturesquely situated with finely wooded banks, and Lough Gara (mostly in Co. Sligo) in the north-west.

In this long county one may travel fifty miles across the Carboniferous Limestone plain, with the grey rock cropping out here and there, and long grass-covered esker-ridges forming the only obstacle to the roads. Lough Ree is a typical lake of the plain. Two inliers of Silurian rocks have been thrust up, forming hills between Lough Ree and Lough Boffin. At Boyle, however, higher Old Red Sandstone country is encountered, and farther north the Millstone Grit and Coal-Measure series cap the mountains almost horizontally at Arigna near Lough Allen. The nodules of clay-ironstone here were formerly smelted, and the seams of bituminous coal, mostly on Millstone Grit horizons, are worked successfully on a high level of the mountains.

The subsoil is principally limestone, but there is some light, sandy soil in the south. In the level parts the land when drained and properly cultivated is very fertile, especially in the district known as the plains of Boyle, which includes some of the richest grazing land in Ireland. Along the banks of the Suck and Shannon there is, however, a large extent of bog and marsh. The proportion of tillage to pasture is roughly as one to three. Oats and potatoes are the principal crops, but the acreage devoted to them decreases; the numbers of cattle, sheep, pigs, goats and poultry, on the other hand, are proportionately large and increasing. Communications are afforded by the Midland Great Western railway, the Sligo line of that system crossing the northern part of the county by Boyle, the Athlone and Mayo line passing from S.E. to N.W. by the towns of Roscommon and Castlereagh, and the Athlone and Galway line crossing the southern part.

The population was 116,552 in 1891, and 101,791 in 1901; 97% are Roman Catholics, and nearly the whole population is rural. The chief towns are Boyle, Roscommon, Elphin and Castlereagh; and a small portion of Carrick-on-Shannon, including the railway station, is in this county, the major portion being in Co. Leitrim. The county is divided into ten baronies. Ecclesiastically it belongs to the Protestant dioceses of Elphin and Ardagh (united with Kilmore and Tuam), and to the Roman Catholic dioceses of Tuam, Clonfert, Achonry, Elphin and Ardagh. Assizes are held at Roscommon and quarter sessions at Boyle, Strokestown and Roscommon. The county returns two members to parliament. To the Irish parliament before the Union of 1800 two members were returned for the county, and two each for the baronies of Boyle, Roscommon and Tulsak.

The district was granted by Henry III. to Richard de Burgo, but remained almost wholly in the possession of the native sept. Until the time of Elizabeth Connaught was included in the two districts of Roscommon and Clare, but in 1579 it

was further subdivided by Sir Henry Sydney, and was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement, except the O'Connor family headed by the O'Connor Don. The most interesting antiquarian remains within the county are the ruins of Crogan, the ancient palace of the kings of Connaught. The principal ancient castles are the old stronghold of the M'Dermotts on Castle Island, Lough Key, the dismantled castle of the M'Donoughs at Ballinacra, and the extensive fortress at Roscommon rebuilt by John d'Uford, justiciary of Ireland in 1268. There are fragments of a round tower at Oran. The abbey of Boyle is in remarkably good preservation, and exhibits fine specimens of the Norman arch. The other monastic remains within the county, with the exception of the abbey of Roscommon, are of comparatively small importance. The Irish bard Carolan, who died in 1738, is buried by the ruined church of Kilonan, in the extreme north of the county. The bishopric of Elphin was united with Kilmore and Ardagh in 1833, and the former cathedral and episcopal buildings are largely modernized.

**ROSCOMMON**, a market town and the county town of Co. Roscommon, Ireland, situated on rising ground in a bare plain in the centre of the county, on the Mayo line of the Midland Great Western railway, 18½ m. N.W. by N. from Athlone. Pop. (1901) 1891. It contains the county buildings, and has Protestant and Roman Catholic churches, the latter of which is a fine building completed in 1903. An extensive trade is carried on in agricultural produce and live stock. A castle, dating from 1268, when it was founded by John d'Uford, justiciary of Ireland, stands, an imposing mass of ruins, but far gone in decay, overlooking the plain. It fell to besiegers in 1566, 1642 and 1652, and was partially burned after the battle of Aughrim in 1691. There are also remains of a Dominican priory of the middle of the 13th century, founded by Felim O'Connor, king of Connaught, and exhibiting fine, though mutilated, details of the style of that period. The name of the town, signifying St Coman's wood, is derived from the saint who founded the monastery of Canons Regular here in the 6th century. The town received charters from Edward I. and James I. Two m. N.E. are small remains of the abbey of Deerane.

**ROSCREA**, a market town near the north-western border of Co. Tipperary, Ireland, pleasantly situated on undulating ground connecting the Devil's Bit and the Slieve Bloom mountains. Pop. (1901) 2325. It is 77 m. W.S.W. from Dublin on the Ballybrophy and Limerick branch of the Great Southern & Western railway. A branch line runs northward to Birr or Parsonstown. Flour-milling and tanning are industries, and monthly cattle fairs are held. There is a branch here of the Trappist Monastery of Mount Melleray in Co. Waterford. The antiquarian remains are of interest. These include portions of an Augustinian abbey, founded by St Cronan, early in the 7th century, which are incorporated into the church. Out of this abbey a diocese grew, to be united with that of Killaloe in the 12th century. Here also was produced the *Book of Dimma*, consisting of the gospels and accompanied by a brazen shrine, ornamented with silver and tracery, and preserved in the library of Trinity College, Dublin. A cross and a shrine of St Cronan are in the churchyard. There are also a round tower, 80 ft. in height, but lacking the upper storeys, and a Franciscan friary (1490); while a circular tower, and a square keep (occupied as barracks), mark strongholds, the one built by King John and the other by the Ormondes, and testify to the former importance of the town, which was doubtless accentuated by its physical position in a passway between the neighbouring mountain ranges. Leap Castle, about 4 m. N., is another fortified mansion, which is still inhabited.

**ROSE**, the name of a distinguished family of German chemists. **VALENTINE ROSE** the elder was born on the 16th of August 1736 at Neu-Ruppin, and died on the 28th of April 1771 at Berlin, where he was an apothecary and for a short time before his death assessor of the Ober Collegium Medicum. He was the discoverer of "Rose's fusible metal" (see **FUSIBLE METAL**). His son, **VALENTINE ROSE** the younger, born on the 31st of

October 1762 at Berlin, was also an apothecary in that city and assessor of the Ober Collegium Medicum from 1797. It was he who in 1800 proved that sulphuric ether contains no sulphur. He died in Berlin on the 10th of August 1807, leaving four sons, one of whom, Heinrich, was a distinguished chemist, and another, Gustav, a crystallographer and mineralogist. **HEINRICH ROSE**, born at Berlin on the 6th of August 1795, began to learn pharmacy in Danzig, where, during the siege of 1807, he nearly lost his life from typhus. Like his brother he served in the campaign of 1815. During the summer of the following year he studied at Berlin under M. H. Klaproth, a devoted friend of the family, and in the autumn entered a pharmacy at Mitau. In 1819 he went to Stockholm, where he spent a year and a half with J. J. Berzelius, and in 1821 he graduated at Kiel. Returning to Berlin he became a *Privatdozent* in the university in 1822, extraordinary professor of chemistry in 1823 and ordinary professor in 1835, and there he died on the 27th of January 1864. He devoted himself especially to inorganic chemistry and the development of analytical methods, and the results of his work are summed up in the successive issues of his classical work, *Ausführliches Handbuch der analytischen Chemie*, of which he published the first edition at Berlin in 1829, and the sixth, practically a new work in French, at Paris in 1861. He was the discoverer of antimony pentachloride, and mention may also be made of his researches on the influence of the mass-action of water in many reactions, carried out before the investigations of Goldberg and Waage in 1867. **GUSTAV ROSE**, born at Berlin on the 18th of March 1798, began his career as a mining engineer, but soon turned his attention to theoretical studies. A pupil of Berzelius like his brother, he graduated in 1820 at Berlin University where he became successively *Privatdozent* (1823), extraordinary professor of mineralogy (1826) and ordinary professor (1839). In 1856 he succeeded to the directorship of the Royal Mineralogical Museum at Berlin, and he helped to found the German Geological Society; of which he was president from 1863 until the end of his life. He made many journeys in different parts of Europe for the sake of mineralogical study, and in 1829 with A. von Humboldt and C. G. Ehrenberg (1795-1876), professor of medicine at Berlin, took part in an expedition to the Ural and Altai mountains and the Caspian Sea, which yielded information of primary importance concerning the mineralogy of the Russian Empire. His work covered every branch of mineralogy, including crystallography and the artificial formation of minerals. The science of petrography, according to Gerhard vom Rath, originated with him. He was the first in his own country to use the reflecting goniometer for the measurement of the angles of crystals, and to teach the method of studying rocks by means of microscopic sections. He also devoted special attention to meteorites and to the problem presented by the different structure of the stony matter in them and in the crust of the earth, and just before his death, which took place at Berlin on the 15th of July 1873, he was engaged in investigating the formation of the diamond. In addition to many scientific memoirs he published *Elemente der Kristallographie* (1830); *Mineralogisch-geognostische Reise nach dem Ural, dem Altai und dem Kaspiischen Meere* (1837) vol. i.; (1842) vol. ii.; *Das Kristallo-chemische Mineralsystem* (1852); and *Beschreibung und Eintheilung der Meteoriten* (1863).

**ROSE, GEORGE** (1744-1818), British politician, was born on the 17th of June 1744, and was educated at Westminster school, afterwards entering the navy, a service which he left in 1762 after he had taken part in some fighting in the West Indies. He then obtained a position in the Civil Service, becoming joint keeper of the records in 1772 and secretary to the board of taxes in 1777. In 1782 he gave up the latter appointment to become one of the secretaries to the treasury under Lord Shelburne, though he did not enter parliament. He left office with his colleagues in April 1783, but in the following December he returned to his former position at the treasury in Pitt's ministry, being henceforward one of this minister's most steadfast supporters. He entered parliament as member for Launceston

early in 1784, and his fidelity and friendship were rewarded by Pitt, who gave him a lucrative post in the court of exchequer; in 1788 he became clerk of the parliaments. In 1801 Rose left office with Pitt, but returned with him to power in 1804, when he was made vice-president of the committee on trade and joint paymaster-general. He resigned these offices a few days after Pitt's death in 1806, but he served as vice-president of the committee on trade and treasurer of the navy under the duke of Portland and Spencer Perceval from 1807 to 1812. He was again treasurer of the navy under Lord Liverpool, and he was still member of parliament for Christchurch, a seat which he had held since 1790, when he died at Cufnells, in Hampshire, on the 13th of January 1818. Rose was an able and conscientious public servant, although he and his two sons drew a large amount of money from sinecures, a fact referred to by William Cobbett in his "A New Year's Gift to old George Rose." He wrote several books on economic subjects, and his *Diaries and Correspondence*, edited by the Rev. L. V. Harcourt, was published in 1860.

His elder son, Sir George Henry Rose (1777-1855), was in parliament from 1794 to 1813, and again from 1818 to 1844, and in the meantime he was British minister at Munich and at Berlin; in 1818 he succeeded his father as clerk of the parliaments. He was the father of Baron Strathnairn (q.v.). The second son was the poet William Stewart Rose (q.v.).

ROSE, HUGH JAMES (1795-1838), English divine, was born at Little Horsted in Sussex on the 9th of June 1795, and was educated at Uckfield school and at Trinity College, Cambridge, where he graduated B.A. in 1817, but missed a fellowship. Taking orders, he was appointed to Buxted, Sussex, in 1819, and to the vicarage of Horsham in 1821. He had already attained some repute as a critic, which was enhanced when, after travelling in Germany, he delivered as select preacher at Cambridge, four addresses against rationalism, published in 1825 as *The State of the Protestant Religion in Germany*. The book was severely criticized in Germany, and in England by E. B. Pusey. In 1827 Rose was collated to the prebend of Middleton; in 1830 he accepted the rectory of Hadleigh, Suffolk, and in 1833 that of Fairstead, Essex, and in 1835 the perpetual curacy of St Thomas's, Southwark. In 1833-1834 he was professor of divinity at Durham, a post which ill-health forced him to resign. In 1836 he became editor of the *Encyclopaedia Metropolitana*, and he projected the *New General Biographical Dictionary*, a scheme carried through by his brother Henry John Rose (1800-1873). He was appointed principal of King's College, London, in October 1836, but he was attacked by influenza, and after two years of ill-health he died at Florence on the 22nd of December 1838. Rose was a high-churchman, who to propagate his views in 1832 founded the *British Magazine* and so came into touch with the leaders of the Oxford movement. Out of a conference at his rectory in Hadleigh came the Association of Friends of the Church, formed by R. H. Froude and Wm. Palmer.

See J. W. Burgon, *Lives of Twelve Good Men* (1891).

ROSE, WILLIAM STEWART (1775-1843), English poet and translator, second son of George Rose (q.v.), was born in 1775. He was educated at Eton College, and in 1796 was returned to parliament for the borough of Christchurch. In 1800 he accepted the Chiltern Hundreds on his appointment as reading clerk of the House of Lords and clerk of the private committees. His first work, *A Naval History of the Late War*, was undertaken at his father's wish, but he only completed one volume. He produced a free version of the *Amadis de Gaul* from the French text of Herberay des Essarts in 1803, followed by a translation of the *Partenopex de Blois* (1807) after Le Grand d'Aussy. With *Partenopex* he printed his ballad of "The Red King," and in 1810 appeared *The Crusade of King Louis and King Edward the Martyr*. In 1814 he made a prolonged journey through Italy and eastern Europe, spending the year 1817 at Venice, where he married a Venetian lady. *The Court and Parliament of Bees*, a translation of the *Animali Parlanti di Casti*, and *Letters from the North of Italy*, addressed to Henry

Hallam, Esq., appeared in 1819. In the same year the publisher Murray offered him £2000 for a translation of Ariosto (T. Moore, *Diary*, 14th of April 1819). He had already written an abridged version of Berni's *racconto del Orlando Innamorato* of Boiardo, and had begun his *Orlando Furioso translated into English Verse* which appeared in two parts in 1823 and 1831. This, which has become the standard English version, is a close rendering in the *ottava rima* of the original. Rose retired from his official position in 1824. He suffered from paralysis in his later years, and at Abbotsford, where he was an honoured guest, rooms were specially fitted up on the ground floor for his use. His last works were *An Epistle to the Right Honourable John Hookham Frere* (1834), in verse, and a volume of *Rhymes* (1837) (see *Quarterly Review*, July 1836 and April 1837). He died on the 30th of April 1843.

ROSE (*Rosa*). The rose has for all ages been the favourite flower, and as such it has a place in general literature that no other plant can rival. In most cases the rose of the poets and the rose of the botanist are one and the same in kind, but popular usage has attached the name rose to a variety of plants whose kinship to the true plant no botanist would for a moment admit. In this place we shall employ the word in its strict botanical significance, and in commenting on it treat it solely from the botanical point of view. The rose gives its name to the order Rosaceae, of which it may be considered the type. The genus consists of species varying in number, according to the diverse opinions of botanists of opposite schools, from thirty to one hundred and eighty, or even two hundred and fifty, exclusive of the many hundreds of mere garden varieties. While the lowest estimate is doubtless too low, the highest is enormously too large, but in any case the wide discrepancies above alluded to illustrate very forcibly the extreme variability of the plants, their adaptability to various conditions, and consequently their wide dispersion over the globe, the facility with which they are cultivated, and the readiness with which new varieties are continually being produced in gardens by the art of the hybridizer or the careful selection of the raiser. The species are natives of all parts of the northern hemisphere, but are specially represented in the tropics unless at considerable elevations.

They are erect or climbing shrubs, never herbs or trees, generally more or less copiously provided with straight or hooked prickles of various shapes and with glandular hairs, as in the sweet-brier or in the moss-rose of gardens. The prickles serve the purpose of enabling the shrub to sustain itself amid other vegetation. The viscid hairs which are specially frequent on the flower stalks or in the neighbourhood of the flower serve to arrest the progress of undesirable visitants, while the perfume emitted by the glands in question may co-operate with the fragrance and colour of the flower to attract those insects whose presence is desirable. The leaves are invariably alternate, provided with stipules, and unequally pinnate, the leaflets varying in number from one (as in *R. simplicifolia* or *berberi folia*) to 11 and even 15, the odd leaflet always being at the apex, the others in pairs. The flowers are solitary or in loose cymes (cluster-roses) produced on the ends of the shoots. The flower-stalk expands into a vase- or urn-shaped dilatation, called the receptacle or receptacular tube, which ultimately becomes fleshy and encloses in its cavity the numerous carpels or fruits. From the edge of the urn or "hip" proceed five sepals, often more or less compound like the leaves and overlapping in the bud. Within the sepals are five petals, generally broad or roundish in outline, with a very short stalk or none at all, and of very various shades of white, yellow or red. The very numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small two-lobed anther. The inner portion of the receptacular tube whence the stamens spring is thick and fleshy, and is occasionally spoken of as the "disk", but, as in this case it does not represent any separate organ, it is better to avoid the use of the term. The carpels are very numerous, ultimately hard in texture, covered with hairs, and each provided with a long style and button-like stigma. The carpels are concealed within the receptacular tube and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule. The so-called fruit is merely the receptacular tube, which, as previously mentioned, becomes fleshy and brightly coloured as an attraction to birds, which devour the hips and thus secure the dispersion of the seed. The dry one-seeded fruits (achenes) are densely packed inside the hip, and are covered with stiff hairs which cling to the bird's beak. The stamens are in whorls, and, according to Payer, they originate in pairs one on each side of the base of

each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second, and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced, and when these stamens assume a petaloid aspect we have as a consequence the double flowers which are so much admired. The carpels are much less subject to this petaloid change, and, as it generally happens in the most double of roses that some few at least of the anthers are formed with pollen, the production of seed and the possibility of cross-breeding become intelligible. Under natural circumstances rose flowers do not secrete honey, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time, and thus, while cross-fertilization by insect agency is doubtless most common, self-fertilization is not prevented.

The large number of species, subspecies, varieties and forms described as British may be included under about a dozen species. Among them may be mentioned *R. spinosissima*, the Scotch rose, much less variable than the others; *R. rubiginosa* (or *R. eglanteria*), the sweet-brier, represented by several varieties; *R. canina*, the dog rose (see fig.), including

Dog Rose (*Rosa canina*) in flower and fruit.

numerous subspecies and varieties; the large-fruited apple rose, *R. pomifera*; and *R. arvensis*, the parent of the Ayrshire roses. Cultivated roses are frequently "budded" or worked upon the stems of the brier or *R. canina*, or upon young seedling plants of the same species; and upon stems of an Italian rose called the Manetti, raised in the Milan Botanic Gardens about 1837. Other species, notably *R. polyantha*, also are used for stocks.

Roses have been grown for so many centuries and have been crossed and recrossed so often that it is difficult to refer the cultivated forms to their wild prototypes. The older roses doubtless originated from *R. gallica*, a native of central and southern Europe. *R. centifolia* (the cabbage rose), a native of the Caucasus, contributed its share. A cross between the two species named may have been the source whence originated the Bourbon roses. The yellow-flowered Austrian and Persian brier originated from *R. lutea*, a native of Austria and the East. The monthly or China roses sprang from the Chinese *R. indica*, and these, crossed with others of the *R. centifolia* or *gallica* type, are the source of the "hybrid perpetuals" so commonly grown nowadays, because, in addition to their other attractions, their blooming season is relatively prolonged, and, moreover, is repeated in the autumn. Tea roses and noisettes, it is to be presumed, also acknowledge *R. indica* as one of their progenitors. A magnificent race called "hybrid teas" have been evolved of late years, by crossing the tea roses and hybrid perpetuals. They are much more vigorous in constitution than the true tea roses, while quite as beautiful in blossom and more perpetual in bloom than the hybrid perpetuals. Recently, by crossing the Japanese *R. Wichuriana* with hybrid perpetuals,

a beautiful and vigorous race of climbers has been produced. The Banksian rose is a Chinese climbing species, with small white or fawn-coloured flowers of great beauty, but rarely seen; the Macartney rose (*R. bracteata*) is also of Chinese origin. Its nearly evergreen deep green leaves and large white flowers are very striking. The Japanese *R. rugosa* is also a remarkable species, notable for its bold rugose foliage, its large white or pink flowers, and its conspicuous globular fruit. *R. damascena* is cultivated in some parts of the Balkans for the purpose of making attar of roses. In Germany the same variety of rose is used, while at Grasse a strain of the Provence rose is cultivated for the same purpose. In India *R. damascena* is grown largely near Ghazipur for the purpose of procuring attar of roses and rose water.

Rose water is chiefly produced in Europe from the Provence or cabbage rose, *R. centifolia*, grown for the purpose at Mitcham and much more abundantly in the south of France. Conserve of roses and infusion of roses, two medicinal preparations retained for their agreeable qualities rather than for any special virtue, are prepared from the petals of *R. gallica*, one variety of which was formerly grown for the purpose near the town of Provins. Conserve of dog rose is made from the ripe hips of the dog rose, *R. canina*. Its only use is in the manufacture of pills.

The rose is so universal a favourite that some portion of the garden must necessarily be devoted to it, if the situation be at all favourable. Many choice roses will not, however, thrive in the vicinity of large towns, since they require a pure air, and do not endure a smoky atmosphere. The best soil for them is a deep rich strong loam free from stagnant moisture. Very light sandy or gravelly soils, or soils which are clayey and badly drained, are not suitable, and both must be greatly improved if rose-growing on them is attempted. Light soils would be improved by a dressing of strong loam in conjunction with cow-dung or nightsoil; the latter, provided it is properly prepared and not too fresh, is indeed the very best manure for roses in all but soils which are naturally very rich. Heavy soils are improved by adding burned earth or gritty refuse, with stable manure and leaf-mould, peat moss litter, &c.; and damp soils must necessarily be drained by trenching. Tea roses may, however, be grown to perfection in a gravel soil, provided it be well manured, cow manure being best. Roses generally require a constant annual supply of manure, and, if this is given as a mulching in autumn, it serves to protect their roots through the winter. They also require liberal supplies of water during the growing season, unless the surface is mulched or top-dressed from time to time with well-rotted manure. Aphides and caterpillars of all kinds may be checked by syringing with dilute tobacco water or some of the many insecticides now provided to facilitate this rather troublesome task.

Some growers prefer roses grown on their own roots, some on the Manetti and others on the brier stock. There is this to be said in favour of their own roots that, if the tops are killed down by accident or by severe weather, the roots will usually throw up new shoots true to their kind, which cannot be looked for if they are worked; though it is sometimes recommended to plant deep in order that the rose itself may learn to do without its foster parent the stock. Too often, however, in the case of persons unfamiliar with roses, the choice rose dies, and the stock usurps its place. This is especially true of the Manetti stock, as its foliage is more like that of many cultivated forms than the brier, and therefore more easily overlooked. Where standards or half-standards are required, the brier stock from the hedges is always used. It forms the most reliable stock for dwarfs of all kinds, and especially for tea roses, most of which fail on the Manetti stock.

An open situation, not shaded but sheltered from strong winds, is what the rose prefers. October and November are the best months for planting roses, but if the weather be wet or frosty and the soil sticky, the plants should be placed in a sheltered place and protected by green boughs or matting until suitable conditions prevail. The planting should never be deep, the uppermost layer of roots being about 2 or 3 in. below the general level of the surface, and the soil should always be kept stirred with the hoe during the summer months. In regard to pruning, roses vary considerably, some requiring close cutting and others only thinning out; some again, such as strong growing climbers, may be safely pruned in autumn, and others are better left till spring. Instructions on this point as to the several groups of varieties will be found in most rose catalogues, and may be followed, provided the variety is true to name. It may be laid down as a general rule that the more strongly growing varieties should be less severely cut back than the weakly varieties; and, again, the more tender the variety, the later in the spring should the pruning be done, April being the best month for pruning teas and noisettes. It should be remembered also that as

amount of correct pruning will improve a rose bush that has been badly planted or placed in a quite unsuitable position.

Where dwarf beds of roses are required, a good plan is to peg down to within about 6 in. from the ground the strong one-year-old shoots from the root. In due time blooming shoots break out from nearly every eye, and masses of flowers are secured, while strong young shoots are thrown up from the centre, the plant being on its own roots. Before winter sets in, the old shoots which have thus flowered and exhausted themselves are cut away, and three or four or more of the strongest and best ripened young shoots are reserved for pegging down the following season, which should be done about February. In the meantime, after the pruning has been effected, plenty of good manure should have been dug in lightly about the roots. Thus treated, the plants never fail to produce plenty of strong wood for pegging down each succeeding season.

The most troublesome fungoid pest of the rose is undoubtedly the mildew (*Sphaerotheca pannosa*). The young shoots, leaves and flower-buds frequently become covered with a delicate white mycelium, which by means of the suckers it sends into the underlying cells robs its host of considerable amounts of food, and causes the leaves to curl and fall early. The spores are produced in great abundance and carried by animals and the wind to other plants, and so the disease is rapidly spread. Later the mycelium increases and forms a thick velvety coating on the young shoots, and in this the winter state of the fungus is produced. Spraying with potassium sulphide (1 oz. to 2 to 3 gallons of water) is the best means of checking the spread of the disease. The rose rust (*Phragmidium subcorticatum*) appears on both cultivated and wild roses in the spring, bursting through the bark in the form of copious masses of orange powder consisting of the spores of the fungus. These spores infect the leaves, and produce on them in the summer small dots of an orange colour and, later, groups of spores that are able to live through the winter. The last, the teleutospores, are of a dark colour, and it is by these that the disease is started in the spring. It is therefore important that all the affected leaves should be destroyed in the autumn, and the bushes should be sprayed with Bordeaux mixture or ammoniacal copper carbonate in the spring to prevent the infection of the leaves by spores brought from a distance. Many other fungi attack the rose, but perhaps the only other one that merits mention here is *Actinonema Rosae*. This attacks the leaves, forming large dark blotches upon them and frequently causing them to fall prematurely.

A very large number of insect pests are found upon the rose, but the best known and most formidable on account of their great powers of reproduction are the aphides. More than one species is found upon the rose, though *Aphis Rosae* is the commonest. Their attack should be checked by the use of a spray made by boiling 4 oz. quassa chips for an hour or so in a gallon of soft water, straining off the solution and dissolving therein 4 oz. of soft soap while it is still warm, afterwards adding 1 or 2 gallons of soft water according to the age of the rose leaves that are to be sprayed. Any delay in dealing with the pest gives the opportunity for its increase, even a day being sufficient to multiply to augment their numbers. The larvae of some of the *Tortrix* moths fold the leaves almost as soon as they are developed from the bud, and do considerable damage in this way and by devouring the leaves, while several "looper" caterpillars are also found feeding on the foliage. Many species of saw-fly larvae are also known to attack the rose, feeding either upon the leaves or devouring the young shoot. These larvae should be carefully searched for and destroyed whenever found. One of the leaf-cutting bees, *Megachile*, cuts pieces out of the leaves with which to line its nest, materially reducing their effective surface. The bees may be caught in a butterfly net or traced to their nests, which should be destroyed.

For further information see the late Dean Hole's *Book about Roses* (1894); *Book of the Rose*, by Rev. A. Foster Mellias (1905); *Beautiful Roses for Garden and Greenhouse*, by J. Weathers (1903); and *Roses, their History, Development and Cultivation*, by the Rev. J. H. Pemberton (1908).

**ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF** (1847- ), British statesman, born in London on the 7th of May 1847, was the grandson and successor to the title of Archibald John Primrose, 4th earl of Rosebery (1783-1868), a representative peer of Scotland, who was in 1828 created a peer of the United Kingdom as Baron Rosebery, and was an active supporter of the Reform Bill. The Scottish earldom was first conferred in 1703 upon the 4th earl's great-grandfather, Archibald Primrose of Dalmeny (1664-1723), a staunch Whig and a commissioner for the Union. The 5th earl's mother was Catherine Lucy Wilhelmina, only daughter of Philip Henry, 4th Earl Stanhope; she was thus a sister of Earl Stanhope, the historian, and a niece of Lady Hester Stanhope, who was the niece of William Pitt. A celebrated beauty, a maid of honour and bridesmaid of Queen Victoria, she married, on the 20th of December 1843, Archibald, Lord Dalmeny (1809-1851),

member for the Stirling Burghs, who became a lord of the admiralty under Melbourne. After his death she became the wife of Harry George Vane, 4th duke of Cleveland, and died in 1901.

The young Lord Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries Mr A. J. Balfour and Lord Randolph Churchill. He was described by the most brilliant Eton tutor of his day, William Johnson Cory (author of *Isosica*), as a "portentously wise youth, not, however, deficient in fun." He added that Dalmeny "desired the palm without the dust." In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded to the earldom and to the family estates. In February 1871 he seconded the Address in the House of Lords; a more original effort followed in November 1871, when he delivered a remarkable essay on the Union of Scotland and England at the Edinburgh Philosophical Institution. Three years later he was elected president of the Social Science Congress at Glasgow, where, on the 30th of September, he gave a striking address upon the discovery of means for raising the condition of the working class as the "true leverage of empire." In the meantime he travelled in the south of Europe and in North America. On his return he acquired an English country house called The Durdans, Epsom, which he largely rebuilt and adorned with some of the finest turf portraits of George Stubbs. Following the example, as he declared, of Oliver Cromwell (for whom he showed an admiration in other respects—culminating in 1900 in the erection of a statue outside Westminster Hall, which was not appreciated either by the Irish Nationalist party or by others among his political associates), he took a pride in owning racehorses, and afterwards won the Derby three times, in 1894, 1895 and 1905. He was the first man to enjoy the distinction of winning the Derby while prime minister; but though this was popular enough among many classes, it did not please the Liberal Non-conformists so much, who considered a racehorse a mere gambling-machine. On the 20th of March 1878 Lord Rosebery married Hannah, only child of Baron Meyer Amschel de Rothschild, of Mentmore, Bucks. The newly married couple took a lease of Lansdowne House, which for several years was a salon for the Liberal party and a centre of hospitality for a much wider circle.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Mr Gladstone at Dalmeny, and during the "Mid Lothian campaign" he had much to do with the stage-management of the demonstrations. As was shown later, he imported into his view of politics a warm sentiment and an imaginative outlook; and he was an enthusiastic student of Lord Beaconsfield's political novels, more particularly of *Sybil*, after the heroine in which he named one of his daughters. In August 1881 he became under-secretary at the Home Office, his immediate chief being Sir William Harcourt. His work was practically confined to the direction of the Scottish department of the Office. A clamour was nevertheless raised in regard to the incompatibility of the under-secretaryship with a position in the House of Lords, and Lord Rosebery resigned the post in June 1883. He and his wife utilized the interval to make a trip round the world, being most warmly received in Australia, and returning by way of India. At the close of 1884 he resumed office as first commissioner of works with a seat in the cabinet, and his adherence carried with it a distinct accession of strength to the Liberal ministry, which was much discredited by the tragedy attached to the fate of Gordon. The attitude of the government on the Afghan question and generally in regard to Russia was held by many to have been perceptibly stiffened owing to Lord Rosebery's influence.

In June 1885 the Liberal administration broke up, but Lord Salisbury's ministry, which succeeded, was beaten early in February 1886, and when Mr Gladstone adopted Home Rule, Lord Rosebery threw in his lot with the old leader, and was made secretary of state for foreign affairs during the brief Liberal ministry which followed. He rather distinguished himself in the Lucia Bay negotiations then being carried on with Germany. If Busch is to be believed, Prince Bismarck's view was that Lord Rosebery had "quite mesmerized" Count Herbert Bismarck; and the latter, from his father's standpoint, conceded too much to Lord Rosebery, who proved himself to be, in Bismarck's language, "very sharp." His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of Sir John Seeley; he had himself visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion; and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. Cambridge gave him the degree of LL.D. in 1888; in January 1889 he was elected a member of the first county council of London, and on the 12th of February he was elected chairman of that body by 104 votes to 17. The tact, assiduity and dignity with which he guided the deliberations of the council made him exceedingly popular with its members. In the spring of 1890 he presided over the Co-operative Congress, but with a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year, however, Lady Rosebery died, and he withdrew for a period from public business. In 1891 he made some brief continental visits, one to Madrid, and in October he saw through the press his little monograph upon *William Pitt*, in the Twelve English Statesmen Series, of which it may be said that it competes in interest with Viscount Morley's *Walpole*. In January 1892, upon a new election, he again for a few months became chairman of the county council. It was already recognized that in him the country possessed not only a public man of exceptionally attractive personality, but one whose literary tastes were combined with a gift for expression which was at once original and fluent. In October the Garter was conferred upon him by Queen Victoria.

Meanwhile, in August, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. His acceptance was construed as a security against the suspicion of weakness abroad which the Liberal party had incurred by their foreign policy during the 'eighties. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but by the exercise of a combination of firmness and forbearance on Lord Rosebery's part the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese League of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was welcomed by the public at large and by the majority of his own party. On all hands he was then considered *dignus imperio*—it was only as the new administration went to pieces that people began to add *nisi imperasset*. The conditions he had to face were by no means hopeful. The Liberal majority of 44 was already dwindling away, and the malcontents, who considered that Sir William Harcourt should have been the prime minister, or who were perpetually intriguing against a

leader who did not satisfy their idea of Radicalism, made Lord Rosebery's personal position no easy one. A systematic policy of detraction was pursued by the small section of the Radical party who objected to a peer premier as such, and a great deal of adverse criticism was also aroused by a speech in which the prime minister, taunted for not again bringing forward a Home Rule measure, insisted upon the truism that the conversion of England, the "predominant partner," was a necessary condition of success. The support of the Irish Nationalists was by no means secure. Lord Rosebery's foreign policy, moreover, was too Tory for his Radical followers; he insisted upon "continuity of policy in foreign affairs," which meant carrying on the Conservative policy and not upsetting it. The premier was thought to have shown a restlessness and a rawness at the touch of censure which did not increase his reputation for reserve power or strength, but this was undoubtedly due in large measure to the recrudescence of the insomnia from which he had suffered in 1891. The government effected little. In Mr Asquith's phrase, it was "ploughing the sands." The Parish Councils Act was only passed by compromising with the Opposition. Local Veto and Disestablishment of the Welsh Church were put in the forefront of the party programme, but the government was already to all appearances riding for a fall, when on the 24th of June 1895 it was beaten upon an adverse vote in the Commons in regard to a question of the supply and reserve of small arms ammunition.

The general election which followed after Lord Salisbury had formed his new ministry was remarkable for the undisciplined state of the Liberal party. At the Eighty Club and the Albert Hall Lord Rosebery advised them to concentrate upon the reform of the House of Lords, that assembly being, as he said, a foremost obstacle to the passing of legislation on the lines of the Newcastle programme; but he was unable to suggest in what direction it should be reformed. Sir William Harcourt and Mr John Morley, on the other hand, concentrated respectively upon Local Option and Home Rule. The Liberals were quarrelling among themselves, and the result was an overwhelming defeat. In Opposition Lord Rosebery was now at a serious disadvantage as head of a parliamentary party; for in any case he could not rally them as a loyally followed leader in the House of Commons might have done. But his followers were not all loyal, and his rivals in leadership were themselves in the House of Commons. Added to this there was still in the background the veteran statesman to whom Liberalism owed an unequalled obligation. When the "Armenian atrocities" became a burning question in the country in 1896, and Mr Gladstone himself emerged from his retirement to advocate intervention, Lord Rosebery's difficulties had taken their final form. He declined to support this demand at the risk of a European war, and on the 8th of October 1896 he announced to the Liberal whip, Mr Thomas Ellis, his resignation of the Liberal leadership. On the following day he made a farewell speech at the Empire Theatre, Edinburgh, to over four thousand people, and for some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Mr Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He was a pall-bearer at his funeral on the 28th of May, as he had previously been at the burials of Tennyson and Millais. His influence in the country was still a strong one on personal grounds, and he came forward now and again to give expression independently to popular feeling. In the autumn of 1898 he gave valuable support to the attitude taken up by Lord Salisbury upon the Fashoda question. He was indeed bound by consistency to withstand what his own government, by the words of Sir Edward Grey, had declared would be an unfriendly act on the part of France. Again, after Mr Kruger's ultimatum in October 1899, Lord Rosebery spoke upon the necessity of the nation closing its ranks and supporting the government in the prosecution of war in South Africa. After Nicholson's Nek he reiterated the resolution of the country "to see this thing through." Nevertheless, in a letter to Captain

Lambton, an unsuccessful Liberal candidate for Newcastle, in September 1900, he condemned the general conduct of affairs by Lord Salisbury's government, while in several speeches in the House of Lords he strongly urged the necessity of army reform. Since his abandonment of the leadership in 1896, the lack of coherence in the Liberal party had become more and more manifest. The war had brought to the front a pro-Boer section, who seemed gradually to be compromising the whole party, and had apparently succeeded in winning the support of Sir Henry Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section.

In deference to the wishes of supporters such as Mr Asquith, Sir Henry Fowler and Sir Edward Grey he determined to "put his views into the common stock" at a representative meeting of Liberals held at Chesterfield in December 1901. There he advised the Liberal party that "its slate must be cleaned," and, as he subsequently explained, this cleansing must involve the elimination of Home Rule for Ireland. His appeal for "spade work" resulted in the formation of the Liberal League, inside the Liberal Opposition; and what Lord Rosebery himself described as his "definite separation" from Sir Henry Campbell-Bannerman's "tabernacle" took place. This announcement, however, was no sooner made than it was explained away by the supporters of both, and early in 1902 Lord Rosebery spoke at the National Liberal Club in a way which indicated that an understanding might still be arrived at. But though Mr Asquith and Sir Edward Grey adhered to the Liberal League, Sir Henry Campbell-Bannerman retained the loyalty of the majority of the Liberal party, and Lord Spencer threw his weight on the same side; and in a speech at the Liberal League dinner on the 31st of July Lord Rosebery had to admit that their principles had not yet prevailed, and that, until they did, a reconciliation between the two wings of the party would be impossible. In January 1903 he addressed a Liberal meeting at Plymouth, and appeared to be attempting to concentrate Opposition criticism upon the points in the government policy which did not involve the Imperialist difference; and in discussing War Office reform he advocated the appointment of Lord Kitchener as secretary of state for war.

When Mr Chamberlain started his new fiscal programme, combining Tariff Reform with Colonial Preference, Lord Rosebery at first seemed inclined to treat it as non-political, and on the 19th of May 1903 he declared in an address to the Burnley Chamber of Commerce that he was not one of those who regarded Free Trade as part of the Sermon on the Mount. This utterance led to an idea that he was inclined to consider favourably the proposal for a preferential tariff, his earlier enthusiasm for Imperial Federation making his support an interesting political possibility. But this idea was quickly dispelled; on the 22nd he expressed his surprise that anybody should have thought he intended to approve of Mr Chamberlain's plan; he was not prepared to dismiss in advance a proposal for the consolidation of the empire made by the responsible government, but he believed that the objections to a policy of preference were insurmountable. The fact, no doubt, was that Mr Asquith, Lord Rosebery's chief lieutenant in the Liberal League, made himself from the outset a determined champion of free trade in opposition to Mr Chamberlain; and Lord Rosebery quickly came into line with the rest of the Liberal party on this question. On the 11th of June, addressing the Liberal League, he admitted that as a lifelong Imperialist it was with pain and grief that he could not support Mr Chamberlain's scheme, but the empire had been built upon free trade, and he only saw danger to the empire in these new proposals. Speaking at Sheffield on the 13th of October he criticized the scheme in more detail, and, as an Imperialist, warned the country against it, emphasizing his own ideal of the future of the empire—"a strong mother with strong children, each working out his own political and fiscal salvation." His

attitude on the new issue undoubtedly affected public opinion, and helped to draw him closer to the great body of the Liberal party, who saw that their identification with the cause of free trade was doing much to remove the public distrust associated with their support of Home Rule. On the 7th of November at Leicester Lord Rosebery insisted that what the country wanted was not fiscal reform but commercial reform, and he appealed to the free-trade section of the Unionist party to join the Liberals in a united defence,—an appeal incidentally for Liberal unity which was warmly seconded ten days later by Sir Henry Campbell-Bannerman. On the 26th of November Lord Rosebery's speech on the same lines at a meeting in South London resulted in a powerful demonstration in favour of his resuming the Liberal leadership, but he made no public response. On the 10th of June 1904 he addressed a meeting of the Liberal League at the Queen's Hall, London, and sketched a programme of "sane and practical Imperialism"; but he irritated the Home Rulers by again repudiating a parliament in Dublin, and he perplexed the public generally by his adverse criticism on the popular Anglo-French Agreement, which he was the only English statesman to oppose, on the ground of its handing over Morocco to France.

At Glasgow on the 5th of December he again outlined a Liberal programme, this and other speeches all leading to the assumption that his return to active co-operation with the Liberal party in the general election—which could not be long delayed—was fairly certain. Early in 1905 this impression gained such strength and such polite references were made to one another in public by Lord Rosebery and Sir Henry Campbell-Bannerman, that his assumption of office in a Liberal ministry, possibly presided over by Earl Spencer, was confidently anticipated. But these forecasts were ultimately upset, not only by Lord Spencer's illness and his removal from the list of possible Liberal prime ministers, but by Sir Henry Campbell-Bannerman's pronouncement at Stirling in November on the subject of Irish Home Rule. Lord Rosebery had just gone down to Cornwall to make a series of speeches in support of the Liberal programme, now fairly well mapped out as regards those items which represented the strong public opposition to what had been done by the Unionist government. It was believed that an understanding had been come to between his Liberal League henchmen (Mr Asquith, Sir E. Grey and Mr Haldane) and Sir Henry Campbell-Bannerman, and that Lord Rosebery's co-operation was to be secured by the adoption of some formula which would temporarily take Home Rule out of the official programme as a question of practical politics. But to the general surprise and Lord Rosebery's own very evident mortification Sir Henry went a long way in his Stirling speech to nail the Home Rule colour to the mast; he did not indeed propose to introduce a Home Rule Bill, but he declared his determination to proceed in Irish legislation on lines which would lead up to the same result. Lord Rosebery abruptly broke off his campaign, declaring at Bodmin (26th of November) that he would never "fight under that banner." From the moment the apparent recrudescence of the Liberal split over this question seemed to have misled Mr Balfour, who resigned office on the 4th of December, into thinking that difficulties would arise over the formation of a Liberal cabinet; but, whether or not the rumour was correct that a blunder had been made at Stirling and that explanations had ensued which satisfied Mr Asquith and Sir Edward Grey, this anticipation proved unjustified. Lord Rosebery himself, it is true, held aloof; his protest had been publicly made and he adhered to it in the absence of any public withdrawal by Sir Henry Campbell-Bannerman; but he encouraged his Liberal League supporters to be loyal to the new prime minister, and Mr Asquith, Sir E. Grey and Mr Haldane were included in the Liberal cabinet. The overwhelming Liberal and Labour victory at the general election of 1906 began a new era in the fortunes of the party, and Lord Rosebery's individuality once more sank back from any position of prominence in regard to its new programme. He remained outside party politics,

emerging only in 1909, first to attack Mr Lloyd George's budget in the country as a "revolution," and then—to the general surprise—to condemn the House of Lords in debate for rejecting it; and in 1910 (see PARLIAMENT) he appeared once more to be coming to the front, by the resolutions he carried in regard to the remodelling of the Upper Chamber, when the death of King Edward VII. caused a temporary postponement of the constitutional crisis. In September 1910 he acted as head of the special mission sent to the Austrian court by George V. to announce his accession to the throne,—a selection peculiarly appropriate, and cordially welcomed as such, because of his well-known Austrian sympathies. Indeed, in the East European crisis of 1909 Lord Rosebery had taken a somewhat isolated part in vindicating the attitude of Austria and her right to annex Bosnia-Herzegovina, in opposition to the criticisms generally passed in the English press.

After his retirement from active politics Lord Rosebery continually displayed his great qualities as a public speaker by eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke. His *Pitt* has already been mentioned; his *Appreciations and Addresses* and his *Peel* (containing a remarkable comment on the position of an English prime minister) were published in 1899; his *Napoleon: the Last Phase*—an ingenious, if paradoxical, attempt to justify Napoleon's conduct in exile at St. Helena—in 1900; his *Cromwell* in the same year. In 1906 he published an appreciation of his old friend Lord Randolph Churchill, inspired by the publication of Mr Winston Churchill's *Life of his father*. In its detached yet intimate way, this is a model of the art by which a good judge of men, possessed at the same time of a just historical sense, may, from the point of view of a contemporary on the opposite side in politics, correct the perspective of an official biography written under the limitations of filial obligation, and give tone and value to the picture of an interesting personality.

Lord Rosebery's family consisted of two sons and two daughters. His eldest son, Lord Dalmeny (b. Jan. 1882), who in 1909 married a daughter of Lord Henry Grosvenor, 3rd son of the 1st duke of Westminster, entered parliament in 1906 as Liberal member for Mid Lothian, but retired in 1910; he was well known as a cricketer, captaining the Surrey eleven in 1905 and 1906. The younger son, the Hon. Neil Primrose (b. Dec. 1882), took more actively than his brother to a political career, and in January 1910 was returned as a Liberal for the Wisbech division of Cambridgeshire. The elder daughter, Lady Sybil, in 1903 married Captain Charles Grant; the younger, Lady Margaret, in 1899 married the 1st earl of Crewe.

**ROSECRANS, WILLIAM STARKE** (1819-1898), American soldier, was born in Kingston, Ohio, on the 6th of September 1819, and graduated in 1842 from the U.S. Military Academy, being appointed to the engineers. After serving (1843-47) as assistant professor at West Point, and in fort construction, he resigned (April 1854) from the army and went into business in Cincinnati. On the outbreak of the Civil War Rosecrans volunteered for service under McClellan and helped raise the Ohio "Home Guards," with which he served in the West Virginian operations of 1861 in the rank of brigadier-general. He was second in command to McClellan during this campaign, and succeeded to the command when that officer was called to Washington. In the latter part of 1861 Rosecrans conducted further operations in the same region with great skill and success, and early in 1862 he was transferred to the West as a major-general of volunteers. He took part in the operations against Corinth, and when General John Pope was ordered to Virginia, Rosecrans took over command of the Army of the Mississippi with which he fought the successful battles of Tuka and Corinth. Soon afterwards he was ordered to replace D. C. Buell in command of the forces, renamed the Army of the Cumberland about the same time.

In December he advanced against General Braxton Bragg, and on the 31st of December to the 3rd of January was fought the bloody and indecisive battle of Stone River (Murfreesboro), after which Bragg withdrew his army to the southward. In 1863 Rosecrans, refusing to advance until the isolation of Vicksburg (farther west) was assured, did not take the offensive until late in June. The operations thus begun were most skillfully conducted, and Bragg was forced back to Chattanooga (*q.v.*), whence he had to retire on being once more outmanœuvred. But Rosecrans sustained a great defeat at the battle of Chickamauga (*q.v.*), and was soon besieged in Chattanooga. He was then relieved from his command. Later he did good service in Missouri, and in March 1865 he was made brevet major-general U.S.A. He resigned in 1867, and in the following year became minister to Mexico. Subsequently he was engaged in many railway and industrial enterprises in that country, as also in California. He was a representative in Congress from California, 1881-85, and register of the treasury, 1885-91. Under an act of Congress he was on the 2nd of March 1889 restored to the rank of brigadier-general, and retired. He died near Redondo, Cal., on the 11th of March 1898. On the 17th of May 1902 his body was reinterred with military honours in the National Cemetery at Arlington, in the presence of President Roosevelt, members of the cabinet and many of his campaigning comrades.

**ROSEGGER, PETER** (1843- ), Austrian poet and novelist, known down to 1894 under the pseudonym *Petri Kellenfeier*, was born at Alpl near Krieglach in Upper Styria, on the 31st of July 1843, the son of a peasant. Until his seventeenth year he was employed as a farm hand and received no regular school education, though he learnt reading and writing from a retired schoolmaster who lived near. Unfit, owing to physical weakness, for the hard labour of agriculture, he was apprenticed to a journeyman tailor, and on his wanderings employed his leisure hours in educating himself. He soon composed poems and wrote stories. Some of these productions he sent in 1864 to Dr Svoboda, the editor of the Graz *Tagespost*, who, recognizing Rosegger's extraordinary talent, interested himself in the young author, and with the assistance of friends enabled him to study (from 1865-69) at the Handelsakademie of Graz. In 1869, encouraged by Robert Hamerling, Rosegger published his first work, a volume of poems in Styrian dialect, *Zitker und Hackbrett*, which immediately established his reputation. As a result, the provincial diet of Styria accorded him a substantial *stipendium* (scholarship) for three years, which enabled him to supplement his studies by foreign travel. He now devoted himself entirely to authorship, and in 1876 founded the monthly periodical *Der Heimgarten*. On the occasion of the centenary of its reorganization the University of Heidelberg conferred upon him, in 1903, the honorary degree of doctor of philosophy.

Rosegger is one of the most fertile authors of recent times. His fresh natural style, sound judgment and his fascinating descriptions of Alpine scenery and the life of its inhabitants have made him one of the most popular authors of Austria and Germany. These characteristics are displayed to great advantage in *Die Schriften des Waldschuimers* (1875), *Aus meinem Handwerkerleben* (1880), *Alpengeschichten* (1896), *Als ich noch jung war* (1895), and in the lovely story *Mann und Weib* (1879), while his simple religious mind is shown in *Mein Himmelreich* (1901), *Erdegen* (1900) and *Dms ewige Licht* (1897), and his attachment to friends in *Gule Kameraden* (1893) and *Persönliche Erinnerungen an Roberi Hamerling* (1891). Among his other works may be mentioned a volume of poems, *Gedichte* (1891), a popular play, *Am Tage des Gerichts* (1892), two books for boys, *Waldferien* (1887) and *Waldjugend* (1900), and the stories *Das Sünderglück* (1904), *Wildlings* (1906) and *I.N.R.I.* *Frohe Botschaft eines armen Sünders* (1905), which has also been translated into English. He has also written several works which are autobiographical in character, such as *Waldheimat* (1873) and *Mein Wellleben* (1898).

Rosegger's *Ausgewählte Schriften* appeared in thirty volumes (1881-94); a popular edition (1895-1900); his *Schriften in steirischer Mundart* (3 vols., 1894-96). See also A. V. Svoboda, P. K. Rosegger (1886); A. Stern, *Studien zur Literatur der Gegend* (1895); and H. Möbius, P. Rosegger (1903).

**ROSELLINI, IPPOLITO** (1800-1843), Italian Egyptologist, was born at Pisa. He studied under Mezzolanti at Bologna, and

in 1824 became professor of oriental languages at Pisa University. He is best known as the associate of J. F. Champollion (q.v.), whose studies he shared and whom he accompanied in his Egyptian explorations (1828). On the death of Champollion the publication of the results of their expedition fell to Rosellini (*Monumenti dell' Egitto e della Nubia*, Florence, 1832-40, 10 vols. fol.).

**ROSEMARY**, botanically *Rosmarinus*, a Labiate plant, the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens, the other two, which are generally present in the family, being deficient. The fruit consists of four smooth nutlets. Botanically the genus is near to *Salvia*, but it differs in the shorter connective to the anther. Rosemary was highly esteemed by the ancients for its aromatic fragrance and medicinal uses. In modern times it is valued mainly as a perfume, for which purpose the oil is obtained by distillation. It doubtless has slight stimulant properties, such as are common to all volatile oils, which may account for the general belief in the efficacy of the plant in promoting the growth of the hair. Rosemary plays no unimportant part in literature and folk-lore, being esteemed as an emblem of remembrance. "There's rosemary, that's for remembrance," says Ophelia. Its use in connexion with funeral ceremonies is not extinct in country places to this day, and it was formerly much valued at wedding festivities. The name "ros marinus" or "ros maris," literally "sea-dew," was probably given in allusion to its native habitat in the neighbourhood of the sea.

**ROSENHEIM**, a town and watering-place of Germany, in the kingdom of Bavaria, situated at the confluence of the Mangfall and the Inn, 40 m. by rail S.E. of Munich. Pop. (1905) 15,403. It is an interesting town, with many mediæval houses. Among its seven churches the Roman Catholic parish church, with a curious cupola and containing numerous old tombs and effigies, and that of the Holy Ghost (15th century), are remarkable. There are a monastery, two convents, several schools and a hospital. Rosenheim is frequented for its saline and sulphur baths, and there are important saltworks, the brine being conveyed from Reichenhall in pipes; it has also machine factories, metalworks and breweries. Cordage is manufactured, and there is a trade in cattle and grain. Although founded in the 12th century Rosenheim did not become a town until 1864.

See Dittריך, *Rosenheim in Oberbayern* (Munich, 1870), and Eid, *Aus Altrosenheim* (Rosenheim, 1906).

**ROSENKRANZ, JOHANN KARL FRIEDRICH** (1805-1879), German philosopher, was born at Magdeburg on the 23rd of April 1805. He read philosophy at Berlin, Halle and Heidelberg, devoting himself mainly to the doctrines of Hegel and Schleiermacher. After holding the chair of philosophy at Halle for two years, he became, in 1833, professor at the university of Königsberg, where he remained till his death on the 14th of July 1879. In his last years he was quite blind. Throughout his long professorial career, and in all his numerous publications he remained, in spite of occasional deviations on particular points, loyal to the Hegelian tradition as a whole. In the great division of the Hegelian school, he, in company with Michelet and others, formed the "centre," midway between Erdmann and Gabler on the one hand, and the "extreme left" represented by Strauss, Feuerbach and Bruno Bauer.

Of his numerous writings, the following may be mentioned:—1. *Philosophical: Kritik der Schleiermacherschen Glaubenslehre* (1836); *Psychologie oder Wissenschaft vom subjektiven Geist* (1837; 3rd ed., 1863); *Kritische Erläuterungen des Hegelschen Systems* (1840); *Vorlesungen über Schelling* (1842); *System der Wissenschaft* (1850); *Meine Reform der Hegelschen Philosophie* (1852); *Wissenschaft der logischen Idee* (1858-59), with a supplement (*Epilogenoma*, 1862); *Hegels Naturphilosophie und die Bearbeitung derselben durch Vera* (1868); *Erläuterungen zu Hegels Encyclopädie der philosophischen Wissenschaften* (1871). Two other of his works on Hegel are important, the *Leben Hegels* (1844) and the *Hegel als deutscher*

*Nationalphilosoph* (1870). Between 1838 and 1840 in conjunction with F. W. Schubert, he published an edition of the works of Kant, to which he appended a history of the Kantian doctrine. 2. *Literary and General: Geschichte der deutschen Poesie im Mittelalter* (1850); *Handbuch einer allgemeinen Geschichte der Poesie* (1832-33); *Die Pädagogik als System* (1848); *Aesthetik des Hasslichen* (1853); *Die Poesie und ihre Geschichte* (1865); *Studien* (1859-47) and *New Studien* (1875-78). He published also an autobiography entitled *Von Magdeburg nach Königsberg* (1873), which deals with his life up to the time of his settlement at Königsberg. See Quübickler, *Karl Rosenkranz* (1899), and J. Hutchison Stirling, *The Secret of Hegel*, part 6.

**ROSENTHAL, TOBY EDWARD** (1848- ), American artist, was born at New Haven, Connecticut, on the 15th of March 1848. Removing to San Francisco with his parents in 1855, he there studied painting under Fortunato Arriola. In 1865 he went to Munich, where he was a pupil of the Royal Academy under Strachuber, Raupp and Piloty. Among his more important works are: "Morning Prayers" (Leipzig Museum), "Elaine," "Trial of Constance de Beverley," "Dancing Lesson During the Empire" and "Departure from the Family."

**ROSES, WARS OF THE**, a name given to a series of civil wars in England during the reigns of Henry VI., Edward IV. and Richard III. Their importance in the general history of England is dealt with elsewhere, and their significance in the history of the art and practice of war is small. They were marked by a ferocity and brutality which are practically unknown in the history of English wars before and since. The honest yeoman of Edward III.'s time had evolved into a professional soldier of fortune, and had been demoralized by the prolonged and dismal Hundred Years' War, at the close of which many thousands of ruffians, whose occupation had gone, had been let loose in England. At the same time the power of feudalism had become concentrated in the hands of a few great lords, who were wealthy enough and powerful enough to become king-makers. The disbanded mercenaries enlisted indifferently on either side, corrupting the ordinary feudal tenantry with the evil habits of the French wars, and pillaged the countryside, with accompaniments of murder and violence, wherever they went. It is true that the sympathies of the people at large were to some extent enlisted: London and, generally, the trading towns being Yorkist, the country people Lancastrian—a division of factions which roughly corresponded to that of the early part of the Great Rebellion, two centuries later, and similarly in a measure indicative of the opposition of hereditary loyalty and desire for sound and effective government. But there was this difference, that in the 15th century the feeling of loyalty was to a great extent focused upon the great lords. Each lord could depend on his own tenantry, and he could, further, pay large bands of retainers. Hence, much as the citizen desired a settlement, the issue was in the hands of the magnates; and as accessions to and defections from one party and the other constantly shifted the balance of power, the war dragged on, becoming more and more brutal with every campaign.

It is from the Wars of the Roses that there originated the deep-rooted dislike of the professional soldier which was for nearly four centuries a conspicuous feature of the English social and governmental system, and it is therefore in their results rather than their incidents that they have affected the evolution of war. They withdrew the English army system from European battlefields precisely at the moment of transition when the regimental and technical organization of armies was becoming a science and seeking models, and the all-powerful English longbow at the moment when the early, scarcely effective firearms were, so to speak, struggling for recognition as army weapons. On the other hand, they destroyed the British military organization. The national army, aloof from the main streams of military progress, remained for 150 years an aggregation of county levies armed with bills and bows. In so far as the king was permitted or able to raise armies, they were small mercenary forces formed, on a basis of unemployed professionals, from pressed men and criminals, and they were

disbanded as soon as the brief occasion for their services had passed.

The first campaign, or rather episode, of these wars<sup>1</sup> began with an armed demand of the Yorkist lords for the dismissal of the Lancastrian element in the king's council, Henry VI. himself being incapable of governing. The Lancastrians, and the king with them, marched out of London to meet them, and the two small armies (3000 Yorkists, 2000 Lancastrians) met at St Albans (May 22, 1455). The encounter ended with the dispersion of the weaker force, and the king fell into the hands of the Yorkists. Four years passed before the next important battle, Blore Heath, was fought (Sept. 23, 1459). In this the earl of Salisbury trapped a Lancastrian army in unfavourable ground near Market Drayton, and destroyed it; but new political combinations rendered the Yorkist victory useless and sent the leaders of the party into exile. They made a fresh attempt in 1460, and, thanks partly to treason in the Lancastrian camp, partly to the generalship of Warwick, won an important success and for the second time seized the king at Northampton (July 10, 1460). Shortly afterwards, after a period of negotiation and threats, there was a fresh conflict. Richard duke of York went north to fight the hostile army which gathered at York and consisted of Lancashire and Midland Royalists, while his son Edward, earl of March, went into the west. The father was ambushed and killed at Wakefield (Dec. 30, 1460), and the Lancastrians inspired as always by Queen Margaret of Anjou, moved south on London, defeated Warwick at St Albans (Feb. 17, 1461), and regained possession of the king's person. But the young earl of March, now duke of York, having raised an army in the west, defeated the earl of Pembroke (Feb. 2, 1461) at Mortimer's Cross (5 m. W. of Leominster). This was the first battle of the war which was characterized by the massacre of the common folk and beheading of the captive gentlemen—invariable accompaniments of Edward's victories, and conspicuously absent in Warwick's. Edward then pressed on, joined Warwick, and entered London, the army of Margaret retreating before them. The excesses of the northern Lancastrians in their advance produced bitter fruit on the retreat, for men flocked to Edward's standard. Marching north in pursuit, the Yorkists brought their enemy to bay at Towton (q.v.), 3 m. S. of Tadcaster, and utterly destroyed them (March 29, 1461). For three years after Towton the war consisted merely of desultory local struggles of small bodies of Lancastrians against the inevitable. The duke of York had become King Edward IV., and had established himself firmly. But in 1464, in the far north of England, the Red Rose was again in the field. Edward acted with his usual decision. His lieutenant Montagu (Warwick's brother) defeated and slew Sir Ralph Percy at Hedgley Moor, near Wooler (April 25, 1464), and immediately afterwards destroyed another Lancastrian army, with which were both Henry VI. and Queen Margaret, at Hexham (May 8, 1464). The massacres and executions which followed effectively crushed the revolt. For some years thereafter Edward reigned peacefully, but Warwick the king-maker and all the Neville following having turned against him (1470), he was driven into exile. But at a favourable moment he sailed from Flushing with 1500 retainers and Burgundian mercenaries, and eluding the Lancastrian fleet and the coast defence troops, landed at Ravenspur (Spurn Head) in Yorkshire in March 1471. His force was hardly more than a bodyguard; the gates of the towns were shut against him, and the country people fled. But by his personal charm, diplomacy, fair promises and an oath of allegiance to King Henry VI., sworn solemnly at York, he disarmed hostility and, eluding Montagu's army, reached his own estates in the Wakefield district, where many of his old retainers joined him. As

<sup>1</sup> The name, as is well known, comes from the "white rose of York" and the "red rose of Lancaster"; but these badges, though more or less recognized as party distinctions, by no means superseded the private devices of the various great lords, such as the "falcon and fetterlock" of Richard duke of York, the "rose in sun" of Edward IV., the "crowned swan" of Margaret, the Vere star, and even the revived "white hart" of Richard II.

he advanced south, a few Yorkist nobles with their following rallied to him, but it was far more the disunion of the Warwick and the real Lancastrian parties than his own strength which enabled him to meet Warwick's forces in a pitched battle. At Barnet, on Easter Eve, April 14, 1471, the decisive engagement was fought. But in the midst of the battle reinforcements coming up under the earl of Oxford to join Warwick came into conflict with their own party, the badge of the Vere star being mistaken for Edward's *Rose-en-soleil*. From that point all the mutually distrustful elements of Warwick's army fell apart, and Warwick himself, with his brother Montagu, was slain. For the last time the unhappy Henry VI. fell into the hands of his enemies. He was relegated to the Tower, and Edward, disbanding his army, reoccupied the throne. But Margaret of Anjou, his untiring opponent, who had been in France while her cause and Warwick's was being lost, had landed in the west shortly after Barnet, and Edward had to take the field at once. Assembling a fresh army at Windsor, whence he could march to interpose between Margaret and her north Welsh allies, or directly bar her road to London, he marched into the west on the 24th of April. On the 30th he was at Cirencester, Margaret, engaged chiefly in recruiting an army, near Bath. Edward hurried on, but Margaret eluded him and marched for Gloucester. At that place the governor refused the Lancastrians admittance, and seeking to cross the Severn out of reach of the Yorkists, they pushed on by forced marches to Tewkesbury. But Edward too knew how to march, and caught them up. The battle of Tewkesbury (May 4, 1471) ended with the destruction of Margaret's force, the captivity of Margaret, the death of her son Edward (who, it is sometimes said, was stabbed by Edward IV. himself after the battle) and the execution of sixteen of the principal Lancastrians.

This was Edward's last battle. The rest of his eventful reign was similar in many ways to that of his contemporary Louis XI., being devoted to the consolidation of his power, by fair means and foul, at the expense of the great feudatories. But the Wars of the Roses were not yet at an end. For fourteen years, except for local outbreaks, the land had peace, and then Richard III.'s crown, struck from his head on Bosworth Field (Aug. 22, 1485), was presented to Henry earl of Richmond, who, as Henry VII., established the kingship on a secure foundation. A last feeble attempt to renew the war, made by an army gathered to uphold the pretender Lambert Simnel, was crushed by Henry VII. at Stoke Field (4 m. S.W. of Newark) on the 16th of June 1487.

**ROSETTA** (Coptic *Rashiti*, Arabic *Rashid*), a town situated at the western or "Rosetta" mouth of the Nile on the west bank. It was called Bolbitine by the Greeks, but according to Herodotus the Bolbitine mouth was artificial, and it was evidently of little importance compared with the Canopic, Sebennytic and Pelusiac mouths. When the other branches and the Alexandria canal silted up, Rosetta prospered like its sister port of Damietta on the eastern branch; the main trade of the overland route to India passed through it until Mehemet Ali cut a new canal joining Alexandria to the Nile. Rosetta is now much decayed. Its population in 1907 was 16,810, almost entirely Mussulman. A railway joins it to Alexandria. The celebrated Rosetta Stone which supplied Champollion with the key for the decipherment of the ancient monuments of Egypt was found near Fort St Julien, 4 m. N. of the town, in 1799, by Boussard, a French officer. It is a basalt stele inscribed in hieroglyphic, demotic and Greek with a decree of the priests assembled at Memphis in favour of Ptolemy V. Epiphanes. It was ceded to the English at the capitulation of Alexandria (1801) and is now in the British Museum. See EGYPT: II. *Ancient Egypt*, section D. "Writing." (F. L. G.)

**ROSEWOOD**, the name given to several distinct kinds of ornamental timber. That, however, so called in the United Kingdom is Brazilian rosewood, the *palissandre* of the French, the finest qualities of which, coming from the provinces of Rio de Janeiro and Bahia, are believed to be the produce principally of *Dalbergia nigra*, a leguminous tree of large dimensions,

called *cabins* and *jacaranda* by the Brazilians. The same name, *jacaranda*, is applied to several species of *Machaerium*, also trees belonging to the natural order Leguminosae; and there can be no doubt that a certain proportion of the rosewood of commerce is drawn from these sources. Rosewood comes to the United Kingdom from Rio de Janeiro, Bahia, Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the centre. On this account squared logs or planks of rosewood are never seen, the wood being imported in half-round fitches 10 to 20 ft. in length and from 5 to 12 in. in their thickest part. Owing to its irregular form, the wood is sold by weight, and its value varies within wide limits according to the richness of colour. Rosewood has a deep ruddy brown colour, richly streaked and grained with black resinous layers. It takes a fine polish, but, on account of its resinous nature, it is somewhat difficult to work. The wood is very much in demand both by cabinet-makers and pianoforte-makers, by whom it is used both solid and in veneer.

The wood of *Dalbergia latifolia*, a native of the East Indies, used for ornamental furniture and carvings under the name of black wood, is frequently termed East Indian Rosewood. The *Bois de Rose* of the French, the Portuguese *Pao de Rosa*, and the German *Rosenholz* is a Brazilian wood, the produce of *Phytolymna floribundum*, called in the United Kingdom tulip wood, and very highly esteemed on account of its beautiful rose colour and grain.

**ROSICRUCIANISM.** What is known as the Society of Rosicrucians (*Rosenkreuzer*) was really a number of isolated individuals who early in the 17th century held certain views in common (which apparently was their only bond of union); for of a society holding meetings, and having officers, there is no trace. So far as the numerous works are concerned it is evident that the writers who posed as Rosicrucians were moral and religious reformers, and utilized the technicalities of chemistry (alchemy), and the sciences generally, as media through which to make known their opinions, there being a flavour of mysticism or occultism promotive of inquiry and suggestive of hidden meanings discernible or discoverable only by adepts.

The publication of the *Allgemeine und General-Reformation der ganzen weiten Welt* (Cassel, 1614), and the *Fama Fraternitatis* (Cassel, 1615) by the theologian Johann Valentin Andrea (1586-1654), caused immense excitement throughout Europe, and they not only led to many re-issues, but were followed by numerous pamphlets, favourable and otherwise, whose authors generally knew little, if anything, of the real aims of the original author, and doubtless in not a few cases amused themselves at the expense of the public. It is probable that the first work was circulated in MS. about 1610, for it is said that a reply was written in 1612 (according to Herder), but if so, there was no mention of the cult before that decade. The authors generally favoured Lutheranism as opposed to Roman Catholicism. Others, like John Heydon, admitted they were not Rosicrucians, but under attractive and suggestive titles to their works sought to make Hermeticism and other curious studies more useful and popular, and succeeded, for a time at least.

The curious legend, in which the fabulous origin of the so-called society was enshrined (that a certain Christian Rosenkreuz had discovered the secret wisdom of the East on a pilgrimage in the 15th century), was so improbable, though ingenious, that the genesis of the Rosicrucians was generally overlooked or ignored, but the worthy objects of the fratres were soon discovered and supported by several able men; the result being a mass of literature on the subject, which absorbs some 80 pages of Gardner's *Catalogue Raisonné of Works on the Occult Sciences* (London, 1903).

The influence that Rosicrucianism had in the modernizing of ancient Freemasonry early in the 18th century must have been slight, if any, though it is likely that as the century advanced, and additional ceremonies were grafted on to the first three degrees, Rosicrucian tenets were occasionally introduced into the later rituals. So far, however, as the real foundation ceremonies of Craft

Masonry are concerned, whether before or after the premier Grand Lodge was formed, it is most unlikely that such a society as the Freemasons would adopt anything of a really distinctive character from any other organization.

In *The Muses' Threnodie* by H. Adamson (Perth, 1638) are the lines—

"For what we do presage is riot in grose,  
For we are brethern of the Rosie Crose;  
We have the Mason Word and second sight,  
Things for to come we can fortell aright."

Dr Begegnan considers that possibly during the decade from 1720 to 1730 a kind of Rosicrucian or Hermetic influence took place in the lodges of London, some additions to the ritual of that period not having been derived from operative masonry; but in the previous century no such influence is traceable. Several modern societies have been formed from time to time (some of which are still flourishing in Great Britain) for the study of Rosicrucianism and allied subjects, but in no sense are they directly derived from the "Brethren of the Rosy Cross" of the 17th century, though keen followers thereof. By far the most important of these is the "Societas Rosicruciana in Anglia," with headquarters in London. The Supreme Magus, Dr William Wynn Westcott, has written its History (1900), with other important works on the subject, and the published *Transactions of the Society* are most valuable.

*The Rosicrucians, their Rites and Mysteries*, by Hargrave Jennings (three editions, 1870-87); *The Real History of the Rosicrucians, founded on their own Manifestoes and on Facts and Documents collected from the Writings of Initiated Brethren*, by A. E. Waite (1887); and *The Arcane Schools*, by John Yarker (1909), may be consulted with advantage, though not authorized publications of the Society. (W. J. H.)

**ROSIN** (a later variant of "resin," *q.v.*) or **COLOPHONY** (*Colophonia resina*, resin from Colophon in Lydia), the resinous constituent of the oleo-resin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleo-resin into the essential oil-spirit of turpentine and common rosin is effected by distillation in large copper stills. The essential oil is carried off at a heat of between 212° and 316° F., leaving fluid rosin, which is run off through a tap at the bottom of the still, and purified by passing through a straining wadding. Rosin varies in colour, according to the age of the tree whence the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale,—superior to which are W, "window glass," and WW, "water white" varieties, the latter having about three times the value of the common qualities. Rosin is a brittle and friable resin, with a faint piny odour; the melting-point varies with different specimens, some being semi-fluid at the temperature of boiling water, while others do not melt till 220° or 250° F. It is soluble in alcohol, ether, benzene and chloroform. Rosin consists mainly of abietic acid, and combines with caustic alkalis to form salts (rosinates or pinates) that are known as "rosin soaps." In addition to its extensive use in soap-making, rosin is largely employed in making inferior varnishes, sealing-wax and various cements. It is also used for preparing shoemaker's wax, as a flux for soldering metals, for pitching lager beer casks, for rosining the bows of musical instruments and numerous minor purposes. In pharmacy it forms an ingredient in several plasters and ointments. On a large scale it is treated by destructive distillation for the production of rosin spirit, pinoline and rosin oil. The last enters into the composition of some of the solid lubricating greases, and is also used as an adulterant of other oils.

The chief region of rosin production is the South Atlantic and Eastern Gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus australis*, and of the loblolly pine, *P. taeda*. The main source of supply in Europe is the "landes" of the departments of Gironde and Landes in France, where the cluster pine, *P. pinaster*, is extensively cultivated. In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris*, and throughout European countries local supplies are obtained from other species of pine.

**ROSKILDE**, or **ROESKILDE**, a town of Denmark in the *amti* (county) of Kjöbenhavn (Copenhagen), 20 m. by rail W. of Copenhagen, on the great lagoon-like inlet named Roskilde Fjord. Pop. (1901) 8368. It has a small port, and is an important railway junction, from which lines diverge W., S.W. and S. through the island of Zealand. Its interest, however, is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation. The cathedral, a beautiful church, was consecrated in 1084, but of this early building only foundation walls remain; the present structure of brick was begun in 1215, and enlarged and restored at various later dates. It stands in relation to Danish history somewhat as Westminster Abbey does to English, containing the tombs of most of the Danish kings from Harold I. (987). The most noteworthy architectural details are the Chapel of the Trinity (15th century) and that of Christian IV. (Renaissance, 1617), carved choir-stalls, and an altar-piece of the 16th century. Other old buildings are a church of Our Lady, dating as it stands from 1242, a diocesan library (partly of the 15th century), royal palace (1733) and institute for daughters of noblemen (1670).

**ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1ST BARON** (1824-1897), British colonial administrator, was born on the 19th of December 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, County Westmeath, from which he afterwards took his title. Passing from Sandhurst into the 87th Foot, he attained the rank of captain; but in 1846, through the influence of Lord Naas, he obtained a post in the Board of Public Works in Ireland, and subsequently became chief commissioner of fairs and markets. His energy in these positions, notably during the famine of 1848, and the clearness and vigour of his reports, secured for him at the age of thirty the office of president of the island of Montserrat. Subsequently he was governor of St Christopher, from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island; of Hong-Kong; of Ceylon (K.C.M.G. in 1869); and in 1872 of New South Wales. It fell to his lot to annex the Fiji Islands to the British Empire, and his services were rewarded in 1875 by promotion to G.C.M.G. In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba, and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory, and on the other hand a British party almost ready to despair of the British connexion. He was called home in 1883 to advise the government on the terms of the new convention concluded with the Transvaal Boers in February 1884. On his return to South Africa he found that a critical situation had arisen in Bechuanaland, where Boer commandos had seized large tracts of territory and proclaimed the "republics" of Stella and Goshen. They refused to retire within the limits of the Transvaal as defined by the new convention, and Robinson, alive to the necessity of preserving this country—the main road to the north—for Great Britain, determined on vigorous action. John Mackenzie and later Cecil Rhodes were sent to secure the peaceful submission of the Boers, but without immediate result, partly owing to the attitude of the Cape ministry. Robinson's declaration that the advice of his ministers to patch up a settlement with the filibustering Boers was equivalent to a condonation of crime, led to the expedition of Sir Charles Warren and the annexation of Bechuanaland early in 1885. The difficulties of Robinson's position were illustrated by the dispute which arose between him and Warren, who declared that the high commissioner's duties to the home government were at times in conflict with the action which, as governor of Cape Colony, he was bound to take on the advice of his ministers in the interests of the colony. Sir Hercules Robinson succeeded in winning the confidence of President Kruger by his fair-mindedness, while he seconded

Rhodes's efforts to unite the British and Dutch parties in Cape Colony. His mind, however, was that of the administrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1886 he investigated the charges brought against Sir John Pope-Hennessy, governor of Mauritius, and decreed his suspension pending the decision of the home authorities, who eventually reinstated Pope-Hennessy. In 1887 Robinson was induced by Rhodes to give his consent to the conclusion of a treaty with Lobengula which secured British rights in Matabel and Mashona lands. In May 1889 Robinson retired. In his farewell speech he declared that there was no permanent place in South Africa for direct Imperial rule. This was interpreted to mean that South Africa must ultimately become independent—an idea repugnant to him. He explained in a letter to *The Times* in 1895 that he had referred to the "direct rule of Downing Street over the crown colonies, as contrasted with responsible colonial government." He was made a baronet in 1891. Early in 1895, when he had entered his 71st year and was not in robust health, he yielded to the entreaties of Lord Rosebery's cabinet, and went out again to South Africa, in succession to Sir H. Loch. His second term of office was not fortunate. The Jameson Raid produced a permanent estrangement between him and Cecil Rhodes, and he was out of sympathy with the new colonial secretary, Mr Chamberlain, who had criticized his appointment, and now desired Robinson to take this opportunity of settling the whole question of the position of the Uitlanders in the Transvaal. Robinson answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He came home to confer with the government, and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on the 28th of October 1897, being succeeded in the title by his son.

**ROSMINI-SERBATI, ANTONIO** (1797-1855), Italian philosopher, was born at Rovereto in Italian Tirol on the 25th of March 1797. He belonged to a noble and wealthy family, but at an early age decided to enter the priesthood. After studying at Pavia and Padua, he took orders in 1821. In 1828 he founded a new religious order, the Institute of the Brethren of Charity, known in Italy generally as the Rosminians. The members might be priests or laymen, who devoted themselves to preaching, the education of youth, and works of charity—material, moral and intellectual. They have branches in Italy, England, Ireland, France and America. In London they are attached to the church of St Etheldreda, Ely Place, Holborn, where the English translation of Rosmini's works is edited. His works, *The Five Wounds of the Holy Church* and *The Constitution of Social Justice*, aroused great opposition, especially among the Jesuits, and in 1849 they were placed upon the Index. Rosmini at once declared his submission and retired to Stresa on Lago Maggiore, where he died on the 1st of July 1855. Before his death he had the satisfaction of learning that the works in question were dismissed, that is, proclaimed free from censure by the Congregation of the Index. Twenty years later, the word "dismissed" (*dimittantur*) became the subject of controversy, some maintaining that it amounted to a direct approval, others that it was purely negative and did not imply that the books were free from error. The controversy continued till 1887, when Leo XIII. finally condemned forty of his propositions and forbade their being taught.

In 1848 Rosmini took part in the struggle which had for its object emancipation from Austria, but he was not an initiator of the movement which ended in the freedom and unity of Italy. In fact, while eager for the deliverance of Italy from Austria, his aim was to bring about a confederation of the states of the country, which was to be under the control of the pope.

The most comprehensive view of Rosmini's philosophical standpoint is to be found in his *Sistema filosofico*, in which he set forth the conception of a complete encyclopaedia of the human knowable, synthetically conjoined, according to the order of ideas, in a perfectly harmonious whole. Contemplating the position of recent philosophy from Locke to Hegel, and having his eye directed to the ancient and fundamental problem of the origin, truth and certainty of our ideas, he wrote: "If philosophy is to be restored to love and respect, I think it will be necessary, in part, to return to the teachings of the ancients, and in part to give those teachings the benefit of modern methods" (*Theodicy*, n. 148). He examined and analyzed the fact of human knowledge, and obtained the following results: (1) that the notion or idea of being or existence in general enters into, and is presupposed by, all our acquired cognitions, so that, without it, they would be impossible; (2) that this idea is essentially objective, inasmuch as what is seen in it is as distinct from and opposed to the mind that sees it as the light is from the eye that looks at it; (3) that it is essentially true, because "being" and "truth" are convertible terms, and because in the vision of it the mind cannot err, since error could only be committed by a judgment, and here there is no judgment, but a pure intuition affirming nothing and denying nothing; (4) that by the application of this essentially objective and true idea the human being intellectually perceives, first, the animal body individually conjoined with him, and then, on occasion of the sensations produced in him *not by himself*, the causes of those sensations, that is, from the action felt he perceives and affirms an agent, a being, and therefore a true thing, that acts on him, and he thus gets at the external world,—these are the true primitive judgments, containing (a) the subsistence of the particular being (subject), and (b) its essence or species as determined by the quality of the action felt from it (predicate); (5) that reflection, by separating the essence or species from the subsistence, obtains the full specific idea (universalization), and then from this, by leaving aside some of its elements, the abstract specific idea (abstraction); (6) that the mind, having reached this stage of development, can proceed to further and further abstracts, including the first principles of reasoning, the principles of the several sciences, complex ideas, groups of ideas, and so on without end; (7) finally, that the same most universal idea of being, this generator and formal element of all acquired cognitions, cannot itself be acquired, but must be innate in us, implanted by God in our nature. Being, as naturally shining to our mind, must therefore be what men call the light of reason. Hence the name Rosmini gives it of ideal being; and this he laid down as the fundamental principle of all philosophy and the supreme criterion of truth and certainty. This he believed to be the teaching of St Augustine, as well as of St Thomas, of whom he was an ardent admirer and defender.

Of his numerous works, of which a collected edition in 17 volumes was issued at Milan (1842-44), supplemented by *Opere postume* in 5 vols. (Turin, 1850-74), the most important are the *New Essay on the Origin of Ideas* (Eng. trans., 1883); *The Principles of Moral Science* (1831); *The Restoration of Philosophy in Italy* (1836); *The Philosophy of Right* (1841-45). The following have also been translated into English: *A Catholic Catechism*, by W. S. Agar (1849); *The Five Wounds of the Holy Church* (abridged trans. with introd. by H. P. Liddon, 1853); *Maxims of Christian Perfection*, by W. A. Johnson (1880); *Psychology* (Anonymous) (1886-88); *Sketch of Modern Philosophy*, by Lockhart (1882); *The Ruling Principle of Method Applied to Education*, by Mrs W. Grey (Boston, Mass., 1887); *Select Letters*, by D. Gazzola. Rosmini's *Sistema filosofico* has been translated into English by Thos. Davidson (*Rosmini's Philosophical System*, 1882, with a biographical sketch and complete bibliography); see also *Lives* by G. S. Macwalter (1883) and G. B. Paganl (1907); C. Werner, *Die Italiens Philosophie des 19. Jahrhunderts* (1884); F. X. Kraus, "Antonio Rosmini: sein Leben, seine Schriften," in *Deutsche Rundschau*, liv. lv. (1888); "Church Reformation in Italy" in the *Edinburgh Review*, cxiv. (July 1861); and numerous recent Italian works, for which Baldwin's *Dictionary of Philosophy* or Pagliani's *Catalogo Generale* (Milan, 1905) should be consulted.

ROSNY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honoré Boëx, born at Brussels in 1856, and his brother Séraphin Justin François Boëx, born at Brussels in 1859. The novels of J. H. Rosny are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, sociology. The stories are approached from the point of view of society rather than of the individual, but the characters, strongly individualized and intensely real, are only incidentally typical. The elder Rosny was the sole author of the earlier novels, and began novel-writing as an avowed disciple of Zola. *Nell Horn, membre de l'Armée du salut* (1885) is a picture of London life and social reform; *Le Bilatral* (1886) and *Marc Fane* (1888) describe the revolutionary and anarchist parties of Paris; *L'Immolation* (1887) is a brutal story of peasant life; *Le Termite* (1890) is a picture of literary life in Paris; and *Vamirez* (1891), with *Erymah* (1895),

and *Les Profondeurs de Kyamo* (short stories, 1896) and others deal with prehistoric man. M. M. Rosny were among the writers who in 1887 entered a formal protest in the *Figaro* against Zola's *La Terre*, and they were designated by Edmond de Goncourt as original members of his academy. Among their later novels the more famous are: *Daniel Valgrais* (1891), a study in the possibilities of personal sacrifice; *L'Impitoyable Bonif* (1894), an indictment of Parisian charity; *L'Indompté* (1895), the history of a girl medical student in Paris; *Le Serment* (1896, dramatized 1897); *Les Ames perdues* (1899), another anarchist novel; *La Charpenie* (1900); *Thérèse Degaudy* (1902); *Le Crime du docteur* (1903); *Le Docteur Harambur* (1904); *Le Millionnaire* (1905); and *Sous le fardeau* (1906).

ROSS, ALEXANDER (1699-1784), Scottish poet, was born on the 13th of April 1699 at Kincardine-O'Neil, Aberdeenshire. He was educated at Marischal College, Aberdeen, and became tutor to the children of Sir William Forbes of Craigievar. He became in 1733 schoolmaster of Lochlee, Angus, where the rest of his life was spent. He had long been in the habit of writing verse for his own amusement, when in 1768 he published, at the suggestion of James Beattie, *The Fortunate Shepherdess . . . to which is (sic) added a few songs*. This is a pastoral narrative poem, written in obvious imitation of Allan Ramsay's *Gentle Shepherd*. Its affectations are chiefly on the surface. The background of shepherd life as known to Ross, and the rather sordid motives of the characters, despite their high-sounding names of Helenore, Rosalind, &c., are depicted with uncompromising truth. He died at Lochlee, and was buried on the 26th of May 1784.

See *Helenore, or the Fortunate Shepherdess*, edited by John Longmuir (1866); also H. Walker, *Three Centuries of Scottish Literature* (1893), ii. 28-34. The bulk of Ross's writings remain in MS.

ROSS, GEORGE WILLIAM (1841- ), Canadian politician, was born near Nairn, Middlesex county, Ontario, on the 18th of September 1841, the son of James Ross and Ellen McKinnon, natives of Ross-shire, Scotland. From 1872-1883 he was a Liberal member of the Federal House; from 1883-99 minister of education in the legislature of the province of Ontario; and from 1899-1905 premier and treasurer of that province. In 1905 his government was defeated, and in 1907 he retired to the Canadian Senate. He was for many years an advocate of total abstinence, and a well-known speaker on imperial questions.

ROSS, SIR HEW DALRYMPLE (1770-1868), British soldier, entered the Royal Military Academy, Woolwich, in 1793, and passed out into the Royal Artillery two years later. With the Royal Horse Artillery he saw active service during the Irish rebellion of 1798, and after eleven years' service was promoted captain and appointed to command "A" troop R.H.A. (afterwards famous as the "Chestnut Troop"). In 1809 the troop landed at Lisbon and at once set out to join Wellington's army, reaching the front two days after Talavera. Ross's guns were attached to the Light Division, and, with Craufurd, took part in the actions on the Coa and the battle of Busaco. When Masséna began his famous retreat from the lines of Torres Vedras, Ross's troop was amongst the foremost in the pursuit; at Redinha and Pombal, at Sabugal and Fuentes d'Onor, the "Chestnuts" earned great distinction, and in December 1811 their commander received a brevet-majority for his services. He was present at Ciudad Rodrigo and Badajoz, at the Salamanca forts and the battle of Salamanca, still attached to the Light Division. In the campaign of Vittoria, Ross's guns were continually with the most advanced troops, and after Vittoria they captured the only piece of artillery that remained to the defeated French. A further brevet-promotion and a good service reward came to Ross for his part in the campaign. At Vera in the Pyrenees Ross's troop was one of the three which played a decisive part in the action, and Vera remains a classical example of the action of horse artillery. "A" troop was engaged at St Pierre and Orthez, and at the conclusion of peace returned to England. It was engaged at Waterloo, and though half its guns were disabled the remainder

took part in the pursuit of the French. Ross received, besides the Peninsular and Waterloo medals, the K.C.B., the Portuguese order of the Tower and Sword and the Russian St Anne. He had commanded the troop for nineteen years when he at last received a regimental lieutenant-colonelcy. As officer commanding Royal Artillery in the Northern District, with delegated command over all the forces of the four northern counties, Sir Hew Ross had for nearly sixteen years to deal with continually threatened civil disorder, and bore himself as well as on the field of battle. From 1840 to 1858, when he retired, he practically directed, in one post or another, all the artillery services of the British army, and when in 1854 the test of war came, the artillery took the field in a far better condition than the rest of Lord Raglan's army. Much of the present efficiency of the "Royal Regiment" is directly traceable to the influence of Sir Hew Ross, to whom it owes the institution of the School of Gunnery at Shoeburyness and the establishment of the Royal Artillery Institution at Woolwich. Major-general in 1841 and lieutenant-general in 1851, he became general in 1854, and died, a field-marshal and G.C.B., in 1868.

See Memoir of the R.A. Institution, 1871; and Duncan, *History of the Royal Regiment of Artillery*.

**ROSS, SIR JAMES CLARK** (1800-1862), British rear-admiral and Polar explorer, was born in London on the 15th of April 1800. He entered the navy in 1812 under his uncle, Captain (afterwards Sir) John Ross, whom he accompanied on his first Arctic voyage in search of a North-West passage (1818). Between 1819 and 1827 he returned four times to the same seas in the Arctic expeditions under Parry, and in 1829-33 again served on the same mission under his uncle, and while thus employed determined (1831) the position of the North Magnetic Pole. In 1834 he was promoted captain, and from 1835-38 was employed on the magnetic survey of Great Britain. In 1839-43 he commanded the Antarctic expedition of the "Erebus" and "Terror" (see POLAR REGIONS), and for this service he received a knighthood (1844) and was nominated to the French order of the Legion of Honour. He published a narrative of this expedition under the title of *A Voyage of Discovery and Research to Southern and Antarctic Regions* (1847), and was the author also of various reports on zoological and other matters relating to his earlier voyages. He was elected to the Royal Society in 1848, and in that year made his last expedition, as captain of the "Enterprise," in the first Franklin search expedition. He died at Aylesbury on the 3rd of April 1862.

**ROSS, JOHN, OR KOESKOOWE** (1790-1866), chief of the Cherokee Indian Nation, was of Scotch-Indian descent, and was born among the Cherokees in Georgia in 1790. In 1819-1827 he was president of the Cherokee national committee, in July 1827 he presided over the Cherokee constituent assembly, and under the constitution which it drafted he was principal chief from 1828 until his death. In 1830-31 he applied to the Supreme Court of the United States for an injunction restraining the state of Georgia from executing its laws within the Cherokee territory, but the court dismissed his suit on the ground that it had no jurisdiction. There was a small party among the Cherokees under the leadership of John Ridge, a subchief, who were early disposed to treat with the United States for the removal of their nation west of the Mississippi, and in February 1835, while negotiations with Ridge were progressing at Washington, Ross proposed to cede the Cherokee lands to the United States for \$20,000,000. The United States Senate resolved that \$5,000,000 was sufficient. The treaty negotiated by the Ridge party and the proposal to treat on the basis of a \$5,000,000-payment were both rejected in a full council of the Cherokees held in October 1835. The council authorized Ross to renew negotiations, but before leaving for Washington he was arrested by the Georgia authorities on the ground that he was a white man residing in the Indian country contrary to law. Ross was soon released, but in December of this year a few hundred Cherokees met the United States Indian commissioner at New Echota and concluded with him a treaty of removal. When Ross learned this he called a

council to meet in February 1836, and at this meeting the treaty was declared null and void and a protest against the proceedings at New Echota was signed by more than 12,000 Cherokees. Notwithstanding Ross's opposition, the Senate in the following May ratified the treaty by a vote exceeding by one the necessary two-thirds majority, and in December 1838, Ross, with the last party of Cherokees, left for the West (see GEORGIA). During the Civil War, Ross first urged upon the Cherokee Nation a policy of friendly inactivity; in May 1861, proclaimed a strict neutrality; in October 1861, signed a treaty with the Confederate States; in the summer of 1862 was forced (by Union sympathizers in the Nation) to proclaim neutrality again; soon afterwards went over to the Union lines; and was in Washington treating with the Federal government in February 1863 when the treaty with the Confederate States was abrogated by the Cherokees. He died at Washington on the 1st of August 1866.

See C. C. Royce, "The Cherokee Nation of Indians" in the *Fiftieth Annual Report of the Bureau of Ethnology* (Washington, 1887), and T. V. Parker, *The Cherokee Indians* (New York, 1907).

**ROSS, SIR JOHN** (1777-1856), British rear-admiral and Arctic explorer, son of the Rev. Andrew Ross, minister of Inch Wigtonshire, entered the Royal Navy in 1786, serving in the Mediterranean till 1789, and afterwards in the Channel. In 1808 he acted as captain of the Swedish Fleet, and in 1812 was promoted commander. Six years later he was given the command of an Arctic expedition fitted out by the Admiralty, the first of a new series of attempts to solve the question of a North-West passage. This expedition failed to discover much that was new, and somewhat prejudiced the Arctic reputation of its leader, who attained the rank of captain on his return. But in 1829, through the munificence of Mr (afterwards Sir) Felix Booth, he was able to undertake a second Arctic expedition, which, during an absence of four years, achieved important geographical and scientific results. On his return Captain Ross was the recipient of gold medals from the English and French geographical societies, and of various foreign orders, including a knighthood of the Pole Star of Sweden, and in the following year (1834) received a knighthood and a C.B. at home. In 1850 he undertook a third voyage to the Arctic regions, this time in search of Sir John Franklin, and in the following year he attained flag-rank. His publications include—*Voyage of Discovery for the Purpose of Exploring Baffin's Bay* (1814), *Narrative of a Second Voyage in Search of a North-West Passage, including the Discovery of the North Magnetic Pole* (1835), *Memoirs and Correspondence of Lord De Saumarez* (1838).

**ROSS, ROBERT** (1766-1814), British major-general, entered the 25th Foot at the age of nineteen, and in 1795 became captain in the 7th Regiment, obtaining a half-pay majority a few months later. As a major of the 20th he served in Holland under the duke of York in 1799. At the action of Krabbendam the regiment greatly distinguished itself, though largely composed of raw militia recruits. Ross was here severely wounded. In 1801 the 20th went to Egypt and took part in the operations which led to Menou's surrender. In 1803, though lieutenant-colonel only by brevet, Ross succeeded to the command, and at once initiated a severe system of training barracks and in the field, in his regiment. The result of this was apparent when under Sir John Stuart's command the regiment proceeded to Naples. The 20th played a decisive part in the brilliant action of Maida, and distinguished itself not only in the subsequent storm of the castle of Scylla. In 1805, Ross and the 20th formed part of Anstruther's brigade of John Moore's army in Spain, and though the statement of the 20th, owing to its good discipline, suffered less loss than other regiments in the retreat on Corunna is incorrect, the 20th regiment was among the best disciplined in the army. In 1807 in 1809 it was sent to Walcheren, where fever soon laid off two-thirds of the men. Ross and his regiment were then sent to Ireland to recover, and here the colonel repeated the course of drill and manoeuvre which had so markedly improved the 20th in Malta. He received a gold medal for Corunna and a sword of honour for Maida (which action had already won him

gold medal). At the end of 1812 the 20th was again engaged in the Peninsula, and Major-General Ross early in the following year received a brigade command in Cole's division. Scarcely engaged at Vittoria, Ross's brigade played a distinguished part in the operations around Pamplona, and the 20th covered itself with glory at Roncesvalles and Sorrauren. At Orthez Ross was severely wounded at the head of the brigade, which was assaulting the village of St. Bot's. He was among those who received the thanks of parliament for this battle, and he received the gold medal for Vittoria and the Peninsula gold medal. At the end of the war Ross was sent in command of a brigade to harry the coast of North America, and with 4500 men and three light guns landed in Maryland. At Bladensburg the Americans stood to fight in a strong position, but Ross's men routed them (Aug. 24, 1814). The same evening Washington was entered, and the public buildings having been destroyed, the expedition re-embarked. This short and brilliant campaign excited the admiration of soldiers, critics and public alike, but the commander did not live to receive his reward. A few days later an expedition against Baltimore was undertaken; skirmishing soon began, and one of the first to fall was Ross. A public monument was erected to his memory in St Paul's Cathedral, and others at his residence at Rosstrevor and at Halifax, N.S. His family was granted the name Ross of Bladensburg by royal letters-patent.

See *Gentleman's Magazine*, 1814, ii. 483; Cole, *Peninsular Generals*; Smythe, *History of the 20th Regiment*.

ROSS, a market town in the Ross parliamentary division of Herefordshire, England; 133 m. W. by N. from London and 12 S.E. from Hereford by the Great Western railway. Pop. of urban district (1901) 3303. It occupies a fine position on and about a rocky eminence on the left bank of the river Wye. There are manufactures of machinery and agricultural implements, and trade in the products of the district, such as cider and malt, and several fairs are held annually. The church of St. Mary the Virgin stands high, and is surmounted by a lofty spire; it shows good Decorated and Perpendicular work. A beautiful terrace called the Prospect adjoins the churchyard and overlooks the river. The market house, dated 1670, is a picturesque building supported on columns, the upper portion serving as a town hall. There are in the town many memorials of John Kyrie, the Man of Ross, who died here in 1724, and is eulogized by Pope in his third *Moral Epistle* (1732). The Prospect was acquired and laid out by Kyrie, who also planted the fine elm avenues near the church; his house stands opposite the market house, where he disbursed his charities; he erected the church spire, and is buried in the chancel, where his grave remained without a monument until Pope called attention to the omission. Nearly opposite the town is Wilton Castle, which defended the ford in the disturbed reign of Stephen, and suffered in the Civil Wars, being held for the Parliament and burned by the Royalists. The inhabited portion is modern. Four miles below Ross the important ford of Goodrich probably carried traffic in British and Roman times, and a magnificent castle, on a precipice rising sheer above the right bank of the river, commands it. The keep is doubtfully assigned to a date previous to the Conquest; the important position on the Welsh March led to several subsequent additions, especially in the 14th century, and the castle was only dismantled by order of the Parliamentarians after it had strongly resisted their arms on behalf of Charles I. in 1646, being the last to fall of the royal strongholds in this country.

Ross (*Rox, Rosse*) was granted to the see of Hereford by Edmund Ironside, but became crown property by an exchange effected in 1550. It derived importance from its situation on the road to South Wales. In 1305, only, it was represented in parliament by two members; but it was never incorporated, and was governed by appointees of the manor court, until the Ross Improvement Act of 1865 established elected commissioners of the borough. Fairs on the days of the Ascension, Corpus Christi, St. Margaret and St. Andrew were conferred by Henry III., and were in existence in 1888. A market every

Thursday was granted by Stephen and confirmed by Henry III.; Friday is now market day.

ROSS AND CROMARTY, a northern county of Scotland. The mainland portion is bounded N. by Sutherland and Dornoch Firth, E. by the North Sea and Moray Firth, S. by Beaulie Firth and Inverness-shire and W. by the strait of the Minch. The island portion, consisting of as much of the island of Lewis as lies north of a line drawn from Loch Resort to Loch Scaforth, is bounded on the W., N. and E. by the Atlantic, and S. by Harris, the southern part of Lewis. Many islands, all but eleven uninhabited, are scattered principally off the west coasts of Lewis and the mainland. The area of the mainland is 1,572,294 acres and of the islands 404,413 acres, giving a total for the county of 1,976,707 acres or 3088.6 sq. m. The inhabited islands belonging to the mainland are all situated off the west coast. They are Gilean (lighthouse) in the parish of Lochalsh, Croulin in Applecross, Horisdale, Dry and Ewe in Gairloch parish, and Martin and Tanera More, of the group of the Summer Isles in the parish of Lochbroom. On the North Sea front the chief indentations are Beaulie Firth and Inner Moray Firth, marking off the Black Isle from Inverness-shire; Cromarty Firth, bounding the districts of Easter Ross and the Black Isle; Moray Firth, separating Easter Ross from Nairnshire; and Dornoch Firth, dividing north-east Ross from Sutherlandshire. On the Atlantic face—which is a coastline of more than 300 m.—the principal sea lochs and bays, from S. to N., are Loch Duich, Loch Alsh, Loch Carron, Loch Kisbarn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gairloch, Loch Ewe, Gruinard Bay, Little Loch Broom and Enard Bay. The chief capes are Tarbat Ness on the east coast, and Coygach, Greenstone, Reidh, Red and Hamha Points on the west. Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, among them being An Rìabhachan (3696), Sgurr na Lapaich (3773), Carn Eige (3877), Mam Soul (3862), Ben Attow (3383), Scour Oruan (3595), famous for its view from the summit, Ben Mohr (3570) and the Saddle (3317). To the north of Glen Torridon occur the masses of the Liatach, with peaks of 3456 and 3358 ft., and Ben Eay with four peaks above 3000 ft. each. On the north-eastern shore of Loch Maree rises Ben Slioch (3217), while the Fannich group contains at least six peaks of more than 3000 ft. The immense isolated bulk of Ben Wyvis (3429), and its subordinate peaks An Socach (3295) and An Cabar (3106), is the most noteworthy feature in the north-east, and the Challich Hills in the north-west with peaks of 3483 and 3474 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest stream is the Orrin, which rises in An Sìthean and pursues a course mainly E. by N. to its confluence with the Conon after a run of about 26 m., during a small part of which it forms the boundary with Inverness-shire. At Aultgowrie the stream rushes through a narrow gorge where the drop is considerable enough to make the falls of Orrin. From its source in the mountains in Strathvaich the Blackwater flows S.E. for 19 m. till it joins the Conon, forming soon after it leaves Loch Garve the small but picturesque falls of Rogie. Within a short distance of its exit from Loch Luichart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 m., mainly E. to the head of Cromarty Firth. The falls of Glomach, in the south-west, are the deepest in the United Kingdom. The stream giving rise to them drains a series of small lochs on the northern flanks of Ben Attow and, in an almost unbroken sheet about 40 ft. broad, effects a sheer leap of 370 ft., and soon afterwards ends its course in the Elchaig. The falls are usually visited from Invershiel, 7 m. to the south-west. Twelve miles south by east of Ullapool, on the estate of Braemore, are the falls of Measach, formed by the Droma, a head-stream of the Broom. The cascades, three in number, are close to the gorge of Corriehalloch. The Oyckell, throughout its course, forms the boundary with Sutherlandshire, to which

it properly belongs. The largest and most beautiful of the many freshwater lakes is Loch Maree (*q.v.*), but a few of the others are interesting. In the far north-west, 243 ft. above the sea, lies Loch Skinaskink, a lake of such irregularity of outline that it has a shore-line of 17 m. It contains several islands covered with rich woods affording a shelter to deer, and drains into Enard Bay by the Polly. Lochan Fada (the "long loch"), 1005 ft. above the sea, is  $\frac{3}{4}$  m. in length, has a greatest breadth of  $\frac{1}{2}$  m., covers an area of  $1\frac{1}{2}$  sq. m., and is 248 ft. deep, with a mean depth of 102 ft. Once drained by the Muic, it has been tapped a little farther west by the Fhasaigh, which has lowered the level of the lake sufficiently to behead the Muic. Other lakes are, north of Loch Maree, Loch Fionn (the "white" or "clear" lake), 8 m. long by 1 m. wide, famous for its heronries; towards the centre of the shire, Loch Luichart (5 m. long by from  $\frac{1}{2}$  m. to nearly 1 m. wide), fringed with birches and having the shape of a crescent; the mountain-girt Loch Fannich (7 m. long by 1 m. wide); and the wild narrow lochs Monar (4 m. long) and Mullardoch (5 m. long), on the Inverness-shire boundary. Of the straths or valleys the more important run from the centre eastwards, such as Strathconon (12 m.), Strathbran (10 m.), Strathgarve (8 m.), Strathpeffer (6 m.) and Strathcarron (14 m.). Excepting Glen Orrin (13 m.), in the east central district, the longer glens lie in the south and towards the west. In the extreme south Glen Shiel (9 m.) runs between fine mountains to its mouth on Loch Duich. General Wade's road passes down the glen. Farther north are Glen Elchaig (9 m.), Glen Carron (12 m.), in the latter of which the track of the Dingwall & Skye railway is laid, and Glen Torridon (6 m.).

**Geology.**—The central portion of this county is occupied by the younger highland schists or Dalradian series. These consist of quartzites, mica-schists, garnetiferous mica-schists and gneisses, all with a gentle inclination towards the S.E. On the eastern side of the county the Dalradian schists are covered unconformably by the Old Red Sandstone; the boundary runs southward from Edderton on Dornoch Firth, by Strathpeffer, to the neighbourhood of Beaulieu. These rocks comprise red flags and sandstones, grey bituminous flags and shales. An anticlinal fold with a S.W.-N.E. axis brings up the basal beds of the series about the mouth of Cromarty Firth and exposes once more the schists in the Sutors guarding the entrance to the firth. The western boundary of the younger schist is formed by the great pre-Cambrian dislocation line which traverses the county in a fairly direct course from Elphin on the north by Ullapool to Glencarron. Most of the area west of the line of disturbance is covered by Torridonian Sandstone, mainly dark reddish sandstones, grits and shales, resting unconformably on the ancient Lewisian gneiss with horizontal or slightly inclined bedding. The unconformity is well exposed on the shores of Gairloch, Loch Maree and Loch Torridon. These rocks, which attain a considerable thickness and are divisible into three sub-groups, build up the mountain districts about Applecross, Coigach and elsewhere. Within the Torridonian tract the older, Lewisian gneiss occupies large areas north of Coigach, on the east of Enard Bay, between Gruinard Bay and Loch Maree; between the last named and Gairloch, on both sides of middle Loch Torridon and at many other spots smaller patches are to be found. The Lewisian gneiss is everywhere penetrated by basic dikes, generally with a N.W.-S.E. direction; some of these are of great breadth. The Torridonian rocks are succeeded unconformably by a series of Cambrian strata which is confined to a variable but, on the whole, narrow belt lying west of the line of main thrusting. This belt of Cambrian rocks has itself suffered an enormous amount of subordinate thrusting. It is composed of the following subdivisions in ascending order: false-bedded quartzite, "Pipe Rock" quartzite, fucoid beds and *Olenellus* band, serpulite grit, Durness dolomite and marble, Durness dolomite and limestone: but these are not always visible at any one spot. So great has been the disturbance in the region of thrusting that in some places, as in the neighbourhood of Loch Kishora and elsewhere, the rocks have been completely overturned and the ancient gneiss has been piled upon the Torridonian. On the shore of Moray Firth at Rastick a small patch of Kimeridge shale occurs; and beneath the cliffs of Shandwick there is a little Lower Oolite with a thin seam of coal. Glacial striations are found upon the mountains up to heights of 3000 ft., and much boulder clay is found in the valleys and spread over large areas in the eastern districts. Raised beaches occur at 100, 50 and 25 ft. above the present sea-level; they are well seen in Loch Carron. Lewis, on Long Island, is made almost entirely of ancient "Lewisian gneiss," but a little Torridonian occurs about Stornoway.

**Climate and Agriculture.**—On the west coast the rainfall is excessive, averaging for the year 50.42 in. at Loch Broom and

62 in. at Strome Ferry (autumn and winter being the wettest seasons), but on the east coast the annual is only mean 27 in. The temperature for the year is 46.5° F., for January 38° F. and for July 57° F. The most fertile tracts lie on the eastern coast, especially in Easter Ross and the Black Isle, where the soil varies from a light sandy gravel to a rich deep loam. Among grain crops oats is that most generally cultivated, but barley and wheat are also raised. Turnips and potatoes are the chief green crops. On the higher grounds there is a large extent of good pasture which carries heavy flocks of sheep, blackfaced being the principal breed. Most of the horses, principally half-breeds between the old garrons (hardy, serviceable, small animals) and Clydesdales, are maintained for the purposes of agriculture. The herds of cattle, mainly native Highland or crosses, are large, many of them supplying the London market. Pigs are reared, though in smaller numbers than formerly, most generally by the crofters. Owing partly to the overcrowding of the island of Lewis and partly to the unkindly nature of the bulk of the surface—which offers no opportunity for other than patchwork tillage—the number of small holdings is enormous, Sutherlandshire alone amongst Scottish counties showing an even larger proportion of holdings under 5 acres; while the average size of all the holdings throughout the shire does not exceed 20 acres. About 800,000 acres are devoted to deer forests, a greater area than in any other county in Scotland, among the largest being Achanshallach (50,000 acres), Fannich (20,000), Kinlochchearg (20,000), Braemore (40,000), Inchbae (21,000) and Duadonnell (23,000). At one time the area under wood must have been remarkable, if we accept the common derivation of the word "Ross" as from the Irish *ros*, "a wood," and there is still a considerable extent of native woodland, principally fir, oak, ash and alder. The fauna is noteworthy. Red and roe deer abound, and foxes and alpine hares are common, while badgers and wild cats are occasionally trapped. Winged game are plentiful, and amongst birds of prey the golden eagle and osprey occur. Waterfowl of all kinds frequent the sea lochs; many rivers and lakes are rich in salmon and trout, and the pearl mussel is found in the bed of the Conon.

**Other Industries.**—Apart from agriculture, the fisheries are the only considerable industry, the county containing two fishery districts—Stornoway and Cromarty—and portions of two others—Loch Broom (the remainder belonging to Sutherlandshire) and Loch Carron (which includes part of Inverness-shire). Herring, cod and ling form the principal catch, while salmon are taken in large quantities in the bays and at the mouth of rivers. Distilleries are found near Dingwall, Tain and some other places, and there is a manufacture, on a very limited scale, of woollens, chemical manures and aerated waters, besides some sandstone quarrying and flour mills. At Muir of Ord, in the parish of Urray, are held great horse, cattle and sheep markets.

The Highland railway entering the county to the north of Beaulieu runs northwards to Dingwall, and then strikes off to the north-east by Invergordon and Tain, where it bends to the west by north, leaving the shire at Culrain, having largely followed the coast throughout. At Muir of Ord it sends off the Black Isle branch and at Dingwall a branch to Strathpeffer, as well as a line to Strome Ferry and Kyle of Lochalsh on the south-western shore. Coaches connect various districts with stations on the Dingwall & Skye railway.

**Population and Administration.**—The population of the county in 1891 was 78,727, and in 1901 that of the mainland was 47,501, and of the islands 28,949, an aggregate of 76,450 or 25 to the sq. m. Thus Ross and Cromarty, though the third largest in size, is the least populated county in Scotland, excepting Sutherland, Inverness and Argyll. In 1901 there were 12,171 persons who spoke Gaelic only (of whom 9028 belonged to the islands) and 39,392 speaking Gaelic and English (of whom 15,990 were insular). The chief towns and villages are Stornoway (pop. 2854), Dingwall (2485), Fortrose (1322), Tain (2067), Cromarty (1242), Invergordon (1085). Ullapool is a small fishing port near the mouth of Loch Broom. For administrative purposes the county is divided into six districts, namely, Black Isle (pop. 6271), Easter Ross (12,192), Lewis (28,760), Mid Ross (12,953), South-Western Ross (4103) and Western Ross (5394). The county returns one member to parliament, and Cromarty, Dingwall and Tain belong to the Wick group of parliamentary burghs, and Fortrose to the Inverness group. Excepting Cromarty, these are royal burghs, and Dingwall is the county town. Ross and Cromarty forms a sheriffdom with Sutherlandshire, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain and Cromarty. The shire is under school-board control, and there are academies at Tain, Dingwall and Fortrose, while several schools earn grants for higher education. The county council gives the "residuum" grant

idea of gaining what advantages he could in a partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was covered by no serious natural obstacle), and to deploy in battle array, facing north, between Reichardtswerben (right) and Pettstädt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which threatened to cut off Frederick from the towns on the Saale. This position, equally, could only be gained by marching round the Prussian flank, *i.e.* by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rossbach. The initial stages of their movement convinced him that the Allies were retreating southward towards their magazines, and about noon he went to dinner, leaving Captain von Gaudi on the watch. This officer formed a different impression of the Allies' intentions, for the columns which from time to time became visible in the undulations of the ground were seen to turn eastwards from Zeuchfeld. Gaudi's excited report at first served only to confirm Frederick in his error. But when the king saw for himself that hostile cavalry and infantry were already near Pettstädt, he realized the enemy's intentions. The battle for which he had manoeuvred in vain was offered to him, and he took it without hesitation. Leaving a handful of light troops to oppose the French advanced post (or flank guard) on the Schortau hill, the Prussian army broke camp and moved—half an hour after the king gave the order—to attack the enemy. The latter were marching in the normal order in two main columns, the first line on the left, the second line on the right; farther to the right was a column consisting of the reserve of foot, and between the first and second lines was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first the regulation distances were preserved, but when wheeling eastward at Zeuchfeld there was much confusion, part of the reserve infantry getting in between the two main columns and hampering the movement of the reserve artillery, and the rest on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rossbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to retreat in order to avoid being taken in flank and rear; and the Allied generals thereupon hurried the march, sending on the leading (right-wing) cavalry towards Reichardtswerben, and calling up part of the left-wing cavalry from the tail of the column, and even the flank-guard cavalry, to take part in the general chase. That Frederick's move meant an attack upon them before they could form up, Soubise and the duke failed to realize. They had taken more than three hours to break camp, and found it difficult to suppose that Frederick's army could move off in one-sixth that time. It was obvious, moreover, that the Prussians were not deploying for battle on the plain in front of Rossbach and Nahlendorf.

Frederick had no intention either of forming up parallel to the enemy or of retreating. As his army could move as a unit twice as fast as the enemy's, he intended to make a *détour*, screened by the Janus Hügel and the Pölsen Hügel, and to fall upon them suddenly from the east. If at the moment of contact the Allies had already formed their line of battle facing north, the attack would strike their right flank; if they were still on the move in column eastwards or north-eastwards, the heads of their columns would be crushed before the rest could deploy in the new direction—deployment in those days being a lengthy affair. To this end General von Seydlitz, with every available squadron, hurried eastward from Rossbach, behind the Janus Hügel, to the Pölsen Hügel; Colonel von Moller, with eighteen heavy guns, came into action on the Janus Hügel at 3.15 against the advancing columns of the Allied cavalry; and the infantry followed as fast as possible. When they came under the fire of Moller's guns, the Allied squadrons, which were now north of Reichardtswerben and well ahead of their own infantry, suffered somewhat heavily; but it was usual to employ heavy guns to protect a retreat, and they contented themselves with bringing some field-guns into action. They were, however, amazed when Seydlitz's thirty-eight squadrons suddenly rode down upon the head and right flank of their columns from the Pölsen Hügel *avec une incroyable vitesse*. Gallantly as the leading German regiments deployed to meet him, the result was scarcely in doubt for a moment. Seydlitz threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The *mêlée* drifted rapidly southward, past the Allied infantry, and Seydlitz finally rallied his horsemen in a hollow near Tagewerben, ready for fresh service. This first episode was over in half an hour, and by that time the Prussian infantry, in *écheleon* from the left, was descending the Janus Hügel

to meet the already confused and disheartened infantry of the Allies. The latter, as their cavalry had done, managed to deploy some regiments on the head of the column, and the French in particular formed one or two columns of attack—then peculiar to the French army—and rushed forward with the bayonet. But Moller's guns, which had advanced with the infantry, tore gaps in the close masses, and, when it arrived within effective musketry range, the attack died out before the rapid and methodical volleys of the Prussian line. Meanwhile the Allies were trying in vain to form a line of battle. The two main columns had got too close together in the advance from Pettstädt, part of the reserve which had become entangled between the main columns was extricating itself by degrees and endeavouring to catch up with the rest of the reserve column away to the right, and the reserve artillery was useless in the middle of the infantry. The Prussian infantry was still in

*écheleon* from the left, and the leftmost battalions that had repulsed the French columns were quickly within musket-shot of this helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled, Soubise and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle had lasted less than an hour and a half, and the last episode of the infantry fight no more than fifteen minutes. Seven Prussian battalions only were engaged, and these expended five to fifteen rounds per man. Seydlitz and Prince Henry of Prussia, the cavalry and the infantry leaders engaged, were both wounded, but the total loss of the king's army was under 550 officers and men as compared with 7700<sup>+</sup> on the part of the Allies. (C. F. A.)

**ROSSE, EARL OF**, a title borne by the Irish family of Parsons. James Parsons, a native of Leicestershire, who flourished in the 16th century, was the father of Sir William Parsons (c. 1570-1650), one of the lords justices of Ireland. Having crossed to Ireland in early life, William Parsons became surveyor-general in 1602 and obtained land in various parts of the country. In 1620 he was made a baronet; in 1643 he was deprived of his office as lord justice, and he died early in 1650. His great-grandson, Sir Richard Parsons, bart. (c. 1657-1703), was created Baron Oxmantown and Viscount Rosse in 1681, and Richard's son and successor, Richard (d. 1741), was made earl of Rosse in 1718. The titles became extinct when Richard, the 2nd earl, died in August 1764.

Sir William Parsons had two brothers, Sir Lawrence and Sir Fenton Parsons. Sir Lawrence, second baron of the Irish exchequer, left a son, William (d. 1653), who defended Bir Castle, King's County, for over a year against the Irish during

Figures again vary in different authorities. The above figure is that given by Berndt, *Zahl im Kriege*.

the rebellion of 1641, and whose son, Sir Lawrence Parsons (d. 1698), was made a baronet in 1677. This Sir Lawrence was a strong Protestant, and was found guilty of high treason, being attainted and sentenced to death during the brief period of James II.'s ascendancy in Ireland. He was not executed, however, and afterwards he took some part in the struggle against the supporters of James II. His descendant, Lawrence Harman Parsons (1749-1807), was created Baron Oxmantown in 1792, Viscount Oxmantown in 1795, and earl of Rosse in 1806. He died on the 20th of April 1807, and was succeeded by his nephew Lawrence.

Lawrence Parsons, 2nd earl of Rosse (1758-1841), the eldest son of Sir William Parsons, bart. (d. 1701), of Birr Castle, was born on the 21st of May 1758. Educated at Trinity College, Dublin, he entered the Irish parliament as member for the university in 1782, and soon came to the front in debate. A friend and follower of Henry Flood, he has been described as "one of the very, very few honest men in the Irish House of Commons." He favoured some measure of relief to Roman Catholics and also parliamentary reform, a speech which he delivered on this question in 1793 being described by W. E. H. Lecky as "exceedingly valuable to students of Irish history"; but he disliked and opposed the union of the parliaments of Great Britain and Ireland. After this event, however, he represented King's County in the united parliament until 1807, and he was a representative peer for Ireland from 1809 to 1841. He died at Brighton on the 24th of February 1841. Rosse wrote *Observations on the Bequest of Henry Flood to Trinity College, Dublin, with a Defence of the Ancient History of Ireland* (Dublin, 1795). His eldest son was the astronomer William Parsons, 3rd earl of Rosse (see below).

**ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800-1867)**, Irish astronomer and telescope constructor, was born at York on the 17th of June 1800, a son of the 2nd earl (see above). Until his father's death he was known as Lord Oxmantown. Entered at Trinity College, Dublin, in 1818, he proceeded to Magdalen College, Oxford, in 1821, and in the same year he was returned as M.P. for King's County, a seat which he resigned in 1834. He was Irish representative peer from 1845, president of the British Association in 1843, president of the Royal Society from 1849 to 1854, and chancellor of the university of Dublin from 1862. From 1827 he devoted himself to the improvement of reflecting telescopes; in 1839 he mounted a telescope of 3 ft. aperture at his seat, Birr Castle, Parsonstown; and in February 1845 his celebrated 6-foot reflector was finished. Owing to the famine and the disturbed state of the country, which demanded his attention as a large landowner and lieutenant of King's County (from 1831), the instrument remained unused for nearly three years, but since 1848 it has been in constant use, chiefly for observations of nebulae, for which it was particularly suited on account of its immense optical power, nominally 6000. Lord Rosse died at Monkstown on the 31st of October 1867. He had four sons. The eldest, Lawrence Parsons, 4th earl of Rosse, and Baron Oxmantown, born on the 17th of November 1840, succeeded to the title on his father's death, and made many investigations on the heavenly bodies, particularly on the radiation of the moon and related physical questions; the youngest, the Hon. Charles Algernon Parsons, born on the 13th of June 1854, is famous for his commercial development of the steam turbine.

The first constructor of reflecting telescopes on a large scale, William Herschel, never published anything about his methods of casting and polishing specula, and he does not appear to have been very successful beyond specula of 18 in. diameter, his 4-foot speculum ("the 40-foot telescope") having been little used by him (see discussion between Sir J. Herschel and Robinson in *The Athenaeum*, Nos. 837-36, 1843). Lord Rosse had therefore no help towards his brilliant results. His speculum metal is composed of four atoms of copper (26.4 parts) and one of tin (58.9 parts), a brilliant alloy, which resists tarnish better than any other compound tried. Chiefly owing to the brittleness of this material, Lord Rosse's first larger specula were composed of a number of thin plates of speculum metal (sixteen for a 3-foot mirror) soldered on the back of a strong but light framework made of a peculiar kind of brass (2.75 of copper to 1 of zinc), which has the same expansion as his speculum

metal. In Brewster's *Edinburgh Journal of Science* for 1828 he described his machine for polishing the speculum, which in all essential points remained unaltered afterwards. It imitates the motions made in polishing a speculum by hand by giving both a rectilinear and a lateral motion to the polisher, while the speculum revolves slowly; by shifting two eccentric pins the course of the polisher can be varied at will from a straight line to an ellipse of very small eccentricity, and a true parabolic figure can thus be obtained. The speculum lies face upwards in a shallow bath of water (to preserve a uniform temperature), and the polisher fits loosely in a ring, so that the rotation of the speculum makes it revolve also, but more slowly. Both the grinding and polishing tools are grooved, to obtain a uniform distribution of the emery used in the grinding process and of the rouge employed in polishing, as also to provide for the lateral expansion of the pitch with which the polisher is coated. In September 1839 a 3-foot speculum was finished and mounted on an altazimuth stand similar to Herschel's; but, though the definition of the images was good (except that the diffraction at the joints of the speculum caused minute rays in the case of a very bright star), and its peculiar skeleton form allowed the speculum to follow atmospheric changes of temperature very quickly, Lord Rosse decided to cast a solid 3-foot speculum. Hitherto it had been felt as a great difficulty in casting specula that the solidification did not begin at one surface and proceed gradually to the other, the common sand mould allowing the edges to cool first, so that the central parts were subject to great straining when their time of cooling came, and in large castings this generally caused cracking. By forming the bottom of the mould of hoop iron placed on edge and closely packed, and the sides of sand, while the top was left open, Lord Rosse overcame this difficulty, and the hoop iron had the further advantage of allowing the gas developed during the cooling to escape, thus preventing the speculum from being full of pores and cavities. This invention secured the success of the casting of a solid 3-foot speculum in 1840, and encouraged Lord Rosse to make a speculum of 6 ft. diameter in 1842. In the beginning of 1845 this great reflector was mounted and ready for work. The instrument has a focal length of 54 ft. and the tube is about 7 ft. in diameter; owing to these large dimensions it cannot be pointed to every part of the heavens, but can only be moved a short distance from the meridian and very little to the north of the zenith; these restrictions have, however, hardly been felt, as there is almost at any moment a sufficient number of objects within its reach.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (see NEBULAE); and many previously unknown features in these objects were revealed by it, especially the similarity of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration prevailing in many of the brighter nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. (See TELESCOPE.)

Lord Rosse gave a detailed account of the experiments which step by step had led to the construction of the 3-foot speculum in the *Philosophical Transactions* for 1840. In the same publication for 1844 and 1850 he communicated short descriptions and drawings of some of the more interesting nebulae, and in the volume for 1861 he published a paper "On the Construction of Specula of 6-ft. Aperture, and a Selection from the Observations of Nebulae made with them," with numerous engravings. The accounts of the observations given in these papers, however, were fragmentary; but in 1879-80 a complete account of them was published by the present earl ("Observations of Nebulae and Clusters of Stars made with the 6-foot and 3-foot Reflectors at Birr Castle, from 1848 to 1878" in the *Ann. Trans. R. Dublin Soc.* vol. ii.). The drawing of the nebula of Orion was published in the *Phil. Trans.* for 1868. See obituary notice in the *Proc. Roy. Soc.* (1868), 16, 36, and in the *Monthly Notices of Roy. Astr. Soc.* vol. 29, p. 123.

**ROSSELLI, COSIMO (1439-c. 1507)**, Florentine painter, was born in 1439. At the age of fourteen he became a pupil of Neri di Bicci, and in 1460 he worked as assistant to his cousin Bernardo di Stefano Rosselli. The first work of Cosimo mentioned by Vasari exists in S. Ambrogio, in Florence, over the third altar on the left. It is an "Assumption of the Virgin," a youthful and feeble work. In the same church, on the wall of one of the chapels, is a fresco by Cosimo which Vasari praises highly, especially for a portrait of the young scholar Pico di Mirandola. The scene, a procession bearing a miracle-working chalice, is painted with much vigour and less mannerism than most of this artist's work. A picture painted by Rosselli for the church of the Annunziata, with figures of SS. Barbara, Matthew and the Baptist, is in the Academy of Florence. Rosselli also spent some time in Lucca, where he painted several altar-pieces for various churches. A picture attributed to him, taken from the church of S. Girolamo at Fiesole, is now in the National Gallery of London. It is a large retable, with, in the

centre, St Jerome in the wilderness kneeling before a crucifix, and at the sides standing figures of St Damasus and St Eusebius, St Paolo and St Eustachia, below is a predella with small subjects. Though dry and hard in treatment, the figures are designed with much dignity. The Berlin Gallery possesses three pictures by Rosselli: "The Virgin in Glory," "The Entombment of Christ," and "The Massacre of the Innocents." In 1480 Rosselli, together with the chief painters of Florence, was invited by Sixtus IV. to Rome to assist in the painting of the frescoes in the Sistine Chapel. Three of these were executed by him—"The Destruction of Pharaoh's Army in the Red Sea," "Christ Preaching by the Lake of Tiberias," and "The Last Supper." The last of these is well preserved, but is a mediocre work. Vasari's story about the pope admiring Rosselli's paintings more than those of his abler brother painters has probably little foundation. Rosselli's Sistine frescoes were partly painted by his assistant Piero di Cosimo, who was so called after Cosimo Rosselli. His chief pupil was Fra Bartolommeo. According to Vasari, Rosselli died in 1484, but this is a mistake, as his will exists dated 25th of November 1506 (see Gaye, *Car. ined.* ii. 457 n.).

For an account of Rosselli's Sistine frescoes, see Platner and Bunsen, *Beschreibung der Stadt Rom*, ii. pt. 1.; and Rumohr, *Italian. Forschungen*, ii. 265.

**ROSSELLINO, ANTONIO** (1427-c. 1479), Florentine sculptor, was the son of Matteo di Domenico Gamberelli, and had four brothers, who all practised some branch of the fine arts. Almost nothing is known about the life of Antonio, but many of his works exist, and are full of religious sentiment, and executed with the utmost delicacy of touch and technical skill. The style of Antonio and his brother Bernardo is a development of that of Donatello and Ghiberti; it possesses all the refinement and sweetness of the earlier masters, but is not equal to them in vigour or originality. Antonio's chief work, still in perfect preservation, is the lovely tomb of a young cardinal prince of Portugal, who died in 1459. It occupies one side of a small chapel, also built by Rossellino, on the north of the nave of San Miniato al Monte. The recumbent effigy of the cardinal rests on a handsome sarcophagus, and over it, under the arch which frames the whole, is a beautiful relief of the Madonna between two flying angels. The tomb was begun in 1461 and finished in 1466; Antonio received four hundred and twenty-five gold florins for it. A reproduction of this tomb with slight

Marble Relief by Antonio Rossellino.

alterations, and of course a different effigy, was made by Antonio for the wife of Antonio Piccolomini, duke of Amalfi, in the

<sup>1</sup> Illustrated by Conelli, *Mon. Sebol. della Toscana* (Florence, 1819), pl. xxiii.

church of S. Maria del Monte at Naples, where it still exists. For the same church he also executed some delicate reliefs, which perhaps err in being too pictorial in style, especially in the treatment of the backgrounds. A fine medallion relief by him in marble, originally modelled in terra-cotta, is preserved in the Bargello at Florence (see fig.).

**BERNARDO ROSSELLINO** (1409-1464), Florentine sculptor, was no less able than his younger brother Antonio. His finest piece of sculpture is the tomb, in the Florentine Santa Croce, of Leonardo Bruni of Arezzo, the historian of Florence, executed in 1443 some years after Bruni's death; the recumbent effigy is of great merit. The inner cathedral pulpit at Prato, circular in form on a tall slender stem, was partly the work of Mino da Fiesole and partly by Bernardo Rossellino. The latter executed the minute reliefs of St Stephen and the Assumption of the Virgin. For his part in the work he received sixty-six gold florins. The South Kensington Museum possesses a relief by Bernardo, signed and dated (1456). It is a fine portrait of the physician Giovanni da S. Miniato. Bernardo's works as an architect were numerous and important, and he was also a skilful military engineer. He restored the church of S. Francis at Assisi, and designed several fine buildings at Civita Vecchia, Orvieto and elsewhere. He also built fortresses and city walls at Spoleto, Orvieto and Civita Castellana. He was largely employed by Nicholas V. and Pius II. for restorations in nearly all the great basilicas of Rome, but little trace of his work remains, owing to the sweeping alterations made during the 17th and 18th centuries. Between the years 1461 and 1464 (when he died while engaged on the Lazzari monument at Pistoia) he occupied the important post of *capo-maestro* to the Florentine duomo. A number of buildings at Pienza, executed for Pius II., are attributed to him; the Vatican registers mention the architect of these as M<sup>o</sup> Bernardo di Fiorenza, but this indication is too slight to make it certain that the elder Rossellino is referred to (see Vasari, ed. Milanesi, iii. 93 seq.).

See Wilhelm Bode, *Die Italienische Plastik* (Berlin, 1902).

**ROSSETTI, CHRISTINA GEORGINA** (1830-1894), English poet, was the youngest of the four children of Gabriele Rossetti (see the article on her brother DANTE GABRIEL ROSSETTI). She was born at 38 Charlotte Street, Portland Place, London, on the 5th of December 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her *Verses*, in which the richness of her vision was already faintly prefigured. In 1850 she contributed to *The Germ* seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853-54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died. In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-church Anglican), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks' visit to Normandy and Paris. In 1862 she published what was practically her earliest book, *Goblin Market*, and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. *The Prince's Progress* followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina's prose work *Commonplace* appeared in 1870. In April 1871 her whole life was changed by a terrible affliction, known as "Graves's disease"; for two years her life was in constant danger. She had already composed her book of children's poems, entitled *Sing-Song*, which appeared

in 1872. After a long convalescence, she published in 1874 two works of minor importance, *Annus Domini* and *Speaking Likenesses*. The former is the earliest of a series of theological works in prose, of which the second was *Seek and Find* in 1879. In 1881 she published a third collection of poems, *A Pageant*, in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was *Time Flies* (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled *The Face of the Deep*. After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on the 29th of December 1894. Her *New Poems* were published posthumously in 1896. In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet. (E. G.)

See the *Poetical Works of C. G. R.*, with Memoir by W. M. Rossetti (1903). Also Edmund Gosse's *Critical Kit-Kats* (1896); an article by Ford Madox Hueffer in the *Fortnightly Review* (March 1904); and another in *The Christian Society* (Oct. 1904). The *Family Letters of Christina Rossetti* were edited by W. M. Rossetti in 1908.

**ROSSETTI, DANTE GABRIEL** (1828-1882), English poet and painter, whose full baptismal name was Gabriel Charles Dante, was born on the 12th of May 1828, at 38 Charlotte Street, Portland Place, London. He was the first of the two sons and the second of the four children of Gabriele Rossetti (1783-1854), an Italian poet and liberal, who, about 1824, after many vicissitudes connected with the part he played in the Naples reform movement against Ferdinand I., came to England, where he married in 1826 Frances Mary Polidori (d. 1886), sister of Byron's physician, Dr John Polidori, and daughter of a Tuscan, Gaetano Polidori, who had in early youth been Alfieri's secretary and who had married an English lady. In 1831 he became professor of Italian in King's College, London, and afterwards achieved a recognized position as a subtle and original, if eccentric, commentator on Dante. In 1852 he published a volume of Italian religious poems. His family, besides Dante Gabriel, consisted of Maria Francesca (1827-1876), who eventually entered an Anglican sisterhood—she is known to Dante scholars by her valuable *Shadow of Dante*; William Michael (b. 1829), a well-known man of letters who from 1845 to 1894 was in the Inland Revenue Office—he married a daughter of Ford Madox Brown; and Christina (q.v.), the poet. The literary spirit was strongly entrenched here; and the talent which was always distinguished in William Michael rose to the height of rare genius in Dante Gabriel and Christina.

Dante Rossetti's education was begun at a private school in Foley Street, Portland Place, where he remained, however, only nine months, from the autumn of 1835 to the summer of 1836. He next went (in the autumn of 1836) to King's College School, where he remained till the summer of 1843, having reached the fourth class. From early childhood he had displayed a marked propensity for drawing and painting. It had there-

fore from the first been tacitly assumed that his future career would be an artistic one, and he left school early. In Latin, however, he was already fairly proficient for his age; French he knew well; Italian he had spoken from childhood, and he had some German lessons about 1844-45. But, although he learned enough German to be able to translate the *Arme Heinrich* of Hartmann von Aue, and some portions of the *Nibelungenlied*, he afterwards forgot the language almost entirely. His Greek too, such as it had been, he lost. On leaving school he went (1843) to Cary's Art Academy (previously called Sass's), near Bedford Square, and thence obtained admission to the Royal Academy Antique School towards 1846. Of the artistic education of foreign travel Rossetti had very little. But in early life he made a short tour in Belgium, where he was indubitably much impressed and influenced by the works of Van Eyck at Ghent and Memling at Bruges.

[It may be convenient to interpolate here a continuous account of Rossetti's career as a pictorial artist. Being much impressed by some of the early works of Ford Madox Brown exhibited at the Academy (1841), Westminster Hall (1844-45) and the British Institution (1845), he sought from that master of technique technical instruction of a more direct and stringent kind than he had previously submitted to. Brown, ever generous in that way, undertook without a fee the training of Rossetti as a painter, and set him to work upon such rudimentary studies as pickle-pots and other "still-life." The pupil's course of such work was, as might be expected, short; the master's example and that of Millais, together with the uncompromising energy of Holman Hunt, with both of whom Rossetti became intimate about this time, helping and encouraging him. Most of all, perhaps, so far as his temporary impressions were concerned, a picture of Brown's which was shown at the "Free Exhibition," Hyde Park Corner, in the spring of 1848 profoundly affected Rossetti. This was, of course, months before the formation of the Pre-Raphaelite Brotherhood in the autumn of the last-named year, when five painter-students, a sculptor (Thomas Woolner) and a layman (W. M. Rossetti) agreed upon certain principles they desired should obtain in art. None of the five owed the initiative of his views to any of the others or to Brown, whose impulse was purely technical and connected with Rossetti only; neither Millais, Holman Hunt, J. Collinson nor F. G. Stephens needed the help of Madox Brown. The point of Pre-Raphaelite crystallization which had so great though brief an influence upon Rossetti's life and art was found at a chance meeting of Rossetti, Millais and Holman Hunt in Millais's house in Gower Street, where certain prints from early Italian frescoes were studied. The enthusiasm of Rossetti led him to propose the formation of a "Brotherhood" with more or less definite views and much loftier aims than artists generally venture to announce. This took effect; the views of the remaining three men were already known, and in a few days they joined the new society and took their shares in the obloquy which attended the doings of Millais, Hunt and Collinson. Brown, though invited, declined to become a P.R.B. Rossetti's first effort was by means of "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at Hyde Park Corner. It was a picture which attested the prodigious value of his studies since the previous October, and the native genius of the painter and the sincere passion with which he had accepted the obligations of Pre-Raphaelitism, as they were then, but not for long, understood. Nothing of his producing was more independent than the inception of "The Girlhood of Mary, Virgin"; indeed the design for it was made some half a year before the meeting in Gower Street, though the execution of this work owed not a little to the influence, if not the actual help, of Millais and Hunt. Its mysticism was Rossetti's own, its technique owed something to Brown. On the whole, there can be no doubt that in this work was the first pronouncement of a new view of art, a fresh technique and power rapidly developing itself. Of course, the style of this noteworthy and epoch-marking picture was

jeune, its handling was timid, while its coloration and tonality were dry, not to say thin. Such was Rossetti's advent in art under the Pre-Raphaelite banner. The picture's reception was not encouraging, nor did the next work from his hands induce him to emerge from that proud exclusiveness in which all such minds as his are content to abide. The diverse moods of the other Brothers chose otherwise, but of Rossetti's immediate circle it has been truly said: "It appears that of seven young men and Brethren five have attained eminent positions, four of them being pre-eminent, although for years after the society was formed no single member, whatever his position might be, escaped insult, obloquy and wicked and malicious misrepresentation. The more conspicuous the Brother [e.g. Millais], the more outrageously was he attacked." No estimate of Rossetti's genius, his triumph and his life as a whole can be justly based without ample allowance being made for the circumstances which attended his advent as a painter. "Ecce Ancilla Domini!" the smaller picture which is now in the National Gallery of British Art at Millbank, was the one perfect outcome of the original motive of the Pre-Raphaelite Brotherhood by its representative and typical member. It is replete with the mystical mood which then ruled the painter's mind; that mood whose what may be called virginal white and its harmonics as its aptest coloration, and the intense light of morning sufficed for its tonality. It was exhibited at the Portland Gallery in 1850. After these pictures were finished, the outside world saw no more of Rossetti as a painter until it had prepared itself to see modern art from a higher plane than before.

In December 1850 there appeared the first number of *The Germ*, a magazine (which lasted for only four numbers) in which Rossetti had a leading place as the poet in verse and prose. The influence of Robert Browning upon Rossetti was more potent in *The Germ* than in that splendid romance in water-colours called "The Laboratory," where a court lady of the *ancien régime* visits an old poison-monger to obtain from him a fatal potion for her rival in love. This wonderful gem of colour, glowing in lurid and wicked passion and voluptuous suggestion, marked the opening of the artist's second period and signalized his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement, and, so far as he was concerned, the artistic *ne plus ultra*. Millais and the other Brothers remained faithful during several years yet to come. Later in 1850, Rossetti produced the original, which is in ink, of the famous "Hesterna Rosa," a gambling scene of men and their mistresses in a tent by lamplight, while pallid dawn gathers force between the trees without. Then came from his hands "Borgia," which, like "The Laboratory," is in water-colours, and, like "Hesterna Rosa," is a sardonic tragedy. "How they met Themselves" came next, and, in illustrating a legend similar to that of the Döppelgänger, affirmed the force, the originality and the tragic passion of Rossetti's genius. Two lovers are walking in a twilight wood, where they are confronted suddenly by their apparitions, portending death. The year 1852 produced "Giotto painting Dante's Portrait," and saw a new development of the painter's mind and mood, dashed with a humour not often to be seen in him. In its somewhat dry coloration it differed from the ardent jewel-like glow and deeper gloom of "Borgia" and its successor and the sumptuous visions of womanhood in later pictures. "Found," Rossetti's sole contribution of the sort which Mr Holman Hunt affected, was begun somewhere about this period; but this piece of pictorial moralizing (the analogue of the poet's own "Jenny"), vigorous and intensely pathetic as it is, was never really finished by its author, being, indeed, far remote from Rossetti's inner self, which was rather over-scornful of didactic art, and thoroughly indisposed towards attempts to ameliorate anybody's condition by means of pictures. Nor did the stringency of naturalistic painting suit his mood or his experience. Nevertheless, what is his in the existing picture remains a masterpiece of poetry with exquisitely finished parts.

Passing a few fine but comparatively unimportant drawings,

such as "Lancelot and Guinevere at the Tomb of Arthur," "Lancelot looking at the Dead Lady of Shalott," "Mariana of the South," "Sir Galahad," "The Blue Closet," and various works owing subjects to the Arthurian cycle of romances, we may note that the artist illustrated by five cuts *Poems by Alfred Tennyson*, on which Millais and Mr Holman Hunt were also engaged, and which was published by Moxon in 1857. As in "Ecce Ancilla Domini!" we had virginal white and morning light employed to strengthen the mystical significance of the design, so in "Borgia" Venetian voluptuousness and sensuous splendours obtained, and in "The Blue Closet" is a very potent and suggestive exercise intended to symbolize the association of colour with music. The last is one of the subtlest of the artist's "inventions," and it shows how he had developed upon "Borgia" an artistic sympathy which is but too likely to be "caviare to the general." "The Wedding of St George" is not so fine; nor was "Lancelot's Dream of the Sangreal," Rossetti's part in the luckless decorations of the Oxford Union<sup>1</sup> (1857-58); nor are "Guinevere and Sir Lancelot," "Galahad in the Chapel" and other Arthurian examples quite worthy of his art. "Bocca Baciata," the super-sensuous portrait of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the expiration of the second epoch in Rossetti's art and the beginning of a new, the third, last and most powerful of all the phases of his career. The picture "Dr Johnson at the Mitre," when the "pretty fools" consulted the lexicographer anent Methodism, is a good example of his humour.

In 1861 Rossetti produced several fine designs for stained glass, and in the revival of stained-glass painting as an art he had a larger share than has frequently been ascribed to him. The practice of designing upon a large scale, and employment of masses of splendid though deep-toned colours, had probably something to do with the prodigious development of his powers and the enlargement of his views as regards painting which took effect at this period (1862-63). At this time a striking and highly imaginative triptych, representing three events in the careers of Paolo and Francesca, was produced; it is a great improvement upon an earlier design. There is unprecedented energy in the group of the lovers embracing in the garden-house just as they have paused in reading the fatal romance. The composition of this group, with the circular window behind their figures, is as fine as it was comparatively novel in Rossetti's practice. Its lurid coloration was so thoroughly in harmony with the pathos of the subject that in this respect the work excelled all the painter had previously produced. The same elements, energy, a sympathetic and poetic scheme of colour, and composition of a fine order, combined with far greater force and originality in "The Bride," or "The Beloved," that magnificent illustration of *The Song of Solomon*. The last named is a life-size group of powerfully coloured and diversely beautiful damsels accompanying their mistress with music and with song on her way to the bridegroom. This picture, as regards its brilliance, finish, the charms of four lovely faces and the splendour of its lighting, occupies a great place in the highest grade of modern art of all the world. It is likewise, so far as the qualities named are concerned, the crowning piece of Rossetti's art, and stands for him much as the "Sacred and Profane Love" of Titian represents that master. Very fine, indeed, but hardly so passionate and virile, is the "Beata Beatrix," now in the National Gallery of British Art with "Ecce Ancilla Domini!" which he produced thirteen years earlier. These works belong to a category of fine and quite original examples, all replete with

<sup>1</sup> In 1857, Rossetti, when in Oxford with William Morris, conceived the design of filling the bays above the gallery in the new Union debating room (now the library) with paintings from the *Monte d'Arthur*, and he enlisted the co-operation of several of his artistic circle, including Burne-Jones and William Morris, in the work, which was begun in August. Morris's picture was "Sir Palomides watching Tristram and Isolt," Burne-Jones's "Nisus luring Merlin." Unfortunately the walls were too new and not properly prepared for painting; the colour soon began to fade and wear off, and in the course of twenty years or so the pictures became almost indistinguishable.

similar technical qualities, poetry and pathos. The group comprises paintings by which Rossetti is best known, such as "Proserpina in Hades," which is, on the whole, perhaps the most original, if not indeed the most poetical and powerful, of all his output; "Sibylla Palmifera," "Venus Verticordia," "Lilith" (the better of the two versions is now referred to), "Washing Hands," "Moona Vanna," "Il Ramoscello," "Aurea Catena," "La Pia," "Rosa Triplex," "Veronica Veronese," "La Ghirlandata," "Pandora," "The Blessed Damozel," and, last and largest, but not, perhaps, the greatest of his paintings (a distinction for which "The Bride" and "Proserpina" must contend), the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Besides these, Rossetti produced a large number of fine things. Nearly the whole of them were exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after their author's death.

(F. G. S.)

Meanwhile, the literary side of Rossetti had developed *pari passu* with his achievements as a painter. The goal before the young Rossetti's eyes was to reach through art the forgotten world of old romance—that world of wonder and mystery and spiritual beauty which the old masters knew and could have painted had not lack of science, combined with slavery to monkish traditions of asceticism, crippled their strength. In that great rebellion against the renaissance of classicism which (after working much good and much harm) resulted in 18th-century materialism—in that great movement of man's soul which may be appropriately named "the Renaissance of the Spirit of Wonder in Poetry and Art"—he had become the acknowledged protagonist before ever the Pre-Raphaelite brotherhood was founded, and so he remained down to his last breath. It was by inevitable instinct that Rossetti turned to that mysterious side of nature and man's life which to other painters of his time had been a mere fancy-land, to be visited, if at all, on the wings of sport. For if there is any permanent vitality in the Renaissance of Wonder in modern Europe, if it is really the inevitable expression of the soul of man in a certain stage of civilization (when the sanctions which have made and moulded society are found to be not absolute and eternal, but relative, mundane, ephemeral and subject to the higher sanctions of unseen powers that work behind "the shows of things"), then perhaps one of the first questions to ask in regard to any imaginative painter of the 19th century is, In what relation did he stand to the newly awakened spirit of romance? Had he a genuine and independent sympathy with that temper of wonder and mystery which all over Europe had preceded and now followed the temper of imitation, prosaic acceptance, pseudo-classicism and domestic materialism? or was his apparent sympathy with the temper of wonder, reverence and awe the result of artistic environment dictated to him by other and more powerful and original souls around him?

We do not say that the mere fact of a painter's or a poet's showing but an imperfect sympathy with the Renaissance of Wonder is sufficient to place him below a poet in whom that sympathy is more nearly complete, but we do say that, other things being equal or anything like equal, a painter or poet of this time is to be judged very much by his sympathy with that great movement, which we call the Renaissance of Wonder because the word "romanticism" never did express it even before it had been vulgarized by French poets, dramatists, doctrinaires and literary harlequins. To struggle against the prim traditions of the 18th century, the unities of Aristotle, the delineation of types instead of characters, as Chateaubriand, Madame de Staël, Balzac and Hugo struggled, was well. But in studying Rossetti's works we reach the very key of those "high palaces of romance" which the English mind had never, even in the 18th century, wholly forgotten, but whose mystic gates no Frenchman ever yet unlocked. Not all the romantic feeling to be found in all the French romanticists (with their theory that not earnestness but the grotesque is the life-blood of romance) could equal the romantic

spirit expressed in a single picture or drawing of Rossetti's, such, for instance, as Beata Beatrix or Pandora. For, while the French romanticists—inspired by the theories (drawn from English exemplars) of Novalis, Tieck and Herder—cleverly simulated the old romantic feeling, the "beautifully devotional feeling" which Holman Hunt speaks of, Rossetti was steeped in it: he was so full of the old frank childlike wonder and awe which preceded the great renaissance of materialism that he might have lived and worked amidst the old masters. Hence, in point of design, so original is he that to match such ideas as are expressed in "Lilith," "Hesterna Rosa," "Michael Scott's Wooing," the "Sea Spell," &c., we have to turn to the sister art of poetry, where only we can find an equally powerful artistic representation of the idea at the core of the old romanticism—the idea of the evil forces of nature assailing man through his sense of beauty. We must turn, we say, not to art—not even to the old masters themselves—but to the most perfect efflorescence of the poetry of wonder and mystery—to such ballads as the "Demon Lover," to Coleridge's "Christabel" and "Kubla Khan," to Keats's "La Belle Dame sans Merci" for parallels to Rossetti's most characteristic designs. Now, although the idea at the heart of the highest romantic poetry (allied perhaps to that apprehension of the warring of man's soul with the appetites of the flesh which is the basis of the Christian idea) may not belong exclusively to what we call the romantic temper (the Greeks, and also most Asiatic peoples, were more or less familiar with it, as we see in the *Saldman and Absal* of Jami), yet it became peculiarly a romantic note, as is seen from the fact that in the old masters it resulted in that asceticism which is its logical expression and which was once an inseparable incident of all romantic art. But in order to express this stupendous idea as fully as the poets have expressed it, how is it possible to adopt the asceticism of the old masters? This is the question that Rossetti asked himself, and answered by his own progress in art. In all of his pictures, the poorest and the best, is displayed that power which Blake calls vision—the power which, as he finely says, is "surrounded by the daughters of inspiration," the power, that is, of seeing imaginary objects and dramatic actions—physically seeing them as well as mentally—and flashing them upon the imaginations (even upon the corporeal senses) of others.

Mr W. M. Rossetti (in the Preface to the *Collected Works*, 1886) has given an interesting account of his brother's literary nurturing. Shakespeare, Walter Scott, Byron, the Bible were the earliest influences: then Shelley, Mrs Browning, the older English and Scottish ballads, and Dante. Afterwards he preferred Keats to Shelley. By 1847 he was "deep in Robert Browning." Malory's *Morte d'Arthur*, about 1850, engrossed him; Victor Hugo and De Musset, among French poets, were his delight. In his last years he had an enthusiasm for Chatterton. From childhood's days he had loved to compose, but *The Germ* (1850) contained Rossetti's first published prose or verse. In it appeared "The Blessed Damozel," the prose poem "Hand and Soul," six sonnets and four lyrics.

"The Blessed Damozel" was written so early as 1847 or 1848. "Sister Helen" was produced in its original form in 1850 or 1851. His translations from the early Italian poets also began as far back as 1845 or 1846, and may have been mainly completed by 1849. He published a volume of *The Early Italian Poets (Dante and his Circle)* in 1861. In 1856 he contributed to the *Oxford and Cambridge Magazine*, in which among other things the "Burden of Nineveh" appeared. Materials for a volume of original poetry accumulated slowly, and these having been somewhat widely read in manuscript had a very great influence upon contemporary poetic literature long before their appearance in print. He had intended to publish a volume in 1862, but the death of his wife (see below) caused its postponement till 1870. In poetry no less than in art what makes Rossetti so important a figure is the position he took up with regard to the modern revival of the "romantic" spirit. The Renaissance of Wonder culminates

in Rossetti's poetry as it culminates in his painting. The poet who should go beyond Rossetti would pass out of the realm of poetry into pure mysticism, as certain of his sonnets show. Fine as are the sonnets (of which the sonnet sequence, the "House of Life," in the 1881 volume, may be specially mentioned), it is in his romantic ballads that Rossetti (notwithstanding a certain ruggedness of movement) shows his greatest strength. "Sister Helen," "The Blessed Damozel," "Staff and Scrip," "Eden Bower," "Troy Town," "Rose Mary," as representing the modern revival of the true romantic spirit, take a place quite apart from the other poetry of the time.

Rossetti's poetry, and his prose too, is marked by an extraordinary fastidiousness of expression and beauty of diction; the form and colour of his style are alike marvellous in clearness and loveliness of language. But the dominant characteristic, after all, is the underlying idea, the romantic motive. By the revival of the romantic spirit in English poetry we mean something much more than the revival, at the close of the 18th century, of natural language, the change discussed by Wordsworth in his famous Preface, and by Coleridge in his comments thereon—that change of diction and of poetic methods which is commonly supposed to have arisen with Cowper, or, if not with Cowper, with Burns. The truth is that Wordsworth and Coleridge were too near the great changes in question, and they themselves took too active a part in those changes, to hold the historical view of what the changes really were. Important as was the change in poetic methods which they so admirably practised and discussed, important as was the revival of natural language, which then set in, it was not nearly so important as that other revival which had begun earlier and of which it was the outcome—the revival of the romantic spirit, the Renaissance of Wonder, even beneath the weight of 18th-century diction, the first movement of which is certainly English, and neither German nor French in its origin, and can be traced through Chatterton, Macpherson and the Percy Ballads.

As a mere question of methods, a reaction against the poetic diction of Pope and his followers was inevitable. But, in discussing the romantic temper in relation to the overthrow of the bastard classicism and didactic materialism of the 18th century, we must go deeper than mere artistic methods in poetry. When closely examined, it is in method only that the poetry of Cowper is different from the ratiocinative and unromantic poetry of Dryden and Pope and their followers. Pope treated prose subjects in the ratiocinative—that is to say, the prose—temper, but in a highly artificial diction which people agreed to call poetic. Cowper treated prose subjects too—treated them in the same prose temper, but used natural language; a noble thing to do, no doubt. But this was only a part (and by no means the chief part) of the great work achieved by English poetry at the close of last century. That period, to be sure, rendered obsolete the poetic diction of Pope; but it introduced something more precious still—entire freedom from the hard rhetorical materialism imported from France; it gave a new seeing to English eyes, which were opened once more to the mystery and the wonder of the universe and the romance of man's destiny; it revived, in short, the romantic spirit, but the romantic spirit enriched by all the clarity and sanity that the renaissance of classicism was able to lend. Of the great movement which substituted for the didactic materialism of the 18th century the new romanticism of the 19th, the leaders were Coleridge and Scott, admirably followed by Byron, Shelley and Keats. Not that Wordsworth was a stranger to the romantic temper. The magnificent image of Time and Death under the yew tree is worthy of any romantic poet that ever lived, yet it cannot be said that he escaped save at moments from the comfortable 18th-century didactics, or that he was a spiritual writer in the sense that Coleridge, Blake and Shelley were spiritual writers.

Of the true romantic feeling, the ever-present apprehension of the spiritual world and of that struggle of the soul with earthly conditions which we have before spoken of, Rossetti's poetry

is as full as his pictures—so full, indeed, that it was misunderstood by certain critics, who found in the most spiritualistic of poets and painters the founder of a "fleshy school." Although it cannot be said that "The Blessed Damozel" or "Sister Helen" or "Rose Mary" reaches to the height of the masterpieces of Coleridge, the purely romantic temper was with Rossetti a more permanent and even a more natural temper than with any other 19th-century poet, even including the author of "Christabel" himself. As to the other 19th-century poets, though the Ettrick Shepherd in "The Queen's Wake" shows plenty of the true feeling, Hogg's verbosity is too great to allow of really successful work in the field of romantic ballad, where concentrated energy is one of the first requisites. And even Dobell's "Keith of Ravelston" has hardly been fused in the fine atmosphere of fairyland. Byron's "footlight bogies" and Shelley's metaphysical abstractions had of course but very little to do with the inner core of romance, and we have only to consider Keats, to whose "La Belle Dame sans Merci" and "Eve of St Mark" Rossetti always acknowledged himself to be deeply indebted. In the famous close of the seventh stanza of the "Ode to a Nightingale"—

"Charmed magic casements opening on the foam  
Of perilous seas in faery lands forlorn"—

there is of course the true thrill of the poetry of wonder, and it is expressed with a music, a startling magic, above the highest reaches of Rossetti's poetry. But, without the evidence of Keats's two late poems, "La Belle Dame sans Merci" and the "Eve of St Mark," who could have said that Keats showed more than a passing apprehension of that which is the basis of the romantic temper—the supernatural? In contrasting Keats with Rossetti, it must always be remembered that Keats's power over the poetry of wonder came to him at one flash, and that it was not (as we have said elsewhere) "till late in his brief life that his bark was running full sail for the enchanted isle where the old ballad writers once sang and where now sate the wizard Coleridge alone." Though outside Coleridge's work there had been nothing in the poetry of wonder comparable with Keats's "La Belle Dame sans Merci," the latter had previously in "Lamia" entirely failed in rendering the romantic idea of beauty as a maleficent power. The reader, owing to the atmosphere surrounding the dramatic action being entirely classic, does not believe for a moment in the serpent woman. The classic accessories suggested by Burton's brief narrative hampered Keats where to Rossetti (as we see in "Pandora," "Cassandra" and "Troy Town") they would simply have given birth to romantic ideas. It is perhaps with Coleridge alone that Rossetti can be compared as a worker in the Renaissance of Wonder. Although his apparent lack of rhythmic spontaneity places him below the great master as a singer (for in these miracles of Coleridge's genius poetry ceases to appear as a fine art at all—it is the inspired song of the changeling child "singing dancing to itself"), in permanence of the romantic feeling, in vitality of belief in the power of the unseen, Rossetti stands alone. Even the finest portions of his historical ballad "The King's Tragedy" are those which deal with the supernatural.

The events of Rossetti's life may be briefly summarized. In the spring of 1860 he married Elizabeth Eleanor Siddall, a milliner's assistant, who, being very beautiful, was constantly painted and drawn by him. From 1856 onwards he had been very intimate with William Morris and Edward Burne-Jones who had the greatest affection and artistic admiration for him. Mrs Rossetti, whose health was delicate, had one still-born child in 1861, and she died from an overdose of laudanum in February 1862. Rossetti then moved from Blackfriars 116 Cheyne Walk, Chelsea, where for a short time George Meredith, A. C. Swinburne and W. M. Rossetti lived with her. Mrs Rossetti's own water-colour designs show an extraordinary genius for invention and a rare instinct for colour. Rossetti felt her death so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being buried in her coffin. But in 1869 the manuscripts were discovered, and published in 1870. From this time to his death

continued to write poems and produce pictures—in the latter relying more and more upon his manipulative skill but exercising less and less his exhaustless faculty of invention.

In 1871 an unsigned article in the *Contemporary Review* (by Robert Buchanan) on the "Fleshly School of Poetry" made a fierce attack on Rossetti's poems from what was intended to be a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and increased his tendency—previously tempered by natural high spirits—towards gloomy brooding. About 1868 the curse of the artistic and poetic temperament, insomnia, attacked him. One of the most distressing effects of this malady is a nervous shrinking from personal contact with any save a few intimate and constantly seen friends. This peculiar kind of nervousness may be aggravated by the use of narcotics, and in his case was aggravated to a very painful degree; at one time he saw scarcely any one save his own family and immediate family connexions and the present writer. He was frequently away with William Morris at Kelmscott, in Oxfordshire. During the time that his second volume of original poetry, *Ballads and Sonnets*, was passing through the press (in 1881) his health began to give way, and he left London for Cumberland. A stay of a few weeks in the Vale of St John, however, did nothing to improve his health, and he returned much shattered. He then went to Birchington-on-Sea, but received no benefit from the change, though affectionately tended by friends like Hall Caine and others already mentioned; and, gradually sinking from a complication of disorders, he died on Sunday the 9th of April 1882.

In all matters of taste Rossetti's influence has been immense. The purely decorative arts (see ARTS AND CRAFTS) he may be said to have rejuvenated directly or indirectly. And he left the deepest impression upon the poetic methods of his time.

One of the most wonderful of Rossetti's endowments, however, was neither of a literary nor an artistic kind: it was that of a rare and most winning personality which attracted towards itself, as if by an unconscious magnetism, the love of all his friends, the love, indeed, of all who knew him. (T. W.-D.)

**AUTHORITIES.**—See various books by W. M. Rossetti—*Dante Gabriel Rossetti as Designer and Writer* (1889); *Ruskin, Rossetti, Pre-Raphaelitism* (1899); and *Some Reminiscences* (1906); *Memoir* by W. M. Rossetti prefixed to the *Collected Works*, published in 1886. Lady Burne-Jones's *Memorials of Edward Burne-Jones* (1904) is full of interesting sidelights. See also F. C. Stephens, *D. G. Rossetti*; "Portfolio" monograph (1894); H. C. Marillier, *D. G. Rossetti* (1899 and 1901); W. Sharp, *Dante Gabriel Rossetti: A Record and a Study* (1882); T. Hall Caine, *Recollections of Dante Gabriel Rossetti* (1882); W. Allingham, *Letters of Dante Gabriel Rossetti to William Allingham, 1854-70* (1897). An article by Vernon Lushington in the *Oxford and Cambridge Magazine* (1856) is an early contemporary view worth noting.

**ROSSI, LUIGI DE**, a 17th-century Italian musical composer, said to have been born at Naples towards the close of the 16th century. Of his life practically nothing is known. An opera of his, *Il Palazzo Incantato*, was given at Rome in 1642; in 1646 he was invited by Cardinal Mazarin to Paris, where he gave his opera *Le Mariage d'Orphée et d'Euridice* (1647), the first Italian opera performed in Paris. A collection of cantatas published in 1646 describes him as musician to Cardinal Antonio Berberini, and G. A. Pertl in 1688 speaks of him along with Carissimi and Cesti as "the three greatest lights of our profession." Rossi is noteworthy principally for his chamber-cantatas, which are among the finest that the 17th century produced. A large quantity are in MS. in the British Museum and in Christ Church library, Oxford. *La Gelosia*, printed by F. A. Gevaert in *Les Gloires d'Italie*, is an admirable specimen.

**ROSSI, PELLEGRINO LUIGI EDOARDO**, COUNT (1787-1848), Italian economist and statesman, was born at Carrara on the 13th of July 1787. He was educated at Pavia and Bologna, and in 1812 became professor of law at the latter university. In 1815 he gave his support to Joachim Murat, and after his fall escaped to France, whence he proceeded to Geneva. There he began a course of jurisprudence applied to Roman law, the success of which gained him the unusual honour of natural-

ization as a citizen of Geneva. In 1820 he was elected as a deputy to the cantonal council, and was a member of the extraordinary diet of 1832. He was entrusted with the task of drawing up a revised constitution, which was known as the *Pacte Rossi*. This was rejected by a majority of the diet, a result which deeply affected Rossi, and induced him to look with favour on the suggestions of Guizot and the duc de Broglie that he should settle in France. He was appointed in 1833 to the chair of political economy in the Collège de France, vacated by the death of J. B. Say. He was naturalized as a French citizen in 1834, and in the same year became professor of constitutional law in the faculty of law at Paris. In 1836 he was elected a member of the *Académie des sciences politiques et morales*, was raised to the peerage in 1839 and in 1843 became doyen of the faculty of law. In 1845 he was sent to Rome by Guizot to discuss the question of the Jesuits, being finally appointed ambassador of France at Rome. The revolution of 1848 severed his connexion with France, and he remained at Rome and became minister of the interior under Pius IX. He was unpopular, however, owing to his conservative views, and was assassinated on the 15th of November, as he was alighting at the steps of the House of Assembly.

As a statesman, Rossi was a man of signal ability and intrepid character, but it is as an economist that his name will be best remembered. His *Cours d'économie politique* (1838-54) gave in classic form an exposition of the doctrines of Say, Malthus and Ricardo. His other works were *Traité de droit pénal* (1829); *Cours de droit constitutionnel* (1866-67), and *Mélanges d'économie politique, d'histoire et de philosophie* (2 vols., 1857). His widow left a sum of 100,000 francs to the Institut de France, to found in his memory scholarships in political economy or law. Carrara erected a statue to his memory in 1876, and in 1887 the *Société d'économie politique* celebrated his centenary with a notice of his life and works.

See also le Comte Fleury d'Ardeville, *Le Comte Pellegrino Rossi, sa vie, ses œuvres, sa mort* (1876).

**ROSSINI, GIOACHINO ANTONIO** (1792-1868), Italian musical composer, was born at Pesaro on the 29th of February 1792. His father was town trumpeter and inspector of slaughter-houses, his mother a baker's daughter. The elder Rossini's sympathies for the French became a source of trouble when, after the occupation of the papal state by the French in 1796, the Austrians restored the old régime. He was sent to prison, and his wife took Gioachino to Bologna, earning her living as a *prima donna buffa* at various theatres of the Romagna, where she was ultimately rejoined by her husband. Gioachino remained at Bologna in the care of a pork butcher, while his father played the horn in the bands of the theatres at which his mother sang. The boy had three years' instruction in the harpsichord from Prinetti of Novara, but Prinetti played the scale with two fingers only, combined his profession of a musician with the business of selling liquor, and fell asleep while he stood, so that he was a fit subject for ridicule with his critical pupil. Gioachino was taken from him and apprenticed to a smith. In Angelo Tesei he found a congenial master, and learned to read at sight, to play accompaniments on the pianoforte, and to sing well enough to take solo parts in the church when he was ten years of age. At thirteen he appeared at the theatre of the Commune in Paër's *Camilla*—his only appearance as a public singer (1805). He was also able to play the horn. In 1807 he was admitted to the counterpoint class of Padre P. S. Mattei, and soon after to that of Cavedagni for the cello at the Conservatorio of Bologna. He learned to play the cello with ease, but the pedantic severity of Mattei's views on counterpoint only served to accentuate the tendency of his genius towards a freer school of composition, and his insight into orchestral resources is to be ascribed rather to knowledge gained by scoring the quartets and symphonies of Haydn and Mozart, than to any prescribed rules for the composition of music. At Bologna he was known as "il Tedeschino" on account of his devotion to Mozart. Through the friendly interposition of the Marquis Cavalli, his first opera, *La Cambiale di Matrimonio*, was produced at Venice when he was a youth of eighteen. But two years before this he had already received the prize at the Conservatorio of Bologna

for his cantata *Il pianto d'armonia per la morte d'Orfeo*. Between 1810 and 1813, at Bologna, Rome, Venice and Milan, Rossini produced operas of which the successes were varying. All memory of them is eclipsed in that of *Tamcredi*. The libretto was an arrangement of Voltaire's tragedy by J. A. Rossi. Traces of Paër and Paisiello were undeniably present in fragments of the music. But all critical feeling on the part of the public was drowned in the effect of sweetness and clarity produced by such melodies as "Mi rivedrai, ti rivèdrò" and "Di tanti palpiti," the former of which became so popular that the Italians would sing it in crowds at the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but their reception was tame and in some cases unsatisfactory after the success of *Tamcredi*. In 1815 he retired to his home at Bologna, where Barbaja, the impresario of the Naples theatre, who had once been a waiter in a coffee-house and now combined the business of theatrical management with that of farming the public gaming-tables, concluded an agreement with him by which he was to take the musical direction of the Teatro San Carlo and the Teatro Del Fondo at Naples, composing for each of them one opera a year. His payment was to be 200 ducats (about £35 or \$175) per month; he was also to receive a share in the gaming-tables amounting to about 1000 ducats (£175 or \$875) per annum. The presence of Zingarelli and Paisiello in Naples was an incentive to intrigue against the success of the youthful composer, but all hostility was made futile by the enthusiasm which greeted the court performance of his *Elisabetta regina d'Inghilterra*, in which Isabella Colbran, who subsequently became the composer's wife, took a leading part. The libretto of this opera by Schmidt was in many of its incidents an anticipation of those presented to the world a few years later in Scott's *Kenilworth*. The opera was the first in which Rossini wrote the ornaments of the airs instead of leaving them to the fancy of the singers, and also the first in which the *recitativo secco* was replaced by a recitative accompanied by a quartet of strings. In *Almaviva*, produced in the beginning of the next year in Rome, the libretto, a version of Beaumarchais' *Barbier de Sville* by Sterbini, was the same as that already used by Paisiello in his *Barbiere*, an opera which had enjoyed European popularity for more than a quarter of a century. The indignation of Paisiello's admirers expressed itself strongly on the production of the new setting, but in the thirteen days devoted to the composition of his *Almaviva*, Rossini had created such a masterpiece of musical comedy that the fame of Paisiello's opera was transferred to his, to which the title of *Il Barbiere di Siviglia* passed as an inalienable heritage. Between 1815 and 1823 Rossini produced twenty operas. Of these *Otello* formed the climax to his reform of serious opera, and offers a suggestive contrast with the treatment of the same subject at a similar point of artistic development by the composer Verdi. In Rossini's time the tragic close was so distasteful to the public of Rome that it was necessary to invent a happy conclusion to *Otello*; and there are still places in Italy in which the Shakespearean end of the story can never be performed without interruption from the audience, who warn Desdemona of Otello's deadly approach. Conditions of stage mechanism in 1817 are illustrated by Rossini's acceptance of the subject of *Cinderella* for a libretto only on the condition that the supernatural element should be omitted. The opera *Cenerentola* is to be ranked with the *Barbiere*. The absence of a similar precaution in the construction of his *Mosè in Egitto* led to disaster in the scene depicting the passage of the Israelites through the Red Sea, when the defects in stage contrivance always raised a laugh, so that the composer was at length compelled to introduce the chorus "Dal tuo stellato Soglio" to divert attention from the dividing waves. In 1821, three years after the production of this work, Rossini married Isabella Colbran. In 1822 he directed his *Cenerentola* in Vienna, where *Zelmira* was also performed. After this he returned to Bologna; but an invitation from Prince Metternich to come to Verona and "assist in the general re-establish-

ment of harmony" was too tempting to be refused, and he arrived at the Congress in time for its opening on the 20th of October 1822. Here he made friends with Chateaubriand and Madame de Lieven. In 1823, at the suggestion of the manager of the King's Theatre, London, he came to England, being much fêted on his way through Paris. In England he was given a generous welcome, which included an introduction to King George IV. and the receipt of £7000 after a residence of five months. In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum, and when the agreement came to an end he was rewarded with the offices of chief composer to the king and inspector-general of singing in France, to which was attached the same income. The production of his *Guillaume Tell* in 1829 brought his career as a writer of opera to a close. The libretto was by Étienne Jouy and Hippolyte Bis, but their version was revised by Armand Marrast. The music is remarkable for its freedom from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1829 he returned to Bologna. His mother had died in 1827, and he was anxious to be with his father. Arrangements for his subsequent return to Paris on a new agreement were upset by the abdication of Charles X. and the July Revolution of 1830. Rossini, who had been considering the subject of *Faust* for a new opera, returned, however, to Paris in the November of that year. Six movements of his *Stabat Mater* were written in 1832 and the rest in 1839, the year of his father's death, and the success of the work bears comparison with his achievements in opera; but his comparative silence during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer's cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vernet for his picture of "Judith and Holofernes." After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He died at his country house at Passy on the 13th of November 1868. He was a foreign associate of the Institute, grand officer of the Legion of Honour, and the recipient of innumerable orders. In his compositions Rossini plagiarized even more freely from himself than from other musicians, and few of his operas are without such admixtures frankly introduced in the form of arias or overtures. A characteristic mannerism in his musical writing earned for him the nickname of "Monsieur Crescendo." His music is associated with the names of the greatest singers—lyrical drama, such as Tamburini, Mario, Rubini, Delle Sedie, Albani, Grisi, Patti and Nilsson.

**ROSSLAND**, an important city in the Kootenay district of British Columbia, incorporated in 1897. Pop. (1907) 4033. It is situated in a valley 7 m. W. of Trail on the Columbia river and 8 m. N. of the international boundary. It has direct railroad communication with Trail and the Arrow lakes as well as with Northport and Spokane in the state of Washington. Rossland owes its importance to the immense deposits of iron and copper pyrites carrying gold, which occur in the vicinity. The best-known mines are the Le Roy, Centre Star and Mt. Eagle. The city derives its electric light and power service from Bonnington Falls on the Kootenay river.

**ROSSLAU**, a town of Germany, in the duchy of Anhalt, on the right bank of the Elbe, here crossed by two railway bridges, 3 m. by rail N. of Dessau and 35 m. S.E. of Magdeburg. Pop. (1905) 11,027. It has a ducal residence, an old castle, a handsome parish church, and manufactures of machinery, paper, sealing-wax, wire goods, sugar, bricks and chemicals. Rossau became a town in 1603.

**ROSSLYN, EARLS OF**. The first earl of Rosslyn was Alexander Wedderburn (see below), who was succeeded by his nephew, James St. Clair Erskine (1762-1837), a son of

Wedderburn's sister Janet by her marriage with Sir Henry Erskine (d. 1765), a Scottish baronet and soldier. Entering the army in 1776, James Erskine served in Portugal, in Denmark and in the Netherlands, and became a general in 1814. From 1782 until 1805, when he became a peer, he was a member of parliament; a Tory politician and an associate of the duke of Wellington, he was lord privy seal in 1820-30 and lord president of the council in 1834-35. He inherited the estates of the family of St Clair and took this name in 1780, and he died on the 18th of January 1837. His son, James Alexander (1802-1866), became 3rd earl, and in 1800 the latter's grandson, James Francis Harry (b. 1860), became 5th earl.

**ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF** (1733-1805), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall), and was born in East Lothian on the 13th of February 1733. He acquired the rudiments of his education at Dalkeith, and in his fourteenth year matriculated at the university of Edinburgh. It was from the first his desire to practise at the English bar, though in deference to his father's wishes he qualified as an advocate at Edinburgh, in 1754, but entered himself at the Inner Temple on the 8th of May 1753, so that he might keep the Easter and Trinity terms in that year. His father was called to the bench in 1755, and for the next three years Wedderburn stuck to his practice in Edinburgh, during which period he employed his oratorical powers in the General Assembly of the Church of Scotland, and passed his evenings in the social and argumentative clubs which abound in Edinburgh. In 1755 the precursor of the later *Edinburgh Review* was started, now chiefly remembered because in its pages Adam Smith criticized the dictionary of Dr Johnson, and because the contents of its two numbers were edited by Wedderburn. The dean of faculty at this time, Lockhart, afterwards Lord Covington, a lawyer notorious for his harsh demeanour, in the autumn of 1757 assailed Wedderburn with more than ordinary insolence. His victim retorted with extraordinary powers of invective, and on being rebuked by the bench declined to retract or apologize, but placed his gown upon the table, and with a low bow left the court for ever. He was called to the English bar at the Inner Temple in 1757. To shake off his native accent and to acquire the graces of oratorical culture, he engaged the services of Thomas Sheridan and Charles Macklin. To secure business and to conduct his cases with adequate knowledge, he studied the forms of English law, he solicited William Strahan, the printer, "to get him employed in city causes," and he entered into social intercourse (as is noted in Alexander Carlyle's autobiography) with busy London solicitors. His local connexions and the incidents of his previous career introduced him to the notice of his countrymen Lords Bute and Mansfield. When Lord Bute was prime minister this legal satellite used, says Dr Johnson, to go on errands for him, and it is to Wedderburn's credit that he first suggested to the premier the propriety of granting Johnson a pension. Through the favour of Lord Bute, he was returned to parliament for the Ayr burghs in 1761. In 1763 he became king's counsel and bencher of Lincoln's Inn, and for a short time went the northern circuits, but was more successful in obtaining business in the Court of Chancery. He obtained a considerable addition to his resources (Carlyle puts the amount at £10,000) on his marriage in 1767 to Betty Anne, sole child and heiress of John Dawson of Marly in Yorkshire. When George Grenville, whose principles leaned to Toryism, quarrelled with the court, Wedderburn affected to regard him as his leader in politics. At the dissolution in the spring of 1768 he was returned by Sir Lawrence Dundas for Richmond as a Tory, but in the questions that arose over John Wilkes (q.v.) he took the popular side of "Wilkes and liberty," and resigned his seat in May 1769. In the opinion of the people he was now regarded as the embodiment of all legal virtue; his health was toasted at the dinners of the Whigs amid rounds of applause, and, in recompense for the loss of his seat in parliament, he was returned by Lord Clive for his pocket-borough of Bishop's Castle, in Shropshire, in January 1770. During the next session

he acted vigorously in opposition, but his conduct was always viewed with distrust by his new associates, and his attacks on the ministry of Lord North grew less and less animated in proportion to its apparent fixity of tenure. In January 1771 he was offered and accepted the post of solicitor-general. The high road to the woolsack was now open, but his defection from his former path has stamped his character with general infamy. Junius wrote of him, "As for Mr Wedderburn, there is something about him which even treachery cannot trust," and Colonel Barré attacked him in the House of Commons. The new law officer defended his conduct with the assertion that his alliance in politics had been with Mr George Grenville, and that the connexion had been severed on his death. All through the American War he consistently declaimed against the colonies, and he was bitter in his attack on Benjamin Franklin (q.v.) before the Privy Council. In June 1778 Wedderburn was promoted to the post of attorney-general, and in the same year he refused the dignity of chief baron of the exchequer because the offer was not accompanied by the promise of a peerage. At the dissolution in 1774 he had been returned for Okehampton in Devonshire, and for Castle Rising in Norfolk, and selected the former constituency; on his promotion as leading law officer of the crown he returned to Bishop's Castle. The coveted peerage was not long delayed. In June 1780 he was created chief justice of the Court of Common Pleas, with the title of Baron Loughborough.

During the existence of the coalition ministry of North and Fox, the great seal was in commission (April to December 1783), and Lord Loughborough held the leading place among the commissioners. For some time after that ministry's fall he was considered the leader of the Whig party in the House of Lords, and, had the illness of the king brought about the return of the Whigs to power, the great seal would have been placed in his hands. The king's restoration to health secured Pitt's continuance in office, and disappointed the expectations of the Whigs. In 1792, during the period of the French Revolution, Lord Loughborough seceded from Fox, and on the 28th of January 1793 he received the great seal in the Tory cabinet of Pitt. The resignation of Pitt on the question of Catholic emancipation (1801) put an end to Wedderburn's tenure of the Lord Chancellorship, for, much to his surprise, no place was found for him in Addington's cabinet. His first wife died in 1781 without leaving issue, and he married in the following year Charlotte, youngest daughter of William, Viscount Courtenay; but her only son died in childhood. Lord Loughborough accordingly obtained in 1795 a re-grant of his barony with remainder to his nephew, Sir James St Clair Erskine. His fall in 1801 was softened by the grant of an earldom (he was created earl of Rosslyn 21st April 1801, with remainder to his nephew), and by a pension of £4000 per annum. After this date he rarely appeared in public, but he was a constant figure at all the royal festivities. He attended one of those gatherings at Frogmore, on the 31st of December 1804. On the following day he was seized with an attack of gout in the stomach, and on the 2nd of January 1805 he died at his seat, Baylis, near Salt Hill, Windsor. His remains were buried in St Paul's Cathedral on the 11th of January.

At the bar Wedderburn was the most elegant speaker of his time, and, although his knowledge of the principles and precedents of law was deficient, his skill in marshalling facts and his clearness of diction were marvellous; on the bench his judgments were remarkable for their perspicuity, particularly in the appeal cases to the House of Lords. For cool and sustained declamation he stood unrivalled in parliament, and his readiness in debate was universally acknowledged. In social life, in the company of the wits and writers of his day, his faculties seemed to desert him. He was not only dull, but the cause of dullness in others, and even Alexander Carlyle confesses that in conversation his illustrious countryman was "stiff and pompous." In Wedderburn's character ambition banished all rectitude of principle, but the love of money for money's sake was not among his faults.

See Brougham's *Statesmen of the Reign of George III.*: Foss's *Judges*; Campbell's *Lives of Lord Chancellors.* (W. F. C.)

**ROSSTREVOR**, a watering-place of county Down, Ireland, on Carlingford Lough. See WARRENPOINT.

**ROSSWEIN**, a town of Germany, in the kingdom of Saxony, situated on the Freiburger Mulde, 46 m. S.E. from Leipzig by the railway via Döbeln to Dresden. Pop. (1905) 9297. It is famous for its technical schools, among which are one for builders, another for furniture-makers, and a third for ironmongers. The industries are considerable, and include woollen and cloth manufactures, dyeing, spinning, and the making of agricultural machinery, cigars, chemicals, bricks and iron goods. Rosswein is an old town, cloth-making being a flourishing industry here in the 14th century.

See C. V. Böhmert, *Die Stadt Rosswein, 1883-94* (Dresden, 1895).

**ROSTAND, EDMOND** (1860- ), French dramatist, was born on the 1st of April 1860, the son of Joseph Eugène Herbert Rostand (b. 1843), a prominent journalist and economist of Marseilles. His first play, a burlesque, *Les romanesques*, was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, *La Princesse lointaine* (Théâtre de la Renaissance, 5th April 1895), from the story of the troubadour Rudel and the Lady of Tripoli. The part of Mélissande was created by Sarah Bernhardt, who also was the original Photine of *La Samaritaine* (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" of *Cyrano de Bergerac* (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title-rôle, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's *Hernani*. The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in *L'Aiglon* he chose a subject from Napoleonic legend, suggested probably by Henri Welschinger's *Roi de Rome, 1811-32* (1897), which contained much new information about the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schönbrunn. *L'Aiglon*, in six acts and in verse, was produced (15th March 1900) by Sarah Bernhardt at her own theatre, she herself undertaking the part of the duke of Reichstadt. In 1902 Rostand was elected to the French Academy. His *Chantecler*, produced in February 1910, was awaited with an interest (enhanced by considerable delay in the production) hardly equalled by the enthusiasm of its reception. Lucien Guitry was in the title-rôle and Mme. Simone played the part of the pheasant, the play being a fantasy of bird and animal life, and the characters denizens of the farmyard and the woods. Rostand's wife, née Rosemonde Étienne Gérard, published in 1890 *Les Pipeaux*, a volume of verse crowned by the Academy.

See a notice by Henry James in vol. 84, pp. 477 seq. of the *Cornhill Magazine*.

**ROSTOCK**, a town of Germany, in the grand duchy of Mecklenburg-Schwerin, one of the most important commercial cities on the Baltic. It is situated on the left bank of the estuary of the Warnow, 8 m. from the port of Warnemünde on the Baltic. 177 m. N.W. of Berlin by rail, 80 m. N.E. of Lübeck, and 106 m. S. of Copenhagen. Pop. (1905) 60,790. It consists of three parts—the old town to the east, and the middle and new towns to the west—of which the first retains some of the antique features of a Hanse town, while the last two are for the most part regularly and handsomely built. There are also several suburbs. The town has four gates, one of them dating from the 14th century, and some fine squares, among them the Blücher Platz, with a statue of Blücher, who was born here, and the Neue Markt. Rostock was a fortress of some strength, but the old fortifications have been razed, and their site is occupied by promenades. Rostock has five old churches: St Mary's, dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg, with two Romanesque towers and containing a magnificent bronze font and a curious clock; St Nicholas's, begun about 1250 and restored in 1450, and again in 1890-94; St Peter's, with a lofty tower over 400 ft. high, built in 1400, which serves as a landmark to ships at sea;

St James's, completed in 1588, and the church of the Holy Rood, begun in 1270. St Mary's church contains a monument marking the original tomb of Hugo Grotius, who died in Rostock in 1645, though his remains were afterwards removed to Delft. Among other interesting buildings are the curious 14th-century Gothic town hall, the façade of which is concealed by a Renaissance addition; the palace of the grand duke of Mecklenburg-Schwerin, built in 1702; the law courts, built in 1878-79; the university buildings, erected in 1867-70; and an assembly hall of the estates of Mecklenburg (Ständehaus), a handsome Gothic building erected in 1889-93.

The university of Rostock was founded in 1418 by Duke Johann III. and Albrecht V. of Mecklenburg. From 1437 till 1443 it had its seat at Greifswald in consequence of commotions at Rostock; and in 1760 it was again removed, on this occasion to Bützow. The professors appointed by the city, however, still taught at Rostock, so that there were practically two universities in the duchy until 1789, when they were reunited at the original seat. Rostock is the seat of the supreme court for both the duchies of Mecklenburg, and is well equipped with schools, hospitals, and other institutions.

Although the population, commerce and wealth of Rostock have declined since Hanse days, it has a considerable trade, being the chief commercial town of Mecklenburg and owning a considerable fleet. Vessels drawing 16 ft. of water are able to get up to the wharves. By far the most important export is grain, which goes almost entirely to British ports; but wool, flax and cattle are also shipped. The chief imports are coal from Great Britain, herrings from Sweden, petroleum from America, timber, wine and colonial goods. Rostock has an important fair at Whitsuntide, lasting for fourteen days, and also a frequented wool and cattle market. The industries of the town are varied. One of the chief is shipbuilding. Machinery, chemicals, sugar, malt, paper, musical instruments, cotton, straw hats, tobacco, carpets, soap, playing cards, chocolate and dye-stuffs are among the manufactures. The town also contains distilleries, saw-mills, oil-mills, tanneries, breweries and electrical works.

Local historians assert that a village existed on the site of Rostock as early as A.D. 329, but no certain proofs have been traced of any earlier community than that founded here in the 12th century, which is said to have received municipal rights in 1218. The earliest signs of commercial prosperity date from about 1260. For a time Rostock was under the dominion of the kings of Denmark. Soon after returning under the protection of Mecklenburg in the 14th century it joined the Hanseatic League; and was one of the original members of the powerful Wendish Hansa, in which it exercised an influence second only to that of Lübeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century, precisely at the period when its political power began to wane. Rostock, however, never entirely lost the independence which it enjoyed as a Hanse town; and in 1788, as the result of long contentions with the rulers of Mecklenburg, it secured for itself a peculiar and liberal municipal constitution, administered by three burgo-masters and three chambers. In 1880 this constitution was somewhat modified, and the city became less like a state within a state. It has belonged to Mecklenburg-Schwerin since 1695; in 1712 it was taken by the Swedes, in 1715 by the Danes and in 1716 by the Russians. The badge of Rostock is the figure 7; and a local rhyme explains that there are 7 doors to St Mary's church, 7 streets from the market-place, 7 gates on the landward side and 7 wharves on the seaward side of the town, 7 turrets on the town-hall which has 7 bells, and 7 linden trees in the park.

See Reinhold, *Chronik der Stadt Rostock* (Rostock, 1836); Krabbe, *Die Universität Rostock im 15 und 16 Jahrhundert* (2 vols., Rostock, 1854); Koppmann, *Geschichte der Stadt Rostock* (Rostock, 1887); Volckmann, *Führer durch Rostock* (3rd ed., 1896); *Die Geschichtsquellen der Stadt Rostock* (Rostock, 1885); and *Die Beiträge zur Geschichte der Stadt Rostock* (Rostock, 1890).

**ROSTOPTSCHIN, COUNT FEODOR VASSILIEVICH** (1765-1826), Russian general, was born on the 23rd of March 1765 in the government of Orel. He had great influence with the Tsar Paul, who made him in 1796 adjutant-general, grand-marshal of the court, then minister of the interior. In 1799-94; St Peter's, with a lofty tower over 400 ft. high, built in 1400, which serves as a landmark to ships at sea; for his opposition to the French alliance, but was restored

favour in 1810, and was shortly afterwards appointed military governor of Moscow. He was therefore charged with its defence against Napoleon, and took every means to rouse the population of the town and district against the invader. He has been generally charged with instigating the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended himself against the charge of incendiarism in a pamphlet printed in Paris in 1823, *La Vérité sur l'incendie de Moscou*, but he subsequently made grave admissions. Shortly after the congress of Vienna, to which he had accompanied the Tsar Alexander, he was disgraced. He only returned to Russia in 1825, and died at Moscow on the 12th of February of the next year.

His *Mémoires écrits en dix minutes* were posthumously published at St Petersburg in 1853, his *Œuvres inédites* in Paris in 1894. A partial account of his life was written by his grandson A. de Ségur (Paris, 1872). See also Varnhagen von Ense, *Denkwürdigkeiten*, vol. ix.; G. Tzenoff, *Wer hat Moskau im Jahre 1812 in Brand gesteckt* (Berlin, 1900).

**ROSTOV-ON-THE-DON**, a seaport of Russia, in the territory of the Don Cossacks, well situated on the high right bank of the Don, 13 m. from its mouth in the Sea of Azov. In 1731 a small fort was erected on an island in the Don, near its mouth. Thirty years later the fortifications were transferred to the site now occupied by Rostov, 5 m. above the head of the first branch of the delta of the Don. The Don, which has here a breadth of 230 to 250 yds., with a hardly perceptible current, offers an excellent roadstead. The navigation, however, is considerably impeded by the shallowness of the river. Dredging operations have but partially remedied this. Moreover, the river is frost-bound for more than one hundred days in the year. The population has grown rapidly: while in 1881 it was 70,700, in 1897 it numbered 119,889, and in 1905 126,375, exclusive of the suburbs; if these, which comprise Nakhichevan (32,582 in 1905) be included, the population is well over 160,000, a figure which is still further swollen in the summer by the influx of about 60,000 men, who find work in connexion with the shipment of grain for export. The permanent population includes 15,000 Jews, 5000 Armenians, with Tatars, Poles, Germans and others. In Nakhichevan there are 20,500 Armenians. Owing to its situation on the navigable river Don and at the junction of three railways, radiating to north-western Russia, Caucasia and the Volga respectively, Rostov has become the chief seaport of south-eastern Russia, being second in importance on the Black Sea to Odessa only. It is the chief centre for the supply of agricultural machinery to the steppe governments of south-eastern Russia. On an average, £3,000,000 to £4,000,000 worth of wheat, about £1,000,000 worth of rye, and over £1,500,000 worth of barley are exported annually, besides oats, flax, linseed, rape seed, oilcake, bran, flour, vegetable oils, raw wool and caviare. The imports average between four and five millions sterling annually, and consist largely of agricultural machinery. There are a shipbuilding yard, flour-mills, tobacco factories, iron works, machinery works, distilleries, soap works, timber mills, bell foundries, paper mills and rope works. Rostov is the chief centre of steam flour-mills for south-eastern Russia and Caucasia. Two fairs, one of which has considerable importance for the whole of south-eastern Russia, are held here yearly. Rostov has excellent fisheries. The town has a cathedral, a fine town hall (1897-99), navigation schools, technical schools, and a good municipal library.

**ROSTOV VELIKIY**, a town of Russia, in the government of Yaroslavl, 35 m. by rail S.W. of the town of Yaroslavl, near Lake Rostov or Nero. Pop. (1897) 14,342. It has numerous cotton and linen mills. The great fair for which it was formerly famous has lost its importance, but the town remains the centre of a variety of domestic trades—tailoring, the manufacture of leather, and the making of boots and small enamelled ikons (sacred images); it is also famous for its kitchen gardening and the export of pickled and dried vegetables and medical herbs. Fishing is carried on. The restoration of the buildings

(royal palace, archiepiscopal palace, and five churches) of the kreml or citadel was begun in 1901. The other public buildings include six 17th-century churches, a museum and a cathedral, consecrated in 1231 and having its interior walls covered with paintings.

Rostov was founded by Slavs in or before 862, and played so prominent a rôle in the history of that part of Russia that it used to be known as Rostov the Great. From the beginning of the 11th century to the 13th it was the chief town of a territory which included large parts of the present governments of Yaroslavl, Vladimir and Novgorod. After the Mongol invasion of 1239-42 it rapidly declined, and in 1474 it was purchased by Ivan III. and annexed to Moscow. It was repeatedly plundered by Tatars, Lithuanians and Poles in the 15th, 16th and 17th centuries.

**ROSTRA**<sup>1</sup> ("beaks"), in Roman antiquities, the orators' platform, which originally stood between the comitium and the forum proper, opposite the curia. It is not known when it was erected, but in 338 B.C. it was decorated by Gaius Maenius with the prows of ships captured from the people of Antium (Livy viii. 14). From that time it was called *Rostra*, having previously been known as *templum* (literally "consecrated place"), since it had been consecrated by the augurs (Cicero, *In Valinium*, x. 24). Some, however, deny the identity of the *templum* and *rostra*. On the platform or hard by were exhibited the statues of famous Romans (Camillus, Caesar), and state documents and memorials (the laws of the Twelve Tables, the treaty with the Latins, the *columna rostrata* of Duilius). Caesar had it pulled down, intending that it should be rebuilt on the west side of the forum, but it was left for Augustus (or Mark Antony) to carry out his plan. The term *Rostra Vetera*, often used by classical authors in connexion with funeral orations, makes it doubtful whether the old platform was entirely demolished, unless the name was simply transferred to the new *rostra* of Augustus. This consisted of a rectangular platform, 78 ft. long, 33 ft. broad and 12 ft. above the level of the forum pavement. It was reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood, possibly also intended for a staircase leading down into the forum. In the existing remains the holes in which the beaks of the ships were fastened, arranged in pairs, are visible. Behind these remains, close to the Clivus Capitolinus, a row of light low-arched cells has been found, which, owing to a certain resemblance to the earlier *rostra* as shown on the well-known coin of Lollius Palicanus, has been identified by Boni with the *rostra* removed by Julius Caesar, the other remains being attributed to the time of Domitian (for objections to this theory, see Hülsen and Richter). In the time of Hadrian the side balustrades were decorated with marble slabs, on which were represented in relief the burning of the lists of the citizens who were in arrears to the fisc and the distribution of necessities to the poorer citizens. Thédénat explains the first as Domitian reassuring a deputation of citizens by burning the denunciatory reports of the *delatores*, and the second (the scene of which he places at the *Rostra Julia*) as the promulgation of the law forbidding the mutilation of children. The erection of the arch of Severus necessitated considerable alterations, the most important of which was a triangular courtyard cut out of the north half of the *rostra*, to allow direct access to it from the side that faced the arch, its breadth being thereby reduced by a third. A later extension of the façade northwards is explained by a long inscription, recording that about the year 470, Ulpius Junius Valentinus, a city prefect, restored the structure (hence called *Rostra Vandalica*) after a naval victory over the Vandals. A relief on the arch of Constantine represents the emperor speaking from the *rostra*.

The *Rostra Julia* was a platform with a semicircular niche

<sup>1</sup> The Lat. singular *rostrum*, a beak, the beak of a ship, is used in English of a platform, stand or pulpit from which a speaker addresses his audience. It is also used in its original meaning of a beak-like prolongation or process in zoology or botany.

in the centre, in front of the Aedes divi Julii, built by Augustus on the spot where the body of Caesar was cremated. The niche was probably used to support the bier while a funeral *laudatio* was being delivered. The front on either side was decorated with the beaks of ships captured at the battle of Actium.

Abt. 3, pt. 2 of I. von Müller's *Handbuch der klassischen Altertumswissenschaft*); H. Thédenat, *Le Forum Romain* (3rd ed. 1904); J. H. Middleton, *Remains of Ancient Rome* (1892); O. Richter, *Rekonstruktion und Geschichte der römischen Rednerbühne* (Berlin, 1884); F. M. Nichols, *The Roman Forum* (1877); also article **ROMÉ**, *Archæologia*.

**ROTA, COURT OF**, one of the departments of the mediæval papal organization, existing alongside the *Dataria*, the *Pœnitentiaria*, the two *Signaturas* (*S. Gratiæ* and *S. Justitiæ*), and other bureaus. The Rota was the supreme court of Christendom. It consisted of twelve members, three from Rome, two from Spain, one each from Bologna, Ferrara, Venice, Milan, Germany, France, and (alternately) Tuscany or Perugia. It declined in importance when the *Signatura Justitiæ* was set above it as the court of appeal for Italy, and more so as the geographical jurisdiction of the pope was gradually lessened. After the Council of Trent the old arrangements were replaced by the Congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X. in 1908 (see **CURIA ROMANA**).

**ROTHE, JUSTUS LUDWIG ADOLF** (1818-1892), German geologist and mineralogist, was born at Hamburg on the 15th of September 1818. In 1867 he was appointed professor of mineralogy at the university of Berlin. He may be regarded as one of the founders of petrographical science. In his published papers he dealt with metamorphism and crystalline schists, discussed the origin of serpentine, and wrote on Vesuvian rocks and on Ponza Island. His separate works included *Der Vesuv und die Umgebung von Neapel* (1857); *Beiträge zur Petrographie der plutonischen Gesteine* (1869-84); *Allgemeine und chemische Geologie* (3 vols., 1879-93); and *Über die Erdbeben* (1882). He died at Berlin on the 1st of April 1892.

**ROTHE, RICHARD** (1799-1867), Lutheran theologian, was born at Posen on the 28th of January 1799. He studied theology in the universities of Heidelberg and Berlin (1817-20) under Karl Daub (1765-1836), Schleiermacher and Neander, the philosophers and historians Georg Hegel, Friedrich Kreuzer (1771-1858) and F. C. Schlosser (1776-1861) exercising a considerable influence in shaping his thought. From 1820 to 1822 he was in the clerical seminary at Wittenberg. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg theological seminary, of which in 1832 he became also second director and *ephorus*, and hence in 1837 he removed to Heidelberg as professor and director of a new clerical seminary; in 1849 he accepted an invitation to Bonn as professor and university preacher, but in 1854 he returned to Heidelberg as professor of theology, and afterwards became member of the Oberkirchenrath, a position he held until his death on the 20th of August 1867. As a youth Rothe had a bent towards a supernatural mysticism; his chosen authors were those of the romantic school, and Novalis remained throughout his life a special favourite. In Berlin and Wittenberg he came under the influence of Pietism as represented by such men as Rudolf Stier (1800-1862) and Friedrich Tholuck, though Tholuck pronounced him a "very modern Christian." He afterwards confessed that, though he had been a sincere, he was never a happy, Pietist. In Rome, under the broadening influence of classical and ecclesiastical art, he learned to look at Christianity in its human and universalistic aspects, and began to develop his great idea, the inseparable relation of religion and morals. He began then, and particularly after the revolution of July 1830, likewise to give a more definite form to his peculiar view of the relations of church and state. He thus became

out of harmony with the pietistic thought and life of Wittenberg. His removal to Heidelberg and the publication of his first important work, *Die Anfänge der christlichen Kirche und ihrer Verfassung* (1837), coincide with the attainment of the principal theological positions with which his name is associated. During the middle period of his career (1837-61) he led the life of a scholastic recluse. During the last six years of his life he came forward as the advocate of a free theology and of the Protestantverein.

Rothe was one of the most profound and influential of modern German theologians. Like Schleiermacher he combined with the keenest logical faculty an intensely religious spirit, while his philosophical tendencies were in sympathy rather with Hegel than with Schleiermacher, and theosophic mysticism was more congenial to him than the abstractions of Spinoza, to whom Schleiermacher owed so much. He classed himself among the theosophists, and claimed to be a convinced and happy supernaturalist in a scientific age. His system, though it may seem to contain doubtful or even fantastic elements, is in its general outlines a noble massive whole, constructed by a profound, comprehensive, fearless and logical mind. A peculiarity of his thought was the realistic nature of his spiritualism: his abstractions are all real existences; his spiritual entities are real and corporeal; his truth is actual being. Hence Rothe, unlike Schleiermacher, lays great stress, for instance, on the personality of God, on the reality of the worlds of good and evil spirits, and on the visible second coming of Christ. Hence his religious feeling and theological speculation demanded their realization in a kingdom of God coextensive with man's nature, terrestrial history and human society; and thus his theological system became a *Theologische Ethik*, as he entitled one of his books (3 vols., 1845-1848). It is on this work that Rothe's permanent reputation as a theologian and ethical writer will rest. The first edition remained twelve years out of print before the second (5 vols., 1867-71) appeared. It was the author's purpose to rewrite the whole, but he died when he had completed the first two volumes. The remainder was reprinted from the first edition by Professor Heinrich Holtzmann, with the addition of some notes and emendations left by the author.

The *Theologische Ethik* begins with a general sketch of the author's system of speculative theology in its two divisions, theology proper and cosmology, cosmology falling into the two subdivisions of *Physis* (the world of nature) and *Ethik* (the world of spirit). It is the last subdivision with which the body of the work is occupied. After an analysis of the religious consciousness, which yields the doctrine of an absolute personal and spiritual God, Rothe proceeds to deduce from his idea of God the process and history of creative development, which is eternally proceeding and bringing forth, as its unending purpose, worlds of spirits, partially self-creative and sharing the absolute personality of the Creator. Rothe regards the natural man as the consummation of the development of physical nature, and obtains spirit as the personal attainment, with divine help, of those beings in whom the further creative process of moral development is carried on. His theory leaves the natural man, without hesitation, to be developed by the natural processes of animal evolution. The attainment of the higher stage of development is the moral and religious vocation of man; this higher stage is self-determination, the performance of every human function as a voluntary and intelligent agent, or as a person, having as its cosmic effect the subjection of all material to spiritual existence. This personal process of spiritualization is the continuation of the eternal divine work of creation. Thus the moral life and the religious life coincide, and when normal are identical; both have the same aim and are occupied with the same task, the accomplishment of the spiritualization of the world. "Piety, that it may become truth and reality, demands morality as its fulfilment, as the only concrete element in which the idea of fellowship with God is realized; morality, that it may find its perfect unfolding, requires the aid of piety, in the light of which alone it can comprehend its own idea in all its breadth and depth." The process of human development Rothe regards as necessarily taking an abnormal form and passing through the phase of sin. This abnormal condition necessitates a fresh creative act, that of salvation, which was, however, from the first, part of the divine plan. As a preparation for this salvation supernatural revelation was required for the purifying and revivification of the religious consciousness, and the Saviour Himself had to appear in human history as a fresh miraculous creation, born of a woman but not begotten by a man. In consequence of His supernatural birth the Saviour, or the second Adam, was free from original sin. By His own moral and religious development He made possible a relation of perfect fellowship between God and man, which was the new and highest stage of the divine creation of mankind. This stage of development inaugurated by the Saviour is attained by means of His kingdom of the community of salvation, which is both moral and religious, and in the first instance and temporarily only religious—that is, a church. As men reach the full development of their nature, and appropriate the perfection of the Saviour, the separation between

the religious and the moral life will vanish, and the Christian state, as the highest sphere of human life representing all human functions, will displace the church. "In proportion as the Saviour Christianizes the state by means of the church must the progressive completion of the structure of the church prove the cause of its abolition." The decline of the church is therefore not to be deplored, but recognized as the consequence of the independence and completeness of the Christian life. It is the third section of his work—the *Pflichtenlehre*—which is generally most highly valued, and where his full strength as an ethical thinker is displayed, without any mixture of theosophic speculation.

Since Rothe's death several volumes of his sermons and of his lectures (on dogmatics, the history of homiletics) and a collection of brief essays and religious meditations under the title of *Stille Stunden* (Nippold, 1872) have been published.

See F. Nippold, *Richard Rothe, ein christliches Lebensbild* (2 vols., Wittenberg, 1873-74); D. Schenkel, "Zur Erinnerung an Dr. R. Rothe," in the *Allgemeine kirchliche Zeitschrift* (1867-68); H. Holtzmann, "Richard Rothe," in the *Jahrbuch des Protestantismus* (1869); K. H. W. Schwarz, *Zur Geschichte der neuesten Theologie* (4th ed., Leipzig, 1869, pp. 417-44); Otto Pfeiderer, *Religionsphilosophie auf geschichtlicher Grundlage* (2nd ed., Berlin, 1884, vol. i, pp. 611-15); cf. *The Development of Theology in Germany since Kant* (1890); W. Hömig, *Richard Rothe, sein Charakter, Leben und Denken* (1898); Adolf Hausrath, *Richard Rothe und seine Freunde* (1902).

**ROTHELIN, JACQUELINE DE ROHAN, MARQUISE DE** (c. 1520-1587), daughter of Charles de Rohan and Jeanne de Saint-Séverin. Her husband, François of Orleans-Longueville, marquis de Rothelin, died in 1548, and in watching her son's interests in Neuchâtel she was brought into contact with the reformers in Switzerland. She then embraced Protestantism and turned her château at Blandy, in Brie, into a refuge for Huguenots. In 1567 she underwent a term of imprisonment at the Louvre for harbouring Protestants.

**ROTHENBURG-OB-DER-TAUBER**, a town of Germany, in the kingdom of Bavaria, 49 m. by rail S.W. of Nuremberg. Pop. (1905) 8436. It is beautifully situated on an eminence 200 ft. above the Tauber. It is flanked by medieval walls, towers and gates, and its antique appearance has been carefully preserved. Perhaps the most interesting building is the town hall, one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure, with a magnificent façade and a delicate spire, and contains a grand hall, the Kaisersaal, in which every Whit Monday a play, *Der Meistertrank*, which commemorates the capture of the tower by Tilly in 1631, is performed. Other buildings are the Gothic church of St James, with curiously carved altars and beautiful stained-glass windows, and containing in the Toppler chapel the tomb of the burgomaster, Heinrich Toppler; the 15th-century church of St Wolfgang; the Franciscan church; and five other churches. The town has many picturesque houses, and possesses a library with some interesting archives. It has manufactures of toys and agricultural machinery, electrical works and breweries.

Rothenburg-ob-der-Tauber, mentioned in the chronicles in 804 as *Rotinburg*, was probably a residence of the dukes of Franconia. It first appears as a town in 942 and until 1108 was the seat of the counts of Rothenburg-Komburg; when this line became extinct it passed to the family of Hohenstaufen, one member of which took the title of duke of Rothenburg. In 1172 it became a free imperial city and it attained the zenith of its prosperity under the famous burgomaster Heinrich Toppler (1350-1408). It took part in the movements in South Germany during the 15th and 16th centuries. In 1631 Rothenburg was stormed by Tilly, and the cup of wine presented by the burgomaster, which, according to tradition, saved the town from destruction, is annually commemorated in the play mentioned above.

See Bensen, *Beschreibung und Geschichte der Stadt Rothenburg* (Erlangen, 1856); Merz, *Rothenburg in alter und neuer Zeit* (2nd ed., Ansbach, 1881); Schultheiss, *Rothenburg, ein Städtebild* (Zürich, 1892); and *Das Festspiel zu Rothenburg-ob-der-Tauber* (Munich, 1892); and W. Klein, *Führer durch die Stadt Rothenburg* (Rothenburg, 1888).

**ROTHERHAM, THOMAS** (1423-1500), archbishop of York, also called THOMAS SCOT, was born at Rotherham on the 24th of

August 1423; he was educated in his native town and seems to have been connected with both the universities of Oxford and Cambridge. Having entered the church he became rector of Ripple, Worcestershire, and later of St Vedast, Foster Lane, London, and it was probably when he was chaplain to John de Vere, earl of Oxford, that he made the acquaintance of Elizabeth Woodville, afterwards the queen of Edward IV. In 1467 Rotherham became keeper of the privy seal to this king; in 1468 he was appointed bishop of Worcester, in 1472 bishop of Lincoln and in 1475 chancellor of England. Several times he went to France on public business; in 1475 at the treaty of Picquigny he received a pension from Louis XI. of France, and in 1480 he was chosen archbishop of York. When Edward IV. died in April 1483 the archbishop remained true to his widow Elizabeth, and consequently lost the chancellorship and was put into prison by Richard III. He was soon set at liberty, and he died in 1500 at Cawood, near York. At Oxford Rotherham built part of Lincoln College and increased its endowment; at Cambridge, where he was chancellor and master of Pembroke Hall, he helped to build the University Library. He founded a college at Rotherham, which was suppressed under Edward VI., and he was responsible for the building of part of the church of All Saints there.

**ROTHERHAM**, a market-town and municipal borough in the Rotherham parliamentary division of the West Riding of Yorkshire, England, 5 m. N.E. of Sheffield, on the Midland, North-Eastern and Great Central railways. Pop. (1801) 42,061; (1901) 54,349. It lies in the valley of the Don, where that river is joined by the Rother, and has communication by water with the Humber. The Don is crossed by a bridge on which is a small ancient building, formerly a chapel. The parish church of All Saints, occupying the site of a building dating from Anglo-Saxon times, was erected in the reign of Edward IV., and is among the best specimens of Perpendicular in the north of England. The town possesses iron, steel and brass works, railway wagon works, potteries, glass-works, breweries, saw-mills and rope-yards. At the township of Masborough, opposite Rotherham across the Don, works were established in 1746 by Samuel Walker, a successful ironmaster. The municipal borough, incorporated in 1871, is under a mayor, 6 aldermen and 18 councillors. Area, 6012 acres.

The town was of some importance in Anglo-Saxon times, and at Templeborough, on the S.E. side of Rotherham, there was a Roman fort, but its traces are effaced. In the time of Edward the Confessor, Rotherham possessed a market and a church. During the Civil War it sided with the Parliament. It was taken by the Royalists in 1643, but after the victory of Marston Moor was yielded to a detachment of the Parliamentary forces.

**ROTHES, EARLS OF.** The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray, and of Ballinbreich in Fife. In 1445 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland. His grandson George, the 4th earl (d. 1558), whose father, William, the 3rd earl, was killed at Flodden, was accused, but acquitted in 1546, of complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated; he was one of the Scottish commissioners who witnessed the marriage of Mary queen of Scots with Francis, the dauphin of France. His son Andrew, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afterwards against Mary queen of Scots in opposing her marriage with Darnley, and in devising the murder of Rizzio. He was, however, one of the peers who acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a position of some prominence in Scottish affairs until his death in 1611. His great-grandson, John, 7th earl of Rothes (1630-1681), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II. to England at the Restoration, when he became

lord president of the council in Scotland. He was lord treasurer of Scotland from 1663 till 1667, when he was made lord chancellor of Scotland for life. His estates having been sequestrated by the parliament in 1651, he received a re-grant in 1663 of the earldom of Rothes, together with the title of Lord Leslie and Ballinbreich, with remainders to his heirs male and female, providing that in every case where a female should succeed to the peerage the name of Leslie should be assumed by her husband. In 1680 the earl was advanced to the dignity of duke of Rothes and marquess of Ballinbreich, but these titles became extinct at his death without a son in the following year. The earldom of Rothes and the other older titles now passed, under the special remainder mentioned above, to his daughter Margaret, whose husband, Charles Hamilton, 5th earl of Haddington, accordingly took the name of Leslie, at the same time making an arrangement by which his own peerage should pass to a younger son in order to keep the two earldoms separate. Margaret's son John, who on her death became 9th earl of Rothes, was vice-admiral of Scotland from 1715 to 1722, and fought with distinction against the Jacobite rebels in 1715; and her grandson, the 10th earl, who sold the estates of Ballinbreich to the Dundas family, was commander-in-chief in Ireland in 1754, and became a general in 1765. The office of sheriff of Fife, which had been an hereditary right of the earls of Rothes since 1540, was sold by the 10th earl under the Heritable Act of 1747. On several subsequent occasions the earldom again passed through the female line, and in 1803 Mary Elizabeth, countess of Rothes in her own right, was succeeded by her grandson, Norman Evelyn Leslie (b. 1877), as 10th earl of Rothes.

See Sir R. Douglas, *The Peerage of Scotland*, edited by Sir J. B. Paul; and G. E. C., *Complete Peerage*.

**ROTHESAY**, a royal, municipal and police burgh, and the chief town of the county and island of Bute, Scotland. Pop. (1901) 9378. It is situated on a beautiful bay, 40 m. S.W. of Glasgow, with which there is regular communication by railway steamers from Wemyss Bay, Gourrock, Greenock (Prince's Pier) and Craigendoran, as well as by many other steamers from Glasgow and the Clyde ports. It is a popular watering-place, and as the bay is sheltered by low wooded hills and affords excellent anchorage, it is well patronized by yachts. Loch Striven, on the opposite shore of Argyllshire, is known as the "Rothesay weather-glass," its appearance furnishing a certain clue to meteorological conditions. The town is under the jurisdiction of a provost and council. Rothesay has ceased to be a manufacturing centre, fishing being now its chief industry. Owing to its mild and equable climate it is a resort of invalids. There is a tramway to Port Bannatyne, pleasantly situated on the east horn of Kames Bay, and Craigmores, about 1 m. west of Rothesay, is a fashionable suburb. Ardbeg Point, Loch Fad, Loch Ascog and Barone Hill (530 ft.) are all within a mile and a half of the town, and there are numerous excursions by road to other points of interest. The Kyles of Bute are within a short sail of Rothesay. In the centre of the town are the ruins of a castle erected in 1098 either by Magnus Barefoot, king of Norway, or by the Scots as a defence against the Norwegians, with whom during the 13th century, and earlier, there was constant strife. The village which grew up round the castle was made a royal burgh by Robert III., who, in 1398, created his eldest son David duke of Rothesay, a title which became the highest Scottish title of the heir-apparent to the crown of the United Kingdom. During the Commonwealth the castle was garrisoned by Cromwell's troops. It was burned by the followers of Argyll in 1685, and remained neglected till the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess.

**ROTHSCHILD**, the name of a Jewish family which has acquired an unexampled position from the magnitude of its financial transactions. The original name was Bauer, the founder of the house being **MAYER ANSELM** (1743-1812), the son of Anselm Moses Bauer, a small Jewish merchant of Frankfort-

on-the-Main. His father wished him to become a rabbi, but he set up as a money-lender at the sign of the "Red Shield" (*Rothschild*) in the Frankfort Judengasse. He had already acquired some standing as a banker when his numismatic tastes obtained for him the friendship of William, ninth landgrave and afterwards elector of Hesse-Cassel, who in 1801 made him his agent. In the following year Rothschild negotiated his first great government loan, ten million thalers for the Danish government. When the landgrave was compelled to flee from his capital on the entry of the French, he placed his silver and other bulky treasures in the hands of Rothschild, who, not without considerable risk, took charge of them and buried them, it is said, in a corner of his garden, whence he dug them up as opportunity arose for disposing of them. This he did to such advantage as to be able afterwards to return their value to the elector at 5% interest. He died at Frankfort on the 19th of September 1812, leaving ten children, five sons and five daughters. Branches of the business were established at Vienna, London, Paris and Naples, each being in charge of one of the sons, the chief of the firm always residing at Frankfort. By a system of co-operation and joint counsels, aided by the skillful employment of subordinate agents, they obtained unexampled opportunities of acquiring an accurate knowledge of the condition of the financial market, and practically embraced the whole of Europe within their financial network. The unity of the interests of the several members of the firm has been preserved by the system of intermarriages which has been the general practice of the descendants of the five brothers. Each of the brothers received in 1815 from Austria the privilege of hereditary landowners, and in 1822 they were created barons by the same country. The charge of the Frankfort house devolved on the eldest, **ANSELM MAYER** (1773-1855), born on the 12th of June 1773, who was chosen a member of the royal Prussian privy council of commerce, and, in 1820, Bavarian consul and court banker. The Vienna branch was undertaken by **SOLOMON** (1774-1826), born on the 9th of December 1774, who entered into intimate relations with Prince Metternich, which contributed in no small degree to bring about the connexion of the firm with the allied powers. The third brother, **NATHAN MAYER** (1777-1836), born on the 16th of September 1777, has, however, generally been regarded as the financial genius of the family, and the chief originator of the transactions which have created for the house its unexampled position in the financial world. He went to Manchester about 1800 to act as a purchaser for his father of manufactured goods; but at the end of five years he removed to London. The boldness and skill of his financial transactions, which caused him at first to be regarded as unsafe by the leading banking firms and financial merchants, later awakened their admiration and envy. By the employment of carrier-pigeons and of fast-sailing boats of his own for the transmission of news he was able to utilize to the best advantage his special sources of information, while no one was a greater adept in the art of promoting the rise and fall of the stocks. The colossal influence of the house dates from an operation of his in 1810. In that year Wellington made some drafts which the English government could not meet; these were purchased by Rothschild at a liberal discount, and renewed to the government, which finally redeemed at par. From this time the allied powers negotiated loans to carry on the war against Napoleon chiefly through the house of Rothschild. Rothschild never lost faith in the ultimate overthrow of Napoleon, his all being virtually staked on the issue of the contest. He is said to have been present at the battle of Waterloo. Being able to transmit to London private information of the allied success several hours before it reached the public, he effected an immense profit by the purchase of stock, which had been depressed on the news of Blucher's defeat two days previously. Rothschild was the first to popularize foreign loans in Britain by fixing the rate in sterling money and making the dividends payable in London and not in foreign capitals. Latterly he became the financial agent of nearly every civilized government, although persistently declining contracts for Spain or the American States. He did not confine himself to

operations on a large scale, but on the contrary made it a principle to despise or neglect no feasible opportunity of transacting business, while at the same time his operations gradually extended to every quarter of the globe. He died on the 28th of July 1836, and was succeeded in the management of the London house by his son LIONEL (1808-1879), born on the 22nd of November 1808, whose name is associated with the removal of the civil disabilities of the Jews. He was elected a member for the City of London in 1847, and again in 1849 and 1852, but it was not till 1858 that the joint operation of an act of parliament and a resolution of the House of Commons, allowing the omission from the oath of the words to which as a Jew he conscientiously objected, rendered it possible for him to take his seat. He continued to represent the City of London till 1874. His eldest son, NATHAN (b. 1840), was created a peer as Baron Rothschild in 1885. JACOB (1792-1868), the youngest of the original brothers, was entrusted with the mission of starting the business in Paris after the restoration of the Bourbons, for whom he negotiated large loans. At the Revolution of 1848 he was a heavy loser, and had also to be protected for a time by a special guard. It was by his capital that the earliest railways were constructed in France; the profits he obtained from the speculation were very large. He died on the 15th of November 1868. The Naples branch was superintended by another of the brothers, KARL (1780-1855). It was always the least important of the five, and after the annexation of Naples to Italy in 1860 it was discontinued.

**ROTHWELL**, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, England, 4 m. S.E. of Leeds. Pop. (1901) 11,702. The church of the Holy Trinity, though largely restored, retains some good Decorated details. Rothwell soon after the Conquest was granted as a dependency of the castle of Pontefract to the Lacys, who erected here a baronial residence of which there are slight remains. Coal and stone are obtained in the neighbourhood, and the town possesses match-works and rope and twine factories in which the majority of the large industrial population is employed.

**ROTIFERA** (or **ROTATORIA**), a small, in many respects well-defined and somewhat isolated, class of the animal kingdom. Now familiarly known as "wheel animalcules," from the wheel-like motion produced by the rings of cilia which generally occur in the head region, the so-called rotatory organs, they were first discovered by A. Leeuwenhoek, to whom we also owe the discovery of Bacteria and ciliate Infusoria. Leeuwenhoek described *Rotifer vulgaris* in 1702, and he subsequently described *Meliceria ringens* and other species. A great variety of forms were described by other observers, but they were not separated as a class from the unicellular organisms (*Protozoa*) with which they usually occur, until the appearance of C. G. Ehrenberg's monograph, which contained a mass of detail regarding their structure. At the present day few groups of the animal kingdom are so well known to the microscopist, few groups present more interesting affinities to the morphologist, and few multicellular animals such a low physiological condition.

A rotifer may be regarded as typically a hemisphere or half an oblate spheroid or paraboloid with a mouth somewhere on the flat end ("disk" or "corona"), which bears a usually double ciliated ring, the outer zone the "cingulum," and inner the "trouchus"; this ring serves both for progression and for bringing up food. The body-wall, cuticulated outside, is formed by a single layer of ill-defined cells, and surrounds the simple body cavity (archicoele), traversed by simple or branched muscular fibres ("mesenchyme") (fig. 1, *m,m*). The mouth opens through a narrow pharynx (*p*) into a chamber which is (as in Crustacea) at once crop and gizzard, the mastax (*ma*), whose thickenings are imbedded in the postero-ventral wall. A slender ciliated gullet (*g*) leads into a large stomach (*st*) whose wall consists of large richly ciliated cells with usually a pair of simple secretory sacs opening into it: it may open through an intestine or rectum into the cloaca. A pair of coiled nephridial

tubes (*n*) formed of a file of perforated "drain-pipe" cells, with ciliated tag-like "flame" cells (*f*), open into a contractile bladder (*bl*),

FIG. 1.—*Notommatia naias*. A and B represent the same animal, some of the organs being shown in one figure and some in the other. *oc*, eyespots; *g*, nerve ganglion; *p*, pharynx; *ma*, mastax; *e*, oesophagus; *st*, stomach; *a*, anus, opening into the cloaca; *gl*, cement-glands in the foot; *n*, nephridia; *f*, flame-cells; *bl*, bladder; *m*, muscles; *ov*, ovary (vitellarium alone seen).

which passes by a slender duct into the cloaca. Into this also opens the genital duct from the single or paired gonad (*ov*). The simple nerve-ganglion or brain (*g*) lies on the anterodorsal side of the pharynx, and by its position determines the orientation of the animal, the cloacal opening lying on the same side, and the course of the gut being "neural." The sense organs are a pair of pigmented eyes (*oc*), and two pairs of antennae, one anterior proximal and near the wreath, the other distal and usually more or less lateral. The sexes are always separate, the males being of very rare occurrence in most cases. In the female the gonad is complex as in flatworms, composed of a germary for the formation of the eggs, and a vitellary, much more conspicuous and alone figured (*ov*), consisting of a definite number of large nucleated cells for the nourishment of the eggs. The apical end of the rotifer usually narrows suddenly beyond the curve of the gut and the cloacal aperture to form the foot of pseudopodium which ends in an organ of attachment, a pair of movable ocs, each with the opening of a cement-gland (*gl*) at its tip. Thus for orientation we place the rotifer like the cuttle-fish, head downwards: the ciliated disk is basal or oral, proximal to the rest of the animal, the foot is apical, and the brain and cloacal aperture are anterodorsal. It is in this position that free-swimming forms glide over the substratum of organic debris in which they find their food.

The cuticle may be locally or generally hardened, in the latter case being termed a lorica. Often the head is retractile, and a constriction of flexible cuticle distal to it is termed a neck: in Philodinaceae there are a series of thin flexible rings which permit both distal and proximal ends to be telescoped into the middle; and in *Taphrocampa*, regular constrictions of the whole bodywall give an appearance of metemeric segmentation to the body. In Philodinaceae accessory toes are found, unfurnished with cement-glands and distinguished as spurs.

**Corona or Disk.**—This typically consists of two concentric zones, the trouchus and cingulum, often separated by a groove or gutter which may be finely ciliated; but in several genera of no close affinity, where it is very oblique to the longitudinal axis of the body, it is represented by a general ciliation of the surface (*Taphrocampa*, *Rattulus*, *Copeus*, *Adineta*). We may suppose that primitively the mouth was seated in the centre of a funnel-shaped disk, surrounded by a double wreath. The nearest approach to this is found in *Microcodon* (fig. 2, 1) and its allies, the trouchus being oval with two median gaps, the cingulum, more delicate, and complete. In Filoculariaceae the trouchus is a horseshoe-shaped ridge

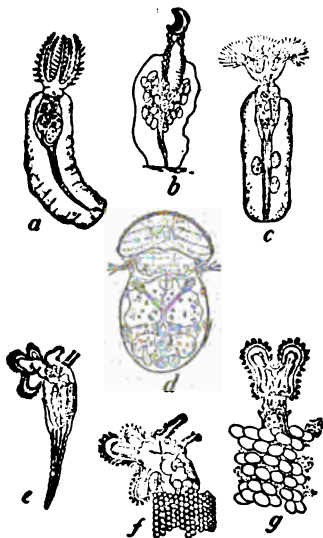

deep down in the funnel-shaped disk. The cingulum appears to be represented by the margin, usually produced into long petal-like

From Camb. Nat. Hist. vol. ii. "Worms," &c., by permission of Macmillan & Co. Ltd.  
FIG. 2.—Diagrammatic Views of Disks of Rotifers: cingulum continuous; trochus dotted; groove shaded; mouth black. 1, Simple disk of *Microcodon*; 2, belloid disk of *Rotifer* and of most Melicertids showing dorsal gap; 3, disk of *Hydatina*, with lobed ridges in the groove, bearing vibratile styles (membranellae); 4, disk of *Melicertia ringens* and *M. confifera*; the star represents the ciliated cup connected by ciliated depressions with the groove; 5, disk of *Conochilus*, like the Belloid, but with mouth antero-dorsal, the gap postero-ventral; 6, disk of *Stephanoceros*—cingulum broken up into setiferous lobes, groove a naked funnel, trochus a horseshoe-shaped ridge, mouth central.

lobes, fringed with long stiff setae, which in *Stephanoceros* are vibratile at intervals, seemingly at will. In *Floscularia* they serve

From H. S. Jennings in *American Naturalist*, vol. xxxv., by permission of Gunn & Co.

FIG. 3.—a, *Stephanoceros cichorii* in gelatinous tube; b, *Ancyclus inquietus* in gelatinous tube, with eggs; c, *Floscularia coronella* in gelatinous tube, with eggs; d, *Aspilus bucinedax*, showing lateral (distal) antennae funnel of mouth hanging into enormous crop, stomach at apical end, with gastric glands, anus on postero-ventral surface, large coiled kidneys at proximal end, uniting into median duct; e, *Melicertia ringens* in tube; f, same, proximal end enlarged, showing a pellet in the cup proximal to the paired lateral antennae; g, *Melicertia janus*, tube formed of faecal pellets.

rotifer is, as it were, constantly drawn forward into the centre of this vortex ring. There is a dorsal interruption to the disk, in-

volving both trochus and cingulum and groove; in this case the two halves of the disk may be developed in lobes, flower-shaped in *Melicertia ringens*, but often rounded and projecting like kettledrums. These give a strong impression of two crown wheels revolving in the same sense. This appearance puzzled the older observers, who were led thereby to give the name "wheel-bearers" to the group until the true character of ciliary motion was recognized; for a wheel cannot be in organic continuity with the support on which it rotates. In *Conochilus* (fig. 2, 5), a Melicertan, the mouth is displaced towards the antero-dorsal side and the gap is postero-ventral.

In *Melicertia ringens* and *M. confifera* (fig. 2, 4; fig. 3, e, f) there is a glandular ciliated pit between the mouth and the chin into which the overflow water passes by a pair of gutters, and in which fine particles are aggregated into pellets, which the animal deposits, as formed, on the edge of its tube and so builds it up. *M. janus* builds up a tube by pellets of its own faeces (fig. 3, g). In most *Ploma* the dorsal gap is not well marked, and the trochus is broken up into a number of lobes, often furnished with vibratile styles, in front and at the sides, but ventrally passing into the uniformly ciliated oral funnel.

Other ciliated organs to be noticed are the proboscis cup of Bdelloidea, and the toes of *Pedalion*. Besides these Synchaetidae and Notommatidae (fig. 7) possess a pair of arrioles, great eversible ciliated pouches a little above the disk, utilized in swimming. The mouth begins as a funnel, continued into a narrow pharynx, which in *Floscularia* is prolonged into a slender tube hanging freely down into the crop; this is followed by the crop-gizzard, also ciliated except behind, where it is hardened into a set of articulated sclerites (trophi) to form the gizzard or masticator. Thus the crop-gizzard has the same combination of structures as we find in the stomach of higher Crustacea, with which we may call it homoplastic. The trophi are (1) a median incus or anvil (fig. 4), Y-shaped, with the foot (fulcrum) distal and the arms (rami) apical, often independently jointed; (2) with the outer ends of the rami articulate two lateral pieces (mallei), and again composed of a distal longitudinal piece (manubrium) and an apical transverse piece (the uncus), the whole recalling, as the name implies, a single-clawed hammer. For the varieties and modifications of the trophi we simply refer to Hudson's figure above. The relative size of the crop to the trophi varies greatly; it is small where the trophi are well developed and complex, as well as in Bdelloidea; but in Flosculariidae it is large, and so it is in Asplanchnidae. Eversible trophi of the forcipate or virgate type, which can be used for nibbling, are common in *Ploma*, notably *Rattulidae*, and are used for attachment to the host in the parasitic *Seisonaceae*, &c. In *Asplanchnidae* also,

From C. T. Hudson in *Oest. Journ. of Microscopical Science*, vol. xxiv., by permission of J. & A. Churchill.

FIG. 4.—Types of Trophi. a, malleate, with enlarged view of malleus above—the Y-shaped incus consists of a short median fulcrum bearing two large rami, each of which is in contact with a stout malleus consisting of a toothed uncus carried on a long manubrium; b, sub-malleate, with enlarged view of malleus—the manubria are twice as long as the 3- to 5-toothed uncus; c, virgate—mallei rod-like, manubria and fulcrum very long, uncus 1- or 2-toothed; d, forcipate—rami large and used as forceps, mallei rod-like, uncus pointed or evanescent; e, incudate—stout fulcrum, rami forming a forceps, mallei evanescent; f, uncinatate—uncus large, 2-toothed, manubria evanescent; fulcrum rudimentary; manubria evanescent; g, ramate—rami subquadrant, fulcrum rudimentary; h, malleo-ramate—mallei fastened by their uncus to the rami, manubria looped, rami large and fulcrum slender.

apical, often independently jointed; (2) with the outer ends of the rami articulate two lateral pieces (mallei), and again composed of a distal longitudinal piece (manubrium) and an apical transverse piece (the uncus), the whole recalling, as the name implies, a single-clawed hammer. For the varieties and modifications of the trophi we simply refer to Hudson's figure above. The relative size of the crop to the trophi varies greatly; it is small where the trophi are well developed and complex, as well as in Bdelloidea; but in Flosculariidae it is large, and so it is in Asplanchnidae. Eversible trophi of the forcipate or virgate type, which can be used for nibbling, are common in *Ploma*, notably *Rattulidae*, and are used for attachment to the host in the parasitic *Seisonaceae*, &c. In *Asplanchnidae* also,

where the whole crop is strengthened by a framework of bars, the incudate mastax lies in a little postero-ventral pouch which can be everted through the crop and mouth. The stomach is generally large; its wall consists of a layer of very large ciliated cells, which often contain fat globules and yellowish-green or brown particles, and outside these a connective tissue membrane; muscular fibrillae have also been described. Very constantly a pair of simple sack-like glands open into the stomach, and probably represent the hepato-pancreatic glands of other Invertebrates.

Following upon the stomach there is a longer or shorter intestine, which ends in the cloaca. The intestine is lined by ciliated cells. In forms living in a tube the intestine turns round and runs forward, the cloaca being placed so as to debouch over the margin of the tube. The cloaca is often very large; the nephridia and oviducts may open into it, and the eggs lodge there on their way outwards; they are thrown out, as are the faecal masses, by an eversion of the cloaca. *Asplanchna*, *Notommata isoboldii*, and certain species of *Ascomorpha* are devoid of intestine or anus, excrementitious matters being ejected through the mouth. The body cavity (archicoele) contains a fluid in which very minute corpuscles have been detected. There is no trace of a true vascular system. The nephridia (fig. 1, B, n) present a very interesting stage of development. They consist of a pair of tubules with an intracellular lumen running up the sides of the body, at times merely sinuous, at others considerably convoluted. From these are given off at irregular intervals short lateral branches, each of which terminates in a flame-cell (f) precisely similar in structure to the flame-cells found in Planarians, Trematodes and Cestodes; here as there the question whether they are open to the body cavity or not must probably be answered in the negative. At the base these tubes open either into a permanent bladder (fig. 1, bl) which communicates with the cloaca, or directly into the cloaca. They have the same functions as the contractile vacuole of freshwater Protozoa (p. 2).

**Nervous System.**—There is a large ganglion lying in close contact with the pharynx, proximal to the crop and on its antero-dorsal side; in Bdeloidae at least it is united by short connectives with a smaller postero-ventral ganglion to form a nerve collar. From this simple nerve fibres are given off to the body-wall, especially

The sense organs are eyes, antennae, sensory styles and a statocyst in a few species. The eyes are refractive globules set in a cup of red pigment traversed by a nerve fibre, and lie on the proximal side of the body, directly on the postero-dorsal surface of the brain, or at a little distance from it, on the neck, often within the circle on the corona, and usually well within the transparent body. There may be one, a pair, or rarely more, the outer ones being more or less rudimentary. The antennae are short tubular extensions of the body wall, sometimes retractile with a depressed tip from which protrudes a tuft of fine stiff bristles. They are possibly organs of external taste (smell) as well as of touch. Typically there are two pairs—a proximal, more or less approximated on the postero-dorsal surface, and a distal pair, more widely separate. But the proximal pair are often fused into a single median antenna (supplied, however, by two nerves), and in one case at least the distal pair may be similarly fused. Additional paired antennae may occur within the coronal surface, which is the seat of the sensory styles, of less complex structure, which occur in many genera. The statocyst (retro-cerebral organ of *P. Marius* de Bouchamp) is a sac filled with highly refractive granules soluble in dilute acids, and opening by a slender duct (or a pair) to the surface; its function is doubtless that of an organ of equilibrium, and it resembles in its opening to the surface the primitive internal ear of even Vertebrates, for the duct to the surface persists through life in the sharks.

**Locomotor Organs.**—Most free rotifers swim by the corona, aided by the ciliated auricles when present. In Bdeloidae this may alternate with a leech-like gait; the corona being withdrawn, the cupped end of the proboscis serves as a sucker for attachment alternately with the adherent foot, so that the animal loops its way along. In two families motile articulated rods occur; in Triarthridae they probably simply expand the dimensions of the body in adaptation to life at the surface; or as a protection against being swallowed by their smaller foes. In *Polyarthra* and *Pteroesa* they are numerous, pinnated (feathered), and are doubtless used for active swimming by jerks; they can be moved up or down by special muscles attached to their bases, which project into the body.

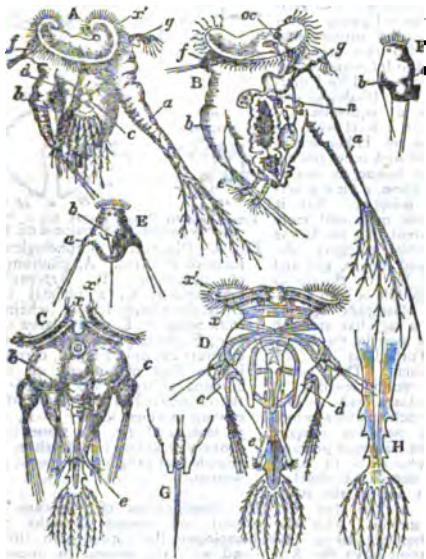

FIG. 5.—*Pedalion mira*. A, lateral surface view of an adult female: a, median ventral appendage; b, median dorsal appendage; c, distal ventro-lateral appendage; d, dorso-lateral appendage; f, dorsal antenna; g, "chin"; x, cephalotroch. B, lateral view, showing viscera: oc, eye-spots; n, nephridia; e, ciliated toes; other letters as above. C, ventral view: x, trochus; x, cingulum; other letters as above. D, ventral view, showing the musculature (cf. text). E, dorsal view of a male: a, lateral appendages; b, dorsal appendage. F, lateral view of a male. G, enlarged view of the antenna f. H, enlarged view of the median ventral appendage. (All after Hudson.)

to the ciliated cells of the corona, to the foot, and also to the muscles and sense organs.

FIG. 6.—Male Rotifers. 1, *Euchlanis deflexa*; 2, lateral; 2a, dorsal views of *Colurus bicuspidalus*; 3, *Notopis brachionus*; 4, *Diglena permollis*; 5, *Gastropus minor*; 6, *Anuroeca serrata*; 7, *Ascomorpha parasita*; 8, *Notoleca heptodon*. (Drawn from specimens by F. R. Dixon-Nuttall.)

In *Pedalion* (fig. 5), a remarkable form discovered by Dr C. J. Hudson in 1871 and found in numbers several times since, these

appendages have acquired a new and quite special development. They are six in number, median, ventral and dorsal, and two unequal lateral pairs. The largest is placed ventrally at some distance distal to the mouth. Its free extremity is a plumose fan-like expansion (fig. 5, Aa and H). It is, in common with others, a hollow process into which run two pairs of broad, coarsely transversely striated muscles. Each pair has a single insertion on the inner wall—the one pair near the free extremity of the limb, the other near its attachment; the bands run up, one of each pair on each side, and run right round the body forming an incomplete muscular girdle, the ends approximating in the median line. Above this point springs the large median dorsal limb, which terminates in groups of long setae. It presents a single pair of muscles attached along its inner wall which run up and form a muscular girdle round the body in its posterior third. On either side is attached a dorso-lateral and ventro-lateral appendage, each with a fan-like plumose termination consisting of compound hairs or setae, found elsewhere only among arthropods (*q.v.*); each of these is moved by muscles running upwards towards the neck and arising immediately under the trochal disk, the inferior ventro-lateral pair also presenting muscles which form a girdle in the hind region of the body. It bears a group of long setose hairs the bases of which are connected with the nerve fibre. There are also two pairs of distal antennae. *Pedalion* presents a pair of ciliated toes in the posterior region of the body (fig. 5, B, C, and D, e), which it can apparently use as a means of attachment; Dr Hudson states that he has seen it anchored by these and swimming round and round in a circle.

**Reproduction Organs.**—Rotifera are unisexual, with the sexes dimorphic. The ovary is, as in many Platyhelminthes, duplex; one

FIG. 7.—Loricated Rotifera. a, *Nathoeca longispina*, loricula only; b, *Anuraea aculeata*, like the former, a floating pelagic type (plankton proper); c, *Synchaeta stylata*; corona with accessory antennae and sensory styles; auricles for swimming—an actively swimming pelagic type (nekton); d, *Pterodina patina*, with belloloid corona and retractile foot with terminal ciliated cup; e, *Distyla gissensis* partly extended; f, *Rattulus tigris*.

walls. The male organs are usually a testis, a large seminal bladder and a protrusible penis. The males are unlike the females in most species; only in *Eosphaera digitata*, *Rhisops vires*, *Proales wormschii*, and the *Seisonaceae* a complete digestive system is present. Frequently the foot is ciliated at the tip, as in the young of tubicolous forms.

The males of rotifers are of relatively rare occurrence, except in the genus *Aplancha*, where they were first recognized as such by Brightwell in 1841; though those of *Hydatina* had long since been seen and described as a distinct genus. Despite their rare occurrence, the males of over one hundred and twenty species have now been recognized, and we may well believe that all species will be found to present males. This statement may seem to need qualification; for the male of one Bdelloid has been seen, and there is a doubtful record of "winter-eggs" in this group. But possibly, as in *Seisonaceae*, the males resemble the females, and have escaped recognition. It may, however, well be that the capacity for wintering in the dry state has physiologically replaced the need for resistant fertilized eggs. Insemination takes place either by the introduction of the penis into the cloaca of the female, or by the puncture of the body-wall of the female by the penis, and the injection of the sperm into

the body cavity, whence the single spermatozoan must make their way to the eggs. The females habitually produce eggs without impregnation, which again habitually develop into females, more rarely into males. These unfertilized eggs develop directly, often in the uterus. In other cases the eggs are liberated earlier and adhere to the foot, or are hatched within the tube (fig. 3, b, c). The impregnated eggs undergo a very partial development in the mother, and these pass into a state of rest, for which they are furnished with a dense shell. They always give rise to parthenogenetic females (see *Ra:nonpudion*). The thin-walled eggs are often termed "summer-eggs," the fertilized ones "winter" or "ephippial" eggs (by parity with the phyllopod *Entomostraca*, *q.v.*). But the appearance of males seems to be as much associated with those of summer drought as of winter cold. No adequate knowledge of the conditions under which males arise has been established. The phenomenon of seasonal dimorphism is of especial moment for the plankton dwellers. Not only is the appearance of males regular, but the forms of the females at different times of the year may be so distinct as to have led them to be classed as distinct species.

**Development.**—The egg is holoblastic, but the segmentation is very unequal, recalling that of marine annelids and of molluscs. Gastrulation takes place by epiboly, and the stomodaeum (oral invagination—maxast pharynx) takes place in two stages of the region of the closed blastopore. Unlike the molluscs and annelids, however, the cloacal invagination lies outside this region, and the foot is formed by an elongation of the end of the body between the two apertures. The nerve ganglion is formed by an ingrowth of epiblast, and so are the pedal and vitellarium, much more conspicuous and usually consisting of a definite number of large cells, producing yolk material for the growth of the egg. The whole ovary is unilateral and unpaired in most rotifers; symmetrical in *Asplanchnaceae*, *Philodinaceae* and *Seisonaceae*. In *Asplanchnaceae* the germarium is median, continuous at the distal end with the middle of the transverse horse-shoe-shaped vitellarium. In *Bdelloidaceae* and *Seisonaceae* the whole organ is paired, the germarium proximal, the vitellarium next the cloaca. As a rule, the wall of the ovary is continued into a uterine tube opening into the cloaca; but in *Philodinaceae* this is absent, and the young are free in the body cavity and escape by perforating the cloacal

Labels include: a, anus; ap, apical organ, corresponding to foot of rotifers; at, median antenna, united by a nerve to b, brain (letter omitted in B); M, bladder, receiving ramified kidney in B, C, D; f, foot; and f/g, its cement-gland; o, ovary; k, kidney; m, mouth; s, supra-cloacal ganglion; sr, nerve ring a section.

walls. The male organs are usually a testis, a large seminal bladder and a protrusible penis. The males are unlike the females in most species; only in *Eosphaera digitata*, *Rhisops vires*, *Proales wormschii*, and the *Seisonaceae* a complete digestive system is present. Frequently the foot is ciliated at the tip, as in the young of tubicolous forms. The males of rotifers are of relatively rare occurrence, except in the genus *Aplancha*, where they were first recognized as such by Brightwell in 1841; though those of *Hydatina* had long since been seen and described as a distinct genus. Despite their rare occurrence, the males of over one hundred and twenty species have now been recognized, and we may well believe that all species will be found to present males. This statement may seem to need qualification; for the male of one Bdelloid has been seen, and there is a doubtful record of "winter-eggs" in this group. But possibly, as in *Seisonaceae*, the males resemble the females, and have escaped recognition. It may, however, well be that the capacity for wintering in the dry state has physiologically replaced the need for resistant fertilized eggs. Insemination takes place either by the introduction of the penis into the cloaca of the female, or by the puncture of the body-wall of the female by the penis, and the injection of the sperm into

ganglion cells below invertebrate sense-organs. Moreover, the body cavity of the Rotifers is a primitive archcoel: the persistent or saccentric cleft between epiblast and hypoblast, traversed by mesenchymal muscular bands. Thus we regard Rotifers as an independent stem branching off at the outset of the rise from the Platode type to higher Invertebrata. The Polyzoa (g\*), which in many ways recall Rotifers, appear to be equally independent.

The following classification of Rotifers is our modification of that of Hudson and Gosse, further altered through considerations put

FIG. 9.—a, *Microcodon clavus*, showing corona, lateral antennae and jointed foot; b, *Rhinops vitrea*, corona from below, showing proboscisiform extension containing eyes; c, *Philodina megalotrocha*; d, head of *Rotifer macrocerus*, postero-ventral view, showing lobes of corona, and antero-dorsal median antenna, telescopic with setae; e, *Rotifer (Actinurus) neptunius*, showing head with retracted corona, and protruded dorsal proboscis bearing median antenna, and telescopic foot with toes and spurs; f, *Asplanchnopus myrmeles*, showing horseshoe-shaped germarium (left), blind saccate stomach (right), apical bladder, foot, &c.; g, *Asplanchna edesbornii*—the coiled tube at left is a kidney; h, i, incudate jaws of *Asplanchna brighwellii* and *gironii* chiefly formed of rami, with the rudimentary mallei parallel and external to them; j, *Ascomorpha hyalina*.

forward by C. Wesenberg-Lund, which, however, we do not consider wholly convincing. He notably regards an oblique disk with uniform ciliation as primitive, a view which we cannot adopt.

**Classification:—**

(A.) Disk usually with well-marked strong trochus, ciliated groove and more delicate cingula interrupted by an antero-dorsal median gap, usually more or less bilobed.

(i.) Trophi incudate:

1. Asplanchnaceae; trochus circular; foot absent or minute; trophi incudate; stomach blind; males frequent, not very dissimilar to females. *Asplanchna* Gosse (fig. 9, g-7); *Asplanchnopus* Deguerne (fig. 9, f); *Ascomorpha* Perty (fig. 9, j).

(ii.) Trophi malleoramal:

2. Melicertacea: females tubicolous, usually attached, or forming spherical floating social aggregates; males free swimming. *Melicerta* Schrank (fig. 3, e, f); *Oecistes* Ehrenberg; *Laciniularia* Schweigger; *Conochilus* Ehrenberg, with gap postero-ventral and mouth antero-dorsal (fig. 2, 5).
3. Trochosphaeracea: female footless; subspherical, the corona bulging into a hemisphere which may equal the hemispherical body; anus apical; male as in Melicertacea, *Trochosphaera* Semper (fig. 8, D).

4. Ploimodaceae; subconical; corona bilobed; retractile foot absent or ciliated; motile appendages present in two families.

- (a) Pterodindidae; foot a ciliated cup; cuticle forming flat lorica. *Pterodina* Ehr. (fig. 7, 4).
- (b) Triarthride: body with a pair of long cervical spines pointing distally and serving for leaping movements or to extend the body and make it too big for small enemies to swallow; *Pedetes* Gosse (no median spines); *Triarthra* Ehr., one postero-ventral spine; *Tetramastix* Zacharias, two unequal median spines.
- (c) Pedalionidae, foot represented by two styles, sometimes ciliated; body provided with six hollow-jointed muscular fins for swimming and leaping. *Pedalion* Hudson (fig. 5).

(iii.) Trophi ramate:

5. Bdelloidaceae; foot with two toes and accessory spurs or a simple perforated disk; body telescopic at either end with an antero-dorsal proboscis ending in a ciliate end and bearing the proximal antenna; corona usually bilobed, very wheel-like. Males if present probably like the females. Germany and ovary paired; oviduct absent; young viviparous. *Rotifer* Schrank (fig. 9, d, e); *Philodina* Ehr. (fig. 9, c); *Callidina* Ehr. (eyeless); *Adeina* Hudson is eyeless with the corona uniformly ciliated, and proboscis adnate, hooked.

(iv.) Trophi uncinata:

Flosculariaceae; disk a contractile cup, often lobed, the cingulum of long vibratile cilia, of very long motionless bristles or absent, rarely with an outer zone of fine cilia. Trochus a pair of ridges or horseshoe open in front. Oral funnel produced into a fine tube hanging freely into a pharyngeal cup, containing the uncinata trophi. Body-wall usually traversed by a network of canals serving by their contraction to expand the disk. Males and larvae with a ciliated pedal cup and a simple ciliated disk.

- (a) Floscularidae; tubicolous, with a lobed disk, bearing stiff or vibratile setae. *Floscularia* Oken (fig. 3, b); *Stephanoceros* Ehr. (fig. 3, a).
- (b) Acyclidae. Disk entire or tentaculate, not setiferous; *Acyclus* Leidz (fig. 3, c). Foot represented by a button-like disk, carried far from the posterior surface. *Apollus* Metchnikoff (fig. 3, d); *Atrachus* Wierzecki (fig. 3, c).

(B) Ploimaseae: disk variable, often circular, sometimes with a lobed trochus bearing malleolae (vibratile styles); trophi complete, malleate, submalleate, virgate, or forstipate; anus subapical; foot usually short, and usually bearing two toes which may be much elongated.

Illicicata, cuticle soft; ciliated exsertile auricles above the disk sometimes present. *Albertia* Dujardin; *Drilophagus* Vejvodsky; *Microcodon* Ehr. (fig. 9, a); *Rhinops* Hudson (fig. 9, b); *Synchaeta* Ehr. (fig. 7, c); *Hydatina* Ehr. has no eye; *Notommata* Ehr. (restricted by Gosse); *Copens* Gosse; *Notops* Hudson (fig. 6, 3); *Proales* Gosse; *Gastrochiza*; *Diglena* Ehr. (fig. 6, 4).

Loricata, cuticle hardened armour-like, often sculptured; *Polyarthra* Ehr.; *Pedetes* Gosse; *Euchlanis* Ehr. (fig. 6, 1); *Anuraea* Ehr. (fig. 7, b); *Notholca* Gosse (fig. 7, a); *Distylis* Eckstein (fig. 7, e); *Rattulus* Ehr. (fig. 7, f); *Colurus* Ehr. (fig. 6, 2); *Tophrocampa* Gosse.

(C) Saisonaceae. Body elongated with a narrow neck above the disk; foot ending in a terminal perforated disk. Trophi virgate exsertile; germary paired; genito-urinary cloaca opening above the neck in the male, subapically in the female. Gut blind (*Paraseison*), or opening into cloaca (*Seison*). Males resembling females, common. All known species are parasitic on the Crustacean *Nebalia*; *Seison* Claus; *Paraseison* Plate.

**Habitat and Habits.**—The Rotifera are all aquatic, the majority dwelling in fresh water with Protozoa and Protophyta, as well as Entomostroacous Crustacea. This association with Protophyta accounts for their study by many distinguished botanists, such as W. C. Williamson and F. Cohn. Some are moss-dwellers, inhabiting the surface film of water that bathes these plants; such especially are the Bdelloids, with their exceptional capacity for resisting desiccation. Others—the majority—live among weeds, the tubicolous ones mostly upon them. A few are saproplitic, haunting the looser debris that forms the uppermost layer of the bottom ooze of quiet waters: we may cite the aberrant Floscularian *Atrachus*. Widely different are the habits of the plankton forms, which float or swim near the surface, and are often provided with long

cuticular extensions for this purpose (fig. 7, a, b). Asplanchnaceae, plankton, dwellers in small pools, are, however, ovoid, and *Trochosphaera* is spherical and must owe its floating powers to the low density of the liquid in its enormously dilated body-cavity. *Lacnularia racemovata* and *Conochilus* form free-floating aggregates, the eggs, as laid, hatching and the young settling among the approximated gelatinous tubes of the parents. Some species only frequent the clearest waters; but the lovely transparent *Hydatina senta* (fig. 2, 3) likes water contaminated by the visits of cattle or the drainings of manure. *Driophagus* and *Albertia* are parasitic on the surface or within the gut of Naid Oligochaete worms: Seisonaceae are ectoparasitic on the Crustacean *Nebalia*, *Proales wernerii* forms galls within the *Conifera Vaucheria*, and *P. parasita* infests the central jelly of the Phytoflagellate *Volvox*; *P. petromyzon* is a frequent commensal in the gill cavity of some Cladoceran Crustacean *Euryceerus lamellatus*.

The geographical distribution is cosmopolitan, as is the case with Protozoa and Protophyta of similar habits. A curious fact is that when a new and striking form is found first in one place it is shortly after collected from widely separated areas. In the case of one genus, *Gastrochias*, this led to the creation of no less than six generic names.

**History and Bibliography.**—As rotifers are common in ponds, the first workers with the microscope observed them repeatedly, the first record being that of John Harris in 1696, who found a Bdelloid in a gallipot that had been standing in his window. Luewewenhoeck found and described some tubicolous species; and during the 18th century a fair number of species were observed, figured and described with names. During this time the illusion of a wheel or wheels produced by the ciliary action of the disk had puzzled all observers. C. E. Ehrenberg included the Rotifers in his *Infusionskisterei*, and described and figured with fair precision many of the genera and species. Dujardin gave a less detailed but more accurate account under the name of *Zoophytes Systolides*. The next full work was a valuable compilation by W. C. Williamson (best known as a botanist) in Pritchard's *Infusoria*, in 1861. Much work was done with the gradual introduction of improved methods during the last forty years of the century. The discovery and recognition of the males was made, however, at the close of the fifties. F. H. Gosse collected and described many species, and elucidated the structure of the mastax in 1856. Zoologists of the standing of Huxley, Claus and Leydig added to our knowledge of the anatomy and to the theory of their relations. But the monumental monograph of C. T. Hudson and Gosse containing a new classification; an illustrated description of all the then known species and much information on habits and structure, provided students with an easy access to the domain and stimulated many to work hard at the group. Of these new-comers we may cite C. F. Rouselet, who has found many new species and many unknown males of known species, elucidated habits and faithfully kept record of the publications on the class in the *Journal of the Royal Microscopical Society*. He has moreover elaborated a method for preserving Rotifera for microscopic observation, so that the types of each observer are now as readily available for comparison as the plant-specimens of the botanist's herbarium. C. Zelinka has given us the most detailed anatomical accounts we possess for several Bdelloidaceae, and was the first to utilize modern methods of microscopic technique on a complete scale.

**ROTORUA**, a town of Rotorua county, North Island, New Zealand. It lies in the midst of a remarkable volcanic district generally known as the Hot Spring district, or fancifully as the Wonderland, which covers an area of 660 sq. m. and extends 160 m. from N.E. to S.W. from White Island, an active volcanic cone in the Bay of Plenty to the mountains of Tongariro, Ngauruhoe and Ruapehu in the interior of the island, S.W. of lake Taupo. Rotorua attracts many visitors on account of the beauty and scientific interest of the locality and the bathing

in its various medicinal springs. It is a scattered township lying on the south-western shore of lake Rotorua, amid hills reaching 2600 ft. in the immediate neighbourhood, and much of the volcanic soil supports a rich growth of forest or "bush."

The springs are principally alkaline, alkaline and siliceous, acidic or acidic and hepatic (sulphurous). The township includes the Maori village of Ohinemutu, an interesting collection of native dwellings, whose inmates constantly use the numerous rudely excavated baths which are fed by springs varying in temperature from 60° F. to the boiling-point, and are in some cases used for cooking. In the vicinity, on the lake-shore, is the government sanatorium. Two miles south of Rotorua is another native village, Whakarewarewa, where there are geysers as well as hot springs. Four miles from Rotorua, near the centre of the lake, the island of Mokoia rises to 1518 ft. It is partly under grass and partly wooded, and is inhabited by Maoris, by whom it is regarded as holy ground. A short channel connects lake Rotorua with lake Rototiti to the N.E. At the eastern end steep cliffs rise from the water, and luxuriant vegetation covers the hills. Both this lake and the smaller ones to the east, Rotokohe and Rotoma, have deeply indented shores, and are set in exquisite scenery. The group is known collectively as the Cold Lakes. The waters of Rotoma are of a particularly vivid blue. To the south of Rototiti is Tikitere, a sombre valley abounding in mud volcanoes, springs and other active volcanic phenomena. Mount Tarawera (16 m. S.E. of Rotorua) is noted for the eruption of June 1886, which changed the outline of several lakes, destroyed the famous Pink and White terraces adjoining lake Tarawera, and converted a region of great beauty into a desolate wilderness. A fissure was formed extending nearly 9 m. along the axis of the disturbance, and the mission station of Wairoa (8 m. from Rotorua) on the western shore of the lake was overwhelmed. A line of craters is seen to the south-west. The large lakes Okataina, Kahahi and Rewhakaiti lie respectively N. W. and S.E. of lake Tarawera.

**ROTROU, JEAN DE** (1609-1650), French tragic poet, was born on the 19th or 20th of August 1609, at Dreux in Normandy. Rotrou studied at Dreux and at Paris, and, though three years younger than Corneille, began play-writing before him. In 1632 he became playwright to the actors of the Hôtel de Bourgogne. With few exceptions, the only events recorded of his life are the successive appearances of his plays and his enrolment in 1635 in the band of five poets who had the duty of turning Richelieu's dramatic ideas into shape. Rotrou's own first piece, *L'Hypocandrique* (pr. 1631), dedicated to the Comte de Soissons, seigneur of Dreux, appeared when he was only eighteen. In the same year he published a collection of *Œuvres poétiques*, including elegies, epistles and religious verse. His second piece, *La Bague de l'oubli* (pr. 1635), an adaptation in part from the *Sorijia del Orvido* of Lope de Vega, was much more characteristic. It is the first of several plays in which Rotrou endeavoured to naturalize in France the romantic comedy which had flourished in Spain and England instead of the classical tragedy of Seneca and the classical comedy of Terence. Corneille had leanings in the same direction. Rotrou's brilliant but hasty and unequal work showed throughout marks of a stronger adhesion to the Spanish model. In 1634, when he printed *Cleogone et Doristie* (acted 1630), he said he was already the author of thirty pieces, but this applies no doubt to adaptations. *Dion* (acted 1630; pr. 1633), *Les Occasions perdues* (acted 1631; pr. 1635), which won for him the favour of Richelieu, and *L'Heureuse Constance* (acted 1631; pr. 1635), which was praised by Anne of Austria, succeeded each other rapidly, and were all in the Spanish manner. In 1631 Rotrou imitated Plautus in *Les Menechmes* (pr. 1636), and in 1634 Seneca in his *Hercule mourant* (pr. 1636). Comedies and tragi-comedies followed. Documents exist showing the sale of four pieces to Antoine de Sommerville for 750 livres townnois in 1636, and in the next year he sold ten to the same bookseller. He spent much time at Le Mans with his patron, M. de Belin, who was one of the opponents of Corneille in the quarrel of the Cid. It has been generally assumed, partly because of a forged letter long accepted as Corneille's, that Rotrou was his generous defender in this matter. He appears to have been no more than neutral, but is credited with an attempt at reconciliation between the parties in a pamphlet printed in 1637, *L'Incognu et véritable amy de messieurs de Scudéry et Corneille*. M. de Belin died in 1647;

and in 1639 Rotrou bought the post of *lieutenant particulier au bailliage* at Dreux. In the next year he married Marguerite Camus, and settled down as a model magistrate and *père de famille*. Among his pieces written before his marriage were a translation of the *Amphytrou* of Plautus, under the title of *Les Deux Sosies* (1636), *Antigone* (1638), and *Laure Persecutée* (acted 1637; pr. 1639), in the opposite style to these classical pieces. In 1646 Rotrou produced the first of his four masterpieces, *Le Véritable Saint Genest* (acted 1646; pr. 1648), a story of Christian martyrdom containing some amusing by-play, one noble speech and a good deal of dignified action. Rotrou uses with considerable success the device of a play within a play. The actor Genest becomes a real convert while playing the part of a Christian martyr. Incidentally (Act i. Sc. v.) Rotrou pays a noble tribute to the genius of Corneille. *Don Bertrand de Cabrère* (1647) is a tragi-comedy of merit; *Venceslas* (1647; pr. 1648) is considered in France his masterpiece, and has had several modern revivals; *Cosroës* (1649) has an Oriental setting, and is claimed as the only absolutely original piece of Rotrou. These masterpieces follow foreign models, and Rotrou's genius is shown in the skill with which he simplifies the plot and strengthens the situations. *Saint Genest* followed Lope de Vega's *La fúgido verdadero*; *Venceslas* followed the *No ay ser padre siendo rey* of Franchisco de Rojas. In this play Ladislas and his brother both love the princess Cassandra; Ladislas makes his way into her house and in the darkness kills a man whom he thinks to be the duke of Courland, but who is really his brother Alexandre, the favoured lover. In the early morning he meets the king and is confronted by the duke of Courland. The outline of this incident is in the Spanish play, but there the spectators are aware of the ghastly mistake at the time of the murder. Rotrou shows his dramatic skill by concealing the real facts from the audience until they are revealed to the horror-struck Ladislas himself.

In 1650 the plague broke out at Dreux. Rotrou remained at his post, although urgently desired to save himself by going to Paris; caught the disease, and died in a few hours. He was buried at Dreux on the 28th of June 1650. Rotrou's great fertility (he left thirty-five collected plays besides others lost, strayed or uncollected), and perhaps the uncertainty of dramatic plan shown by his hesitation almost to the last between the classical and the romantic style have injured his work. He has no thoroughly good play, hardly one thoroughly good act. But his situations are often pathetic and noble, and as a tragic poet properly so called he is at his best almost the equal of Corneille and of Racine. His single lines and single phrases have a brilliancy and force not to be found in French drama between Corneille and Hugo.

A complete edition of Rotrou was edited in five volumes by Viollet le Duc in 1822. In 1882 M. de Ronchaud published a handsome edition of six plays—*Saint Genest*, *Venceslas*, *Don Bertrand de Cabrère*, *Antigone*, *Hercule Mourant* and *Cosroës*. *Venceslas* and *Saint Genest* are also to be found in the *Chefs-d'œuvre Tragiques* of the Collection Didot.

Rotrou's brother, Pierre Rotrou de Saudreville, left a memoir of him which is unfortunately lost, but this is cited by the Abbé Brillou (1671-1736) as his authority in a *Notice biographique sur Jean Rotrou*, first printed in 1885 at Chartres under the editorship of L. Merlet. Other good earlier authorities are Nicéron, *Mémoires pour servir à l'histoire des hommes illustres* (1731), vol. xvii. pp. 89-97; and the duke of the Vallière, *Bibl. du théâtre français depuis son origine* (Dresden, 1768), vol. ii. pp. 155-273. Modern works are by J. Jarry, *Essai sur les œuvres dramatiques de Jean Rotrou* (Paris and Lille, 1868); Léonce Person, *Hist. du Venceslas de Rotrou, suivie de notes critiques et biographiques* (1882), in which many legends about Rotrou are discredited; *Hist. du véritable Saint Genest de Rotrou* (1882), *Les Papiers de Pierre Rotrou de Saudreville* (1883); Henri Chardon, *La Vie de Rotrou mieux connue* (1884); and Georg Steffens, *Jean de Rotrou als Nachahmer Lope de Vega's* (Berlin, 1891).

**ROTTA, CHROTTA, HROTTA** (Fr. *Cithare*, *rotta*; Ger. *Cythara*, *Rotta*), a medieval stringed instrument derived from the Greek *citharā*. The *rotta* possessed, in common with all other forerunners of the violin, the chief structural features of the *cithara*, i.e. the box sound-chest composed of back

and belly either flat or delicately arched connected by ribs. The *rotta* represents the first step in the evolution of the *cithara*, when arms and cross-bar were replaced by a frame joined to the body, the strings being usually restricted to eight or less. Examples of these early *rottas* abound in miniatures from the 8th to the 12th century or even the 14th, such as Cotton MS. *Vespasian A. I.* (Brit. Mus.), 700 A.D., and the MS. copy in the Durham Cathedral Library of the Cassiodorus Commentary on the Psalms<sup>1</sup> *manu Bedae*. The most interesting is a real specimen of wood found in an Alamannic tomb of the 4th to the 7th century at Oberflacht<sup>2</sup> in the Black Forest, and now preserved in the Völker Museum, Berlin.

The next step was the addition of a finger-board and the consequent reduction of the strings to three or four, since each string was now capable of producing several notes. In the Carolingian Bible presented to Charles the Bald<sup>3</sup> by Count Vivian of Tours there is a fine example of the *rotta* at this stage, in which the artist has reproduced the position of the fingers of the left hand stopping the strings, and of the right hand plucking them. The same instrument occurs in a companion Bible, known as the Bible of St Paul because it was preserved in the monastery of that name "without the walls" at Rome. Although these MSS. were executed in the 9th century, they do not represent contemporary scenes, but were inspired by Romano-Christian models, if not actually copied from older MSS. This is the only representation yet found of the finger board thus applied to the *rotta*. In the final transition preceding the transformation into the guitar, the *rotta* appears as a guitar-shaped instrument without neck or head and having a hole large enough to allow the hand to pass through left in the body on each side of the strings. At first this instrument, which developed into the *crwth*, was twanged with the fingers, but in the 11th century it was played with a bow, the bridge having been slightly raised on feet.

The first (and perhaps also the second) of these transitions was accomplished in the Christian East, where, however, the upper frame of the earliest *rotta* seems to have been at once discarded in favour of a long neck with frets, for which the *tanbur* undoubtedly supplied the idea. This evolution is to be traced in the miniatures of single MS., which supplies examples of all the transitions. The miniatures illustrate the Psalms in the Utrecht Psalter; they were beyond doubt originally designed to accompany a Greek or Syriac version.<sup>4</sup> The Utrecht Psalter, executed in the diocese of Reims under Anglo-Saxon influence during the 9th century, is no servile copy, but it owes much of its inspiration and local colour to an unknown Greek or Syrian prototype.

As soon as the neck was added to the guitar-shaped body, the instrument ceased to be a *rotta* and became a guitar (*g.v.*), or a guitar-fiddle (*g.f.*) if played with the bow. Of the *rotta*, there were two distinct types, the one derived from the *cithara*, the *rotta* proper, and the other derived from the lyre, which survived to the 18th century as the Welsh *crwth*. Although the various forms of the name came to be applied somewhat indiscriminately in different countries and epochs to both types, yet the structural features of both remained true to their respective archetypes.

The words *rotta* in England and *cythara* in Germany seem to have clung more especially to the first of these types, while the forms *crwth*, *crowd*, *crowth* were reserved for the bowed instruments, the earliest of which appeared in the 11th century.<sup>5</sup>

The *crwth* or *crowd*, so popular in England during the 14th century, does not seem to have won equal favour in Germany, where at that time the *nidel* or guitar-fiddle had been popularized by the minstingers. The *crwth* derived from the lyre underwent no further development. (K. S.)

**ROTTENBURG**, a town and episcopal see of Germany, in the kingdom of Württemberg, situated on the left bank of the Neckar, which is here crossed by two bridges connecting the

<sup>1</sup> Both miniatures are reproduced by J. O. Westwood in *Facsimiles* (London, 1868).

<sup>2</sup> Reproduced in *Jahreshefte d. Würtemb. Altertums Ver.* vol. iii. (Stuttgart, 1846), pl. viii. figs. 10 and 11.

<sup>3</sup> See *Facsimiles*, by Comte Auguste de Bastard (Paris, 1883).

<sup>4</sup> The whole case of this much-discussed Psalter, with *résumés* of the principal writings on the subject of facsimiles of the miniatures bearing on the evolution of the *cithara*, will be found in Kathleen Schlesinger's *Instruments of the Orchestra*, pp. 343-82 and pl. iii., vi. and vii. (London, 1909).

<sup>5</sup> See Kathleen Schlesinger, *op. cit.*, pp. 334, 338-39 n. and 441-50.

town with the suburb of Ehingen, 7 m. by rail S.W. of Tübingen. Pop. (1905) 7554. It is the seat of a Roman Catholic bishop, and possesses the fine Gothic cathedral of St Martin; several other churches; an old castle now used as a prison; and a building, formerly a Jesuit monastery and now the residence of the bishop. The chief industries are the manufacture of machinery, screws, watches and beer, tanning and the cultivation of fruit and hops. Rottenburg passed into the possession of Austria in 1281 and into that of Württemberg in 1805. Near the town are the remains of the Roman station of Sumalocenna or Salmulocenna.

**ROTTERDAM**, a city of Holland in the province of South Holland, on both banks of the New Maas, at the confluence of the canalized Rotte, and a junction station 14½ m. by rail S.S.E. of the Hague. Steam tramways connect it with Schiedam, and with Numansdorp on the south of the island of Beierland, and there is a regular service of steamers by river and canal to Antwerp by way of the South Holland and Zeeland Islands and in every direction. The population of the city was about 20,000 in 1632; 53,212 in 1796; 105,858 in 1860; and 379,017 in 1905. Its shipping facilities have raised Rotterdam to the position of the first commercial city of Holland. By means of the New Waterway (1869-90) to the Hook of Holland it is accessible for the largest ships. The principal quay is the Boompjes ("little trees"), forming the river-front on the north side. Although originally situated exclusively on the north or right bank of the Maas, in 1869 Rotterdam was extended to the southern shore by the acquisition of the commune of Feienoord; while in 1886 Delfthaven on the west, and in 1895 Charlois on the south-west and Kralingen on the east, were also incorporated. The river is spanned by a road bridge (1878) and a railway bridge (1877) passing from the Boompjes to the North Island, whence they are continued to the farther shore by swing-bridges through which the largest ships can pass to the upper river. These bridges prove useful in breaking up the ice which forms above them in winter. On the south side of the river are numerous large docks and wharves, while the city proper on the north side consists of a labyrinth of basins and canals with tree-bordered quays.

In the centre of the town is the Beursplein, or Exchange Square, with the large general post office (1875), the "Amicitia" club, and the exchange itself (1723). Behind the exchange is the great market-place, built on vaulting over a canal, and containing a bronze statue of Erasmus, who was born in Rotterdam in 1467. The statue is the work of Hendrik de Keyser, and was erected in 1622 (the inscription being added in 1677) to replace an older one. Beyond the market-place is the High Street, which runs along the top of the Maas Dyke. On the west of the city a pretty road planted with trees and grass plots leads from the Zoological Gardens (1857), on the north to the small park overlooking the river. In the park is a statue of the popular poet Hendrik Tollens (d. 1856), a native of the city. Among the churches of Rotterdam are an English church, originally built by the 1st duke of Marlborough, whose arms may be seen with the royal arms over the entrance. The Groote Kerk, or Laurens Kerk (end of the 15th century), contains a fine brass screen (1715), a celebrated organ with nearly 5000 pipes, and the monuments of Admirals Witte de Witte (d. 1658), Kortenaer (d. 1665), and van Brakel (d. 1690), and other Dutch naval heroes. The lofty tower commands an extensive view. In the New Market adjoining is a fountain adorned with sculptures erected in 1874 to commemorate the jubilee of the restoration of Dutch independence (1813). The museums of the city comprise an ethnographical museum, the maritime museum established by the Yacht Club in 1874, and the Boyman's Museum (1867) containing pictures, drawings and engravings, as well as the town library. Of the original collection of pictures bequeathed by F. J. O. Boyman in 1847, more than half was destroyed by fire in 1864; but the collection has been enlarged since and is representative of both ancient and modern artists. Close to the museum is a statue of the statesman Gysbert Karel van Hogendorp

(1762-1834), a native of the city. Among the remaining buildings must be mentioned the town hall (17th century, restored 1823), the court-house, the concert-hall of the "Harmonic" club, the record office (1900), the *leeksbuis*, or subscription library and reading-rooms, and the ten-storied *Witte Huis* (1897), which is used for offices and is one of the highest private buildings on the Continent.

The industries comprise the manufacture of tobacco, cigars, margarine, rope; leather, &c., and there are breweries, distilleries and sugar refineries. The gas, electricity (1894) and waterworks (1870) are under municipal control. Shipbuilding yards extend above and below the city, one of the earliest being that of the Netherlands Steamboat Company (1825). It is, however, as a commercial rather than as a manufacturing city that Rotterdam is distinguished, its progress in this respect having been very striking. Between 1850 and 1901 the area of canals and docks in use on both sides of the river increased from 96 to over 300 acres, about £2,000,000 having been spent on the building of docks in the last quarter of the 17th century. Besides its maritime trade Rotterdam has an extensive river traffic, not only with Holland, but also with Belgium and Germany. Its overseas trade is principally with the Dutch colonies, New York, La Plata and the east and west coasts of Africa. The great harbour works on the south side of the river required to accommodate this growing trade were planned by the engineer Stieltjes (d. 1878), who has a monument on the North Island. Besides being easily accessible from the river and connected with the railways, the docks are provided with every facility for coaling and loading or discharging cargoes. The larger passenger steamers of the Rotterdamsche Lloyd to Netherlands India and of the Holland-American Steamship Company (the two principal passenger and cargo steamship companies at Rotterdam) have their berths on the south side of the river. In the centre of the river there is accommodation for over thirty vessels at the mooring buoys. The increase in the importance of Rotterdam as a port, apart from the development of the trade of the Netherlands generally, is shown by the fact that whereas in 1846 only 31% of the total trade of the country passed through the port, in 1883 the proportion was 50%; in the same year 43.75% of the total number of vessels engaged in Dutch trade used the port of Rotterdam, whereas in 1850 the proportion was only 35.77%. The average number of all vessels using the port annually during the decade 1897-1906 was 7228 of 11,163,624 tons, but a steady increase was recorded during this period, from 6212 ships of 8,434,032 tons in 1897 to 8570 ships of 14,572,246 tons in 1906.

Rotterdam probably owes its existence to two castles, which existed in feudal times. In 1299 John I., count of Holland, granted to the people of Rotterdam the same rights as were enjoyed by the burghers of Beverwijk, which were identical with those of Haarlem (K. Hegel, *Städte und Gilden*, 1801, Bd. ii.). This privilege marks the origin of the town. In 1479 it was surprised by Francis van Brederode, and in 1572 it was plundered by the Spaniards, who were in possession for four months. It continued to increase in size, various extensions of its boundaries being made, and its trading importance is to a large extent the result of its commercial intercourse with England.

**ROTTWEIL**, a town of Germany, in the kingdom of Württemberg, lying on a hill on the left bank of the Neckar, 46 m. S.W. of Tübingen by rail. Pop. (1905) 9008. It is partly surrounded by walls, and contains two fine churches, the Gothic Heilige-Kreuz-kirche, built in the 14th century and restored in 1860, and the Capellen-kirche with a Gothic spire 230 ft. high. It has a medieval town hall, several schools and a museum of antiquities. Especially noteworthy is the collection of sculptures and pictures of old German art in the chapel of St Lawrence, where there is also a Roman mosaic, found in the vicinity portraying Orpheus in the centre and, at the sides, Roman chariot-races and gladiators. The industries of the place

embrace the manufacture of powder, locomotives, machinery, cotton, leather and beer. There is also a considerable trade in live stock, agricultural produce and wine.

Rottweil-Altstadt, which lies about  $\frac{1}{2}$  m. to the south, was a Roman colony. It has an old church and a Cistercian nunnery founded in 1221 and dissolved in 1838. Near the town is Wilhelmshall, with saline springs. In the 13th century Rottweil became a free imperial city and was subsequently the seat of an imperial court of law, the jurisdiction of which extended over Swabia, the Rhineland and Alsace. The functions of this tribunal came to an end in 1784. In 1803 Rottweil passed into the possession of Württemberg.

See Ruckgaber, *Geschichte der Stadt Rottweil* (3 vols., Rottweil, 1835); and Greiner, *Das ältere Recht der Reichsstadt Rottweil* (Stuttgart, 1900).

**ROTUMAH** (Rotuma, Rotuam or Grenville), an island of the South Pacific Ocean, in  $12^{\circ} 30'$  S.,  $177^{\circ} E.$ , about 300 m. N. by W. of Fiji, of which British colony it is a dependency. Its area is 14 sq. m., and its extreme elevation 800 ft. It is surrounded by coral reefs, and is richly wooded. Several islets lie round it. The population is about 2200, the natives being Polynesian, though their language has been classified as Melanesian. They are Wesleyans or Roman Catholics. The chief product is copra. A European commissioner resides. Local laws, subject to approval by the legislative council of Fiji, are promulgated by a regulation board, composed of the commissioner, native chiefs of the seven districts into which the island is divided, and two native magistrates. Rotumah was discovered by Captain Edwards, of the "Pandora" in 1791, and was annexed by Great Britain in 1881.

**ROUAULT, JOACHIM** (d. 1478), French soldier, was a member of an old family of Poitou. He attached himself to the dauphin (afterwards Louis XI.) and became his premier squire. He followed Louis in his expedition against the Swiss in 1444, distinguished himself in the war against England in 1448, and received the posts of governor of Blaye and Fronsac and constable of Bordeaux. After taking an important part in the battle of Castillon (1453), which resulted in the defeat and death of John Talbot, 1st earl of Shrewsbury, he fought against John V., count of Armagnac, in 1455, and in the following year made a fruitless expedition into Scotland. He took part in the campaign in Catalonia, and became marshal of France in 1461, and governor of Paris in 1471. In 1471 and 1472 he defended Amiens and Beauvais against the Burgundians. Towards the end of his life he was disgraced by Louis XI., and sentenced to banishment and the confiscation of his property. (M. P.)

**ROUBAIX**, a manufacturing town of northern France, in the department of Nord, 6 m. N.E. of Lille on the railway to Ghent. Pop. (1906) 119,955. Roubaix is situated about a mile from the Belgian frontier on the Roubaix Canal, which connects the lower Deule with the Scheldt by way of the Marcq and the Espierre. Tramways connect the town with Lille and with the neighbouring communes of Tourcoing (pop. 62,694), Croix (pop. 16,292) and Wattrelos (pop. 14,618), with which it unites to form one great industrial centre. The chief business of Roubaix is the woollen manufacture, but cotton, silk and other materials are also produced. The chief of these are fancy and figured stuffs for garments, velvet and upholstering fabrics. Wool-combing and wool-dressing works, spinning-mills, weaving establishments, dye-houses and printing-works occupy some 50,000 work-people, and four hundred firms act as commission agents for the sale of raw material and the other requisites for the industry. Power is supplied chiefly by steam, less than 5000 out of 28,000 looms being hand-looms. There are breweries, rubber-works, metal foundries and machinery-works in the town. Tomato and grape growing under glass for the winter market is extensively prosecuted. To maintain the high standard of artistic taste which has made the industry of Roubaix a success, schools have been multiplied. By the co-operation of the town and the state the national school of industrial arts was founded in 1883. This is a small university of art,

commerce and industry, the twenty-two courses of which include all the branches of knowledge useful in any of those pursuits. Among the public institutions are the tribunal of commerce and the chamber of commerce, the exchange, a board of trade-arbitration and the establishment (*bureau de conditionnement*) for determining the nature and weight of silk, wool and cotton.

The prosperity of Roubaix had its origin in the first factory franchise granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix, a descendant of the royal house of Brittany. In the 18th century Roubaix suffered from the jealousy of Lille of which it was a dependency, and it was not till the 19th century that its industries acquired real importance. The population, which in 1804 was only 8700, had risen in 1861 to 40,000, in 1866 to 65,000, and in 1876 to 83,000.

**ROUBILLAC** (more correctly ROUBILLAC), **LOUIS FRANÇOIS** (1695-1762), French sculptor, was born at Lyons and became a pupil of Balthazar of Dresden and of N. Coustou. It is generally stated that he settled in London about 1720, but as he took the second grand prize for sculpture in 1730, while still a pupil of Coustou, it is unlikely that he visited England at an earlier date. The date 1744, as given by Dussieux, is incorrect. He was at once patronized by Walpole and soon became the most popular sculptor in England, superseding the success of the Fleming Rysbrack and even of Scheemakers. He died on the 11th of January 1762, and was buried in the church of St Martin-in-the-Fields. Roubillac was largely employed for portrait statues and busts, and especially for sepulchral monuments. His chief works in Westminster Abbey are the monuments of Handel, Admiral Warren, Marshal Wade, Mrs Nightingale and the duke of Argyll, the last of these being the first work which established Roubillac's fame as a sculptor. The statues of George I., Sir Isaac Newton, and the duke of Somerset at Cambridge, and of George II. erected in Golden Square, London, were also his work. Trinity College, Cambridge, possesses a series of busts of distinguished members of the college by him. Roubillac possessed skill in portraiture and was technically a master, but lived at a time when his art had sunk to a low ebb. His figures are frequently uneasy, devoid of dignity and sculpturesque breadth, and his draperies treated in a manner more suited to painting than sculpture. There are, however, noteworthy exceptions, his bust of Pope, for example, reaching a high standard. More often, however, his striving after dramatic effect detracts from repose of attitude.

His most celebrated work, the Nightingale monument, in Westminster Abbey, a marvel of technical skill, is saved from being ludicrous by its ghastly and even impressive hideousness. On this the dying wife is represented as sinking in the arms of her husband, who in vain strives to ward off a dart which Death is aiming at her. The lower part of the monument, on which the two portrait figures stand, is shaped like a tomb, out of the opening door of which Death, as a half-veiled skeleton, is bursting forth. The celebrated bust of Shakespeare, known as the Davenant bust, in the possession of the Garrick Club, London, must be attributed to Roubillac. The statue of Shakespeare, a commission from David Garrick, and bequeathed by the actor to the English nation, is in the British Museum, and shows the talent of the sculptor in a flattering light. It is noteworthy that none of his work is recorded in France, the land of his birth and education.

See Le Roy de Sainte-Croix, *Vie et ouvrages de L. F. Roubillac, sculpteur lyonnais (1695-1762)* (Paris, 1882). (An extremely rare work, of which a copy is in the National Art Library, Victoria and Albert Museum, South Kensington, London.) Allan Cunningham, *The Lives of the Most Eminent British Painters, Sculptors, and Architects*, vol. 3, pp. 31-67 (London, 1830)—the fount of information of later biographies. Dutton Cook, *Art in England ("A Sculptor's Life in the Past Century")* (London, 1869); Austin Dobson, *The Magazine of Art*, "Little Roubillac," vol. 17, pp. 202 and 231 (London, 1894). See also J. T. Smith, *Nollekens and his Times* (London, 1829 *passim*). Henry B. Wheatley has also devoted research to the work and life of Roubillac. (M. H. S.)

**ROUCHER, JEAN ANTOINE** (1745-1794), French poet, the son of a tailor of Montpellier, was born on the 22nd of February 1745. By an epithalamium on Louis XVI. and Marie Antoinette he gained the favour of Turgot, and obtained

a salt-tax collectorship. His poem was entitled *Les Mois*; it appeared in 1779, was praised in MS., damned in print and restored to a just appreciation by the students of literature of the 19th century. It has the drawbacks of merely didactic-descriptive poetry on the great scale, but occasionally displays much grace and spirit. The malicious wit of Rivarol's *mot* on the ill-success of the poem, "C'est le plus beau naufrage du siècle," is not intelligible unless it is said that one of the most elaborate passages describes a shipwreck. Roucher was a disciple of Voltaire, and therefore a friend of the Revolution, but he remained moderate in his opinions. He frequently presided over an anti-Jacobin club, and denounced the tyranny of the popular demagogues in supplements published with the *Journal de Paris* in 1792. He was arrested on the 4th of October 1793, and, accused of being the leader of a conspiracy among the prisoners at Saint Lazare, was sent to the guillotine on the same tumbril with his friend André Chénier on the 25th of July 1794. Roucher translated in 1790 Adam Smith's *Wealth of Nations*. His letters from prison were edited by his son-in-law under the title of *Consolations de ma captivité* (1797), and his death was made the subject of a tragedy in 1834 by his brother Claude Roucher-Deratte, a voluminous writer.

See A. Guillois, *Pendant la terreur, le poète Roucher, 1745-1794* (1890), founded on the poet's papers by one of his descendants.

**ROUË**, a dissipated debauchee. The word is French, and its original meaning was "broken on the wheel." Breaking on the wheel was a form of execution reserved in France, and some other countries, for crimes of peculiar atrocity. A *roué*, therefore, came by a natural process to be understood to mean a man morally worse than a *pendard* or gallows-bird, who only deserved hanging for common crimes. He was also a leader in wickedness, since the chief of a gang of brigands (for instance) would be broken on the wheel, while his obscure followers were merely hanged. Philip, duke of Orleans, who was regent of France from 1715 to 1723, gave the term the sense of impious and callous debauchee, which it has borne since his time, by habitually applying it to the very bad male company who amused his privacy and his leisure. The *locus classicus* for the origin of this use of the epithet is in the *Memoirs* of Saint-Simon (vol. xii. pp. 441-46, ed. Chéruel and Regnier, Paris, 1873-86).

**ROUELLE, GUILLAUME FRANÇOIS** (1703-1770), French chemist, was born in 1703 at Mathieu, near Caen. He started as an apothecary, but in 1742 he was appointed experimental demonstrator of chemistry at the Jardin du Roi in Paris, where he was especially influential and popular as a teacher, numbering Lavoisier and J. L. Proust among his pupils. Many stories are told of the vivacity and enthusiasm with which he lectured, of the absent-mindedness which sometimes led him, forgetting that his pupils could not hear what he was saying, to continue his explanations while he was out of the classroom looking for some piece of apparatus, and of the vigorous tirades, generally culminating in the epithet "plagiaire," in which he used to indulge against men with whom he disagreed (Höfer, *Hist. de la chimie*, ii. 378). His most important achievement was to define "salts"—a term formerly used in the most loose and indeterminate way—as the compounds formed by the union of acids and bases, and further to distinguish between neutral, basic and acid salts. Other subjects on which he published papers were the inflammation of turpentine and other essential oils by nitric acid, and the methods of embalment practised by the Egyptians. He died at Passy on the 3rd of August 1770. He is known as Rouelle the elder, to distinguish him from his younger brother and assistant, HILAIRE MARIN (1718-1779), who, on his resignation in 1768, succeeded him as demonstrator at the Jardin du Roi.

**ROUEN**, a city of France, capital of the department of Seine-Inférieure and the ancient capital of the province of Normandy, on the Seine, 87 m. N.W. of Paris by rail. Pop. (1906) 111,402. The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by boulevards. Outside the ellipse formed by

these lie the suburbs of Martainville, St Hilaire, Beauvoisine, Bouvreuil and Cauchoise; 2½ m. to the east is the industrial town of Darnétal (pop. 6770), and in the level plain on the opposite bank of the Seine is the extensive manufacturing suburb of St Sever with the industrial towns of Sotteville (pop. 18,096) and Petit Quevilly (pop. 14,852) in its immediate neighbourhood. Finally in the centre of the river, north-east of St Sever, is the Ile Lacroix, which also forms part of Rouen. Communication across the Seine is maintained by ferry and by three bridges, including a *pont transbordeur*, or moving platform, slung between two lofty columns and propelled by electricity. Rouen possesses four railway stations. The central point of the old town is the Place de l'Hôtel de Ville, occupied by the church of St Ouen, the hôtel de ville and an equestrian statue of Napoleon I., and traversed by the Rue de la République which leads from it past the cathedral to the Place de la République and the Quai de Paris. Parallel to this street to the west are the Rue Beauvoisine with its southern continuation, the Rue des Carmes and the Rue Grand-Pont, and the wide and handsome Rue Jeanne d'Arc terminating on the Quai de la Bourse. These thoroughfares, which are all within the boulevards, are crossed at right angles by the Rue de la Grosse-Horloge and by the Rue Thiers, running from the Place Cauchoise on the west to the Place de l'Hôtel de Ville, and passing on the left the Jardin Solferino and the museum.

The cathedral was built on the site of a previous cathedral which was destroyed by fire in 1200, and its construction lasted from the beginning of the 13th century, to which period belong the lateral doors of the west portal, to the beginning of the 16th century, when the Tour de Beurre was completed. The spire surmounting the central tower, which is the highest in France (485 ft.), is modern. The western façade, with its profusion of niches, pinnacles and statues, belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St Romain, is in the main of the 12th century, its upper stage (with its steep, pointed roof) having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high mullioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. The juxtaposition of these two towers, so different in character, is the most striking feature of the main façade, which is notable besides for its width. The portals of the transept are each flanked by two towers and decorated with sculpture and statuary. That to the north, the Portail des Libraires, looks upon the Cour des Libraires, once the resort of the booksellers of Rouen. That to the south is known as the Portail de la Calende. The plan of the church comprises a nave with aisles and lateral chapels, a transept and a choir with ambulatory. The most remarkable part of the interior is the Lady Chapel (1302-20) behind the choir with the tombs (1518-25) of Cardinal Georges d'Amboise and his nephew, the statuary of which, including the kneeling statues of the two cardinals, is of the finest Renaissance workmanship. The chapel also contains the tomb (1536-44) of Louis de Brézé, senechal of Normandy. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries.

St Ouen, formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St Ouen in the 7th century, exceeds the cathedral in length as well as in purity of style. In spite of the juxtaposition of the second and third, the Radiant and Flamboyant types of Gothic architecture, the building, as a whole, presents a unity which even the modern façade has failed to mar. It was founded in 1318 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was constructed in the 14th century. The nave of the church belongs to the 15th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The building of the western façade, which is flanked by two towers, was not undertaken till 1564

The walls of the church are pierced by windows filled with stained glass of the 14th, 15th and 16th centuries and cover more space than is usual even in French Gothic churches. The Portail des Marmousets, the entrance to the south transept, has a projecting porch, behind and above which rises a magnificent rose window. The north façade has no entrance. In the interior, now despoiled of many artistic treasures, there is an organ-case dating from 1630 and a railing of the 18th century surrounding the choir.

The church of St Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, the characteristics of which are specially displayed in the decoration of the façade and the tracery of the portal with its five arched openings. It is celebrated for carving attributed to Jean Goujon which appears on the western doors and in other parts of the church, and has a handsome organ-loft reached by a graceful open staircase, and stained glass of the 15th and 16th centuries. The spire above the central tower is modern and was finished in 1869. Close by the church is the old parish cemetery called the Altre de St Maclou; it is surrounded by wooden galleries of the Renaissance period, supported on stone pillars on which are sculptures representing a dance of death.

The church of St Vincent, near the Seine, is a building of the 16th century and contains the finest stained-glass windows in Rouen; those at the end of the north aisle, by Engrand and Jean le Prince, artists of Beauvais, are the most noted. The stained glass in the churches of St Pierre (16th century) and St Godard (late 15th century) is inferior only to that of St Vincent. Among the less important ecclesiastical buildings of Rouen are the churches of St Gervais, St Romain, St Laurent, St Vivien, and the tower of St André, a relic of an old church of the 15th and 16th centuries.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and, later, of the parlement of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procureurs, was erected in 1493 and is remarkable for its lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Grosse Horloge, which rises beside the arcade, was built in 1389. The tower known as the Tour de Jeanne d'Arc was the scene of her trial, and is all that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

There are numerous old houses in Rouen in the Gothic and Renaissance styles. The Hôtel de Bourgheroulde, the most famous of them, is a stone mansion of the 15th century added to in the reign of Francis I., the façades of which are decorated with bas-reliefs representing scenes from the meeting of the Field of the Cloth of Gold and allegories from the Triumphs of Petrarch. Among more modern buildings are the hôtel de ville of the 18th century, adjoining the north side of the church of St Ouen, the Bourse dating from the same period, and the Musée-Bibliothèque constructed in 1880 and containing rich collections of pictures and ceramics and a library with upwards of 133,000 volumes and many valuable MSS. An important museum of antiquities and a museum of natural history are contained in the old convent of the Visitation. A statue of the composer F. A. Boteldieu overlooks the Quai de la Bourse, and one of Pierre Corneille stands at the western extremity of the Ile Lacroix; both were natives of the town. At Bonsecours, on a hill on the Seine 2 m. above Rouen, are the modern church, which is a resort of pilgrims, and the monument to Joan of Arc consisting of three small Renaissance buildings with a statue of the heroine in the principal one.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the III. army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a council of

trade-arbitration, a chamber of commerce and a branch of the Bank of France. Among its educational establishments are preparatory schools of medicine and pharmacy, and of higher instruction in science and literature, lycées and training-colleges for both sexes, ecclesiastical seminaries, and schools of commerce and industry, of architecture, music and fine arts. All the more important nations have consulates in the city. Rouen is an important centre for trade in wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are leading imports. Besides its manufactures it exports plaster, sugar and sand. The principal industries of Rouen and its district are the spinning and weaving of cotton, notably the manufacture of *rouenneries* (cotton fabric woven with dyed yarn), the printing and dyeing of the manufactured material and the spinning of flax, hemp and jute; ship-building and the making of braces, shirts, bodices, boots, shoes and hats is also carried on, and there are distilleries, petroleum-refineries and manufactories of chemicals, soap, machinery, carding-combs and brushes. The port of Rouen comprises the marine docks below the Boidieul bridge, and the river dock, the timber dock and the petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 19½ to 22½ ft. of water, and its quays have a superficies of 123 acres. It is served by the lines of the Orleans, the Western and the Northern railway companies, and these, in addition to the waterways connected with the Seine, make Rouen a convenient centre for the distribution of merchandise.

*Ratuma* or *Ratumacos*, the Celtic name of Rouen, was modified by the Romans into *Rotomagus*, and by the writers of medieval Latin into *Rodomum*, of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Vellocasses, a people of secondary rank, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and a little later the seat of an archbishop. Rouen owed much to its first bishops—from St Mello, the apostle of the region, who flourished about 260, to St Remigius, who died in 772. The bishops built many churches and their tombs became in turn the origin of new sanctuaries. Under Louis le Débonnaire and his successors, the Normans several times sacked the city, but after the treaty of St Clair-sur-Epte in 912, Rouen became the capital of Normandy and attained still greater prosperity. It was the principal residence of the dukes and was the scene in 949 of a victory gained by Duke Richard I. over Otto the Great, emperor of Germany, Louis d'Outremer, king of France, and Arnold, count of Flanders. In 1087 William the Conqueror, mortally wounded at Mantes, died at Rouen. The succeeding Norman kings of England tended to neglect Rouen in favour of Caen and afterwards of Poitiers, Le Mans and Angers; but its monasteries, local trade and manufactures, and the communal organization which the citizens exacted from their sovereigns during the course of the 12th century maintained an importance which is indicated by the building of several fine churches, notably that of St Ouen. In 1203 Rouen was the scene of the murder of Arthur of Brittany at the hands of King John of England. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered the capital unopposed. The union of the province with the crown of France in no way hindered the prosperity of the city, for Philip confirmed its communal privileges and built a new castle. A convention between the merchants of Rouen and those of Paris relating to the navigation of the Seine was followed by treaties with London, with the Hanseatic towns and with Flanders and Champagne. In 1302 the seat of the exchequer or sovereign court, afterwards the parlement, of Normandy was definitely fixed at Rouen, which had previously shared its sessions with other towns. In 1356 Charles the Bad, king of Navarre, a favourite in the city, was arrested within its walls, an event which displeased the inhabitants, who after the disaster at Poitiers supported the cause of Étienne Marcel. The revolt of the Harelle in 1382, caused by the exactions both of the uncles of Charles VI. and of the monks of St Ouen, was followed by heavy punishment. In spite of this a stubborn resistance was offered to Henry V. of England who, after a long siege, occupied the town in 1419. The prosperity of Rouen continued under the English domination, and during this period the greater part of the church of St Ouen was constructed. In 1431 Joan of Arc was tried and burnt in the city. From that year the French began a series of

attempts to recapture the town, but they were unsuccessful till 1449 when Somerset, the English commander, was obliged to surrender the principal fortified places in Normandy. During the close of the 15th century and the first half of the 16th, Rouen was the metropolis of art and taste in France and was one of the first places to reflect the influence of the Renaissance. During the wars of religion the arts declined. In 1562 the town was sacked by the Protestants. This did not prevent the League from gaining so firm a footing there that Henry IV. besieged it unsuccessfully and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 lost Rouen many of its richest and most industrious citizens in the Calvinistic emigration. The town suffered less from the excesses of the French Revolution than from the depredations of bandits who, under the Directory, infested the neighbourhood of the city and were not suppressed till the Consulate. During the Franco-German War the city was occupied by the invaders from December 1870 till July 1871, and had to submit to heavy requisitions.

See A. Chéruel, *Histoire de Rouen pendant l'époque communale* (Rouen, 1843); *Histoire de Rouen sous la domination anglaise au quinzième siècle* (Rouen, 1840); N. Périaux, *Histoire sommaire et chronologique de la ville de Rouen* (Rouen, 1874); C. Enlart, *Rouen* (Paris, 1904).

**ROUERGUE** (*Ruthenensis pagus*), one of the old provinces of France, was originally inhabited by the *Rutheni*. It was bounded on the N. by Auvergne, on the S. and S.W. by Languedoc, on the E. by Gévaudan and the Cévennes and on the W. by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1678). Administratively it formed first a *sénéchaussée*, dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascony. It was then part of the departments of Aveyron and of Tarn-et-Garonne. The county of Rodez, after having been in the possession of the houses of Toulouse and Carlat, fell in the 14th century into that of Armagnac. Jean II. of Armagnac having served Charles V. faithfully during his wars with England, received from him, in 1374, what were called the four "*châtellenies*" with the "*Commun de la paix*," a tax which had been established there to organize resistance against foreigners. Jean V. of Armagnac was deprived of the county for crime and treason against Louis XI., in 1469, but afterwards it was given back to Charles of Armagnac, who died without legitimate issue in 1496. Its possession was then disputed between King Francis I. and the duke of Alençon, who at last compromised (1519); the king ceded the county to his sister Marguerite d'Angoulême, who took it as dowry first to the duke of Alençon, and then to her second husband Henri d'Albret, king of Navarre. The county afterwards passed to Jeanne d'Albret, then to Henri IV., and was joined to the crown lands in 1590.

**ROUGE** ("red," from Lat. *rubeus*), a French name applied to various colouring substances of a brilliant carmine tint, especially when used as cosmetics. The best of these preparations are such as have for their basis carthamine, obtained from the safflower (*Carthamus tinctorius*). The Chinese prepare a rouge, said to be from safflower, which, spread on the cards on which it is sold, has a brilliant metallic green lustre, but when moistened and applied to the skin assumes a delicate carmine tint. Jeweller's rouge for polishing plate is a fine red iron oxide prepared by calcination from ferrous sulphate (green vitriol).

**ROUGET DE LISLE, CLAUDE JOSEPH** (1760-1836), French author, was born on the 10th of May 1760, at Lons-le-Saunier (Jura). He entered the army as an engineer, and attained the rank of captain. He was one of those authors whom a single work has made famous. The song which has immortalized him, the *Marseillaise*, was composed at Strassburg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a

public dinner. The piece was at first called *Chant de guerre de l'armée du Rhin*, and only received its name of *Marseillaise* from its adoption by the Provençal volunteers whom Barbaroux introduced into Paris, and who were prominent in the storming of the Tuilleries. The author was a moderate republican, and was cashiered and thrown into prison; but the counter-revolution set him at liberty. He died at Choisy-le-Roi (Seine et Oise) on the 26th of June 1836. The stirring melody of the *Marseillaise* and its ingenious adaptation to the words serve to disguise the alternate poverty and bombast of the words themselves. Rouget de Lisle wrote a few other songs of the same kind, and in 1825 he published *Chants français*, in which he set to music fifty songs by various authors. His *Essais en vers et en prose* (1797) contains the *Marseillaise*, a prose tale of the sentimental kind called *Adelaide et Monville*, and some occasional poems.

**ROUGH CAST** (the French equivalent is *crépis*), in architecture, the exterior coating originally given to the walls of common dwellings and outbuildings, but now frequently employed for decorative effect on country houses, especially those built in half timber. It is a composition of small gravel and sand, mixed with strong lime mortar, and is thrown on the walls already covered with two ordinary coats of plaster. Variety can be obtained on the surface of the wall by small pebbles of different colours, and in the Tudor period fragments of glass were sometimes embedded. The central tower of St Alban's cathedral, built with Roman tiles from Verulam, was covered with rough cast believed to be coeval with the building. The rough cast was removed about 1870.

**ROUHER, EUGÈNE** (1814-1884), French statesman, was born at Riom (Puy de Dôme) on the 30th of November 1814. He practised law in his native place after taking his degree in Paris in 1835, and in 1846 sought election by his fellow-citizens to the Chamber of Deputies as an official candidate of the Guizot ministry. It was only after the revolution of 1848, however, that he became deputy for the department of Puy de Dôme. Re-elected to the Legislative Chamber in 1849 he succeeded Odilon Barrot as minister of justice, with the additional office of keeper of the seals, which he retained with short intervals until January 1852. From the tribune of the Chamber he described the revolution of February as a "catastrophe," and he supported reactionary legislation, notably the bill (May 31, 1850) for the limitation of the suffrage. After the *coup d'état* of December 2, 1851, he was entrusted with the redaction of the new constitution, and on his resignation of office in January became vice-president of the Council of State. After the formal establishment of the Empire, Napoleon III. rewarded him by a grant of £40,000 and the estate of Cirey. In 1855 he became minister of agriculture, commerce and public works, and in 1856 senator. He secured for France an excellent system of railways without making them a state monopoly, and he conducted the complicated negotiations for the treaty of commerce with England which was concluded in January 1860, and subsequently arranged similar treaties with Belgium and Italy. In 1863 he became minister president of the Council of State, and on the death of A. A. M. Billault minister of state and chief spokesman of the emperor before the Corps Législatif. Although the government had a great majority in the Chamber, the opposition counted the redoubtable names of Thiers, Berryer and Jules Favre, and government measures were only passed by frequent resort to the closure. Rouher had to defend Napoleon's foreign adventures as well as the free-trade treaties and the extravagances of Baron Haussmann for which he was directly responsible. After an attempted defeat of the foreign policy which had aided the aggrandizement of Prussia at the expense of Austria, Thiers told him in the Chamber that there were "no more blunders left for him to make." He opposed the abortive Liberal concessions of January 1867, announced in a personal letter from Napoleon III. to himself, and resigned with the rest of the cabinet, only to resume office after a short interval as minister of finance. When concessions became inevitable Rouher, the "vice-empeur," resigned

to make way after six months' interval for *Émile Ollivier*. He still fought for reaction in his new office of president of the Senate. After the fall of the Empire he fled to England, but returned to France a year later to work for the fortunes of the prince imperial. After serious disturbances he was elected member for Ajaccio on the 11th of February 1872, his election being characterized by the prefect of Corsica as a regular conspiracy in favour of the Empire. In the Chamber, where he subsequently represented Riom, he formed the group of the Appel au Peuple. His first speech in the House was the occasion (May 21, 1872) of violent attacks by Audiffret-Pasquier and Gambetta. The death of the prince imperial in 1879 put an end to the serious chances of the Bonapartists, although Rouher sought to secure the recognition of Prince Napoleon, son of the ex-king Jerome, as heir to the imperial honours. Rouher lost his reason after a stroke of paralysis in 1883, and died on the 3rd of February 1884.

For an estimate of Rouher, see *marquis de Castellane, Les Hommes d'état français du XIX. siècle* (1888), and generally the literature dealing with the Second Empire.

**ROULERS** (Flemish *Roeselaere*), a town of Belgium, in the province of West Flanders, 13 m. N.W. of Courtrai. Pop. (1904) 24,548. It is one of the oldest communes in Belgium, and was famous for its weavers in the 11th and 12th centuries. Its prosperity depends on the cultivation of flax and the manufacture of linen. The church of St Michael is remarkable for its lofty tower. Baldwin VIII., count of Flanders, died here in 1120, and in 1794 the French under Pichegru defeated the Austrians under Clerfayt.

**ROULETTE**, in mathematics, the locus of a point carried on a curve which rolls on another (fixed) curve. The name appears to have been used by Pascal to denote the cycloid (*q.v.*), which is the simplest roulette, being traced by a point on the circumference of a circle rolling on a straight line. The trochoids and epicycloids (*q.v.*) are also simple roulettes, the latter being traced by points on a circle which rolls on another circle.

See W. H. Besant, *Roulettes and Glissettes*.

**ROULETTE**, a gambling game, of French origin. It is one of the two games played in the gambling-rooms at Monte Carlo, and the description here given, and the maximum and minimum stakes mentioned, are to be understood as applying to the game as it is there conducted. It is solely a game of chance, though so-called "systems" are innumerable, and some of them for a short period often appear to give the player an advantage. There is no possible system, however, which will assure success in the long-run, and it is herein that the ingenuity of the game consists. Every systematic method of play must depend upon increased stakes to retrieve past losses; and though a player with an unlimited capital might be practically certain to achieve his end in the course of time, the circumstance that there is always a maximum renders the bank invincible. The roulette table, covered with a green cloth, is made up of precisely corresponding halves with a circular space left into the middle holding the wheel, on either side of which the cloth is divided into

spaces marked *passé, pair, manqué, impair*, and the black and red diamonds. The wheel is divided into thirty-seven compartments, coloured alternately black and red, numbered from one to thirty-six, the thirty-seventh being zero. *Pair* indicates even numbers, *impair* odd numbers, *manqué* includes the numbers from 1 to 18; *passé*, from 19 to 36. The methods of staking are innumerable. The minimum stake is five

francs, which must be placed on the table in the form of a five-franc piece, and not in smaller change. *Rouge, noir,*

*pair, impair, manqué* and *passé* are even chances; i.e. a stake put upon any of them is paid in corresponding coin should the player win, the exception being when the little ball which is spun round the wheel falls into zero, in which case the even money chances are put "in prison"—that is to say, laid aside until another spin, when if the bank wins they are lost, if the player wins he is allowed to retrieve his money. The maximum in the case of these chances is 6000 francs. Any one who desires to play *en plein* puts his stake on one of the thirty-seven numbers. If the ball falls into the corresponding number on the wheel, the stake is paid thirty-five times; and as there are thirty-seven numbers on the board, with the advantage already described of imprisoning the even-money chances when zero comes up, it will be seen that there is a steady percentage in favour of the tables and consequently against the player. This percentage is of course greatly increased when, as is often the case, a second zero, called *double-zero*, is used. In some gambling-houses there is even a third one, called Eagle Bird. The maximum stake allowed *en plein* is 180 francs. The next most daring selection is *à cheval*, when the stake is placed on the line separating any two numbers, and if either of them wins the player is paid seventeen times, the highest stake permissible being 360 francs. *Transversale plein* covers any three numbers in a line, the coin or note being placed on the line dividing any one of the numbers from the neighbouring even-money chance, as, for instance, between 4 and *passé*, or 6 and *manqué*. A *transversale simple* covers six numbers, as, for example, where the line between 4 and 7 joins *passé*, or between 6 and 9 joins *manqué*; and if any one of these numbers wins, five times the value of the stake is paid, the maximum here being 1200 francs. *En carré* includes four numbers, the coin being placed, for instance, on the cross between 1, 2, 4, 5, or 28, 29, 31, 32; eight times the value of the stake is paid, and the maximum is 760 francs. The dozens and the columns are also indicated on the board, the first dozen of course including 1 to 12. In each of the columns are twelve numbers in different order. A stake placed on either a dozen or a column is paid twice its value, the maximum here being 3000 francs. A stake constantly played is called the *quatre premiers*, which includes zero, 1, 2 and 3, the stake being placed on the line where zero and 1 join *passé*, or where zero and 3 join *manqué*. If any one of these four numbers, including zero, wins, the stake is paid eight times; and four times eight being thirty-two, there is a greater advantage to the table than when it loses *en plein* or on certain other chances. Zero can also be played in combination with any one or two of its neighbours; if with one of them the stake is paid seventeen times, if with two of them eleven times. A croupier sits on either side of the wheel; there is also one at each end of the table, their business being to assist the players in staking and recovering their winnings. Behind each of the former pair an official on a high chair supervises the table. The croupier whose duty it is to spin the wheel waits for a time till stakes have been made, and then, exclaiming, "Messieurs, faites votre jeu!" sets the cylinder in motion, throwing the ball in the direction contrary to that in which the wheel revolves. When it is seen that the ball will soon fall at rest in one of the compartments of the cylinder the croupier gives the notice, "Rien ne va plus," after which no stakes can be placed. When the ball finally rests in the compartment, the croupier announces the number and the even-money chances that win, as for instance *rouge, impair* and *manqué*. He and his fellows then gather in with a rake all the money that has been lost, after which the winnings are paid and the game proceeds. At the beginning of play each table is supplied with a certain large sum. When the bank loses this and is forced to send for another supply it is said to be "broken."

**ROUND** (O. Fr. *ronde*, Lat. *rotundus*, the Fr. is the source also of Du. *ronde*; Ger., Swed., Dan. and Nor. *rund*), circular, spherical, globular. As a substantive, the word has several specific applications; thus it is used of the rung of a ladder, of a rounded cross-bar connecting the legs of a chair, of the circuit of the

watch under an officer which patrols the sentries in a fortress, fortified town, camp or other military station, and hence of the beat or customary course of a policeman, a postman, or a tradesman, and of the full course at such a game as golf. Similarly there were old dances called "rounds," in which the dancers stood in a circle or ring. They were popular in the 16th and 17th centuries. Later the name was also applied to country dances where the dancers stood in two lines. For the "round" in music see CANON. A complaint or remonstrance signed by a number of persons is commonly known as a "round robin"; properly such a document should have the signatures arranged in a circle, the idea being that thus the order in which the complainants signed should be unknown. In the 16th century "round robin" was a name of mockery given to the Eucharist.

**ROUNDERS**, an English ball game, probably dating from the 18th century, but not attaining to any popularity before 1800. It was the immediate ancestor of Baseball (*q.v.*). Up to the year 1889 no special code of rules existed, but the game was played on the green, the field being marked out in a regular pentagon by five bases about 15 or 20 yds. apart, called respectively *home-base* (at which the striker stood), *1st base*, *2nd base*, *3rd base*, and *4th base*. The feeder, or bowler, stood in the middle of the pentagon and tossed the ball, which was softer than a cricket ball, to the striker, who with a round club, often a cricket stump, endeavoured to hit it as far out of the reach of the fielders as possible, a run being scored when the striker made the circuit of the bases without being put out. Almost any number of players could form a side, and the batsman would be retired when a batted ball was caught on the fly or first bounce, or when he was struck by having the ball thrown at him while running between bases. Rounders in its primitive form was more of a romp than a regular game, but it experienced a revival in Scotland and the north of England about the year 1889, when two governing bodies were formed, the National Rounders Association of Liverpool and Vicinity and the Scottish Rounders Association. These, with the later Gloucester Rounders Association, drew up the rules now recognized.

A hard ball similar to that used in baseball was adopted, and the rule by which a runner could be put out by hitting him with a thrown ball abandoned. The bat must not exceed 3½ in. in diameter nor 35 in. in length. The game is similar to baseball, but there are several important differences, the most radical being that the ball may be hit in any direction, as at cricket. The original pentagon has been discarded in favour of an elongated diamond, the home-base being at one end and 1st, 2nd and 3rd bases at the other points, while the 4th base is situated on the line of 3rd base towards home and 17 yds. from the former, the sides of the diamond being 22 yds. in length. The bowler stands in a space marked off in the centre of the diamond and tosses the ball to the batsman, who must hit at every "good" ball, *i.e.* one that is straight over the home-base and between head and knee. Two bad balls score one for the batsman. If the latter hits the ball he must run to 1st base and then 2nd, and so on round to home again, resting at any base; but he may be put out if the batted ball be caught on the fly or first bounce or the backstop (wicket-keeper in cricket) catch a ball struck at but not hit, or the batsman be touched with a ball while running between bases. Ten players constitute a side and three innings a piece are played, every player batting once in each innings. Each base made counts one. The *backstop* is placed directly behind the batsman, and behind the backstop are placed *1st cover* (right), *longstop* (middle), and *4th cover* (left). The *1st*, *2nd* and *3rd* basemen are stationed at the bases, while behind them in the field are placed the *2nd cover* (right), *centre cover* and *3rd cover* (left). The bases are designated by light wooden posts. An umpire presides over the game. A variation of rounders is *Fieldball*, invented in 1888, a combination of rounders and cricket, a wicket being placed in front of the backstop, and the four bases arranged in a circle 25 yds. distant from each other. The bat and ball are similar to those used in baseball. Another variation is called *Baseball Rounders*, which was invented in 1889 and is practically the same as baseball.

**ROUNDHEAD**, a term applied to the adherents of the parliamentary party in England during the great Civil War. Some of the Puritans, but by no means all, wore the hair closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Roundhead" appears to have been first used as a term of derision towards the end of 1641 when the debates in parlia-

ment on the Bishops Exclusion Bill were causing riots at Westminster. One authority says of the crowd which gathered there: "They had the hair of their heads very few of them longer than their ears, whereupon it came to pass that those who usually with their cries attended at Westminster were by a nickname called Roundheads." John Rushworth (*Historical Collections*) is more precise. According to him the word was first used on the 27th of December 1641 by a disbanded officer named David Hide, who during a riot is reported to have drawn his sword and said he would "cut the throat of those round-headed dogs that bawled against bishops." Clarendon (*History of the Rebellion*, iv. 121) remarks on the matter: "and from those contestations the two terms of 'Roundhead' and 'Cavalier' grew to be received in discourse, . . . they who were looked upon as servants to the king being then called 'Cavaliers,' and the other of the rabble contemned and despised under the name of 'Roundheads.'" Baxter ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of Strafford; referring to Pym, she asked who the roundheaded man was. The name remained in use until after the revolution of 1688.

Roundhead was also used during the Civil War as the name of a weapon. This is described as having "an head about a quarter of a yard long, a staffe of two yards long put into their head, twelve iron pikes round about, and one in the end to stop with."

**ROUNDSMAN SYSTEM** (sometimes termed the *billet*, or *ticket*, or *item system*), in the English poor law, a plan by which the parish paid the occupiers of property to employ the applicants for relief at a rate of wages fixed by the parish. It depended not on the services, but on the wants of the applicants, the employer being repaid out of the poor rate all that he advanced in wages beyond a certain sum. According to this plan the parish in general made some agreement with a farmer to sell to him the labour of one or more paupers at a certain price, paying to the pauper out of the parish funds the difference between that price and the allowance which the scale, according to the price of bread and the number of his family, awarded to him. It received the local name of *billet* or *ticket system* from the ticket signed by the overseer which the pauper in general carried to the farmer as a warrant for his being employed, and afterwards took back to the overseer, signed by the farmer, as a proof that he had fulfilled the conditions of relief. In other cases the parish contracted with a person to have some work performed for him by the paupers at a given price, the parish paying the paupers. In many places the roundsman system was carried out by means of an auction, all the unemployed men being put up to sale periodically, sometimes monthly or weekly, at prices varying according to the time of year, the old and infirm selling for less than the able-bodied. The roundsman system disappeared on the reform of the poor law in 1834.

**ROUND TABLE, THE**, in the Arthurian Romance (*q.v.*), the table round which, in order to avoid quarrels as to precedence, King Arthur's knights are seated, and so applied collectively to the knights themselves as the title of a mythical order of chivalry. The origin of the Round Table is obscure. Geoffrey of Monmouth makes no mention of it, and the earliest record is that of Wace, much expanded by his translator, Layamon, who gives a picturesque detailed description of the fight for precedence which took place at Arthur's board on a certain Yuletide day, and the slaughter which ensued. For this slaughter Arthur took summary vengeance, slaying all the kinsfolk of the man who started the fight, and cutting off the noses of his women-folk. For the future avoidance of any such scenes a cunning workman of Cornwall offered to make a table which should seat 1600 knights and more, and at which all should be equal. Arthur accepted this offer, and the result was the Round Table, peace and harmony. Wace does not mention the number of knights.

These versions of the "pseudo-chronicles" practically ascribe the foundation to Arthur; the romances, however, differ. In these either Merlin made the table for Uther Pendragon,

or it had belonged to Leodegrance, king of Cornwall and father of Guenevere, and was given to Arthur on his marriage with that princess. When the founding of the Round Table is ascribed to Merlin it is generally in close connexion with the Grail legend, forming the last of a series of three, founded in honour of the Trinity—the first being the table of the Last Supper, the second that of the Grail, established by Joseph of Arimathea. The number of knights whom the table will seat varies; it might seat twelve or fifty or a hundred and fifty; nowhere, save in Layamon, do we find a practically unlimited power of accommodation. It is also to be noted that whereas, in the pseudo-chronicles, it is the common table of Arthur's court, designed in the interests of peace and unity, in the romances it is a sign of superiority, only the best and most valiant knights being adjudged worthy of a seat at the Round Table. In fact, it has become the equivalent of an order of knighthood, the members of which form a brotherhood bound by oath to succour each other at need and to refrain from fighting among themselves. The membership is not restricted to the knights of Arthur's immediate court and household, knights who are, in all essentials outsiders, appearing but as passing guests at Arthur's board, such as, e.g., Perceval and Tristan, may be elected knights of the Round Table. In two romances, the prose *Tristan* and the *Parzival*, the place of the Round Table proper is taken, on a journey, by a silken cloth laid on the ground, round which the knights are seated. In the versions more closely connected with the Grail story the name of the chosen knight appears on his seat, and there is one vacant place, the *Siege perillous*, eventually to be filled by the Grail winner.

It is obvious that the tradition has passed through several stages, and has varied in the process. The original source is not easy to determine. Dr Lewis Mott has pointed out that "Round Tables" exist in many parts of Great Britain, the name being often associated with circular trenches, or rings of stones, which were demonstrably employed in connexion with the agricultural festivals held at Pentecost, Midsummer and Michaelmas. However this may be, and it seems probable that Dr Mott is right in his identification, the pseudo-chroniclers and romance writers certainly had in their minds a genuine table, although, probably, one of magical properties. Thus Layamon's table can seat an indefinite number, and yet it can be carried by Arthur when he rides abroad. On closely examining Layamon's version it seems probable that he had in his mind not merely a circular, but a turning table; he gives it as ground for the quarrel that all the knights wished to sit within; at the table the Cornish workman will make none shall be left without, but they shall sit "without and within, man against man." It is difficult to explain this phrasing in any other hypothesis than that Layamon pictured to himself Arthur's hall as open on one side, and that, on a great feast-day, owing to the number of guests, the table extended beyond the covering afforded by the roof. As the feast took place "on mid-winter's day" the annoyance of those who were without would be intelligible. To obviate this the cunning workman devised a circular table, turning on a pivot, with seats affixed, at which the guests sat the one half in turn within, the other without, the hall "man against man." This would make the Round Table analogous to the turning castles which we frequently meet with in romances; and while explaining the peculiarities of Layamon's text, would make it additionally probable that he was dealing with an earlier tradition of folklore character, a tradition which was probably also familiar to Wace, whose version, though much more condensed than Layamon's, is yet in substantial harmony with this latter. This, too, is certain; the fight for precedence at Arthur's board may be paralleled by accounts of precisely similar quarrels in early Irish literature, e.g. the famous tale of *Fled Bricrend* or *Bricriu's Feast* of the Ultonian cycle.

Recent grail researches have made it most probable that that mysterious talisman was originally the vessel of the ritual feast held in honour of a deity of vegetation,—Adonis, or

another; if the Round Table also, as Dr Mott suggests, derives from a similar source, we have a link between these two notable features of Arthurian tradition, and an additional piece of evidence in support of the view that behind the Arthur of romance there lie not only memories of an historic British chieftain, but distinct traces of a mythological and beneficent hero. Incidentally also it would seem that those versions which connect the table more closely with Arthur are the more correct.

**ROUND TOWERS.** A peculiar class of round tower exists throughout Ireland; about one hundred and twenty examples once existed; most of these are ruined, but eighteen or twenty are almost perfect. These towers were built either near or adjoining a church; they are of various dates, from perhaps the 8th to the 13th century; though varying in size and detail, they have many characteristics common to all. They are built with walls slightly battering inwards, so that the tower tapers towards the top. The lower part is formed of solid masonry, the one doorway being raised from 6 to 20 ft. above the ground, and so only accessible by means of a ladder. The towers within are divided into several storeys by two or more floors, usually of wood, but in some cases, as at Keneith, of stone slightly arched. The access from floor to floor was by ladders. The windows, which are always high up, are single lights, mostly arched or with a flat stone lintel. In some of the oldest towers they have triangular tops, formed by two stones leaning together. One peculiarity of the door and window openings in the Irish round towers is that the jambs are frequently set sloping, so that the opening grows narrower towards the top, as in the temples of ancient Egypt. The later examples of these towers, dating from the 12th and 13th centuries, are often decorated with chevron, billet and other Norman enrichments round the jambs and arches. The roof is of stone, usually conical in shape, and some of the later towers are crowned by a circle of battlements. The height of the round towers varies from about 60 to 132 ft.; that at Kilcullen was the highest. The masonry differs according to its date,—the oldest examples being built of almost uncut rubble work, and the later ones of neatly jointed ashlar.

Much has been written as to the use of these towers, and the most conflicting theories as to their origin have been propounded. It is fairly certain, however, that they were constructed by Christian builders, both from the fact that they always are or once were near a church, and also because crosses and other Christian emblems frequently occur among the sculptured decorations of their doors and windows. Their original purpose was probably for places of refuge, for which the solid base and the door high above the ground seem specially adapted. They may also have been watch-towers, and in later times often contained bells. Their circular form was probably for the sake of strength, angles which could be attacked by a battering ram being thus avoided, and also because no quoins or dressed stones were needed, except for the openings—an important point at a time when tools for working stone were scarce and imperfect. Both these reasons may also account for the Norman round towers which are so common at the west end of churches in Norfolk, Suffolk and Essex; though these have little resemblance to those of Ireland except in the use of a circular plan. One example exactly like those of Ireland exists in the Isle of Man, within the precincts of Peel Castle adjacent to the cathedral of St German; it was probably the work of Irish builders. There are also three in Scotland, viz. at Egilshay in Orkney, and at Abernethy and Brechin.

Round towers wider and lower in proportion than those of Ireland appear to have been built by many prehistoric races in different parts of Europe. The towers of this class in Scotland are called "brochs"; they average about 50 ft. high and 30 ft. in internal diameter. Their walls, which are usually about 15 ft. thick at the bottom, are built hollow, of rubble masonry, with series of passages one over the other running all round the tower. As in the Irish towers, the entrance is placed at some distance from the ground; and the whole structure is designed as a stronghold. The brochs

domestic establishment. His mistress, whom towards the close of his life he married after a fashion, was Thérèse le Vasseur, a servant at the inn, whom he first met in 1743. She had little beauty, no education or understanding, and few charms that his friends could discover, besides which she had a detestable mother, who was the bane of Rousseau's life. But he made himself happy with her, and (according to Rousseau's account, the accuracy of which has been questioned) five children were born to them, who were all consigned to the foundling hospital. This disregard of responsibility was partly punished by the use his critics made of it when he became celebrated as a writer on education and a preacher of the domestic affections.<sup>1</sup> Diderot, with whom from 1741 onwards he became more and more familiar, admitted him as a contributor to the *Encyclopédie*. He formed new musical projects, and he was introduced by degrees to many people of rank and influence, among them Madame d'Épinay (*q.v.*), to whom in 1747 he was introduced by her lover M. de Francueil. It was not, however, till 1749 that Rousseau made his mark as a writer. The academy of Dijon offered a prize for an essay on the effect of the progress of civilization on morals. Rousseau took up the subject, developed his famous paradox of the superiority of the savage state, won the prize, and, publishing his essay (*Discours sur les arts et sciences*) next year, became famous. The anecdote as to the origin of this famous essay is voluminous. It is agreed that the idea was suggested when Rousseau went to pay a visit to Diderot, who was in prison at Vincennes for his *Lettre sur les aveugles*. Rousseau says he thought of the paradox on his way down; Morellet and others say that he thought of treating the subject in the ordinary fashion and was laughed at by Diderot, who showed him the advantages of the less obvious treatment. Diderot himself, who in such matters is almost absolutely trustworthy, does not claim the suggestion, but uses words which imply that it was at least partly his. It is very like him. The essay, however, took the artificial and crotchety society of the day by storm. Francueil gave Rousseau a valuable post as cashier in the receiver-general's office. But he resigned it either from conscientiousness, or crotchet, or nervousness at responsibility, or indolence, or more probably from a mixture of all four. He went back to his music-copying, but the salons of the day were determined to have his society, and for a time they had it. In 1752 he brought out at Fontainebleau an operetta, the  *Devin du village*, which was successful. He received a hundred louis for it, and he was ordered to come to court next day. This meant the certainty of a pension. But Rousseau's shyness or his perversity (as before, probably both) made him disobey the command. His comedy *Narcisse*, written long before, was also acted, but unsuccessfully. In the same year, however, a letter *Sur la musique française* again had a great vogue.<sup>2</sup> Finally, for this was an important year

<sup>1</sup> Apart from the fact that there were probably no children at all, the whole bearing of the belief of Rousseau that they were sent by him to the *Enfants trouvés* has been falsified by hostile writers. He was a penniless man of letters, with theories as to state maintenance of children; and Thérèse was a consenting party. Rousseau, however, never saw any of the alleged children; and Mrs Macdonald has shown good cause for believing that their existence was a myth, an imposition on Rousseau's credulity, invented by Thérèse and her mother to make the tie more binding. (H. CH.)

<sup>2</sup> Rousseau's influence on French music was greater than might have been expected from his very imperfect education; in truth, he was a musician by natural instinct only, but his feeling for art was very strong, and, though capricious, based upon true perceptions of the good and beautiful. The system of notation (by figures) concerning which he read a paper before the Académie des Sciences, August 22, 1742, was ingenious, but practically worse than useless, and failed to attract attention, though the paper was published in 1743 under the title of *Dissertation sur la musique moderne*. In the famous "guerre des buffons," he took the part of the "buffonists," so named in consequence of their attachment to the Italian "opera buffa," as opposed to the true French opera; and, in his *Lettre sur la musique française*, published in 1753, he indulged in a violent tirade against French music, which he declared to be so contemptible as to lead to the conclusion "that the French neither have, nor ever will have, any music of their own, or at least that, if they ever do have any, it will be so much the worse for them." This silly libel so enraged the performers at the Opera that they hanged and burned

with him, the Dijon academy, which had founded his fame, announced the subject of "The Origin of Inequality," on which he wrote a discourse which was unsuccessful, but at least equal to the former in merit. During a visit to Geneva in 1754 Rousseau saw his old friend and love Madame de Warens (now reduced in circumstances and having lost all her charms), while after abjuring his abjuration of Protestantism he was enabled to take up his freedom as citizen of Geneva, to which his birth entitled him and of which he was proud. Shortly afterwards, returning to Paris, he accepted a cottage near Montmorency (the celebrated Hermitage) which Madame d'Épinay had fitted up for him, and established himself there in April 1756. He spent little more than a year there, but it was an important year. Here he wrote *La Nouvelle Héloïse*; here he indulged in the passion which that novel partly represents, his love for Madame d'Huodetot, sister-in-law of Madame d'Épinay, a lady young and amiable, but plain, who had a husband and a lover (St Lambert), and whom Rousseau's devotion seems to have partly pleased and partly annoyed. Here too arose the obscure triangular quarrel between Diderot, Rousseau and Frederick Melchior Grimm, which ended Rousseau's sojourn at the Hermitage. The supposition least favourable to Rousseau is that it was due to one of his numerous fits of half-insane petulance and indignation at the obligations which he was nevertheless always ready to incur. That most favourable to him is that he was expected to lend himself in a more or less complaisant manner to assist and cover Madame d'Épinay's adulterous affection for Grimm. At any rate, Rousseau quitted the Hermitage in the winter of 1757-58, and established himself at Montlouis in the neighbourhood.

Hitherto Rousseau's behaviour had frequently made him enemies, but his writings had for the most part made him friends. The quarrel with Madame d'Épinay, with Diderot, and through them with the philosophe party reversed this. In 1758 appeared his *Lettre à d'Alembert contre les spectacles*, written in the winter of the previous year at Montlouis. This was at once an attack on Voltaire, who was giving theatrical representations at Les Délices, on D'Alembert, who had condemned the prejudice against the stage in the *Encyclopédie*, and on one of the favourite amusements of the society of the day. Voltaire's strong point was not forgiveness, and, though Rousseau no doubt exaggerated the efforts of his "enemies," he was certainly henceforward as obnoxious to the philosophe coterie as to the orthodox party. He still, however, had no lack of patrons—he never had—though his perversity made him quarrel with all in turn. The amiable duke and duchess of Luxembourg, who were his neighbours at Montlouis, made his acquaintance, or rather forced theirs upon him, and he was industrious in his literary work—indeed, most of his best books were produced during his stay in the neighbourhood of its author in effigy. Rousseau revenged himself by printing his clever satire entitled *Lettre d'un symphoniste de l'Académie Royale de Musique à ses camarades de l'Orchestre*. His *Lettre à M. Burney* is of a very different type, and does full justice to the genius of Gluck. His articles on music in the *Encyclopédie* deal very superficially with the subject; and his *Dictionnaire de musique* (Geneva, 1767), though admirably written, is not trustworthy, either as a record of facts or as a collection of critical essays. In all these works the imperfection of his musical education is painfully apparent, and his compositions betray an equal lack of knowledge, though his refined taste is as clearly displayed there as is his literary power in the *Letters and Dictionary*. His first opera, *Les Muses galantes*, privately prepared at the house of La Popelinère, attracted very little attention; but *Le Devin du village*, given at Fontainebleau in 1752, and at the Académie in 1753, achieved a great and well-deserved success. Though very unequal, and exceedingly simple both in style and construction, it contains some charming melodies, and is written throughout in the most refined taste. His *Pygmalion* (1775) is a melodrama without singing. Some posthumous fragments of another opera, *Daphnis et Chloé*, were printed in 1780; and in 1781 appeared *Les Consolations des misères de ma vie*, a collection of about one hundred songs and other fugitive pieces of very unequal merit. The popular air known as "Rousseau's Dream" is not contained in this collection, and cannot be traced back farther than J. B. Cramer's celebrated "Variations." M. Castil-Blaze has accused Rousseau of extensive plagiarisms (or worse) in *Le Devin du village* and *Pygmalion*, but apparently without sufficient cause. (W. S. B.)

**Montmorency.** A letter to Voltaire on his poem about the Lisbon earthquake embittered the dislike between the two, being surreptitiously published. *La Nouvelle Héloïse* appeared in the same year (1760), and it was immensely popular. In 1762 appeared the *Contrat social* at Amsterdam, and *Émile*, which was published both in the Low Countries and at Paris. For the latter the author received 6000 livres, for the *Contrat* 1000.

*Julia, ou La Nouvelle Héloïse*, is a novel written in letters describing the loves of a man of low position and a girl of rank, her subsequent marriage to a respectable freethinker of her own station, the mental agonies of her lover, and the partial appeasing of the distresses of the lovers by the influence of noble sentiment and the good offices of a philanthropic Englishman. It is too long, the sentiment is overstrained, and severe moralists have accused it of a certain complaisance in dealing with amatory errors; but it is full of pathos and knowledge of the human heart. The *Contrat social*, as its title implies, endeavours to base all government on the consent, direct or implied, of the governed, and indulges in much ingenious argument to get rid of the practical inconveniences of such a suggestion. *Émile*, the second title of which is *De l'Éducation*, is much more of a treatise than of a novel, though a certain amount of narrative interest is kept up throughout.

Rousseau's reputation was now higher than ever, but the term of the comparative prosperity which he had enjoyed for nearly ten years was at hand. The *Contrat social* was obviously anti-monarchic; the *Nouvelle Héloïse* was said to be immoral; the sentimental deism of the "Profession du vicairé Savoyard" in *Émile* irritated equally the philosophe party and the church. On June 11, 1762, *Émile* was condemned by the parlement of Paris, and two days previously Madame de Luxembourg and the prince de Conti gave the author information that he would be arrested if he did not fly. They also furnished him with means of flight, and he made for Yverdun in the territory of Bern, whence he transferred himself to Motiers in Neuchâtel, which then belonged to Prussia. Frederick II. was not indisposed to protect the persecuted when it cost him nothing and might bring him fame, and in Marshal Keith, the governor of Neuchâtel, Rousseau found a true and firm friend. He was, however, unable to be quiet or to practise any of those more or less pious frauds which were customary at the time with the unorthodox. The archbishop of Paris had published a pastoral against him, and Rousseau did not let the year pass without a *Lettre à M. de Beaumont*. The council of Geneva had joined in the condemnation of *Émile*, and Rousseau first solemnly renounced his citizenship, and then, in the *Lettres de la montagne* (1763), attacked the council and the Genevan constitution unsparingly. All this excited public opinion against him, and gradually he grew unpopular in his own neighbourhood. This unpopularity is said on uncertain authority to have culminated in a nocturnal attack on his house. At any rate he thought he was menaced if he was not, and migrated to the Île St Pierre in the Lake of Bienné, where he once more for a short, and the last, time enjoyed that idyllic existence which he loved. But the Bernese government ordered him to quit its territory. He was for some time uncertain where to go, and thought of Corsica (to join Paoli) and Berlin. But finally David Hume offered him, late in 1765, an asylum in England, and he accepted. He passed through Paris, where his presence was tolerated for a time, and landed in England on January 13, 1766. Thérèse travelled separately, and was entrusted to the charge of James Boswell, who had already made Rousseau's acquaintance. Here he had once more a chance of settling peaceably. Severe English moralists like Johnson thought but ill of him, but the public generally was not unwilling to testify against French intolerance, and regarded his sentimentalism with favour. He was lionized in London to his heart's content and discontent, for it may truly be said of Rousseau that he was equally indignant at neglect and intolerant of attention. When, after not a few displays of his strange humour, he professed himself tired of the capital,

Hume procured him a country abode in the house of Mr Davenport at Wootton in Derbyshire. Here, though the place was bleak and lonely, he might have been happy enough, and he actually employed himself in writing the greater part of his *Confessions*. But his habit of self-tormenting and tormenting others never left him. His own caprices interposed some delay in the conferring of a pension which George III. was induced to grant him, and he took this as a crime of Hume's. The publication of a spiteful letter (really by Horace Walpole, one of whose worst deeds it was) in the name of the king of Prussia made Rousseau believe that plots of the most terrible kind were on foot against him. Finally he quarrelled with Hume because the latter would not acknowledge all his own friends and Rousseau's supposed enemies of the philosophe circle to be rascals. He remained, however, at Wootton during the year and through the winter. In May 1767 he fled to France, addressing letters to the lord chancellor and to General Conway, which can only be described as the letters of a lunatic. He was received in France by the marquis de Mirabeau (father of the great Mirabeau), of whom he soon had enough, then by the prince de Conti at Trye. From this place he again fled and wandered about for some time in a wretched fashion, still writing the *Confessions*, constantly receiving generous help, and always quarrelling with, or at least suspecting, the helpers. In the summer of 1770 he returned to Paris, resumed music-copying, and was on the whole happier than he had been since he had to leave Montlouis. He had by this time married Thérèse le Vasseur, or had at least gone through some form of marriage with her.

Many of the best-known stories of Rousseau's life date from this last time, when he was tolerably accessible to visitors, though clearly half-insane. He finished his *Confessions*, wrote his *Dialogues* (the interest of which is not quite equal to the promise of their curious sub-title, *Rousseau juge de Jean Jacques*), and began his *Réveries du promeneur solitaire*, intended as a sequel and complement to the *Confessions*, and one of the best of all his books. It should be said that besides these, which complete the list of his principal works, he has left a very large number of minor works and a considerable correspondence. During this time he lived in the Rue Platière, which is now named after him. But his suspicions of secret enemies grew stronger rather than weaker, and at the beginning of 1778 he was glad to accept the offer of M. de Girardin, a rich financier, and occupy a cottage at Ermenonville. The country was beautiful; but his old terrors revived, and his woes were complicated by the alleged inclination of Thérèse for one of M. de Girardin's stable-boys. On July 2nd he died in a manner which has been much discussed, suspicions of suicide being circulated at the time by Grimm and others.<sup>1</sup>

There is little doubt that for the last ten or fifteen years of his life, if not from the time of his quarrel with Diderot and Madame d'Épinay, Rousseau was not wholly sane—the combined influence of late and unexpected literary fame and of constant solitude and discomfort acting upon his excitable temperament so as to overthrow the balance, never very stable, of his fine and acute but unrobust intellect. He was by no means the only man of letters of his time who had to submit to something like persecution. Fréron on the orthodox side had his share of it, as well as Voltaire, Helvétius, Diderot and Montesquieu on that of the innovators. But Rousseau had not, like Montesquieu, a position which guaranteed him from serious danger; he was not wealthy like Helvétius; he had not the wonderful suppleness and trickiness which even without his wealth would probably have defended Voltaire himself; and he lacked entirely the "bottom" of Fréron and Diderot. When he was molested he could only shriek at his

<sup>1</sup>The local inquiry into the death, on the following day, resulted in a certificate that he died of apoplexy; but the story that he shot himself persisted. In December 1897 Rousseau's coffin in the Panthéon was opened, and M. Berthelot, who examined the skull, found no trace of injury by a bullet; and on the whole there is no reason to doubt the verdict of the original inquiry at Ermenonville. (H. Cu.)

enemies and suspect his friends. His moral character was undoubtedly weak in other ways than this, but it is fair to remember that but for his astounding *Confessions* the more disgusting parts of it would not have been known, and that these *Confessions* were written, if not under hallucination, at any rate in circumstances entitling the self-condemned criminal to the benefit of considerable doubt. If Rousseau had held his tongue, he might have stood lower as a man of letters; he would pretty certainly have stood higher as a man. He was, moreover, really sinned against, if still more sinning. The conduct of Grimm to him was certainly bad; and, though Walpole was not his personal friend, a worse action than his famous letter, considering the well-known idiosyncrasy of the subject, would be difficult to find. It was his own fault that he saddled himself with the Le Vasseurs, but their conduct was probably, if not certainly, ungrateful in the extreme. Only excuses can be made for him; but the excuses for a man born, as Hume after the quarrel said of him, "without a skin" are numerous and strong.

His peculiar reputation increased after his death. During his life his personal peculiarities and the fact that his opinions were nearly as obnoxious to the one party as to the other worked against him, but it was not so after his death. The men of the Revolution regarded him with something like idolatry, and his literary merits conciliated many who were far from idolizing him as a revolutionist. His style was taken up by Bernardin de Saint Pierre and by Chateaubriand. It was employed for purposes quite different from those to which he had himself applied it, and the reaction triumphed by the very arms which had been most powerful in the hands of the Revolution. Byron's fervid panegyric enlisted on his side all who admired Byron—that is to say, the majority of the younger men and women of Europe between 1820 and 1850—and thus different sides of his tradition were continued for a full century after the publication of his chief books. His religious unorthodoxy was condoned because he never scoffed; his political heresies, after their first effect was over, seemed harmless from the very want of logic and practical spirit in them, while part at least of his literary secret was the common property of almost every one who attempted literature.

In religion Rousseau was undoubtedly what he has been called above—a sentimental deist; but no one who reads him with the smallest attention can fail to see that sentimentalism was the essence, deism the accident of his creed. In his time orthodoxy at once generous and intelligent hardly existed in France. There were ignorant persons who were sincerely orthodox; there were intelligent persons who pretended to be so. But between the time of Massillon and D'Aguesseau and the time of Lamennais and Joseph de Maistre the class of men of whom in England Berkeley, Butler and Johnson were representatives did not exist in France. Little inclined by nature to any but the emotional side of religion, and utterly undisciplined in any other by education, course of life, or the general tendency of public opinion, Rousseau naturally took refuge in the nebulous kind of natural religion which was at once fashionable and convenient. If his practice fell far short even of his own arbitrary standard of morality, as much may be said of persons far more dogmatically orthodox.

In politics, on the other hand, Rousseau was a sincere and, as far as in him lay, a convinced republican. He had no great tincture of learning, he was by no means a profound logician, and he was impulsive and emotional in the extreme—characteristics which in political matters predispose the subject to the preference of equality above all political requisites. He saw that under the French monarchy the actual result was the greatest misery of the greatest number, and he did not look much further. The *Contrat social* is for the political student one of the most curious and interesting books existing. Historically it is null; logically it is full of gaping flaws, practically its manipulations of the *volonté de tous* and the *volonté générale* are clearly insufficient to obviate anarchy. But its mixture of real eloquence and apparent cogency is exactly such as

always carries a multitude with it, if only for a time. Moreover, in some minor branches of politics and economics Rousseau was a real reformer. Visionary as his educational schemes (chiefly promulgated in *Émile*) are in parts, they are admirable in others, and his protest against mothers refusing to nurse their children hit a blot in French life which is not removed yet, and has always been a source of weakness to the nation.

But it is as a literary man pure and simple—that is to say, as an exponent rather than as an originator of ideas—that Rousseau is most noteworthy, and that he has exercised most influence. The first thing noticeable about him is that he defies all customary and mechanical classification. He is not a dramatist—his work as such is insignificant—nor a novelist, for, though his two chief works except the *Confessions* are called novels, *Émile* is one only in name, and *La Nouvelle Héloïse* is as a story diffuse, prosy and awkward to a degree. He was without command of poetic form, and he could only be called a philosopher in an age when the term was used with such meaningless laxity as was customary in the 18th century. If he must be classed, he was before all things a describer—a describer of the passions of the human heart and of the beauties of nature. In the first part of his vocation the novelists of his own youth, such as Marivaux, Richardson and Prévost, may be said to have shown him the way, though he improved greatly upon them; in the second he was almost a creator. In combining the two and expressing the effect of nature on the feelings and of the feelings on the aspect of nature he was absolutely without a forerunner or a model. And, as literature since his time has been chiefly differentiated from literature before it by the colour and tone resulting from this combination, Rousseau may be said to hold, as an influence, a place almost unrivalled in literary history. The defects of all sentimental writing are noticeable in him, but they are palliated by his wonderful feeling, and by the passionate sincerity even of his insincere passages. Some cavils have been made against his French, but none of much weight or importance. And in such passages as the famous "Voilà de la pervenche" of the *Confessions*, as the description of the isle of St Pierre in the *Réveries*, as some of the letters in the *Nouvelle Héloïse* and others, he had achieved absolute perfection in doing what he intended to do. The reader, as it has been said, may think he might have done something else with advantage, but he can hardly think that he could have done this thing better.

(G. SA.)

**BIBLIOGRAPHY.**—The dates of most of Rousseau's works published during his lifetime have been given above. The *Confessions* and *Réveries*, which, read in private, had given much umbrage to persons concerned, and which the author did not intend to be published until the end of the century, appeared in Geneva in 1782. In the same year and the following appeared a complete edition in forty-seven small volumes. There have been many since, the most important of them being that of Musset-Pathay (Paris, 1823). Some unpublished works, chiefly letters, were added by Bosscha (Paris, 1858) and Streckeisen Moulton (Paris, 1861). See also the latter's *Rousseau et ses amis* (1865). Works on Rousseau are innumerable. The chief biographies are: in French that of Saint Marc Girardin (1874), in English the *Life* by Viscount Morley. But the materials for his biography are so controversial and so personal—his own *Confessions* and the memoirs of associates whose accuracy and honesty are disputed—that the correct historical view can hardly be said yet to be standardized. Mrs Frederika Macdonald, in her *Jean Jacques Rousseau* (1906), makes out a good case for regarding Mme. d'Épinay's *Mémoires* as coloured, if not actually dictated, by the malevolent attitude of Grimm and Diderot; and her study of the documents undoubtedly qualifies a good many of the assumptions that have been made on the strength of evidence which is at least tainted by contemporary prejudice, and leaves the way open for an interpretation of the facts which would reconcile Rousseau's character as a writer with his actions as a man. Unfortunately for the consistency of historical writing, the view taken of Rousseau's biography affects those of Grimm, Diderot, Mme. d'Épinay and others, and while Mrs Macdonald's researches have done much to suggest a rehabilitation of Rousseau's veracity they have not definitely been accepted to an extent which would justify the rewriting of these other lives in her sense. Rousseau da Genève à l'Hermilage, 1712-57* (1908). (H. CA.)

**ROUSSEAU, PIERRE ÉTIENNE THÉODORE** (1812-1867), French painter of the Barbizon school, was born in Paris on the 15th of April 1812, of a bourgeois family which included one or two artists. At first he received a business training, but soon displayed aptitude for painting. Although his father regretted the decision at first, he became reconciled to his son leaving business, and throughout the artist's career (for he survived his son) was a sympathizer with him in all his conflicts with the Salon authorities. Théodore Rousseau shared the difficulties of the romantic painters of 1830 in securing for their pictures a place in the annual Paris exhibition. The whole influence of the classically trained artists was against them, and not until 1848 was Rousseau adequately presented to the public. He had exhibited one or two unimportant works in the Salon of 1831 and 1834, but in 1836 his great work "La Descente des vaches" was rejected by the vote of the classic painters; and from then until after the revolution of 1848 he was persistently refused. He was not without champions in the press, and under the title of "le grand refusé" he became known through the writings of Thoré, the critic who afterwards resided in England and wrote under the name of Bürger. During these years of artistic exile Rousseau produced some of his finest pictures: "The Chestnut Avenue," "The Marsh in the Landes" (now in the Louvre), "Hoar-Frost" (now in America); and in 1851, after the reorganization of the Salon in 1848, he exhibited his masterpiece, "The Edge of the Forest" (also in the Louvre), a picture similar in treatment to, but slightly varied in subject from, the composition called "A Glade in the Forest of Fontainebleau," in the Wallace collection at Hertford House.

Up to this period Rousseau had lived only occasionally at Barbizon, but in 1848 he took up his residence in the forest village, and spent most of his remaining days in the vicinity. He was now at the height of his artistic power, and was able to obtain fair sums for his pictures (but only about one-tenth of their value thirty years after his death), and his circle of admirers increased. He was still ignored by the authorities, for while Diaz was made Chevalier of the Legion of Honour in 1851, Rousseau was left undecorated at this time; but was nominated shortly afterwards. At the Exposition Universelle of 1855, where all Rousseau's rejected pictures of the previous twenty years were gathered together, his works were acknowledged to form one of the finest of the many splendid groups there exhibited. But during his lifetime Rousseau never really conquered French taste, and after an unsuccessful sale of his works by auction in 1861, he contemplated leaving Paris for Amsterdam or London, or even New York. Misfortune then overtook him: his wife, who had been a source of constant anxiety for years, became almost hopelessly insane; his aged father looked constantly to him for pecuniary assistance; his patrons were few. Moreover, while he was temporarily absent with his invalid wife, a youth living in his home (a friend of his family) committed suicide in his Barbizon cottage; when he visited the Alps in 1863, making sketches of Mont Blanc, he fell dangerously ill with inflammation of the lungs; and when he returned to Barbizon he suffered from insomnia and became gradually weakened. He was elected president of the fine art jury for the 1867 Exposition. His disappointment at being passed over in the distribution of the higher awards told seriously on his health, and in August he was seized with paralysis. He slightly recovered, but was again attacked several times during the autumn. Finally, in November, he began to sink, and he died, in the presence of his lifelong friend, J. F. Millet, on the 22nd of December 1867.

Rousseau's other friend and neighbour, Jules Dupré, himself an eminent landscape painter of Barbizon, relates the difficulty Rousseau experienced in knowing when his picture was finished, and how he, Dupré, would sometimes take away from the studio some canvas on which Rousseau was labouring too long. Millet, the peasant painter, for whom Rousseau had the highest regard, was much with him during the last years of his life, and at his death Millet took charge of the insane

wife. Rousseau was a good friend to Diaz, teaching him how to paint trees, for up to a certain point in his career Diaz considered he could only paint figures.

Rousseau's pictures are always grave in character, with an air of exquisite melancholy which is powerfully attractive to the lover of landscapes. They are well finished when they profess to be completed pictures, but Rousseau spent so long a time in working up his subjects that his absolutely completed works are comparatively few. He left many canvases with parts of the picture realized in detail and with the remainder somewhat vague; and also a good number of sketches and water-colour drawings. His pen work in monochrome on paper is rare; it is particularly searching in quality. There are a number of fine pictures by him in the Louvre, and the Wallace collection contains one of his most important Barbizon pictures. There is also an example in the Ionides collection at the Victoria and Albert Museum.

**ROUSSEAU DE LA ROTTIÈRE, JEAN SIMÉON** (b. 1747), French decorative painter, was the youngest son of Jules Antoine Rousseau, "sculpteur du Roi." The territorial addition to his patronymic has never been explained, but it is known to have been in use when he was little more than a boy. He studied at the Académie Royale, where we find him in September 1768 winning the medal given to the best painter of the quarter. He appears with his brother Jules Hugues to have been employed from an early date by his father for the decorative work executed by the family at Versailles. There has been some controversy among the authorities as to the respective shares of father and son in these works, but many of the attributions are fairly determined by dates, Jules Antoine Rousseau having been at work at Versailles for years before the birth of his famous son. The "Bains du Roi," the "Salon de la Méridienne," part of the bedchamber of Madame Adélaïde, and the "Garde-robe of Louis XVI." were among the achievements which there can be little doubt were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévilly," now at the Victoria and Albert Museum. This little room, 14 ft. long, 10½ ft. wide and 16 ft. high, was removed from the house in the Rue de Saint Louis, in the Marais. The Seigneur de Sévilly, who was hereditary "Trésorier-général de l'Extraordinaire des guerres" under Louis XVI., married his cousin Anne Marie Louise de Pange, a favourite maid-of-honour of Marie Antoinette, and the story runs that his wife and the queen, desiring to give him a surprise, had the room decorated during his absence from Paris. It was purchased for the museum for 60,000 francs in 1869. The wall paintings of this sumptuous room came from the hand of Rousseau de la Rottière; the overdoor and part of the ceiling were executed by Lagrenée le jeune; the architect was Ledoux; the grey marble figures of aged men on either side of the fireplace were sculptured by Clodion; the mounts of the chimney-piece are apparently from the chisel of Gouthière. The date of the room is assigned to 1781-82, and Jean Siméon's authorship of much of its decoration is rendered certain by his own still existing sketch. The decoration is Pompeian in feeling, and in the main its taste is admirable; the execution is of the highest excellence. The tall narrow panels are painted in medallions with amorini; festoons and bouquets of flowers fill every available space; the shutters are painted with doves and shepherdesses. Lagrenée's pictures in the upper lunettes represent the elements; upon the ceiling is Jupiter enthroned within a deep blue border. The perfection of detail, the unity of the whole composition, the dexterity with which so small a chamber, lofty out of proportion to its length and width,

has been picked out with recessed arches, the tenderness of its scheme of colour, combine to produce an exquisite effect. It is a melancholy reflection that M. de Sévilly, whom his wife and Marie Antoinette combined to surprise with this *chef-d'œuvre*, was guillotined, and that his wife, whose sitting-room it was, was condemned to die with him and with Madame Elisabeth de France, whom they had befriended, but was saved, against her will, by the princess, who made a false declaration as to her condition. She had two subsequent husbands, and lost them both in little more than two years. She herself lived less than five years after her delivery by the fall of Robespierre. There is no information as to Rousseau's later life. The last known mention of him is in 1792.

**ROUSSILLON**, one of the old provinces of France. It now forms the greater part of the department of Pyrénées Orientales (*q.v.*). It was bounded S. by the Pyrenees, W. by the county of Foix, N. by Languedoc and E. by the Mediterranean. The province derived its name from a small place near Perpignan, the capital, called Ruscino (Rosceliona, Castel Rossello), where the Gallic chieftains met to consider Hannibal's request for a conference. The district formed part of the Roman province of Gallia Narbonensis from 121 B.C. to A.D. 462, when it was ceded with the rest of Septimania to Theodoric II., king of the Visigoths. His successor, Amalaric, on his defeat by Clovis in 531 retired to Spain, leaving a governor in Septimania. In 719 the Saracens crossed the Pyrenees, and Septimania was held by them until their defeat by Pippin in 756. On the invasion of Spain by Charlemagne in 778 he found the borderlands wasted by the Saracenic wars, and the inhabitants hiding among the mountains. He accordingly made grants of land to Visigothic refugees from Spain, and founded several monasteries, round which the people gathered for protection. In 792 the Saracens again invaded France, but were repulsed by Louis, king of Aquitaine, whose rule extended over all Catalonia as far as Barcelona. The different portions of his kingdom in time grew into allodial fiefs, and in 803 Suniaria II. became the first hereditary count of Roussillon. But his rule only extended over the eastern part of what became the later province. The western part, or Cerdagne, was ruled in 900 by Miron as first count, and one of his grandsons, Bernard, was the first hereditary count of the middle portion, or Bésalu. In 1111 Raymond-Bérenger III., count of Barcelona, inherited the fief of Bésalu, to which was added in 1117 that of Cerdagne; and in 1172 his grandson, Alfonso II., king of Aragon, united Roussillon to his other states on the death of the last count, Gerard II. The counts of Roussillon, Cerdagne and Bésalu were not sufficiently powerful to indulge in any wars of ambition. Their energies had been devoted to furthering the welfare of their people. Under the Aragonese monarchs the progress of the united province still continued, and Collioure, the port of Perpignan, became a centre of Mediterranean trade. But the country was destined to pay the penalty of its position on the frontiers of France and Spain in the long struggle for ascendancy between these two powers. By the treaty of Corbeil (1258) Louis IX. surrendered the sovereignty of Roussillon and the ancient countship of Barcelona to Aragon, and from that time until the 17th century the province ceased to belong to France. James I. of Aragon had wrested the Balearic Isles from the Moors and left them with Roussillon to his son James (1276), with the title of king of Majorca. The consequent disputes of this monarch with his brother Pedro III. of Aragon were not lost sight of by Philip III. of France in his quarrel with the latter about the crown of the Two Sicilies. Philip espoused James's cause and led his army into Spain, but retreating died at Perpignan in 1285. James then became reconciled to his brother, and in 1311 was succeeded by his son Sancho, who founded the cathedral of Perpignan shortly before his death in 1324. His successor James II. refused to do homage to Philip VI. of France for the signiory of Montpellier, and applied to Pedro IV. of Aragon for aid. Pedro not only refused it, but on various pretexts declared war against him, and seized Majorca and Roussillon in 1344. The province was now again united to Aragon, and enjoyed peace

until 1462. In this year the disputes between John II. and his son about the crown of Navarre gave Louis XI. of France an excuse to support John against his subjects, who had risen in revolt. Louis turned traitor, and the province having been pawned to him for 300,000 crowns, was occupied by the French troops until 1493, when Charles VIII. restored it to Ferdinand and Isabella. During the war between France and Spain (1496-98) the people suffered equally from the Spanish garrisons and the French invaders. But dislike of the Spaniards was soon effaced in the pride of sharing in the glory of Charles V., and in 1542, when Perpignan was besieged by the dauphin, the Roussillonais remained true to their allegiance. Afterwards the decay of Spain was France's opportunity, and on the revolt of the Catalans against the Castilians in 1641, Louis XIII. espoused the cause of the former, and the treaty of the Pyrenees in 1659 secured Roussillon to the French crown.

See also the publications of the *Société agricole, scientifique et littéraire des Pyrénées Orientales* (1834 fol.).

**ROUTE, EDWARD JOHN** (1831-1907), English mathematician, was born at Quebec on the 20th of January 1831. At the age of eleven he came to England, and after studying under A. de Morgan at University College, London, entered Peterhouse, Cambridge, in 1851. In the mathematical tripos three years later he was senior wrangler, beating J. Clerk Maxwell, who, however, tied with him for the Smith's prize. Elected a fellow of his college, he devoted himself to teaching, and quickly proved himself one of the most successful mathematical "coaches" ever known at Cambridge. In thirty years, of some 700 pupils who passed through his hands 500 became wranglers; and for twenty-two successive years, from 1861 to 1882, the senior wrangler was trained by him. He made considerable contributions to scientific literature, and among his publications were: *An Analytical View of Newton's Principia*, with Lord Brougham (1855); *An Essay on the Stability of a given State of Motion*, which won the Adams' prize in 1877; and treatises on the *Dynamics of Rigid Bodies*, on *Analytical Statics*, and on the *Dynamics of a Particle*. He died at Cambridge on the 7th of June 1907.

**ROUTE, MARTIN JOSEPH** (1755-1854), English classical scholar, was born at South Elmham, Suffolk, on the 18th of September 1755. He was educated at Queen's College, Oxford, and subsequently elected to a fellowship at Magdalen, of which society he became president in 1791. He died at Oxford on the 22nd of December 1854, and retained his physical and intellectual powers to the last. He was the author of editions of the *Euthydemus* and *Gorgias* of Plato (1784), to which Dindorf declared himself indebted for his first ideas of Greek criticism, and of Bishop Burnet's *History of his Own Time* (2nd ed., 1833) and *History of the Reign of King James the Second* (1852). Routh was also an authority on patristic literature; his *Reliquiæ Sacrae* (2nd ed., 1846-48), a collection of the fragments of the Fathers of the 2nd and 3rd centuries, and *Scriptorum ecclesiasticorum opuscula præcipua quaedam* (2nd ed., 1840) being valuable contributions to ecclesiastical knowledge.

See *Gentleman's Magazine*, 1855; J. W. Burgon, *Lives of Twelve Good Men* (1888).

**ROUTLEDGE, GEORGE** (1812-1888), English publisher, was born at Brampton in Cumberland on the 23rd of September 1812. He gained his earliest experience of business with a bookseller at Carlisle. Proceeding to London in 1833, he started in business for himself as a bookseller in 1836, and as a publisher in 1843, making his first serious success by reprinting the Biblical commentaries of an American writer, Albert Barnes. His fame as a publisher, however, rests chiefly upon the enormous number of cheap books which he issued. A series of shilling volumes called the "Railway Library" was an immense success, including as it did Mrs Harriet Beecher Stowe's *Uncle Tom's Cabin*, and also published in popular

form some of the writings of Washington Irving, Fenimore Cooper, Bulwer Lytton and Benjamin Disraeli. He also brought out a number of shilling books in "Routledge's Universal Library." Routledge died in London on the 13th of December 1888. After being styled Routledge, Warne & Routledge, his firm changed its name to that of George Routledge & Sons. A branch of the business was established in New York in 1854.

**ROUVIER, MAURICE** (1842- ), French statesman, was born at Aix on the 17th of April 1842, and spent the early years of his manhood in business at Marseilles. He supported Gambetta's candidature there in 1867, and in 1870 he founded an anti-imperial journal, *L'Égalité*. Becoming secretary general of the prefecture of Bouches-du-Rhône in 1870-71, he refused the office of prefect. In July 1871 he was returned to the National Assembly for Marseilles at a by-election, and voted steadily with the Republican party. He became a recognized authority on finance, and repeatedly served on the Budget Commission as reporter or president. At the general elections of 1881 after the fall of the Ferry cabinet he was returned to the chamber on a programme which included the separation of Church and State, a policy of decentralization, and the imposition of an income-tax. He then joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883-85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on the 31st of May 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of General Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in which President Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell in the attempt to screen the president. Rouvier's opposition in his capacity of president of the Budget Commission was one of the causes of the defeat of the Floquet cabinet in February 1889. In the new Tirard ministry formed to combat the Boulangist agitation he was minister of finance. This portfolio he retained consecutively in the Freycinet, the Loubet and the Ribot cabinets, 1890-93. His relations with Cornélius Herz and the baron de Reinach compelled his retirement, however, from the Ribot cabinet at the time of the Panama scandals in December 1892. Again, in 1902, he became minister of finance, after nearly ten years in exclusion from office, in the Radical cabinet of M. Combes; and on the fall of the Combes ministry in January 1905 he was invited by the president to form a new ministry. In this cabinet he at first held the ministry of finance. In his initial declaration to the chamber the new premier had declared his intention of continuing the policy of the late cabinet, pledging the new ministry to a policy of conciliation, to the consideration of old age pensions, an income-tax, separation of Church and State. Public attention, however, was chiefly concentrated on foreign policy. During the Combes ministry M. Delcassé had come to a secret understanding with Spain on the Moroccan question, and had established an understanding with England. His policy had aroused German jealousy, which became evident in the asperity with which the queen of Morocco was handled in Berlin. At a cabinet meeting on June 5th it is said that M. Rouvier reproached the Foreign Minister with imprudence in the matter of Morocco, and after a heated discussion M. Delcassé gave in his resignation. M. Rouvier himself took the portfolio of foreign affairs at this anxious juncture. He, after critical negotiations, secured on July 8th an agreement with Germany accepting the international conference proposed by the sultan of Morocco on the assurance that Germany would recognize the special nature of the interest of France in maintaining order on the frontier of her Algerian empire. Lengthy discussions resulted in a new convention in September, which contained the programme of the proposed conference, and in December M. Rouvier was able to make a statement of the whole proceedings in the chamber, which received the assent of all parties. M. Rouvier's government did not long survive the presidential election of 1906. The disturbances arising

in connexion with the Separation Law were skilfully handled by M. Clemenceau to discredit the ministry, which gave place to a cabinet under the direction of M. Sarrien.

**ROVERETO**, the most important industrial town in the southern or Italian-speaking portion of the Austrian province of Tirol, though its population (which in 1900 was 10,180, Italian-speaking and Romanist) is less than that of Trent. It is also the principal town of the administrative district of Rovereto. Built on the left bank of the Adige, in the widest portion of the Val Lagarina (the name given to the Adige valley from Acquaviva, above Rovereto, to the Italian frontier), it is divided into two parts by the Leno torrent. It is on the Brenner railway, by which it is 15 m. S.W. of Trent and 41½ m. N. of Verona. Save in the newer quarter of the town, the streets are narrow and crooked, several being named after the most distinguished native of the place, Antonio Rosmini-Serbatì (q.v.). The finest church is that of Santa Maria del Carmine, the old 14th-century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 15th century. The town is dominated by the castle (now used as barracks), which was reconstructed in 1402 by the Venetians, after it had been burnt in 1487 by the count of Tirol. The staple silk industry (which dates from the 16th century) has declined, the number both of *filande* (establishments wherein the cocoons are unwound) and of *filatoje* (those wherein the silk is spun) having diminished.

In 1132 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. Towards the middle of the 13th century that family obtained by marriage the lands of the Lizzana family (whose castle rises S. of the town), and in 1300 practically founded the town and surrounded it with walls. In 1416 it was taken by the Venetians, who in 1487 successfully resisted, at Calliano, an attempt to take it made by the count of Tirol and the bishop of Trent. In 1509, at the outset of the war of the League of Cambray, the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol. South of Rovereto is the village of Marco, near which are certain natural remains (either those of a landslip that occurred in 883, or of a glacier moraine) believed to have been described by Dante (*Inf.* xii. 4-9), who is said to have spent part of the year 1304, during his exile from Florence, in the castle of Lizzana, between Marco and Rovereto. (W. A. B. C.)

**ROVIGNO**, a seaport of Austria, in Istria, 75 m. S. of Trieste by rail. Pop. (1900) 10,205, mostly Italian. It is situated on the west coast of Istria, and possesses an interesting cathedral, built on the summit of the promontory Monte di Sant' Eufemia. Its campanile, built after the model of the famous campanile in Venice, is crowned with a bronze statue of St Eufemia, the patron saint of the town, whose remains are preserved in the church. It contains a station of the Berlin Aquarium, with a fine collection of the fauna of the Adriatic Sea. In the neighbourhood are vineyards, which produce the best wine in Istria, and olive gardens, while its hazel-nuts are reputed the finest in the world. Rovigno is the principal centre of the Austrian tunny and sardine fishery. The industries, in addition to ship-building and the preservation of fish, include the manufacture of tobacco, cement, macaroni and similar preparations, and flour. There is an active export trade. Its inhabitants are renowned seamen. Rovigno is the ancient *Arupenum* or *Rubinum*, and according to tradition it was originally built on an island, Cissa by name, which disappeared during the earthquakes about 737. Rovigno passed definitively into the hands of the Venetians in 1330, and it remained true to the republic till the treaty of Campo Formio (1797).

**ROVIGO**, a town of Venetia, Italy, capital of the province of Rovigo. It stands on the low ground between the lower Adige and the lower Po, 50 m. by rail S.W. of Venice and 27 m. S.S.W. of Padua, and on the Adigetico Canal, 17 ft. above sea-level. Pop. (1901) 6038 (town); 10,735 (commune). It is a station

on the line between Bologna and Padua, with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Venetian and of Ferrarese influence. The cathedral church of Santo Stefano (1696) is of less interest than La Madonna del Soccorso, an octagon with a fine campanile, begun in 1504 by Francesco Zamberlano of Bassano, a pupil of Palladio. The town hall contains a library including some rare early editions, belonging to the Accademia de' Concordi, founded in 1580, and a fair picture gallery enriched with the spoils of the monasteries. The Palazzo Roncali is a fine Renaissance building by Saumicheli (1555). Two towers of its medieval castle remain. Wool, silk, linen and leather are among the local manufactures.

Rovigo (Neo-Latin *Rhodigium*) appears to be mentioned as Rodigo in 838. It was selected as his residence by the bishop of Adria on the destruction of his city by the Huns. From the 11th to the 14th century the Este family was usually in authority; but the Venetians took the place by siege in 1482 and retained possession of it by the peace of 1484, and though the Este more than once recovered it, the Venetians, returning in 1514, retained possession till the French Revolution. In 1806 the city was made a duchy in favour of General Savary. The Austrians in 1815 created it a royal city. (T. As.)

**ROVUMA**, a river in East Africa, forming during the greater part of its course the boundary between German and Portuguese territory. The lower Rovuma is formed by the junction in 11° 25' S., 38° 31' E. of two branches of nearly equal importance, the longer of which, the Lujenda, comes from the south-west, the other, which still bears the name Rovuma, from the west. Its source lies on an undulating plateau, 3000 ft. high, immediately to the east of Lake Nyasa, in 10° 45' S., 35° 40' E., the head-stream flowing first due west before turning south and east. In its eastward course the Rovuma flows near the base of the escarpment of an arid sandstone plateau to the north, from which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Msinje and Luchulingo, flowing in broad valleys running from south to north. The Lujenda rises in close proximity to Lake Chilwa, in the small Lake Chiuta (1700 ft.), the swamps to the south of this being separated from Chilwa only by a narrow wooded ridge. The stream which issues from Chiuta passes by a swampy valley into the narrow Lake Amaramba, from which the Lujenda finally issues as a stream 80 yds. wide. Lower down it varies greatly in width, containing in many parts low wooded islands which rise above the flood level, and are often inhabited. The river is fordable in many places in the dry season. At its mouth it is about a mile wide. The lower Rovuma, which is often half a mile wide but generally shallow, flows through a swampy valley flanked by plateau escarpments containing several small backwaters of the river. The mouth, which lies in 10° 28' S., 40° 30' E., is entirely in German territory, the boundary near the coast being formed by the parallel of 10° 40'. The length of the Rovuma is about 500 m.

**ROW, JOHN** (c. 1525-1580), Scottish reformer, was born near Stirling and educated in that town and at St Andrews, where he began to practise as an advocate in the consistorial court. In 1550 he was sent to Rome in the interests of John Hamilton, archbishop of St Andrews, and attracted the notice of the highest authorities, who, when his failing health drove him back to Scotland in 1558, nominated him papal nuncio to inquire into the spread of heresy in that country. That inquiry ultimately led him to change his faith. Much influenced by Knox's preaching, he joined the reformers and in April 1560 was admitted minister of Kennoway in Fife, and in July of the same year minister of the Old or Middle Church at Perth. He was one of the commission of six who drew up the "Confession of Faith" and the "First Book of Discipline," and during the struggle with Queen Mary was often employed on important engagements. He was moderator of the Church Assembly at Edinburgh in July 1567 and at Perth in the follow-

ing December, and again in Edinburgh 1576 and Stirling 1578. Meanwhile he helped to compile the "Second Book of Discipline," and became more than ever opposed to the Episcopal system of church government. He was a considerable scholar and is said to have been the first to teach Hebrew in Scotland. He died at Perth on the 16th of October 1580.

His son **JOHN ROW** (1568-1646), minister of Carnock, wrote a *Historie of the Kirke of Scotland 1558 to 1637*, which was continued to 1639 by his son, the third John Row (c. 1598-c. 1672), rector of the Perth grammar school and then (appointed by Cromwell) principal of King's College, Aberdeen, who, with his father and grandfather was a famous Hebraist, but left the Church of Scotland to become an Independent minister. This *Historie* was published by the Wodrow Society and by the Maitland Club in 1842.

**ROWE, NICHOLAS** (1674-1718), English dramatist and miscellaneous writer, son of John Rowe (d. 1692), barrister and serjeant-at-law, was baptized at Little Barford in Bedfordshire on the 30th of June 1674. Nicholas Rowe was educated at Westminster School under Dr Busby. He became in 1688 a King's Scholar, and entered the Middle Temple in 1691. On his father's death he became the master of an independent fortune. His first play, *The Ambitious Step-mother*, the scene of which is laid in Persepolis, was produced in 1700, and was followed in 1702 by *Tamerlane*. In this play the conqueror represented William III., and Louis XIV. is denounced as Bajazet. It was for many years regularly acted on the anniversary of William's landing at Torbay. *The Fair Penitent* (1703), an adaptation of Massinger and Field's *Fatal Dowry*, was pronounced by Dr Johnson to be one of the most pleasing tragedies in the language. In it occurs the famous character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. In 1704 Rowe tried his hand at comedy, producing *The Biter* at Lincoln's Inn Fields. The play is said to have amused no one except the author, and Rowe returned to tragedy in *Ulysses* (1706). *The Royal Convert* (1707) dealt with the persecutions endured by Aribert, son of Hengist and the Christian maiden Ethelinda. *The Tragedy of Jane Shore*, which was played at Drury Lane with Mrs Oldfield in the rôle in 1714, ran for nineteen nights, and kept the stage longer than any of his other works. *The Tragedy of Lady Jane Grey* followed in 1715. Rowe's friendship with Pope, who speaks affectionately of his vivacity and gaiety of disposition, led to attacks inspired by the publisher Edmund Curll, the best known of these being *The New Rehearsal, or Bays the Younger, containing an Examen of Seven of Rowe's Plays*, by Charles Gildon. Rowe acted as under-secretary (1709-11) to the duke of Queensberry when he was principal secretary of state for Scotland. On the accession of George I. he was made a surveyor of customs, and in 1715 he succeeded Nahum Tate as poet laureate. He was also appointed clerk of the council to the prince of Wales, and in 1718 was nominated by Lord Chancellor Parker as clerk of the presentations in Chancery. He died on the 6th of December 1718, and was buried in Westminster Abbey. He was twice married, and his widow received a pension from George I. in 1719 in recognition of her husband's translation of Lucan. This verse translation, or rather paraphrase of the *Pharsalia*, was called by Samuel Johnson "one of the greatest productions in English poetry," and was widely read, running through eight editions between 1718 and 1807.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vols., 1709) on the corrupt Fourth Folio, a course in which he was followed by later editors. We owe to him the preservation of a number of Shakespearean traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the *Works*. Moreover, his practical knowledge of the stage suggested technical improvements. He divided the play into acts and scenes on a reasonable method.

noted the entrances and exits of the players, and prefixed a list of the *dramatis personae* to each play. Rowe wrote occasional verses addressed to Godolphin and Halifax, adapted some of the odes of Horace to fit contemporary events, and translated the *Caracites* of La Bruyère and the *Callipædia* of C. Quillet. He also wrote a memoir of Boileau prefixed to a translation of the *Lutrin*.

Rowe's Works were printed in 1727, and in 1736, 1747, 1756, 1766 and 1792; his occasional poems are included in Anderson's and other collections of the British poets.

**ROWEL** (from O. Fr. *rouel* or *roel*, dim. of *roue*, Lat. *rota*, wheel), the name of the small revolving wheel or disk with radiating points forming the termination of a rider's spur. The earliest rowels probably did not revolve but were fixed. They appear on monuments of the 13th century, as in the great seal of Henry III. of England, but the older "prick" spurs remained the standard form till the 14th century (see *SPUR*). In veterinary science, the word is used of a small disk of leather or other material used as a seton.

**ROWING** (O. Eng. *rowan*, to row, cf. Lat. *remans*, Gr. *ῥοωβς*, oar), the act of driving forward or propelling a boat (*q.v.*) along the surface of the water by means of oars.

*History.*—The earliest historical records describe battles and voyages in which the ships were propelled by oars. There must, of course, have been from time to time friendly trials of speed between these ancient craft, such as that described by Virgil in the fifth book of the *Aeneid*, but there is no record in classical or even in medieval times of rowing having been indulged in solely as a recreation, or as a means of promoting athletic contest. The absence of any element of competition is sufficient to account for the fact that the boats, the oars, and the method of rowing of the 17th century differed but little from those of the earliest times.

The history of Great Britain abounds in instances of the use of the oar. The ancient Britons propelled themselves in coracles of wickerwork covered with skins, by means of paddles rather than oars, but the Saxons were expert oarsmen, as also were the Danish and Norwegian invaders. It is recorded by William of Malmesbury that Edgar the Peaceable was rowed in state on the river Dee by eight tributary kings, himself acting as coxswain.

During the 11th and 12th centuries, when roads were often impassable, considerable use was made of the various rivers of England for the transmission of both passengers and merchandise; and, until the introduction of coaches, the nobility and gentry who had mansions and watergates on the banks of the Thames relied almost entirely upon their boats and elaborately fitted barges as a means of conveyance from place to place.

This use of boats and barges as a means of conveyance for merchandise and passengers provided a means of livelihood for a class of professional oarsmen known as bargemen or watermen. They were professionals, not in the sense of professional athletes, but because they made their living by rowing and navigating passenger and other craft along and across the Thames. Watermen as a class are mentioned in history as early as the 13th century. The distress occasioned to them by the long frosts is referred to in the chronicles of that period. They are mentioned as having been employed to row the barons and their retinues to Runnymede for the signing of the Magna Carta by King John, and about the same time several of the city companies established barges for the purposes of processions and other pageants upon the Thames. It is stated by Fabian that in 1454 "Sir John Norman, then lord mayor of London, built a noble barge at his own expense and was rowed by watermen with silver oars, attended by such of the city companies as possessed barges, in a splendid manner." The lord mayor's procession by water to Westminster was annual until 1856, the state barge of the lord mayor being a magnificent species of shallop rowed by watermen, while those of the city companies were propelled by a double bank of oars in the fore half, the after part consisting

of a cabin which somewhat resembled that of a gondola. In 1514 and in 1555 acts of parliament were passed for the regulation of watermen and their boats and fares upon the Thames (7 Henry VIII. cap. vii. and 2 and 3 Ph. & Mar. cap. xvi.), and from the terms of these statutes there can be no doubt that there were in the 15th century a considerable body of men who lived by the "trade of Rowing" as it is there called. During the 16th and 17th centuries there were no doubt competitions from time to time between these watermen, but the first actual mention of boat-racing is the record of the establishment in 1715 of Doggett's Coat and Badge. Mr Thomas Doggett, who may fairly be described as the founder of modern boat-racing, was a celebrated comedian. He established a fund to provide an annual prize of a waterman's coat with a large silver badge on the arm. The race was founded in honour of the house of Hanover and to commemorate the anniversary of "King George I.'s happy accession to the throne of Great Britain." The contest was to take place at the beginning of August and on the Thames between six young watermen who were not to have exceeded the time of their apprenticeship by more than twelve months. Although the first race took place in 1715 the names of the winners have only been preserved since 1791. Doggett's Coat and Badge is still an annual event, the conditions as to boats to be used and other details having been slightly modified. It is entirely controlled and managed by the Fishmongers' Company.

The first English regatta (Ital. *regata*)—an entertainment introduced, as the *Annual Register* records, from Venice—of which we have evidence, took place on the Thames off Ranelagh Gardens in 1775. Great public interest seems to have been taken in the spectacular aspect of this pageant, the barges of the lord mayor and the city companies being present, but there is no record of the competing wagers boats or of the names of the watermen who took part in the races.

About the years 1800 to 1810 there are instances of matches between watermen for stakes presented by gentlemen who no doubt made wagers upon the result, and from these professional wager matches it was but a short step to sporting matches between the gentlemen themselves. When once the "gentleman amateur," as he was called, appeared, his evolution, from the sportsman who occasionally rowed a match against a friend, or against time, for a wager, to the amateur oarsman of the present day, was not slow. The amateur rowing which began about the year 1800 on the Thames at Westminster has flourished as a branch of athletic sport, and has spread to every quarter of the globe.

*Rowing in the United Kingdom.*—The earliest rowing clubs in England were small groups of oarsmen who combined to purchase a six-oared or eight-oared boat for the purpose of racing. The club was called by the same name as the ship it possessed, and at the commencement of the 19th century the principal clubs in existence upon the Thames were the "Star," the "Arrow," the "Shark" and the "Siren." The two latter have long since disappeared, but the "Star" and the "Arrow" combined about the year 1818 and founded the Leander Club, an institution which after varying fortunes has for many years been recognized as the premier rowing club of the world.

The earliest contemporary record of boat-racing is the Water Ledger of Westminster School, which commences in the year 1813 with a list of the crew of the six-oared boat "Fly." In 1811 Eton had a ten-oared boat and three boats with eight oars, but there is no existing record of a race until 1817. In 1818 Eton challenged Westminster School to row from Westminster to Kew Bridge against the tide; but the race was stopped by the authorities, and it was not until 1829 that the first contest between the two schools took place. Between 1829 and 1847 there were eight matches between Eton and Westminster. The race was revived for a few years in the sixties, and in the year 1868 the state of the lower tideway was such that the Westminster boys moved their boathouse first to Wandsworth and then to Putney. This arrangement was found to be inconvenient, and shortly afterwards Westminster rowing came to an

end. Eton rowing, on the other hand, has continued to prosper, and for many years it has been the greatest "nursery" of first-class oarsmen. Since 1861 the Eton College Boat Club has never failed to enter a crew at Henley Regatta.

At Oxford the records of periodical races between college boats begin as early as 1815, and those of Cambridge a few years later. The first contest between eight-oared crews representing the two universities took place at Henley-on-Thames in June 1829. The second contest was not until 1836, and was rowed from Westminster to Putney. In 1837 and 1838 the universities were unable to make a match, and in each of those years a race was rowed between Cambridge and the Leander Club, which had thus early become the premier club of the tideway. It was not always easy in the early days of boat-racing for the university boat clubs to agree as to the conditions and time of the match, but on several occasions when the universities had been unable to meet on the tideway they fought their battle whilst competing for the Grand Challenge Cup at Henley Regatta. Since 1856 the Oxford and Cambridge boat race has been an annual event. It is rowed about a week or ten days before Easter from Putney to Mortlake over what is known as the championship course, a distance of 4½ m. The race is rowed with the flood-tide, and occupies as a rule a time varying between 19 and 22 min. The time occupied by a crew in covering this course depends a great deal more upon the conditions of wind and tide than upon the excellence, or the reverse, of the crew. The crew of each university is selected by a president, usually one of the senior members of the last crew, who is elected at the first meeting in the summer term and holds office for a year. Thus the university race comes at the end of his term of office, and he has every opportunity during the summer and autumn of studying the material which will be at his disposal for the formation of a crew in the ensuing spring. The aquatic arrangements at the two universities are very much alike. The university year begins in October. During the winter term the freshmen are instructed in the elements of rowing, while the senior men are engaged in practising for the University (inter-collegiate) Fours, a race which takes place early in November. During the latter portion of the term the president of the University Boat Club is engaged in selecting and coaching the trial eights, two picked crews comprising the bulk of the material available for the formation of the university crew. The trial eight races are rowed in the beginning of December, that of Cambridge on the Ouse at Ely, and that of Oxford on the Thames at Moulsoford, neither the Cam nor the Isis being wide enough for two crews to race abreast. During the whole of the Easter term the university crews are engaged in practice and training for the University Boat Race. The attention of the remainder of the rowing men at the universities is devoted to training for the bumping races known at Oxford and Cambridge respectively as the *Torpids* and *Leander Races*. Each college is represented in these races, and no oarsman who has rowed in the first boat of his college during the previous summer is qualified to compete. The boats start at fixed distances apart, and each boat endeavours to bump the boat in front of it, and to avoid being bumped by the boat behind. When a bump is effected, the two boats involved draw to the side, and the next night the successful boat starts in front of its victim. Each spring the boats start in the order in which they finished the previous year. The races last for six nights at Oxford and four at Cambridge. In the summer term the important bumping races between the best crews of each college take place. They are known as "The Eights" at Oxford and "The May Races" at Cambridge. To attain the position of "Head of the River" in these races is the summit of a college boat club's ambition.

The great arena of rowing contests is Henley Royal Regatta. It was founded in 1830 at a public meeting held in the town hall at Henley-on-Thames, at which it was decided to raise a subscription and purchase two challenge cups, the Grand Challenge Cup to be rowed for annually in eight-oared boats open to all amateur crews, and the Town Challenge Cup for

four-oared crews residing within 5 m. of Henley. The first regatta was held on the 14th of June 1830, and was a most successful affair, the Grand Challenge Cup being won by the Trinity Boat Club, Cambridge. In 1840 another district race was added, and in 1841 the Stewards Challenge Cup for four oars was added to the programme, open to competition upon the same conditions as the Grand Challenge Cup. There have now for many years been eight events at the regatta, four of which are open to all amateurs, viz. the Grand Challenge Cup for eight oars, the Stewards Challenge Cup for fours, the Silver Goblets for pair oars founded in 1845, and the Diamond Sculls for single scullers founded in 1844. The races for which the entry is restricted are the Ladies Challenge Plate for eight oars (founded 1845) and the Visitors Challenge Cup for four oars (founded 1847), which are open to crews from schools and colleges in the United Kingdom; also the Thames Challenge Cup for eight oars (founded 1868) and Wyfold Challenge Cup for four oars (founded 1855). The rule as to entry for the Thames Cup is that no one who has won the Grand Challenge or Stewards Cup may compete, nor may any one enter for this race and for the Grand or Stewards Cups in the same year. The rule for the Wyfold Cup is the same, except that a competitor may also enter for the Grand Challenge Cup.

The original regatta course was from the upper end of the Temple Island to Henley Bridge, but a change was made in 1886 so as to avoid the corner at the finish. The races now start at the lower end of the island and finish at the upper end of the grounds of Phyllis Court. The course is 1 m. 550 yds. in length and about 110 ft. in width. The races are rowed against the stream, and the time usually occupied by the winning crew of the Grand Challenge Cup is within a few seconds of 7 min. In 1843 took place the famous "seven-oar" victory of Oxford. At the eleventh hour one of the Oxford crew was incapacitated by illness. Their opponents, the Cambridge Subscription Rooms Club, refused to allow them to introduce a substitute, and the Oxford men gained undying fame by winning the Grand Challenge Cup with seven oars. Ten years later (1853) there was a magnificent race between Oxford and Cambridge in the Grand Challenge Cup, the former winning by 18 in. only. In 1862 there was a dead heat in the final heat of the Diamond Sculls between Mr E. D. Brickwood and Mr W. B. Woodgate. In 1878 occurred the memorable contest between Mr T. C. Edwards-Moss and Mr G. W. Lee (U.S.A.) in a heat for the Diamond Sculls which was won on the post by the former. In 1891 the Leander Club, after a dead heat with the Thames R.C., began a series of victories in the Grand Challenge Cup, winning the cup on seven occasions in the next ten years. In 1892 the Diamond Sculls left England for the first time, having been won by Mr J. J. K. Ooms of Holland. In 1895 a crew representing Cornell University, U.S.A., entered for the Grand Challenge Cup and were drawn in their heat against the Leander Club. Owing to a misunderstanding between the starter and the Leander crew, the latter failed to start, and the Cornell crew rowed on to the finish without offering to return to the start, a proceeding which caused no little comment at the time. On the following day they were defeated by Trinity Hall, Cambridge, the ultimate winners. In 1897 the Grand Challenge Cup was won by 2 ft. by New College, Oxford, in the record time of 6 min. 51 secs. after a desperate race with Leander. The feature of the next ten years was the persistency with which colonial and foreign crews endeavoured to carry off the principal prizes of the regatta, and the invasion culminated in 1906 by the capture of the Grand Challenge Cup by a crew from the Club Nautique de Gand, Belgium. On this occasion the Leander Club was not represented, but in 1907 the Belgians repeated their victory after defeating a strong Leander crew in one of the heats. In 1903 Mr Herbert Steward, the chairman of the regatta committee, published a detailed record of the regatta from its commencement, which gives a complete history of the meeting and an account of every race.

Henley regatta is rowed "in accordance with" the rules of

the Amateur Rowing Association, a body which has control of all other amateur rowing in England. The Henley Stewards and the Amateur Rowing Association (or A.R.A.) are in complete harmony. Their rules are identically the same, but the Stewards being the older body are not subject to the A.R.A., and in the improbable event of a difference occurring they would be entitled to act independently. The A.R.A. was formed in 1882 for the purpose of drawing up a definition of an "amateur," and for the purpose of having a body who could if necessary select a national representative crew to meet any foreign or colonial invaders. It has long since dropped the latter portion of its original programme, and the A.R.A. as at present constituted is an association to which all the principal amateur boat clubs are affiliated. Its objects are to maintain the standard of amateur oarsmanship and to promote the interests of boat racing. It is governed by a committee which occupies in the British rowing world a position not unlike that of the stewards of the Jockey Club in racing matters. The constitution and objects of the A.R.A. are clearly defined in the rules, and their definition of an amateur is so much stricter than that of some other countries that it is advisable to set it out *in extenso*. It is as follows:—

No person shall be considered an amateur oarsman, sculler or coxswain—

- (1) Who has ever rowed or steered in any race for a stake, money or entrance fee;
- (2) Who has ever knowingly rowed or steered with or against a professional for any prize;
- (3) Who has ever taught, pursued or assisted in the practice of athletic exercises of any kind for profit;
- (4) Who has ever been employed in or about boats or in manual labour for money or wages;
- (5) Who is or has been by trade or employment for wages a mechanic, artisan or labourer, or engaged in any menial duty;
- (6) Who is disqualified as an amateur in any other branch of sport.

The rules of the A.R.A. also comprise the "Laws of Boat Racing," which govern the race from start to finish; and the "Rules for Regattas," which deal with a large number of matters such as the definition of the different classes of oarsmen, seniors, juniors and maidens, the making of entries, the powers of regatta committees, &c.

A large number of regattas are held under these rules in all parts of the country during the summer months. There are also several matches and other competitions rowed under special rules, the most important of these being the Wingfield Sculls (founded 1830), or amateur championship of the Thames, rowed in the month of July over the championship course from Putney to Mortlake (4½ m.).

If the number of entries at Henley Regatta, the extension of the sphere of influence of the A.R.A. and the public interest in the Oxford and Cambridge Boat Race, may be taken as tests, rowing has more than held its own among the various competing forms of recreation in the world of British amateur athletic sport.

*Rowing in the United States.*—The earliest record of a boat race in the United States is that of a contest in light barges in the year 1811 between the "Knicker-bocker" of New York and the "Invincible" of Long Island, in which the former was successful. The evolution from racing in heavy pleasure boats to racing in specially constructed craft proceeded with great rapidity, and by the year 1834 a large number of small clubs in New York had combined, under the title of the Castle Garden Boat Club Association. In 1837 the first regatta took place at Poughkeepsie, the race being between "six-oars" for a prize of \$200. In those days there was no real distinction in America between amateur and professional, and in spite of rules and definitions the distinction between one who is qualified as an amateur and one who is not has remained in America much less certain and precise than in the United Kingdom.

Yale and Harvard Universities became centres of aquatic energy very early in the history of American rowing. The first racing boat at Yale, a six-oar, was bought in 1844, and in the following spring Harvard purchased an eight, and in 1852

a race was rowed between a Harvard crew and three Yale crews at Lake Winnepesaukee, which resulted in a victory for the former. In 1850 Harvard again defeated Yale in a six-oared race, but on the following day at Worcester City Regatta the same crews entered for a prize and Yale defeated Harvard. In 1864 at a college regatta Yale defeated Harvard, but in 1866 Harvard with a very fine crew showed their superiority over all the other colleges. In 1869 Harvard sent a challenge to Oxford and Cambridge to row a four-oared match on the Thames from Putney to Mortlake. It was accepted by the former and the race was rowed on the 27th of August. The race aroused great public interest, and the banks of the river were crowded from end to end of the course. The crews were: *Oxford*, F. Willan (bow), A. C. Yarborough, J. C. Tinné and S. Darbishire (stroke); *Harvard*, J. S. Fay (bow), E. G. Lyman, W. H. Simmons and A. P. Loring (stroke). Harvard led at first, but Oxford eventually rowed them down and won by three lengths.

The trip of the Harvard four to England aroused the rowing enthusiasm of other American universities such as Princeton, Cornell, Columbia and Pennsylvania, and during the next ten years considerable improvement was shown in American rowing. In 1875 no fewer than thirteen university or college crews competed in a race, in which Cornell finished first, Columbia second and Harvard third, the ships used being six-oars without coxswains. In 1876 the eight-oared match over a four-mile course between Harvard and Yale was instituted, and in 1878 a four from Columbia University went to Henley and won the Visitors Challenge Cup. In 1879 and 1880 there were a very large number of inter-collegiate matches and regattas, in several of which Columbia maintained the reputation which they had gained at Henley. In 1881 a Cornell four started at Henley for the Stewards Cup, but were easily beaten. During the next few years there was considerable difference of opinion between universities as to the correct style of stroke, and in 1882 a Yale crew, coached by Mr Davis, did some fine performances, rowing a very fast short stroke in a very long boat. They were, however, eventually beaten by Harvard after an exciting race, in which it is only fair to them to record that the erratic steering of their coxswain contributed in no small degree to their defeat. The next year, 1883, Yale tried an even faster and shorter stroke, but were easily beaten by Harvard, who rowed with great length and steadiness. This year saw the end of the very fast short stroke, and although the "strokes" of the various crews since that day have differed in minor degrees, they settled down to a longer steadier method of rowing which is spoken of in England as the "American style." It differs from that adopted by English oarsmen in that there is an absence of swing and body work, and in that the oarsmen appear to rely almost entirely upon their long slides and hard leg work. In the early "inetics" Cornell was almost always successful at home, and in 1895 they entered for the Grand Challenge Cup at Henley. Owing to a misunderstanding at the start the Leander crew were left at the post in the first heat, but on the next day Cornell suffered defeat at the hands of Trinity Hall. In 1896 Yale entered at Henley under the tuition of Cook, but were somewhat easily beaten by Leander. The result of these two expeditions to Henley was an attempt to introduce the English style of rowing in America. The experiment was not altogether successful. Mr R. C. Lehmann, who had met with considerable success in England as a coach both at Oxford and Cambridge, went to Harvard for two seasons. The attempt to instruct the American oarsmen in the English methods of swing and body work, instead of the American stroke, resulted in their falling short of perfection in either style, and they were beaten by Yale upon each occasion. Mr Lehmann's visit, if it failed to give pace to the crews he coached, resulted, however, in improving the whole spirit of American college rowing. Mutual confidence and friendly rivalry took the place of the atmosphere of suspicion and almost of enmity which had at times existed between Harvard and Yale. In 1895 an Inter-collegiate Rowing Association was formed by

Cornell, Columbia and Pennsylvania to organise contests at Poughkeepsie open to all colleges. In 1899 and 1900 Pennsylvania won, in 1902, 1904 and 1908 Syracuse, and in most other years Cornell. The two annual inter-collegiate regattas are the Harvard-Yale at New London, and that at Poughkeepsie, open to all but not participated in by Harvard and Yale. By way of exception, Harvard rowed at Poughkeepsie in 1896, and in 1897 and 1898 Cornell rowed in two regattas. In 1901 Pennsylvania was just beaten by Leander Club in the race for the Grand Challenge Cup at Henley.

The history of amateur rowing in the United States, other than that of the colleges and universities, is a narrative of continual struggles on the part of the authorities to distinguish between the amateur and the non-amateur. The National Association of Amateur Oarsmen was established in 1872. Many regattas have been held since that date under their rules, but the standard of amateurism which satisfied the N.A.A.O. has never been strict enough to comply with the requirements of the English A.R.A. or the Henley Stewards. In 1883 a Hillsdale four from U.S.A. tendered an entry at Henley, but it was refused by the Stewards, on the ground that the men were not amateurs according to the English definition. In subsequent years several American scullers entered for the Diamond Sculls, and in 1897 they were won by E. H. Ten-Eyck of Wachusett Boat Club, Worcester, U.S.A. In 1898 Ten-Eyck's entry was refused by the Henley Stewards. No little resentment has been caused in America by the reluctance of the English authorities to accept American entries, but their justification lies in the essential difference, not only in letter but in spirit, between the laws and customs of the two countries with regard to the amateur status and amateur sport. In 1904 a crew of the Vesper B.C. of Philadelphia were duly vouched by the N.A.A.O. and their entry accepted by the Henley Stewards. They competed and were beaten, and it afterwards became known that not only had several of the men made money out of the trip, but that two or three of the oarsmen were not qualified to row at Henley. It also appeared that certain members of the N.A.A.O. had, to say the least of it, been extremely careless in giving assurances as to the status of the Vesper crew, and all relations between the N.A.A.O. and the Henley Stewards were abruptly terminated, the Stewards determining that they would not accept foreign entries except from a country where there was a governing body which had control of amateur rowing and which had an agreement with the Stewards by which they definitely pledged themselves not to send competitors to Henley unless they came within the English definition. In 1906 Harvard challenged Cambridge. The race, which attracted an immense concourse of spectators, was rowed from Putney to Mortlake in September. Cambridge led from the start and won by three lengths.

*Rowing in other Countries.*—During the latter years of the 19th century and during the early years of the present century, rowing increased very greatly in popularity as a branch of athletic sport in every quarter of the globe. It would be impossible here to describe the history or organization of boat clubs and regattas in Australia, in Canada, and in the various countries of Europe. Canadian rowing has always been of a high class. In 1904 L. Scholes, a Canadian sculler, won the Diamond Sculls at Henley, and on several occasions Canadian eights and fours have competed for the Grand Challenge and Stewards Challenge Cups at Henley. In Australia they have a regatta which is called the "Australian Henley," and an inter-university contest for a cup presented by Oxford and Cambridge oarsmen. In Europe international championships have been instituted in the hope of bringing together oarsmen and scullers from all countries. The Belgian oarsmen have by their Henley successes achieved the greatest distinction among continental oarsmen. In Holland the principal rowing clubs have their headquarters at Amsterdam, and several Dutch crews have been seen at Henley. In France there are innumerable rowing clubs which are now governed by the *Fédération française*, a body which has a strict code of rules, but

which has not adopted quite so strict an amateur definition as that of the English A.R.A. In Germany, also, rowing is very extensively practised under the auspices of the *Deutsche Ruderverband*; the chief contests between English and German crews of recent years were at the Cork Regatta of 1902 when Leander Club defeated the Berlin Club in the eight-oared race, and at the Henley Regatta of 1907, when a four of the *Ludwigshafener Club* were defeated in a heat of the Stewards Cup by a Leander crew.

*Methods and Style.*—The English style is the only one in which the oarsman swings his body to the full extent fore and aft, at the same time making use of his sliding seat. Most of the foreign crews who have competed in England have sacrificed a portion of their swing in order to enable them, as they believe, to make better use of their leg work. There can be no doubt that the English style is in a sense more exhausting to the oarsman, that is to say it enables him to bring more muscle into play and to make full use of his weight and strength, but in spite of recent defeats it is still believed by English oarsmen to be the most effective. The crews of 1906 and 1907 which were defeated by the Belgians were the best that England could at the time produce, but they undoubtedly rowed in a style which fell a long way short of ideal English rowing.

The secret of good rowing is the simultaneous application of leg and body work from end to end of the stroke. The instant the blades are covered the whole weight must be lifted from the stretcher and applied to the oar-handle, and must remain so applied until the hands come in to the chest. In order to ensure that the pressure so applied to the blade shall be as long and as hard as possible, the body must be swung forward to its full extent, and during the stroke the shoulders must always be swinging back faster than the seat, while at the same time the legs are driving hard at the stretcher. The slide and swing should be finished simultaneously. There are many subsidiary rules of style as to the movements of the hands and arms, but they are all of secondary importance and are devised so as to enable the average man to execute the working portion of the stroke effectively and often, without undue exertion to himself. The movements of a crew, must be as nearly as possible simultaneous in every particular. There have been many instances of crews which although inferior in style and strength to their opponents have been victorious owing to being "better together."

**ROWLAND, HENRY AUGUSTUS** (1848-1901), American physicist, was born at Honesdale, Pennsylvania, on the 27th of November 1848. From an early age he exhibited marked scientific tastes and spent all his spare time in electrical and chemical experiments. At the Rensselaer Polytechnic Institute at Troy, N.Y. he graduated in 1870, and he then obtained an engagement on the Western New York railway. But the work there was not to his liking, and after a short time he gave it up for an instructorship in natural science at the university of Wooster, Ohio, which in turn he resigned in order to return to Troy as assistant professor of physics. Finally, in 1876, he became the first occupant of the chair of physics at the Johns Hopkins University, Baltimore, a position which he retained until his premature death on the 16th of April 1901. Rowland was one of the most brilliant men of science that America has produced, and it is curious that at first his merits were not perceived in his own country. In America he was unable even to secure the publication of certain of his scientific papers; but Clerk Maxwell at once saw their excellence, and had them printed in the *Philosophical Magazine*. When the managers of the Johns Hopkins University asked advice in Europe as to whom they should make their professor of physics, he was pointed out in all quarters as the best man for the post. In the interval between his election and the assumption of his duties at Baltimore, he studied physics under Helmholtz at

Berlin, and carried out a well-known research on the effect of an electrically charged body in motion, showing it to give rise to a magnetic field. As soon as he was settled at Baltimore, two important pieces of work engaged his attention. One was a redetermination of the ohm. For this he obtained a value which was substantially different from that ascertained by the committee of the British Association appointed for the purpose, but ultimately he had the satisfaction of seeing his own result accepted as the more correct of the two. The other was a new determination of the mechanical equivalent of heat. In this he used Joule's paddle-wheel method, though with many improvements, the whole apparatus being on a larger scale and the experiments being conducted over a wider range of temperature. He obtained a result distinctly higher than Joule's final figure; and in addition he made many valuable observations on thermometrical questions and on the variation of the specific heat of water, which J. P. Joule had assumed to be the same at all temperatures. In 1882, before the Physical Society of London, he gave a description of the diffraction gratings with which his name is specially associated, and which have been of enormous advantage to astronomical spectroscopy. These gratings consist of pieces of metal or glass ruled by means of a diamond point with a very large number of parallel lines, on the extreme accuracy of which their efficiency depends. For their production, therefore, dividing engines of extraordinary truthness and delicacy must be employed, and in the construction of such machines Rowland's engineering skill brought him conspicuous success. The results of his labours may be found in the elaborate *Photographic Map of the Normal Solar Spectrum* (1888) and the *Table of Solar Wave-Lengths* (1898). In the later years of his life he was engaged in developing a system of multiplex telegraphy.

**ROWLANDS, RICHARD** (fl. 1560-1620), Anglo-Dutch antiquary, whose real name was Verstege, was the son of a cooper whose father, Theodore Roland Verstege, a Dutch emigrant, came to England about 1500. Under the name of Rowlands, Richard went to Christ Church, Oxford, in 1565, where he studied early English history and the Anglo-Saxon language. Leaving the university without a degree, he published in 1576 a work of antiquarian research, translated from the German, entitled *The Post of the World*, describing the great cities of Europe; and soon afterwards he moved to Antwerp, where he resumed the name of Verstege, and set up in business as a printer and engraver. In 1587 he went to Paris, and in 1595 to Spain, where he studied in the college at Seville, afterwards returning to Antwerp, where he lived so far as is known until his death, the date of which, though certainly later than 1620, is unknown. Rowlands was a zealous Roman Catholic, and in 1587 he published at Antwerp *Theatrum Crudelitatum Hæreticorum*, in which he criticized the treatment of the Roman Catholics in England under Elizabeth so freely that when a French translation of the book appeared in the following year he was thrown into prison at the instance of the English ambassador in Paris. Many of his writings were published in the name of Verstege. His works included *A Dialogue on Dying Well* (1603), a translation from the Italian; *Restitution of Decayed Intelligence in Antiquities concerning the English Nation*, dedicated to James I. (1605); *Neder Doytsche Epigrammen* (1617); *Sundry Successive Regal Governments in England* (1620); *Spiegel der Nederlandsche Elanden* (1621). The verses on the defeat of the Irish rebels under Tyrone, entitled *England's Joy*, by R. R. (1601), is doubtfully attributed to him. Richard Verstege, author of *Nederlantische Antiquiteiten* (Brussels, 1646), is probably another person, possibly Rowlands's son.

See Anthony & Wood, *Athenæ Oxonienses*, edited by P. Bliss (4 vols., London, 1813-20); J. W. Burgon, *Life and Times of Sir T. Gresham* (2 vols., London, 1839); W. C. Hazlitt, *Collections and Notes* (London, 1882 and 1887).

**ROWLANDS, SAMUEL** (c. 1573-1630), English author of pamphlets in prose and verse, which reflect the follies and humours of the lower middle-class life of his time, seems to have had no

contemporary literary reputation; but his work throws considerable light on the social London of his day. Among his works, which include some poems on sacred subjects, are: *The Betraying of Christ* (1598); *The Letting of Humours Blood in the Head-veins* (epigrams and satires) and *A Merry Meeting, or 'Tis Merry when Knaves meet* (1600)—the two latter being publicly burnt by order, but republished later under other names—*Humours Ordinarie* and *The Knave of Clubs*; *Greene's Ghost haunting Conio-Catchers* (1602), which he pretended to have edited from Greene's papers, but which is largely borrowed from his printed works; *'Tis Merry when Gossips meet* (1602), a dialogue between a Widow, a Wife, a Maid and a Vintner; *Looke to it; for Ile stabbe ye* (1604), in which Death describes the tyrants, careless divines and other evil-doers whom he will destroy; *Hells broke loose* (1605), an account of John of Leyden, and in the same year a *Theatre of Divine Recreation* (not extant), poems founded on the Old Testament; *A Terrible Battell betwene . . . Time and Death* (1606); *Democritus, or Doctor Merry-man his Medicines against Melancholy humors*, reprinted, with alterations, as *Doctor Merrie-man*, and *Diogenes Lanthorne* (1607), in which "Athens" is London; *The Famous History of Guy, Earl of Warwick* (1607), a long romance in Rowlands's favourite six-lined stanza, and one of his hastiest, least successful efforts; *Humors Looking Glasse* (1608); and *Martin Mar-all, Beadle of Bridewell* (1610), a history of roguery containing much information about notable highwaymen and the completest vocabulary of thieves' slang up to that time. Of his later works may be mentioned *Sir Thomas Overbury; or the Poisoned Knights Complaint*, and *The Melancholie Knight* (1615), which suggests a hearing of Beaumont and Fletcher's *Knight of the Burning Pestle*. The last of his humorous studies, *Good News and Bad News*, appeared in 1622, and in 1628 he published a pious volume of prose and verse, entitled *Heavens Glory, Seeke it; Earths vanitie, Flye it; Hells Horror, Fere it*. After this nothing is known of him. Mr Gosse, in his introduction to Rowlands's complete works, edited (1872-80) for the Hunterian Club in Glasgow by Mr S. J. H. Herrtage, sums him up as a "kind of small non-political Defoe, a pamphleteer in verse whose talents were never put into exercise except when their possessor was pressed for means, and a poet of considerable talent without one spark or glimmer of genius."

Mr Gosse's notice is reprinted in his *Seventeenth Century Studies* (1883). A recently discovered poem by Rowlands, *The Bride* (1617), was reprinted at Boston, U.S.A., in 1905 by Mr A. C. Potter.

**ROWLANDSON, THOMAS** (1756-1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. On leaving school he became a student in the Royal Academy. At the age of sixteen he resided and studied for a time in Paris, and he afterwards made frequent tours on the Continent, enriching his portfolios with numerous jottings of life and character. In 1775 he exhibited at the Royal Academy a drawing of "Delilah visiting Samson in Prison," and in the following years he was represented by various portraits and landscapes. Possessed of much facility of execution and a ready command of the figure, he was spoken of as a promising student; and had he continued his early application he would have made his mark as a painter. But by the death of his aunt, a French lady, he fell heir to a sum of £7000, plunged into the dissipations of the town and was known to sit at the gaming-table for thirty-six hours at a stretch. In time poverty overtook him; and the friendship and example of Gillray and Bunbury seem to have suggested caricature as a means of filling an empty purse. His drawing of Vauxhall, shown in the Royal Academy exhibition of 1784, had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1800-11 issued in his *Poetical Magazine* "The Schoolmaster's Tour"—a series of plates with illustrative verses by Dr William Coombe. They were the most popular of the artist's works. Again engraved by Rowlandson himself in 1812, and issued under the title of the "Tour of Dr Syntax

in Search of the Picturesque," they had attained a fifth edition by 1813, and were followed in 1820 by "Dr Syntax in Search of Consolation," and in 1821 by the "Third Tour of Dr Syntax in Search of a Wife." The same Collaboration of designer, author and publisher appeared in the English "Dance of Death," issued in 1814-16, one of the most admirable of Rowlandson's series, and in the "Dance of Life," 1822. Rowlandson also illustrated Smollett, Goldsmith and Sterne, and his designs will be found in *The Spirit of the Public Journals* (1825), *The English Spy* (1825), and *The Humourist* (1831). He died in London, after a prolonged illness, on the 22nd of April 1827.

Rowlandson's designs were usually executed in outline with the reed-pen, and delicately washed with colour. They were then etched by the artist on the copper, and afterwards aqua-tinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer he was characterized by the utmost facility and ease of draughtsmanship, and the quality of his art suffered from this haste and over-production. He was a true if not a very refined humorist, dealing less frequently than his fierce contemporary Gillray with politics, but commonly touching, in a rather gentle spirit, the various aspects and incidents of social life. His most artistic work is to be found among the more careful drawings of his earlier period; but even among the exaggerated caricature of his later time we find hints that this master of the humorous might have attained to the beautiful had he so willed.

See J. Grego, *Rowlandson the Caricaturist, a Selection from his Works, &c.* (2 vols., 1880).

**ROWLEY, WILLIAM** (c. 1585-c. 1642), English actor and dramatist, collaborator with several of the dramatists of the Elizabethan period, especially with Thomas Middleton. He is not to be identified with "Master Rowley, once a rare scholar of learned Pembroke Hall in Cambridge," whom Francis Meres described in his *Palladis Tamia* as one of the "best for comedy." The only Rowley at Pembroke Hall at the period was Ralph Rowley, afterwards rector of Chelmsford. William Rowley is described as the chief comedian in the Prince of Wales's company, and it was doubtless during the two years' union (1614-16) of these players with the Lady Elizabeth's company that he was brought into contact with Middleton. Rowley joined the King's Servants in 1623, and retired from the stage about four years later. The fact of his marriage is recorded in 1637, and he is supposed to have died about 1642. Four plays attributed to his sole authorship are extant: *A new Wonder, A Woman never Vext* (printed, 1632); *A Match at Midnight* (1633); *A Tragedie called Alls Lost by Lust* (1633); and *A Shoemaker a Gentleman with the Life and Death of the Cripple that stole the Weathercock at Pauls* (1638). They are distinguished by effectiveness of situation and ingenuity of plot, so that we may conjecture why he was in such request as an associate in play-making, and he had further an experimental knowledge of the coarse comedy likely to please the pit. It is recorded by Langhaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." The plays he wrote with Middleton are dealt with under that heading. With George Wilkins and John Day he wrote *The Travailes of the Three English Brothers* (1607); with Thomas Heywood he produced the romantic comedy of *Fortune by Land and Sea* (printed, 1655); he was associated with Thomas Dekker and John Ford in *The Witch of Edmonton*<sup>1</sup> (printed, 1658); *A Cure for a Cuckold* (printed, 1661) and *The Thracian Wonder* (printed, 1661) are assigned to the joint authorship of Webster and Rowley; while Shakespeare's name was unjustifiably coupled with his on the title-page of *The Birth of Merlin: or, The Childe hath found his Father* (1662). Rowley also wrote an elegy on Hugh Attwell, the actor, and a satirical pamphlet describing contemporary London, entitled *A Search for Money* (1609).

The dramatist SAMUEL ROWLEY, described without apparent reason by J. P. Collier as William Rowley's brother, was employed

<sup>1</sup> It is usual to minimize Rowley's share in this play. Mr. Secombe (*Dict. Nat. Biog.*, s.v. Rowley) says: "Dekker appears to have had the chief share, but Rowley supplied some acceptable buffoonery." J. O. Halliwell-Phillips (*Dict. of Old English Plays*), however, defined it as a tragic-comedy by William Rowley, adding that he had help from the other two.

by Henslowe as a reader of plays. He wrote some scriptural plays now lost, with William Borne (or Bird, or Boyle) and Edward Juby. His only extant pieces are: *When you see me, You know me. Or the famous Chronicle Historie of King Henry the eight, with the birth and vertuous life of Edward Prince of Wales* (1605), of interest because of its possible connexion with the Shakespearian play of *Henry VIII.*, and *The Noble Soldier. Or, A Contract Broken, justly reveng'd* (1634), which was entered, however, in the Stationers' Register as the work of Thomas Dekker, to whom the major share is probably assignable.

**ROWLEY REGIS**, an urban district in the Kingswinford parliamentary division of Staffordshire, England, on the Stourbridge branch of the Great Western railway, 7 m. W. of Birmingham, Pop. (1901) 34,670. It lies in a hilly district rich in coal and iron, while a hard basaltic intrusion known as Rowley rag is largely quarried. The town is a modern growth out of a village surrounding the church of St Giles, which dates from the 13th century, though rebuilt in 1840. Iron manufactures are extensive; there are also brick and tile works and breweries.

**ROWLOCK** (pronounced *rullock* or *rollock*), a device on the gunwale of a boat in or on which an oar rests, forming a fulcrum for the oar in rowing. The word is a corruption due to "row" of the earlier "oar-lock," O.E. *arlic*, a lock or enclosed place for an oar. The simplest form of rowlock is a notch, square or rounded, on the gunwale, in which the oar rests; other kinds are formed by two pins or pegs, "thole pins" (thole being ultimately the same word as *Norw. toll*, a young fir-tree), and by a swivel with two horns of metals, pivoted in the gunwale or on an outrigger (see OAR).

**ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, BARON** (1838-1903), second son of the Right Hon. Henry Corry by his wife Harriet, daughter of the 6th earl of Shaftesbury, was born in London on the 8th of October 1838, educated at Harrow and at Trinity College, Cambridge, and called to the bar in 1863. His father, a son of the 2nd earl of Belmore, represented County Tyrone in parliament continuously for forty-seven years (1826-73), and was a member of Lord Derby's cabinet (1866-68) as vice-president of the council and afterwards as first lord of the Admiralty. Montague Corry was thus brought up in close touch with Conservative party politics; but it is said to have been his winning personality and social accomplishments rather than his political connexions that recommended him to the favourable notice of Disraeli, who in 1866 made Corry his private secretary. From this time till the statesman's death in 1881 Corry maintained his connexion with Disraeli, the relations between the two men being more intimate and confidential than usually subsist between a private secretary and his political chief. When Disraeli resigned office in 1868 Corry declined various offers of public employment in order to be free to continue his services, not given gratuitously, to the Conservative leader; and when the latter returned to power in 1874, Corry resumed his position as official private secretary to the prime minister. He accompanied Disraeli (then earl of Beaconsfield) to the congress of Berlin in 1878, where he acted as one of the secretaries of the special embassy of Great Britain. On the defeat of the Conservatives in 1880, Corry was raised to the peerage with the title of Baron Rowton, of Rowton Castle, Shropshire. He had rendered service of an exceptional order to his chief, and after Beaconsfield's removal to the House of Lords his private secretary became invaluable in keeping him in touch with the rank and file of his party. Lord Rowton was in Algiers when Beaconsfield was stricken with his last illness in the spring of 1881; but returning post-haste across Europe, he was present at the death-bed of his old chief. Beaconsfield (q.v.) bequeathed to Rowton all his correspondence and other papers.

Lord Rowton will long be remembered as the originator of the scheme known as the Rowton Houses. Consulted by Sir

<sup>2</sup> William Borne or Bird engaged to play with the Admiral's Men for three years from 1597. In 1600 he borrowed 30s. from Henslowe to pay for a new play, *Jagurik*, by W. Boyle (probably another name for himself). He helped S. Rowley in *Joshua* (1601), and in addition (1602) to Marlowe's *Dr Faustus*. His connexion with the theatre ceased about 1621.

Edward Guinness (afterwards Lord Iveagh) with regard to the latter's projected gift of £200,000 for endowment of a trust for the improvement of the dwellings of the working classes, Rowton made himself personally familiar with the conditions of the poorest inhabitants of London; and he determined to establish "a poor man's hotel," which should offer better accommodation than the common lodging-houses, at similar prices. In the face of much discouragement and difficulty, the first Rowton House was opened at Vauxhall in December 1807, the cost (£30,000) being defrayed by Lord Rowton, though he was by no means a man of great wealth. In 1804 a company, Rowton Houses (Limited), was incorporated to extend the scheme, a main characteristic of which was that the houses should not be charitable institutions but should be on a paying commercial basis. The scheme proved a gratifying success, and was imitated not only in many of the chief towns of Great Britain, but also in different countries of Europe and in America (see HOUSING). Lord Rowton also devoted himself to the business of the Guinness Trust, of which he was a trustee, and was interested in many philanthropic schemes. Lord Rowton was unmarried, and the title consequently became extinct at his death, which occurred in London on the 9th of November 1893.

**ROXANA**, or **ROXANE**, daughter of the Bactrian king Oxartes, and wife of Alexander the Great. After the latter's death she gave birth to a son (Alexander IV.), who was accepted by the generals as joint-king with Arrhidæus. Having crossed over to Macedonia, and thrown in her lot with Olympias, mother of Alexander the Great, she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 309 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aëtian.

See Plutarch, *Alexander*, 47, 77; Arrian, *Anab.* iv. 18, vii. 27; *Diod. Sic.* xviii. 3, 38, xix. 11, 52, 105; Strabo xi. p. 517, xvii. p. 794.

**ROXBURGHIE, EARLS AND DUKES OF.** **ROBERT KER**, 1st earl of Roxburgh (c. 1570-1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (d. c. 1584), who fought against Mary queen of Scots both at Carberry Hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526) who fought at Flodden and was killed near Melrose in January 1526 by the Scots of Buccleuch. The deed was avenged when the Kers under Sir Walter killed Sir Walter Scott of Buccleuch in Edinburgh in 1552. Robert Ker was also descended, on the maternal side, from Andrew Ker of Ferniehurst (c. 1471-1545), a celebrated border chieftain. Another famous member of the family was Andrew's grandson, Sir Thomas Ker of Ferniehurst (d. 1586), who, Camden says, was "of an immovable fidelity to the queen of Scots and the king her son." He was the father of Robert Carr, earl of Somerset, the favourite of James I.

After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1590 and was made Lord Roxburgh about the same time; he accompanied King James to London in 1603, and was created earl of Roxburgh in 1616. He was lord privy seal for Scotland from 1637 to 1640, and in the Scottish parliament he showed his sympathy with Charles I.; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. He died at Floors, his residence near Kelso, on the 18th of January 1650. His son Harry, Lord Ker, had died in January 1643; consequently his titles and estates passed by special arrangement to his grandson, **WILLIAM DRUMMOND** (d. 1675), the youngest son of his daughter Jean and her husband John Drummond, 2nd earl of Perth. William took the name of Ker, became 2nd earl of Roxburgh, and married his cousin Lord Ker's daughter Jean.

The second earl's son was **ROBERT**, 3rd earl (c. 1658-1682), whose son was **JOHN**, 1st duke of Roxburgh (c. 1680-1741). John became 5th earl on the death of his brother Robert, the 4th earl, in 1696, and is described by George Lockhart of Carnwath as "perhaps the best accomplished young man of quality in Europe." In 1704, he was made a secretary of state of

Scotland, and he helped to bring about the union with England, being created duke of Roxburgh in 1707 for his services in this connexion. This was the last creation in the Scottish peerage. The duke was a representative peer for Scotland in four parliaments; George I. made him a privy councillor and keeper of the privy seal of Scotland, and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of state from 1716 to 1725, but he opposed the malt-tax, and in 1725 Sir Robert Walpole procured his dismissal from office. He died on the 24th of February 1741. His only son, **ROBERT** (c. 1700-1755), who had been created Earl Ker of Wakefield in 1722, became 2nd duke, and was succeeded by his son **JOHN**, 3rd duke of Roxburgh (1740-1804), the famous bibliophile. John was betrothed to Christiana, daughter of the duke of Mecklenburg-Strelitz; but when the princess's sister Charlotte was affianced to George III., reasons of state led to the rupture of the engagement, and he died unmarried on the 19th of March 1804. The duke's library, including a unique collection of books from Caxton's press, and three rare volumes of broadside ballads, was sold in 1812, when the Roxburgh Club was founded to commemorate the sale of Valdarfer's edition of Boccaccio. Roxburgh's cousin William, 7th Lord Bellenden (c. 1728-1805), who succeeded to the Scottish titles and estates, died childless in October 1805, and for seven years the titles were dormant. Then in 1812 Sir **JAMES INNES**, bart. (1736-1823), a descendant of the 1st earl, established his claim to them, and taking the name of Innes-Ker, became 5th duke of Roxburgh. Among the unsuccessful claimants to the Roxburgh dukedom was John Bellenden Ker (c. 1765-1842), famous as a wit and botanist and the author of *Archæology of Popular Phrases and Nursery Rhymes* (1837), whose son was the legal reformer. Charles Henry Bellenden Ker (c. 1785-1871).

The 5th duke's great-grandson, **HENRY JOHN INNES-KER** (b. 1876), became 8th duke in 1892. The duke of Roxburgh sits in the House of Lords as Earl Innes, a peerage of the United Kingdom, which was conferred in 1837 upon James Henry, the 6th duke (1816-1879).

**ROXBURGHSHIRE**, a Border county of Scotland, bounded W. by Berwickshire, E. and S.E. by Northumberland, S. by Cumberland, S.W. by Dumfriesshire and N.W. by the shires of Selkirk and Mid Lothian. It has an area of 426,060 acres, or 665.7 sq. m. The only low-lying ground in the shire is found in the N. and in the valleys of the larger rivers, and the whole S. is markedly hilly. Though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland, Catcleuch Shin (1742 ft.) and Peel Fell (1964) are Scottish peaks. The chief heights of the mountainous mass constituting the watershed between Teviotdale and Liddesdale are Cauldcleuch Head (1996), Greatmoor (1964), Pennygant (1805), Din Fell (1735), Windburgh (1622) and Arnton Fell (1644). In the W. is Crib Law (1369), and in the N., near Melrose, occur the triple Eildons (highest peak, 1385). The county is abundantly watered. The Tweed flows through the N. of the shire for 26 out of its total run of 97 m., though for about 2 m. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 m. lower down with Berwickshire (parishes of Earlstoun and Merton). On the right its affluents are the Bowden and the Teviot, and on the left the Allan and the Eden. The Teviot is the principal river lying entirely in Roxburghshire. From its source near Causeway Grain Head on the Dumfriesshire border, it follows mainly a N.E. direction for 37 m. to its confluence with the Tweed at Kelso. Its chief tributaries are, on the right, Allan Water, the Slitrig, Dean Burn, the Rule, the Jed, the Oxnam and the Kale, and, on the left, Borthwick Water and the Ale, both rising in Selkirkshire. The Liddel is the leading stream in the S. Rising near Peel Fell in the Cheviots it flows S.W. to the Esk after a course of 27 m., receiving on the right Hermitage Water, on the left Kershope Burn. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel, which drains to the Esk, much the greater portion of the surface is drained, by the Tweed, to the North Sea. The lakes are few

and small, the largest being Yetholm or Primside Loch and Horselaw, both in the parish of Linton among outlying hills of the Cheviots. Teviotdale, Liddesdale, Tweedsdale and Jedvale are the principal valleys.

**Geology.**—This county contains a considerable range of sedimentary rocks from the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the N.W. and W. part of the county; they have been thrown into numerous sharp folds. It is on the crests of the anticlines that the strata of the former system appear flanked on either side by those of the latter. The oldest rocks are the mudstones and radiolarian cherts with contemporaneous and intrusive igneous rocks of Arenig age; these are followed by shales and greywackes of Llandilo age and similar rocks of Caradoc age. Then comes the Silurian with the Birkhill shales and massive grits and greywackes of the Gala or Queensberry group with the Hawick rocks; these are all of Llandovery age and they occupy the greater part of the Silurian area. Wenlock and Ludlow rocks are found S. of Hawick rocks from Wisp Hill N.E. by Stobs Castle; other inlying masses occur in the Old Red Sandstone and Carboniferous areas, the largest of these being that which appears in a belt some 14 m. in length from near Riccarton in the direction of Hobbirk. Two divisions of the Old Red Sandstone occur; the lower, which consists of subordinate sandstones and conglomerates in sheets of contemporaneous lavas with some tuffs, is confined to the Cheviots; the strata are unconformable upon the upturned Silurian beds. The upper division, which in its turn is unconformable upon the lower, occupies about one-third of the county. It consists of coarse conglomerates at the base followed by sandstones and marls. It is well developed in the N., where volcanic rocks come in; the Trow Craigs of Makerstown which cross the Tweed are due to these lavas. It extends from Newtown and Kelso to Kirkton with extensions in the valleys S.W. Carboniferous rocks are represented by the Calciferous sandstone series; in the S.W. in Liddesdale and on the uplands of Carter Fell, Larriston Fell, &c., they are sandstones with shales, some calcareous beds and coal and volcanic beds. In the N.E. corner of the county the outer part of the Berwickshire Carboniferous basin just comes within the boundary. An interesting series of volcanic "necks" belonging to this period is exemplified in Dunain Law, Black Law, Maiden Paps, Ruberslaw and other hills. Glacial deposits are represented by boulder clay and beds and ridges of sand and gravel.

**Climate and Industries.**—The average annual rainfall is about 37 in., higher in the hilly regions and somewhat lower towards the N. and E. The mean temperature for the year is 48° F., for January 38° F. and for July 60° F. The soil is chiefly loam in the level tracts along the banks of the larger streams, where it is also very fertile. In other districts a mixture of clay and gravel is mostly found, but there is besides a considerable extent of mossy land. Of the area under grain about two-thirds are occupied by oats, the remainder being principally devoted to barley. Among green crops turnips and swedes are most generally cultivated, potatoes covering a comparatively small acreage. In different parts of Tweedsdale and Jedvale several kinds of fruit are successfully grown. Both in the pastoral and arable localities agriculture is in an advanced condition. The hill country is everywhere covered with a thick green pasturage admirably suited for sheep, which occupy the walks in increasingly large quantities. The herds of cattle are also heavy, horses are kept mostly for farming operations, and pigs are raised in moderate numbers. Fairly large holdings predominate, farms of between 100 and 300 acres being general, and only in Berwickshire is the proportion of farms of more than 1000 acres exceeded. Many districts on the Tweed and Teviot are beautifully wooded, but having regard to the great area once occupied by forest, the acreage under wood is now relatively small.

The county is the principal seat of the tweed and hosiery manufactures in Scotland. Engineering, ironfounding, dyeing and tanning are also carried on at Hawick and Jedburgh, and agricultural implements and machinery, chemical manures and especially fishing tackle are made at Kelso. The salmon fisheries on the Tweed are of considerable value.

The Waverley route of the North British railway runs through the county from near Melrose in the N. to Kershopefoot in the S. At St Boswells branches are sent off to Duns and Reston, and to Jedburgh and Kelso via Roxburgh. The North-Eastern railway, an English company, has a line from Berwick to Kelso, via Coldstream and Carham.

**Population and Administration.**—The population in 1901 was 48,804, or 73 persons to the sq. m. In 1901 there were 132 persons who spoke Gaelic and English, but none Gaelic only. The principal towns are Hawick (pop. 17,303), Kelso (4008), Jedburgh (3136), Melrose (2195). The county returns a member to parliament, and Hawick belongs to the Border group of parliamentary burghs. Jedburgh, the county town, is a royal burgh, and Hawick, Kelso and Melrose are police

burghs. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county is under school-board jurisdiction, and there are secondary schools at Hawick and Kelso, while the board schools at Jedburgh and Melrose have secondary departments. Most of the "residue" grant is expended in assisting teachers to attend science and art classes at Edinburgh University and Hawick, and in subsidizing science and art and technical classes at Hawick, Kelso and elsewhere.

**History and Antiquities.**—Among the more important remains of the original inhabitants are the so-called "Druidical" stones and circles at Plenderleath between the Kale and Oxnam; on Hownam Steeple, a few miles to the N.W. (where they are locally known as the Shearers and the Bandster); and at Midshields on the Teviot. The stones on Ninestane Rig, near Hermitage Castle, and on Whigill are supposed to commemorate the Britons of Strathclyde who, under Aidan, were defeated with great slaughter by Ethelfrith, king of Bernicia, at the battle of Degsanstane or Dawstane in 603. There are hill forts in Liddesdale on the Allan, in the parish of Oxnam, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. The fortress was defended by palisades around the three circular terraces which form the hill-top. Within the enclosure there was a town of huts, judging from certain marks that indicate the site of such dwellings, and the relics of early British pottery that have been found, while the fact that springs exist renders the theory of a settlement all the more probable. One of the most important and most mysterious of British remains is the Catrail, or Picts' Work Dyke. In its original condition it is supposed to have consisted of a line of double mounds or ramparts, averaging about 30 ft. in width, with an intervening ditch 6 ft. broad, the slope from the centre of the mound to the middle of the bottom of the trench being 10 ft. Owing to weather and other causes, however, it is now far from perfect and in places has disappeared for miles. Beginning at Torwoodlee, N.W. of Galashiels, it ran S.W. to Yarrow church, whence it turned first S. and then S.E., following a meandering course to Peel Fell in the Cheviots, a distance of 48 miles. Though it must have been difficult to defend so long a line, the bulk of opinion is in favour of its being a defence work. Roman remains are also of exceptional interest. Watling Street crossed the Border N. of Brownhart Law (1664 ft.) in the Cheviots, then took a mainly N.W. direction across the Kale, Oxnam, Jed and Teviot to Newstead, near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into Haddingtonshire. The chief stations were *Ad Fines* on the Cheviots, *Gadonica* (Bonjedward) near Jedfoot and Eildon Hill (? *Trimontium*). Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden Way which ran from Overburgh in Lancashire to Bewcastle in Cumberland, and so to the Border. It entered Roxburghshire N. of Deadwater and went (roughly) N. as far as Wolflee, whence its direction becomes a matter of surmise. Of Roman camps the principal appear to have been situated at Cappuck, to the S.E. of Jedburgh, and near Newstead, at the base of the Eildons, the alleged site of *Trimontium*. After the retreat of the Romans the country was occupied by the Britons of Strathclyde in the W. and the Bernicians in the E. It was then annexed to Northumbria for over four centuries until it was ceded, along with Lothian, to Scotland in 1018. David I. constituted it a shire, its ancient county town of Roxburgh (see *KELSO*) forming one of the Court of Four Burghs. The castle of Roxburgh, after changing hands more than once, was captured from the English in 1460 and dismantled. Other towns were repeatedly burned down, and the abbey of Dryburgh, Jedburgh, Kelso and Melrose ultimately ruined in the expedition of the earl of Hertford (the Protector Somerset) in 1544-45. The Border freebooters—of whom the Armstrongs and Elliots were the chief—conducted many a bloody fray on their own account. On the union of the crowns the county gradually settled into what was

comparatively a state of repose, disturbed to some extent during the Covenanting troubles and, to a much slighter degree, by the Jacobite rebellions.

**BIBLIOGRAPHY.**—Sir George Douglas, *Roxburgh, Selkirk and Peebles* (Edinburgh, 1899); W. S. Crockett, *The Scott Country* (Edinburgh, 1902); Alexander Jeffrey, *The History and Antiquities of Roxburghshire* (4 vols., Edinburgh, 1857-64).

**ROXBURY**, formerly a city of Norfolk county, Massachusetts, U.S.A., situated between Boston and Dorchester, but since 1868 a part of Boston. It is primarily a residential district. Among its institutions are the Roxbury Latin School, established in 1645,<sup>1</sup> the Fellows Athenaeum (a part of the Roxbury branch of the Boston Public Library), with about 26,000 volumes in 1909, and the New England Hospital for Women and Children (1863), the New England Baptist Hospital (1893), the Woman's Charity Club Hospital (1890), the Roxbury Homoeopathic Dispensary (1886), the Roxbury Home for Children and Aged Women (1886), a Home for Aged Couples (1884) and the Massachusetts Home for Intemperate Women (1879). On Mount Bellevue, in West Roxbury (set apart from Roxbury in 1851 and annexed to Boston in 1873), there is an observatory (erected in 1869 by the city of Boston as a stand-pipe for the high service water supply). Among the manufactures of the district are cotton and woollen goods, cordage, carpets, shoes and foundry products. The town of Roxbury (at first usually spelled Rocksburry) was founded in 1630 by some of the Puritan immigrants who came with Governor John Winthrop; the settlers were led by William Pynchon, who in 1636 led a party from here and founded Springfield, Mass. At the home of Rev Thomas Welde (d. 1662), the first minister, Anne Hutchinson (q.v.) was held in custody during the winter of 1637-38. Associated as teacher with Welde and his successors, Samuel Danforth and Nehemiah Walter, was John Eliot, the apostle to the Indians, who removed to Roxbury in 1632 and died here in 1690. Roxbury was the home also of Thomas Dudley, of his son Joseph and of his grandson Paul; of Robert Calef (d. 1719), the leader of the opposition to the witchcraft craze; of General Joseph Warren, and of William Eustis (1753-1825), who was U.S. secretary of war (1800-12), minister to the Netherlands (1814-18), and governor of Massachusetts (1823-25); and from 1837 to 1845 Theodore Parker was the pastor of the Unitarian Church of West Roxbury. Of special interest in the old Roxbury burial-ground is the "Ministers' Tomb," containing the remains of John Eliot, and the tomb of the Dudleys. West Roxbury was the scene of the Brook Farm experiment (see BROOK FARM). Roxbury was chartered as a city in 1846.

See F. S. Drake, *The Town of Roxbury, its Memorable Persons and Places* (Boston, 1878 and 1905).

**ROY, WILLIAM** (1726-1790), a famous British surveyor, military draughtsman, antiquary, &c. In 1746, when an assistant in the office of Colonel Watson, deputy quartermaster-general in North Britain, he began the survey of the mainland of Scotland, the results of which were embodied in what is known as the "duke of Cumberland's map." In 1755 he obtained his commission in the 4th King's Own Foot, and in 1759 gained his lieutenantcy and went to serve in Germany in the Seven Years' War. In 1765 he appears as deputy quartermaster-general to the forces, surveyor-general of coasts and engineer-director of military surveys in Great Britain; in 1767 he became F.R.S., in 1781 major-general, in 1783 director of Royal Engineers. Besides his campaigns and observations in Germany, his visits to Ireland (1766) and to Gibraltar (1768) were important. In 1783-84 he conducted observations for determining the relative positions of the French and English royal observatories. His measurement of a base-line for that purpose on Hounslow Heath in 1784, the germ of all subsequent surveys of the United Kingdom, gained him in 1785 the

Copley medal of the Royal Society. Roy's measurements (not fully utilized till 1877, when the Paris and Greenwich observatories were properly connected) form the basis of the topographical survey of Middlesex, Surrey, Kent and Sussex. He was finishing an account of this work for the *Phil. Trans.* when he died on the 1st of July 1790.

Roy's principal book-publication is the *Military Antiquities of the Romans in Britain* (1793). See also notices of him and contributions from him in the records of the War Office and the Royal Engineers, in the *Transactions* of the Royal Society of London, vols. lxvii., lxxv., lxxvii., lxxx., lxxxv., and in the *Gentleman's Magazine*, vols. lv., lx. He was whimsically denounced by Jonathan Oldbuck in *Monkbarns* in *Scott's Antiquary*.

**ROYAL FERN**, in botany, the common name for the fern *Osmunda regalis*, a native of Britain, where it grows in bogs, marshy woods, &c. It is a handsome plant with bi-pinnate fronds 2 to 6 ft. long and 1 ft. or more broad; the tops of the fronds are fertile, the fertile pinnae being cylindrical and densely covered with the spore-cases, giving the appearance of a dense panicle of flowers, whence the plant is known as the flowering fern. There are various cultivated forms—*cristata* has the ends of the fronds and the pinnae finely crested, and *corymbifera* has curiously forked and crested fronds. Several other species, such as *O. cinnamomea*, *O. Claytoniana*, are known as handsome greenhouse ferns (see also FERNS).

**ROYAL SOCIETY, THE**, the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in the year 1660, but a nucleus had in fact been in existence for some years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in sundry letters written in 1646 and 1647. These weekly meetings, according to Wallis, were first suggested by Theodore Haak, "a German of the Palatinate then resident in London," and they were held sometimes in Dr Goddard's lodgings in Wood Street, sometimes at the Bull-Head Tavern in Cheapside.

Some of these "Philosophers," resident in Oxford about 1648, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of Dr Wilkins, warden of Wadham College. A close inter-communication was maintained between the Oxford and London Philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham College.

On November 28, 1660, the first journal book of the society was opened with a "memorandum," from which the following is an extract: "Memorandum that Novemb. 28. 1660. These persons following, according to the usuall custom of most of them, mett together at Gresham Colledge to heare Mr Wren's lecture, viz. The Lord Brouncker, Mr Boyle, Mr Bruce, Sir Robert Moray, Sir Paul Neile, Dr Wilkins, Dr Goddard, Dr Petty, Mr Ball, Mr Rooke, Mr Wren, Mr Hill. And after the lecture was ended, they did, according to the usuall manner, withdrawe for mutuall converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimental Learning." It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o'clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Dr Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of the 28th of November and by seventy-three others. On the 12th of December another meeting was held at

<sup>1</sup> This school was founded, primarily through the influence of the Rev. John Eliot, by inhabitants of Roxbury. In 1672 Thomas Bell, one of the original founders, bequeathed to the school all his Roxbury lands. In 1789 the school was incorporated.

which fifty-five was fixed as the number of the society,—persons of the degree of baron, Fellows of the College of Physicians, and public professors of mathematics, physics and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting-place of the society. Sir Robert Moray (or Murray) was chosen president (March 6, 1661), and continued from time to time to occupy the chair until the incorporation of the society, when Lord Brouncker was appointed the first president under the charter. In October 1661 the king offered to be entered one of the society, and next year the society was incorporated under its present title. The name "Royal Society" appears to have been first applied to the Philosophers by John Evelyn, in the dedication of his translation of a book by Gabriel Naudé, published in 1661. Evelyn received in that year the thanks of the "philosophic assembly" for the honourable mention he had made of them by the name of "The Royal Society."

The charter of incorporation passed the Great Seal on the 15th of July 1662, to be modified, however, by a second charter in the following year, repeating the incorporating clauses of the first charter, but conferring further privileges on the society. The second charter passed the Great Seal on the 22nd of April 1663, and was followed in 1669 by a third, confirming the powers granted by the second charter, with some modifications of detail, and granting certain lands in Chelsea to the society. The council of the Royal Society met for the first time on the 13th of May 1663, when resolutions were passed that debate concerning those to be admitted should be secret, and that Fellows should pay 1s. a week to defray expenses.

At this early stage of its history the "correspondence" which was actively maintained with continental philosophers formed an important part of the society's labours, and selections from this correspondence furnished the beginnings of the *Philosophical Transactions* (a publication now of world-wide celebrity). At the first publication of the *Transactions* was entirely "the act of the respective secretaries." The first number, consisting of 16 quarto pages, appeared on Monday, March 6, 1664-65, under the title of *Philosophical Transactions: giving some Account of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world*, with a dedication to the Royal Society signed by Henry Oldenburg, the first secretary of the society. It was ordered (1st of March 1664-65) "that the tract be licensed by the Council of the Society being first reviewed by some of the members of the same." In 1750, 496 numbers, or 46 volumes, had been published. After this date the work was issued under the superintendence of a committee, and the division into numbers disappeared. The society also from its earliest years published, or directed the publication of, separate treatises and books on matters of philosophy; most notable among these being the *Philosophiæ naturalis principia mathematica Autore Is. Newton. Imprimatur: S. Pepys, Reg. Soc. Præses. Julii 5, 1686, 4to Londini 1687*.

In 1887 the *Philosophical Transactions* was divided into two series, labelled A and B respectively, the former containing papers of a mathematical or physical character, and the latter papers of a biological character. More than 225 quarto volumes have been published. In 1832 appeared the first volume of *Abstracts of papers printed in the Philosophical Transactions from the year 1800*. This publication developed in the course of a few years into the *Proceedings of the Royal Society*, which has been continued up to the present time. It is published now in two series, corresponding to the two series of the *Philosophical Transactions*, and is issued in 8vo form at the rate of about three volumes a year.

It is, however, certain that one of the most important functions of the society from the beginning was the performance of experiments before the members. In the royal warrant of 1663 ordering the mace which the king presented to the society, it is described as "The Royal Society for the improving of Natural Knowledge by experiments"; and during its earlier years the

time of the meetings was principally occupied by the performance and discussion of experiments. The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr Hubbard," which, by a resolution of council passed on the 21st of February 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset House. A certain number, however, of instruments and models of historical interest have remained in the possession of the society, and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington House. The remainder have been deposited in the Victoria and Albert Museum, South Kensington.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society were therefore invited by Henry Howard of Norfolk to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather, Thomas earl of Arundel, and thus the foundation was laid of the important collection of scientific works, now exceeding 60,000 volumes, which the society possesses. Of the Arundel MSS. the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3550, the proceeds being devoted to the purchase of scientific books. These MSS. are still kept in the British Museum as a separate collection. The society, however, still possesses a valuable collection of scientific correspondence, official records, and other manuscripts, including the original manuscript, with Newton's autograph corrections, from which the first edition of the *Principia* was printed, and many other original documents of great interest.

Under date December 21, 1671, the journal-book records that "the lord bishop of Sarum proposed for candidate Mr Isaac Newton, professor of the mathematics at Cambridge." Newton was elected a Fellow January 11, 1671-72, and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane Court, their first meeting in the new quarters being held November 8, 1710. In the same year they were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV., when by the new warrant then issued the president and six of the Fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to them by the government in the new Somerset House, where they remained until they removed to Burlington House in 1857. The policy of Sir Joseph Banks was to render the Fellowship more difficult of attainment than it had been; and the measures which he took for this purpose, combined with other circumstances, led to the rise of a faction headed by Dr Horsley. Throughout the years 1783 and 1784 feeling ran exceedingly high, but in the end the president was supported by the majority of the society. An account of the controversy will be found in a tract entitled *An Authentic Narrative of the Dissensions and Debates in the Royal Society*. An important step in pursuance of the same policy was taken in the year 1784: when the number of candidates recommended for election by the council was limited to fifteen, and the election was made annual. This limitation has remained in force up to the present time. Concurrent with the gradual restriction of the Fellowship was the successive establishment of other scientific bodies. The founding of the Linnean Society in 1788 under the auspices of several Fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter; and this has been followed by the formation of the

large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onwards the Royal Society has constantly been appealed to by the government for advice in connexion with scientific undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has successfully urged upon the attention of, the government: the improvement and equipment of the Royal Observatory, Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1752; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Trigonometrical Survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769 (commanded by Captain Cook), 1877 and 1882; the Antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the North-West Passage), of 1819 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin), of 1874 (under Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal-tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea-water; Babbage's calculating machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Færoe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic Bureau; 1897, determination of the relations between the metric and imperial units of weights and measures; and, more recently, an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. In recent years also the society, acting at the request of the government, has taken the leading part in investigations, in the course of which important discoveries have been made, in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping sickness. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the *International Catalogue of Scientific Literature from 1900*, and of the International Association of Academies, which is composed of all the principal scientific academies of the world, meeting regularly to promote international action in questions of scientific interest.

In addition to the occasional services enumerated above, the Royal Society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory at Greenwich. From 1877 until the reconstitution of the Meteorological Office in 1906 the society nominated the meteorological council, which had the control of that office. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the control of the National Physical Laboratory, an institution established in 1899 in pursuance of the recommendations of a treasury committee appointed by H.M. government in response to representations from the Royal Society. The society had previously for many years had control of the Kew Observatory, now incorporated with the National Physical Laboratory, and still remains trustee of the Cassiot Fund, a fund established for the maintenance of the observatory. The society elects four of the nine members of the managing committee of the Lawes Agricultural Trust, and is officially represented on the governing bodies of a number of important scientific and educational institutions and of the principal public schools.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £4000 for the promotion of scientific research. This grant originated in a proposal by Lord John Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward of a sum to defray the cost of experiments might be of essential service. This grant of £1000 afterwards became annual, and was continued until 1876. In that year an additional sum of £4000 for similar purposes was granted, and the two funds of £1000 and £4000 were administered concurrently until

1881, in which year the two were combined in a single annual grant of £4000 under new regulations. Since 1896 parliament has also voted annually a grant of £1000 to be administered by the Royal Society in aid of scientific publications, not only those issued by itself, but also scientific matter published through other channels. One of the most useful of the society's publications is the great catalogue of scientific papers—an index now in twelve quarto volumes, under authors' names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the year 1883. The work was prepared under the direction of the Royal Society. A continuation carrying the catalogue up to the end of the 19th century, and a subject index to the whole catalogue, have also been compiled.

A statement of the trust funds administered by the Royal Society will be found in the *Year Book* published annually, and the origin and history of these funds will be found in the *Record of the Royal Society* (2nd ed. 1901). The income of the society is derived from the annual contributions and composition fees of the Fellows, from rents and from interest on various investments. The balance-sheet and an account of the estates and property are published in the *Year Book*. Five medals (the Copley, two Royal, the Davy and the Hughes) are awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially, and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of £1000 3% consols, for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV., and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year from the date of the award. The Davy medal was founded by the will of Mr John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*. The society also has the award of three research studentships, one founded in 1890 in memory of J. F. Joule, and the other two created out of a bequest to the society by Sir William Macklinson in 1897.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually select fifteen by ballot, and the names so selected are submitted to the society for election by ballot. Princes of the blood, however, and not more than two persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding fifty, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election. Every Fellow of the society is liable to an admission fee of £10 and an annual payment of £4; but, by aid of a fund established in 1878 for the purpose, the admission fees and £1 of the annual contribution of all the Fellows elected since that date have been remitted. The composition for annual payments is £60.

The anniversary meeting for the election of the council and officers is held on St Andrew's Day. The council for the ensuing year, out of which are chosen the president, treasurer, principal secretaries, and foreign secretary, must consist of eleven members of the existing council and ten fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session, at 4.30 p.m. The selection for publication from the papers read before the society is made by the "Committee of Papers," which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published either in the *Philosophical Transactions* (4to) or the *Proceedings of the Royal Society* (8vo), and one copy of each of these publications is presented gratis to every Fellow of the society and to the chief scientific societies throughout the world.

The making and repealing of laws is vested in the council, and in every case the question must be put to the vote on two several days of their meeting.

The text of the charters of the Royal Society is given in the *Record*, and in the same work will be found lists of the presidents, treasurers, secretaries and assistant-secretaries from the foundation to the year 1900. The same work gives a chronological list of all the Fellows, with dates of election, and an alphabetical index. Other histories are Thomson's *History of the Royal Society* (1812); Weldon's *History of the Royal Society*; Bishop Sprat's (1667), which consists largely of a defence of the society against the attacks of a priori philosophers; and Dr Birch's (1756), which treats mainly of the society's scientific work. (R. W. F. H.)

**ROYALTY** (O. Fr. *realte, roialte, royalte*, from Med. Lat. *regalitas*, the substantive of *regalis*, of or belonging to a king, *rex*), kingly state or personality, hence a royal person, or number of persons of royal birth collectively, a member of a royal family. More particularly "royalty" is used of the rights and attributes of a sovereign, and especially of dues paid to the crown, which belong to the sovereign *jure coronae*, such as dues from gold and silver mines, waifs, estrays, &c. The term is usually applied to the payment made by a publisher to an author on every copy of his book sold; to the payment made to a patentee on each article manufactured under his patent by a licensee (see PATENTS), and to the payment made to the owner of minerals for the right of working, paid on the ton or other weight raised.

**ROYAN**, a town of W. France, in the department of Charente Inférieure, on the right bank of the Gironde, at its mouth 63 m. below and N.N.W. of Bordeaux. Pop. (1906) 7142. Royan is one of the most frequented bathing resorts on the Atlantic seaboard. The coast is divided into a number of small bays or "conches," forming so many distinct beaches: to the E. of the town is the "Grande Conche" with the municipal casino; to the S. the "Conche de Fonillon," separated from the first-named by a quay which forms a fine terraced esplanade; beyond the fort of Royan follow in succession the conches "du Chay" and "de Robinson," and the most fashionable of all, that of Pontailac. The port carries on sardine-fishing and an active coasting trade, but the harbour at high tide is accessible only to vessels drawing from 8 to 10 ft., and at low water is dry. Eugène Pelletan, the author, has a statue in the town, of which he was a benefactor. The lighthouse of Cordouan, 200 ft. in height, rebuilt on the site of an older tower by the architect Louis de Foix in 1584-1610 and added to about the end of the 18th century, stands on a rock 7½ m. W.S.W. of Royan.

Royan after passing through many hands came to the family of la Trémoille, in whose favour it was made first a marquise and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was a centre of Calvinism and had to sustain in 1622 an eight days' siege by the troops of Louis XIII. As late as the end of the 18th century it was but a "bourg" of about one thousand inhabitants, noticeable only for its priory, where Brantôme wrote a portion of his *Chronicles*. The prosperity of the place dates from the Restoration, when steamboat communication was established with Bordeaux.

**ROYAT**, a watering-place of central France, in the department of Puy-de-Dôme, situated at a height of 1475 ft. on the Tiretaine, 1½ m. S.W. of Clermont-Ferrand. Pop. (1906) 1451. The thermal springs, situated in the part of Royat known as St. Mart, are strongly impregnated with carbonic acid and chloride of sodium and are used in cases of rheumatism, gout, bronchitis, asthma, anaemia, &c. They were known in Roman times, and ruins of ancient baths are still to be seen. The village of Royat proper, a little higher up the valley, has a church of the 11th and 12th centuries fortified with battlements.

**ROYER-COLLARD, PIERRE PAUL** (1763-1845), French statesman and philosopher, was born on the 21st of June 1763 at Sompuis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. His mother, Angélique Perpétue Collard, was a woman of unusual strength of character and of austere piety. Pierre Paul Royer was sent at twelve to the college of Chaumont of which his uncle, Father Paul Collard, was director. He subsequently followed his uncle to Saint-Omer, where he studied mathematics. At the outbreak of the Revolution, which moved him to passionate sympathy, he was practising at the Parisian bar. He was returned by his section, the Island of Saint Louis, to the Commune, of which he was secretary from 1790 to 1792. After the revolution of the 10th of August in that year he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of the 12th Prairial (31st of May 1793)

he was in danger of his life. He returned to Sompuis, and was saved from arrest possibly by the protection of Danton and in some degree by the impression made by his mother's courageous piety on the local commissary of the Convention. In 1797 he was returned by his department (Marne) to the Council of the Five Hundred, where he allied himself especially with Camille Jordan. He made one great speech in the council in defence of the principles of religious liberty, but the *coup d'état* of Fructidor (4th of September 1797) drove him again into private life. It was at this period that he developed his legitimist opinions and entered into communication with the comte de Provence (Louis XVIII.). He was the ruling spirit in the small committee formed in Paris to help forward a Restoration independent of the comte d'Artois and his party; but with the establishment of the Consulate he saw the prospects of the monarchy were temporarily hopeless, and the members of the committee resigned. From that time until the Restoration Royer-Collard devoted himself exclusively to the study of philosophy. He derived his opposition to the philosophy of Condillac chiefly from the study of Descartes and his followers, and from his early veneration for the fathers of Port-Royal. He was occupied with the erection of a system which should provide a moral and political education consonant with his view of the needs of France. From 1811 to 1814 he lectured at the Sorbonne. From this time dates his long association with Guizot. Royer-Collard himself was supervisor of the press under the first restoration. From 1815 onwards he sat as deputy for Marne in the chamber. As president of the commission of public instruction from 1815 to 1820 he checked the pretensions of the clerical party, the immediate cause of his retirement being an attempt to infringe the rights of the university of Paris by giving university diplomas, independent of university examinations, to the teaching fraternity of the Christian Brothers. Royer-Collard's acceptance of the Legitimist principle did not prevent a faithful adhesion to the social revolution effected in 1789, and he protested in 1815, in 1820, and again under the monarchy of July against laws of exception.

He was the moving spirit of the "Doctrinaires," as they were called, who met at the house of the comte de Ste. Aulaire and in the salon of Madame de Staël's daughter, the duchesse de Broglie. The leaders of the party, beside Royer-Collard, were Guizot, P. F. H. de Serre, Camille Jordan and Charles de Rémusat. In 1820 he was excluded from the council of state by a decree signed by his former ally Serre. In 1827 he was elected for seven constituencies, but remained faithful to his native department. Next year he became president of the chamber, and fought against the reactionary policy which precipitated the Revolution of July. It was Royer-Collard who in March 1830 presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1839. He died at his estate of Châteaueux, near Vitry, on the 2nd of September 1845. He had been a member of the Academy since 1827. Royer-Collard married in 1790 Mlle. de Forges de Châteaueux. The two daughters who survived to womanhood received an education of the utmost austerity.

Royer-Collard left no considerable writings, but fragments of his philosophical work are included in Jouffroy's translation of the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Barante, *Vie politique de M. Royer Collard. ses discours et ses écrits* (2 vols., 1861). There are also biographies by M. A. Philippe (1857), by L. Vingtain (1858), by E. Spuler (1893), in *Grands écrivains français*. Cf. E. Faguet, *Politique et morale du XIX<sup>e</sup> siècle* (1891); H. Taine, *Les Philosophes français du XIX<sup>e</sup> siècle* (1857); L. Saché, *Les Derniers Jansénistes* (1891); and Lady Blennerhassett, "The Doctrinaires" in the *Cambridge Modern History* (vol. x. chap. ii., 1907). For further references see H. P. Thieme, *Guide bibliographique* (Paris, 1907).

**ROYLE, JOHN FORBES** (1799-1858), British botanist and teacher of materia medica, was born in Cawnpore in 1799. Entering the service of the East India Company as assistant surgeon, he devoted himself to studying botany and geology, and made large collections among the Himalayan Mountains. He also investigated the medical properties of the plants of

Hindustan and the history of their uses among the native races. The results of these investigations appeared in an essay *On the Antiquity of Hindoo Medicine* (1837). For nearly ten years he held the post of superintendent of the East India Company's botanic garden in the Himalayas at Saharanpur. In 1837 he was appointed to the professorship of materia medica in King's College, London, which he held till 1856. From 1838 onwards he conducted a special department of correspondence, relating to vegetable products, at the East India House, and at the time of his death he had just completed there an extensive and valuable museum of technical products from the East Indies. In 1851 he superintended the Indian department of the Great Exhibition. He died at Acton near London on the 2nd of January 1858.

The work on which his reputation chiefly rests is the *Illustrations of the Botany and other branches of Natural History of the Himalaya Mountains, and of the Flora of Cashmere*, in 2 vols. 4to, begun in 1839. In addition he wrote *An Essay on the Productive Resources of India* (1840), *On the Culture and Commerce of Cotton in India and Esiweho* (1851) and *The Fibrous Plants of India fitted for Cordage* (1855), together with papers in scientific journals.

**ROYSTON**, a market town in the Hitchin parliamentary division of Hertfordshire, England, close to the border of Cambridgeshire, 48 m. N. of London by the Cambridge branch of the Great Northern railway. Pop. of urban district (1901) 3517. The church of St John the Baptist is mainly Early English. There are a market house, and institute with library and museum. Beneath a street in the town is a curious example of a hermit's cave, excavated in the chalk, and containing rude carvings of the crucifixion and other sacred subjects. It was discovered in 1742. The town lies on the Roman Ermine Street, at the point where it strikes from the hills across the plain, and its straight course is deflected slightly W. Roman relics have been found, and several barrows and earth-mounds occur on the neighbouring hills. A monastery of Augustinian canons was founded here towards the close of the 12th century, but there are no remains.

**ROYTON**, an urban district of Lancashire, England, within the parliamentary borough of Oldham, 2 m. N. of Oldham on the Lancashire & Yorkshire railway. Though of early origin, it is, as a town, of wholly modern growth. The cotton manufacture is its chief industry. Pop. (1901) 14,881.

**ROZAS, JUAN MARTINEZ DE** (1759-1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago. He held the post of acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning his position as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national Junta on the 18th of September 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called together in July 1811. But at the end of that year divisions began to arise between Rozas' followers from Concepción and the men of Santiago; and a feud broke out between Rozas and José Miguel Carrera (q.v.) who had secured control of Santiago. In 1812 Carrera succeeded in securing the banishment of his rival, who retired to Mendoza, where he died on the 3rd of March 1813.

See P. B. Figueroa, *Diccionario biográfico de Chile, 1550-1887* (Santiago, 1888), and J. B. Suarez, *Rasgos biográficos de hombres notables de Chile* (Valparaiso, 1886); both giving biographical sketches of prominent characters in Chilean history.

**RUABON** (*Rhiwabon*), a town of Denbighshire, N. Wales, in the E. parliamentary division, near the Shropshire border, 5 m. S.W. of Wrexham, on the Great Western railway. Pop. (1901) 3248. It is situated on a small tributary of the Dee. The old Gothic church is thought by some to have been founded by Mabon, a brother of Llewelyn (13th c.), and has monuments

to the Wynn family, by Nollekens and Rhysbrac, and to Dr D. Powel (d. 1598), translator into English of Caradoc's (of Llancarfan) *History of Wales*. In the neighbourhood are collieries, engineering works, an iron foundry and chemical works, besides an extensive industry in glazed and other bricks. Near Ruabon is Caerdden (*Coerddis*), an ancient camp (village) surrounded by circular intrenchments, and Wynnstay, with an avenue of fine trees. Antiently the residence of Madoc ab Gruffyd Maelor (founder of Valle Crucis Abbey), it was called Wattstay, from Watt's Dyke, an old rampart on the estate. It was named Wynnstay on its coming into possession of the Wynns (17th c.). Offa's Dyke, near here, is 10 ft. high, and broad enough for two carriages abreast. Not far is Chirk Castle (supposed to have been built in 1013), besieged by Cromwell's artillery: near it, in the Ceiriog valley, the defeat of Henry II. by Owen Gwynedd took place in 1165.

**RUBBER**, **INDIARUBBER** or **CAOUTCHOUC** (a word probably derived from *Cahuca* or *Cawcho* the names in Ecuador and Peru respectively for rubber or the tree producing it), the chief constituent of the coagulated milky juice or latex furnished by a number of different trees, shrubs and vines. The latex of the best rubber plants furnishes from 20 to 50% of rubber. The latex is not to be confused with the sap of trees, on the circulation of which their nutrition depends. Though frequently occurring, it is not a universal feature of plant life, and does not appear to be necessary or even directly connected with the nutritive system of plants. Its exact function is not fully understood. Latex, though chiefly secreted in vessels or small sacs which reside in the cortical tissue between the outer bark and the wood is also found in the leaves and sometimes in the roots or bulbs. The trees and plants whose latices furnish caoutchouc in considerable quantity chiefly belong to the natural orders Euphorbiaceae, Urticaceae, Apocynaceae, Asclepiadaceae. The latex is usually obtained from the bark or stem by making an incision reaching almost to the wood when the milky fluid flows more or less readily from the laticiferous vessels. It is, like milk, an emulsion, and when examined with the microscope is seen to consist of numerous globules suspended in a watery fluid. On standing, some latices separate, more or less readily, into an upper layer resembling cream and consisting of the globules, and a lower watery layer. This separation can be rapidly effected with some latices by the use of a centrifugal machine, but this method has not yet been applied to any extent commercially. The globules which furnish the cream gradually pass on standing into solid caoutchouc, a process which is facilitated by rapid stirring, or by the addition of an acid or other chemical agent. If the latex is warmed or an acid, an alkali or astringent plant juice is added to it, "coagulation" usually takes place more or less readily, the caoutchouc separating in solid flakes or curds. The efficacy of heat or of an acid, an alkali or other agent in promoting coagulation depends on the character of the latex, and varies with that obtained from different plants. The watery fluid in which the globules are suspended holds certain proteids, carbohydrates and a small proportion of salts in solution. The latex exhibits a neutral, acid or alkaline reaction depending upon the plant from which it has been obtained.

When exposed to air the latex gradually undergoes putrefactive changes accompanied by coagulation of the caoutchouc. The addition of a small quantity of ammonia or of formalin to some latices usually has the effect of preserving them for a considerable time. The nature of the coagulation is not yet completely understood. It has been compared with that of milk and of blood, which depend essentially on the coagulation or separation in curds of a proteid or albuminous substance, such as takes place when white of egg is warmed. There is, however, reason to believe that the coagulation of latex into rubber is not mainly of this character. The globules in the latex are liquid, and the phenomenon of coagulation would seem to consist in the passage of this liquid into solid caoutchouc through the kind of change known as polymerization or condensation, in which a liquid passes into solid without alteration

of composition or by condensation with the elimination of the elements of water. The effect of chemical agents in producing coagulation are in consonance with what is known of other instances of polymeric or condensation changes, whilst the fact that the collection of globules separated by creaming after thorough washing, and therefore removal of all proteid, is susceptible of solidification into caoutchouc by a merely mechanical act such as churning, strongly supports the view that the character of the change is distinct from that of any alteration which may occur in the proteid constituents of the latex.

The existence of caoutchouc or rubber was first observed soon after the discovery of America. It was noticed that certain Indian tribes of South America played with a ball composed of a resilient and elastic substance, which afterwards was found to possess the power of removing lead pencil marks from paper and came into commerce as "Indian Rubber." It was not until the middle of the 18th century that the trees which yielded caoutchouc were identified, chiefly by French observers. La Coudamine ascertained the nature of the tree, now known as *Hevea brasiliensis*, from which the Para rubber of S. America was obtained, whilst a little later Fresnau and Aublet described the Euphorbiaceous trees which furnished the rubber of Guiana.

The methods adopted by the natives in S. America and in Mexico for incising the trees and obtaining the rubber are exceedingly primitive, but survive with little modification at the present day.

*Statistics of Rubber Production.*—Until recently rubber was obtained almost exclusively from the tropical forests of S. and Central America, E. and W. Africa and Asia, being the produce of naturally occurring trees and vines. The increase in the demand, for which the employment of rubber tires is largely responsible, has given an increased stimulus to the production of "wild" rubber, with the result that trees and vines have been recklessly cut and destroyed, and in some instances vast regions, as in the S. Sudan, have been nearly entirely denuded of rubber vines. This has led to restrictive measures, the vines being tapped under definite regulations as to the manner and time of tapping, and also to requirements as to replanting vines to take the place of those which have been injured or destroyed, certain areas being periodically closed. Such measures, which are now in operation in the French Sudan, the Congo and in German W. and E. Africa, can, however, only be enforced by special administrative machinery and at considerable expense, and this legislative action can only be regarded as temporary and preliminary to the establishment of plantations of rubber trees, which are not only easier to control, but the trees are less liable to injury from careless tapping. In Africa it seems probable that the production of rubber from vines is likely to be entirely superseded in process of time, and replaced by the plantations of trees which are already being established in those districts in which careful experiment has determined the kind of rubber tree best adapted to the locality. The forests of tropical America have suffered similarly, trees having been injured or destroyed and in some cases cut down in order to secure the immediate increase of supply which was called for by a considerable rise in value. The result has been that in the forests of Brazil and Mexico the conservation of rubber trees has received greater attention, whilst new and extensive areas are planted in S. and Central America. The wild rubber of S. and Central America is still the principal source of the rubber supply of the world, and is likely to continue to be so for many years to come. Although the cost of transport from the remote forest regions of some districts is a serious consideration, this is not likely to be operative in reducing production until there has been a considerable and permanent fall in price, by which time new areas in those countries in which planting is now taking place will probably have come into bearing.

The enormous increase in the commercial demand for rubber and the probability of the continuance of this increase in view

of the great variety of purposes to which the material can be applied, has led to great activity in rubber planting in other parts of the world, especially in Ceylon and the Malay Peninsula and Archipelago, where the Para rubber trees (*Hevea brasiliensis*) has been successfully introduced, and numerous plantations, many of which have not been in existence for more than ten or fifteen years, are now contributing to the world's supply. This rubber is known as "Plantation" rubber in contradistinction to the "wild" rubber.

"Plantation" Para rubber from Ceylon and the Malay States has brought prices equal to and often exceeding those of fine Para rubber from Brazil. This is largely due to the improved methods of preparing the rubber practised by the planters of Ceylon and Malaya, which lead to the exclusion of the impurities usually found in "wild" rubber. Para rubber from Brazil generally contains about 15% of water, whilst "plantation" Para is usually nearly dry and contains 1% of water or less. It would appear, however, that the finest "wild" Para rubber as a rule possesses greater tensile strength than the "plantation" rubber. This has been ascribed by some to the presence in "wild" rubber of certain impurities derived either from the latex or introduced during the preparation of the rubber which are thought to enhance the physical properties of the caoutchouc. It is more probable, however, that the superiority of the "wild" Para is principally due to the greater age of the forest trees from which the rubber is obtained, many of which are from thirty to fifty years old. It is well known that the *Hevea* tree usually furnishes very inferior rubber if tapped before it is six or seven years old, and there is evidence to show that the quality of the rubber improves with the age of the tree. The oldest of the plantation trees of Ceylon and Malaya are not much more than twelve years old, whilst it is to be feared that immature trees are often tapped and their latex mixed with that of older trees before coagulation, thus forming inferior rubber. It is therefore to be expected that as time goes on the quality of "plantation" rubber will improve, and there would seem to be no reason why it should not eventually be fully equal to that of the "wild" rubber.

In 1909 the total production of rubber is stated to have been about 70,000 tons, of which more than one-half came from tropical America, about one-third from Africa, whilst the remainder was chiefly of Asiatic origin, including "plantation" rubber from Ceylon and Malaya, which amounted to about 300 tons.

Chiefly owing to the supplies of "wild" rubber which are still available, comparatively little has been done until recently in establishing plantations either in Africa or in tropical America, but in Asia, including Ceylon, India and Malaya, in which there are relatively few important naturally-occurring rubber plants, there has been for some years great activity in forming plantations of rubber trees introduced mainly from tropical America, and there are now many millions sterling of British capital invested in companies established to form rubber plantations chiefly in Ceylon and Malaya. Each year should therefore show an increase in the production of plantation rubber. No trustworthy estimate of the rate of the increase of production can, however, be formed, as several uncertain economic factors have to be taken into account. Among these are the precise extent of demand, the limit of the inevitable fall in price with largely increased production, the cost of labour as increasing amounts are required, and the effect of changed conditions on the output of "wild" rubber and the competition of the new plantations which are being established in tropical America.

There can be little doubt that with a fall in price further uses for rubber would arise, leading to an increased demand, and among them may be mentioned its utilization as a road material. Difficulties in the supply of labour in the East may hinder the further development of the rubber-planting industry, especially at a period when a reduction in the cost of production may be the chief problem. In 1909 the average cost of producing "plantation" rubber in Ceylon and Malaya

may be stated approximately to have been from 10d. to 1s. per lb. The cost of collecting "wild" rubber is less easy to state with any approach to accuracy, since the cost varies in different districts of S. and Central America, but the average cost is stated not to be less than 1s. per lb. In Africa the cost of collection is much less, but the rubber is generally of inferior quality.

The market price of commercial rubber is determined by the current price of "fine Para" from S. America. This is subject to considerable fluctuation, and varied in 1900 to 1908 from 2s. 10d. to 5s. 0d. a lb. As much as 6s. 0d. per lb was given for specially prepared "plantation Para." Towards the latter part of 1904 the price of fine Para reached a high level and then considerably declined, reaching in 1907-8 a lower figure than had been recorded since 1900. At the beginning of 1908 the price gradually rose again to the neighbourhood of 4s. a lb. During 1909, without any serious decline in production, the price rapidly rose, owing to extraordinary causes, to about 10s. a lb, and in the early part of 1910 rose to over 12s. a lb, and subsequently fell to about half this price. Having regard to the present cost of producing "plantation" rubber, and to the probability that, apart from a possible increase in the price of labour, this cost is susceptible of further reduction, it may be concluded that rubber production will continue to be profitable even should a considerable fall in market value take place.

**The Principal Rubber Trees, their Cultivation, and the Preparation of Rubber.**—Most commercial rubber is derived from natural supplies, from the wild rubber trees of S. and Central America, India and Africa. Each year, however, the output of "plantation" rubber will show a considerable increase, and it is to be expected that ultimately this will form the chief source of supply, unless unforeseen circumstances should arise to interfere with the development of the plantation industry, which has been vigorously started chiefly with European capital in the tropical possessions of Great Britain, France and Germany. The best rubber is now obtained from large trees, of which the following are the more important:—

1. "Para" rubber, which takes the first position in the market, is derived from species of *Hevea*, principally *Hevea brasiliensis*, of which there are enormous forests in the valleys of the Amazon and its tributaries, and also in Peru, Bolivia, Venezuela and Guiana. In Brazil alone it is stated that the rubber area amounts to at least one million sq. m. The tree has been recently planted with great success especially in Ceylon and Malaya (Plate figs. 11 and 12).

2. "Ceara" or Maniok rubber is derived from species of *Manihot*, chiefly *Manihot Glaziovii*, a native of S. America especially abundant in Brazil, and successfully introduced into other countries (Plate fig. 13). The latex of this tree flows less freely than that of *Hevea brasiliensis*, and the collection of large quantities of the latex is attended with considerable difficulty. The latex is therefore usually allowed to coagulate on the tree, as it slowly exudes from the incision. On this account it is often exported in strings or "scrap" and not usually in biscuits or balls. Partly for this reason and partly because pieces of wood and dirt are apt to be included with the scrap, the market value of Ceara rubber is usually less than that of Para. The plantations of *Manihot* established in E. Africa, Ceylon and S. India have, however, begun to furnish a better quality of Ceara rubber, which is often prepared in biscuit form. Other species of *Manihot* are also under trial, and some give promise of good results, especially *M. dichotoma* and *M. heptaphylla*.

3. The "Ule" rubber of Central America and British Honduras originates from *Castilloa elastica*. In S. America its natural occurrence appears to be limited to west of the Andes, but the tree is abundant in Mexico, Guatemala and Nicaragua. The rubber comes into commerce in thick strips or sheets or as "scrap." The rubber is usually dark in colour and is often contaminated with proteid impurities derived from the latex. Ule rubber is generally inferior in strength to Para and commands a lower price. The *Castilloa* tree has been experimentally planted in Ceylon, the West Indies and other countries (Plate fig. 14).

Other trees occurring in S. America which furnish rubber of secondary commercial importance are *Hancornia speciosa*, yielding the Mangabeira rubber of Brazil, and species of *Sapium* furnishing the Colombian rubber and much of the rubber of Guiana (derived from *Sapium Jenmanni*), which is scarcely inferior to the rubber of Para.

4. "Rambong" or Assam rubber is the produce of *Ficus elastica*, commonly known as the indiarubber tree and cultivated in Europe as an ornamental plant. This tree, indigenous to Asia, attains large

dimensions in India, Ceylon and the Malay Archipelago (Plate fig. 15). It furnishes most of the rubber of India, Sumatra and Java. Although intrinsically of excellent quality, Rambong rubber, owing to the careless method of collection practised by the natives which leads to the inclusion of much impurity, usually fetches a lower price than Para. The tree has not been introduced into W. Africa and Egypt, but has not proved very successful in Africa as a rubber producer.

5. "Lagos" rubber is the produce of the African rubber tree *Funtumia dashica*, which is indigenous to Africa from Uganda to W. Africa (Plate fig. 16). It is known as the silk rubber tree, probably on account of the silky hairs which are attached to the seeds. The latex, which is usually coagulated by standing or by heating, is obtained from incisions in the bark of the tree. The rubber is of good quality, though, owing to the method of preparation adopted, the product is often impure and discoloured, and consequently usually brings a lower price than the best rubbers of commerce.

6. Besides the trees described above, a number of climbing plants or vines belonging to the Apocynaceae secrete a latex which furnishes rubber of good quality. These vines are less satisfactory than trees as rubber producers, owing to the readiness with which they are injured and destroyed by careless tapping, and to the difficulty of regulating these methods in the case of vines distributed over enormous areas of forest. Of these vines the most important are the species of *Landolphia* which occur throughout tropical Africa, including the Sudan, Congo, Mozambique and Madagascar, the principal of which are *Landolphia ovarianensis* and *L. Heudelotii*, common throughout W. Africa, and *L. Kirkii* and *L. Daviei* in E. Africa. The rubber is obtained by incising the stems of the vines and coagulating the latex by exposure, by admixture with acid vegetable juices or by heating. *Landolphia* rubber is usually roughly prepared and in consequence commands a low price. The vines of species of *Cliandra* and *Carpodinus* in W. Africa also furnish good rubber, as do the *Forsteronia gracilis* of British Guiana and *Forsteronia floribunda* of Jamaica. Vines resembling *Landolphia* are widely distributed in Asia. Among these are species of *Willughbeia* and *Leuconotis*, from which much of the rubber exported from Borneo is derived; *Parameria glandulifera*, common in Siam and Borneo, and *Urceola esculenta* and *Cryptostegia grandiflora*, both common in Burma.

Among other sources from which rubber is commercially obtained may be mentioned the Guayule plant (*Parthenium argentatum*) of Mexico, and the "Ecaenda" plant of Portuguese W. Africa, from the tuberous roots of which rubber is extracted by the natives. The "Ecaenda" plant has been named *Raphanocome utilis*. The root rubber prepared by the natives of the Congo and the S. Sudan is extracted partly from the roots of *Landolphia* or from the rhizomes of *Landolphia thallosis* or *Carpodinus lanceolatus*. It is obtained by breaking up the roots or rhizomes in hot water and separating the rubber, and machines have now been devised for this purpose. Little is at present known of the large rubber tree of Tonkin (*Blackrodea tonkinensis*), the latex of which is stated to furnish excellent rubber.

#### SOURCES OF COMMERCIAL RUBBER

1. **PARA RUBBER** is so named from the Para province of Brazil, from the principal town of which, also known as Para, most of the rubber is shipped. This rubber is obtained chiefly from *Hevea brasiliensis*, Müll. Arg., a large euphorbiaceous tree upwards of 60 ft. in height, and having trifoliate leaves, the leaflets being lanceolate and tapering at both ends (fig. 1). The trunk reaches about 8 ft. in circumference. The flowers are usually pale green. The fruit is a capsule containing three seeds rather larger than coconuts, having a brown smooth surface figured with black patches. The seeds readily lose their vitality, and on this account need special care in transport. They should be loosely packed in dry soil or charcoal. These seeds have been examined at the Imperial Institute, and the kernels have been found to contain nearly half their weight (48%) of an oil resembling linseed oil and applicable for the same purposes. The residue or "cake" left after expression of the oil is apparently nutritious and may prove to be of value for feeding animals. There is present in the seeds an enzyme which rapidly decomposes the oil if the seeds are crushed and kept, setting free a fatty acid and glycerin. As the seeds are very abundant, they will probably be utilized commercially as soon as the demand for planting has subsided.

In Brazil the trees are found in different districts, but flourish best on rich alluvial clay slopes by the side of rivers, where there is a certain amount of drainage, and the temperature reaches from 89° F. to 94° F. at noon and is never cooler than 73° F. at night, while rain falls during about six months and the soil and atmosphere are moist throughout the year. The genus *Hevea* was formerly called *Siphonia*, and the tree named *Pa de Xerringa* by the Portuguese, from the use by the Omapua Indians of squirts or syringes made from a piece of pipe inserted in a hollow flask-shaped ball of rubber. The trees are not generally tapped until they are ten to fifteen years old, as young trees yield inferior rubber. If carefully conducted, tapping does not injure the tree. The latex is collected in the so-called dry season between June and February. The trees are tapped in the early morning when the latex is most readily obtained.

To obtain the latex, deep incisions are made near the base of the tree extending up the trunk. Small shallow cups are placed below the

FIG. 1.—*Hevea brasiliensis*.

incisions to receive the milk, each cup being attached by sticking a piece of soft clay to the tree and pressing the cup against it. The latex, of which each tree yields only about 6 oz. in three days, has a strong ammoniacal odour, which rapidly disappears, and in consequence of the loss of ammonia the latex will not keep for longer than a day unchanged; hence when it has to be carried to a distance from the place of collection, 3% of ammonia solution is added. The latex usually furnished about 30% of rubber.

To obtain the rubber, the latex is usually treated in the following manner. A piece of wood about 3 ft. long, with a flattened end forming a kind of paddle, is dipped in the milk, or this is poured over it as evenly as possible. The milk is then carefully dried by turning the mould round and round in the smoke produced by burning wood mixed with certain oily palm nuts; those of *Attalea excelsa* are considered best, the smoke being confined within certain limits by the narrowness of the neck of the pot in which the nuts are heated. The creosote and other products from the smoke no doubt act antiseptically and prevent to a large extent the subsequent putrefaction of the proteids retained by the coagulated rubber. Each layer of rubber is allowed to become firm before forming another; a practised hand can make 5 or 6 lb in an hour. In some districts a stout stick is substituted for the paddle, on which the rubber as it coagulates is wound cylindrically. The rubber thus prepared is the finest that can be obtained. The cakes when completed are, in order to remove them from the mould, slit open with a sharp knife, which is kept wet, and are hung up to dry. The flat rounded cakes of rubber made in this manner are known in the London market as "biscuits." They retain about 15% of moisture. The scrapings from the tree, which contain fragments of wood, are mixed with the residues of the collecting pots and the refuse of the vessels employed, and are made up into large rounded balls, which form the inferior commercial quality called "negrohead," and often contain 25 or 35% of impurity. The yield of rubber varies, but it is stated on an average to be 10 lb of rubber per tree, and if carefully tapped one tree will yield this amount for many years in succession.

*Plantations of Hevea brasiliensis*.—*Hevea brasiliensis* was introduced to Ceylon and Singapore from seedlings raised at Kew from Brazilian seed, specially collected by Mr H. A. Wickham in S. America. The seedlings rapidly developed and in most places in which they were planted grew into large trees which furnished satisfactory latex when tapped in their sixth or seventh year. Ever since plantations of *Hevea* have been made on an increasing scale in the Straits Settlements, the Federated Malay States and in Ceylon, and at the present time rubber plantations form the principal industry in these colonies. Successful plantations of *Hevea* have also been established in Java, Sumatra and Borneo. Many of these plantations have not yet reached the productive stage—that is, the sixth or seventh year. A large number of plantations in British Malaya and Ceylon are now actively exporting increasing quantities of rubber. *Hevea* seedlings were also introduced into India, but did not apparently succeed except in Burma and S. India.

It may be estimated that between one and two million acres of land in the different countries referred to have been already

appropriated for rubber plantations. Plantations are also being formed in British, French and German possessions in W. Africa and in the Congo, also in the tropical portions of Australia. In certain districts of British W. Africa the *Hevea* which has been planted promises well, especially in the Gold Coast, where good yields of latex are stated to have been obtained.

It may be useful to summarize here the experience which has been gained in the formation of plantations of *Hevea* and in the production of rubber.

*Hevea brasiliensis* as a rule flourishes to the greatest extent at low altitudes on rich soil capable of retaining moisture. The nature of the soil appears, however, to be of secondary importance, provided that it is able to hold moisture and that climatic conditions of high and even temperature with considerable rainfall and absence of wind are satisfied. Although the tree is sensitive to such conditions, it appears to possess a certain capacity of adaptation which should be borne in mind. Generally a low altitude is desirable, but good results have been obtained in Ceylon in sheltered positions at elevations of 3000 ft. and over, although at higher altitudes the growth of these trees appears to be slower. In many plantations besides catch crops (cassava, sesame, ground-nuts, &c.) other crops, such as tea, coffee, cocoa and tobacco, are grown with rubber. It is improbable, except in the early stages of the rubber tree, that this procedure will succeed; the rubber will ultimately dominate the position to the detriment and ultimate extinction of the other crop, whilst the growth of the rubber tree will be retarded. A partial exception may perhaps be made in the case of cocoa, when the two plants are placed not too closely in about equal numbers. In these circumstances it appears that satisfactory results may be obtained from both crops, at any rate for a certain number of years.

The experience of planters in general is in favour of the complete removal of weeds from a rubber plantation. This practice, which involves periodical weeding, adds considerably to the cost of maintaining plantations, and although justified so far by results, possesses several other disadvantages. During the tropical rains the soil is liable, to a greater or less extent, to denudation, which becomes very serious when the land slopes; and in any case, the soil is apt to become impoverished by the loss of its soluble constituents. These disadvantages are at their maximum when the rubber trees are quite young. At a later stage the shade of the large trees compensates to a considerable extent for the absence of cover on the ground. Another disadvantage of uncovered soil in a plantation of young rubber trees is that the ground under the heat of a tropical sun rapidly loses its moisture. For this reason proposals have been made to plant in the place of weeds low-growing leguminous plants, the growth of which will not only prevent impoverishment and loss of soil during the rains and conserve moisture in the heat, but will also have the effect of enriching the soil in nitrogenous constituents through the power leguminous plants possess of absorbing nitrogen from the air through nodules on their roots. Among the plants which are being tried for this purpose are various species of *Crotalaria*, passion-flower, and the well-known sensitive plant of the East. The success of the method cannot yet be judged, but the experiment is one which deserves very full trial.

One of the most important subjects in connexion with rubber plantations is the method to be adopted in tapping the trees for latex. The native methods in vogue in Brazil and Mexico are primitive and often injurious to the tree. At present it cannot be said that finality has been reached on the subject of the best method, giving a good return of latex with a minimum of damage to the tree. A method at one time largely adopted was to make a series of V-shaped incisions on four sides of the tree to a height of about 6 ft. from the base—that is, within the reach of an ordinary man without the need for ladder or scaffolding; the latex obtained from the upper part of the tree is said to furnish less rubber and of poor quality.

The latex is collected in cups placed at the apex of each V. Other systems are the herring-bone plan of a vertical channel

FIG. 2.—Tapping, herring-bone system

with lateral connecting channels about 1 ft. apart at an angle of about 45°, the latex being collected in cups placed at the base of the vertical channels (fig. 2); the spiral system, in which a series of spiral grooves are cut all round the trunk, by which means virtually the entire area of the trunk is tapped. In some instances a combination of these methods is employed. The V-system is the oldest, but is being largely superseded by the herring-bone; the spiral system is more recent and is still on trial.

Instead of the axe or large knives which frequently inflicted serious damage to the trees, special small knives and prickers are now employed so constructed as to avoid injury to the tree through making a larger incision than is necessary, and without penetrating into the wood below the laticiferous layer. It is possible to tap or prick trees daily for a number of years without apparent injury, but the practice of tapping on alternate days appears to be safer and to afford equally satisfactory if not better results. The yield of latex is at first small, but increases with successive tapplings, which appear to stimulate the local production of latex, and finally reaches a maximum.

When the bark has been removed a period of from three to four years must elapse before it is so fully renewed as to render fresh incisions possible. In the case of a tree from seven to ten years old, tapping is so arranged that by the time the last incisions on the original growth are made, the new growths on other portions are at least four years old, and ready for new incisions to be made. Too frequent tapping leads to the production of latex poor in caoutchouc, whilst tapping of trees before they are six or seven years old, and from 20-25 in. in circumference, produces inferior rubber. As a rule, an annual yield of more than 1-2 lb of rubber per tree must not be looked for from recent plantations, although much higher yields up to 10-15 lb and over per tree are recorded from S. America, and it is therefore probable that with greater experience as to the best methods of tapping and with older trees considerably larger yields may be expected from plantations in the future. An average of 150 trees to the acre (20x15 ft.) and a yield of 1½ lb of rubber per annum per tree at 2s. 6d. per lb gives the result of £28, 2s. 6d. per acre. The cost of production may be assumed to be about 1s. per lb, to which has to be added the expense of transport. The cost of clearing forest land and planting with rubber in Ceylon is estimated at about 100 Rs. per acre in the first year, and from 20-30 Rs. per acre in subsequent years until the sixth year, when the plantation would begin to be productive.

The point of next importance is the coagulation of the latex so as to produce rubber in the form and of the quality required by the manufacturer. The primitive methods of coagulation and curing practised in S. America undoubtedly are susceptible of considerable improvement, and certainly waste can be reduced to a minimum. It is, however, important to remember that rough as these native methods are they result in the production of rubber which commands the highest price. As the removal of the impurities of the latex is one of the essential points to be aimed at, it was thought that the use of a centrifugal machine to separate the caoutchouc as a cream from the watery part of the latex would prove to be a satisfactory process. This method is said to answer well with the latex of *Castilloa*, but it appears to be inapplicable to the latex of *Hevea*, which does not cream readily when centrifugized.

The plan usually adopted is to collect the latex in rectangular tanks or casks. It is then coagulated by the addition of an acid liquid, acetic acid or lime juice being generally employed, and the mixture allowed to stand. The coagulated rubber separates as a mass of spongy caoutchouc. If the coagulation has been effected in shallow dishes, the rubber is obtained in a thin cake of similar shape known as a "biscuit."

The rubber thus formed is washed and dried. The coagulated rubber separated from the watery fluid is cut up into small pieces and passed through the grooved rollers of the washing machine, from which it issues in sheets, long crinkled ribbons or "crêpe," which are then dried in hot air chambers or in a vacuum dryer, by which means the water is dissipated at a lower temperature. In order to prevent decomposition of any proteid impurity which may remain incorporated with the rubber, the freshly coagulated rubber is sometimes cured in the smoke of burning wood or a small quantity of an antiseptic such as creosote is added during coagulation.

Plantation rubber comes into commerce in the form of the crinkled ribbons known as crêpe, in sheets or biscuits, and sometimes in large blocks made by compressing the crêpe rubber. Block rubber is considered to possess certain advantages in securing a constant proportion of water, and in being satisfactory for transport. The best condition and form in which to export rubber cannot be regarded as settled. The probabilities are that in the end the production of a rubber as nearly as possible free from water and impurities and of constant composition will be realized as best meeting the requirements of the modern manufacturer. The need for scrupulous cleanliness in the preparation of rubber is now recognized, and the arrangements of a rubber factory in Ceylon or Malaya are comparable with those of the modern dairy.

In the present transition stage of rubber production it is necessary for the manufacturer in Europe to wash all rubber. He receives

both the wild rubber containing variable quantities of impurity and the purer plantation rubber, the latter, however, in much smaller amount. The fact that at present washing machinery exists in all European factories and that most of the rubber received needs washing, leads to the greater purity of plantation rubber, except for special purposes, being generally discounted by the manufacturer. As soon as the output of plantation rubber of constant composition has reached much larger dimensions it is probable that the manufacturer will be able to dispense with washing. This will operate to the advantage of plantation rubber and against the wild rubber, so long as the latter is not exported in a purer condition.

So far the *Hevea* plantations in Ceylon and the East have not been seriously troubled by insect or fungoid pests, and those which have occurred have succumbed to proper treatment. The most serious trouble has been occasioned in the Malay States by a white thread-like fungus (*Fomes semitostus*) which attacks the roots of the *Hevea* tree and eventually kills it. The development of this fungus is greatly promoted by the presence of decaying stumps and wood in the plantation. Vigorous measures are now taken in many plantations to remove all old wood and to extract stumps of old trees, which in the first instance it was considered unnecessary to remove.

2. *Manihot Glaziovii* belonging to the Euphorbiaceae is the tree of N.E. Brazil which furnishes Ceara or Manioba rubber (fig. 3).

It is closely related to the Manioc, cassava or tapioca plant (*Manihot utilissima*) which resembles when young and exhibits a similar tuberous root system. The tree grows well on dry and rocky soil without rain for a considerable period of the year, and flourishes at high altitudes up to about 4000 ft. It is therefore adapted for conditions which are unsuitable for *Hevea*. The tree grows about 30 ft. high, with a rounded head of foliage, and greyish-green 3 to 7-lobed palmate leaves, somewhat resembling the leaves of the castor-oil plant in shape and size. The seeds (fig. 3), which are abundant and retain their vitality well, have a hard thick coat. The seeds take a year to germinate, unless the edges near the end bearing the caruncular projecting are rasped off. Cuttings, if they have a single bud, strike readily.

The trees are tapped when they are about five years old. The mode of collecting the rubber is as follows. After brushing away the loose stones and dirt from the root of the tree by means of a handful of twigs, the collector lays down large leaves for the latex to drop upon. He then slices off the outer layer of the bark to the height of 4 or 5 ft. The latex, which exudes slowly and in many tortuous courses, some of it ultimately falling on the ground, is allowed to remain on the tree for several days, until it becomes dry and solid, when it is pulled off in strings, which are either rolled up into balls or put into bags in loose masses, in which form it enters commerce under the name of Ceara "scrap." Ceara rubber is also exported in the form of lumps and cakes. The annual yield of rubber is rather more than 1 lb per tree. The latex coagulates readily, especially if churned or if diluted with water, when a purer rubber is obtained.

The *Manihot* tree has been widely introduced into other countries, and appears to succeed wherever the rainfall is not excessive. In Ceylon and in some parts of India, especially in Madras, it has succeeded well. In W. Africa the tree flourishes, but it is under trial as a rubber producer. The *Manihot* tree also promises well in E. Africa, Nyasaland and the Mozambique. The pure Ceara rubber, as for example the "biscuits" prepared in Ceylon, is of excellent quality, scarcely if at all inferior to Para. That derived from Brazil, however, is generally inferior, being mixed with wood and dirt. The cultivation and collection of the rubber being troublesome, it is unlikely to be attended to in those countries in which *Hevea* is successful.

3. The source of "Ule" rubber exported from Central America, and of the "Cauchó" rubber of Peru is *Castilloa elastica*, Cerv., a lofty tree, N. O. Urticaceae, with a trunk 3 ft. or more in diameter, and large hairy oblong lanceolate leaves often 18 in. long and 7 in. wide (fig. 4). The tree grows most abundantly in a sporadic manner

FIG. 3.—*Manihot Glaziovii*. 1, branch with flowers; 2, fruit; 3, seed.

in the dense moist forests of the basin of the Rio San Juan, where the rain falls for nine months in the year. It prefers rich fertile soil on the banks of watercourses, but does not flourish in swamps. It is found also in Costa Rica, Guatemala, Honduras, Mexico, Cuba and Hayti, and in Panama with another species of *Castilloa*, and on the W. coast of S. America down to the slopes of Chimborazo; the Cordilleras of the Andes separating the *Castilloas* from the *Heveas* of Brazil.

FIG. 4.—*Castilloa elastica*. 1, leaf; 2, twig with male flowers; 3, twig with female flowers; 4, seed; 5, nat. size.

In Nicaragua the latex is collected in April, when the old leaves begin to fall and the new ones are appearing, during which time the latex is richest. The tree is tapped either in the same manner as the *Hevea*, or by encircling the tree with a simple spiral cut at an inclination of 45°, or by two parallel spirals if the tree be large. At the bottom of the spiral an iron spout about 4 in. long is driven into the tree, and the milk is received in iron pails. A tree 20 to 30 ft. high to its first branches, and about 4 ft. in diameter, is expected to yield annually 20 gallons of milk, each gallon giving about 2 lb of rubber. In the evening the milk is strained through a wire sieve and transferred to barrels. The milk, which is acid, is coagulated by the addition of the alkaline juice of the "achete" plant, or of another plant called "coasso." The strained juice of either of these plants, obtained by bruising the moistened herb and subsequent expression, is added to the milk in the proportion of about 1 pint to the gallon. In British Honduras an alkaline decoction prepared from the Moon plant (*Calomictyon speciosum*) is used for the same purpose. If these plants are not procurable, two parts of water are added to one of the milk, and the mixture allowed to stand for twelve hours. The coagulum is next flattened out by a wooden or iron roller to get rid of the cavities containing watery liquid, and the sheets are then hung up for fourteen days to dry, when they weigh about 2 lb, the sheets being usually  $\frac{1}{2}$  to  $\frac{3}{4}$  in. thick and 20 in. in diameter. When coagulated in water, the mass is placed in vats in the ground and allowed to dry, this taking place about a fortnight. It is then rolled into balls. That which dries on the incisions in the tree is called "bola" or "burucha," and is said to be highly prized in New York. The loss of Nicaragua rubber in drying is estimated at 15%. It is exported chiefly from San Juan del Norte, or Grey Town, and the larger proportion goes to the United States. The *Castilloa* tree appears to be suitable for cultivation only in districts where the Para rubber would grow equally well. The tree is ready for tapping at about the same age as *Hevea* and the average yield of rubber is about the same. Since the latex "creams" readily the rubber can be separated from the latex by centrifugalizing, and its quality and market value thus enhanced. Much of the native *Castilloa* rubber is of inferior quality. The tree has been introduced into S. India, Ceylon and the W. Indies, where it has succeeded well, especially in Trinidad and Tobago. It is also under trial in E. and W. Africa and Nyasaland. Several other species of *Castilloa* than *C. elastica* are known to furnish rubber, but little has been recorded as to their advantages.

4. *Funtumia elastica* (formerly known as *Kickxia* or *Kixia elastica*) is the W. African (Ire or Irai or Lagos) rubber tree, which belongs to the Apocynaceae, a natural order which includes the *Landolphia* vines as well as other rubber producers. It is a large forest tree of upright habit extending to 60 or 70 ft. in height and 3 to 4 ft. in diameter. The bright green, glabrous leaves are broad and oblong, about 6 in. in length (see fig. 5). The flowers are yellow, and the seeds enclosed in a pod are long and thin with numerous long silky fibres attached to them, which enable the seeds to be readily carried by the wind. The trees are common throughout the central regions of E. and W. Africa (from Uganda to Sierra Leone). The botanical name is taken from a W. African native name for a rubber tree—"Funtum."

Many of the trees in the accessible forests of W. Africa have been destroyed by over-tapping and felling. Plantations of *Funtumia* have been established in several districts, including the Gold Coast and S. Nigeria. The trees are tapped on the "herring-bone" plan and the milk collected in vessels at the base. This is then poured into the hollowed-out trunk of a tree, where it is allowed to stand covered with palm leaves for about a fortnight. The watery portion of the latex soaks into the trunk, and the soft spongy rubber which remains is kneaded and pressed into lumps or balls.

In some districts the collected milk is heated alone or diluted with water, to coagulate the rubber, but if heated alone an inferior rubber is apt to result owing to overheating.

FIG. 5.—*Funtumia elastica* (Lagos rubber). 1, twig with flowers; 2, part of under side of leaf showing stomata at *dd* (about nat. size); 3, fruit (about  $\frac{1}{2}$  nat. size).

The *Funtumia* latex can also be coagulated by the astringent infusion of *Bauhinia* leaves or by exposing it in shallow dishes, when the liquid "creams." The yield of rubber is stated as a rule to be less than that of Para. The rubber, if properly prepared, is of excellent quality, and the tree deserves further attention, especially in those regions of W. Africa which are unsuited to *Hevea*. *Funtumia africana* furnishes a very inferior rubber, which is highly resinous.

5. *Ficus elastica* is the tree which produces Rambong or Assam rubber. It is well known in Europe as a small ornamental tree, but in the tropics it attains very large dimensions, and develops a system of branching roots which act as buttresses to the large trunk (see fig. 6). It is a native of India; Burma and the Malay Archipelago, and is most abundant in those regions in which the climate is distinctly humid, and subject to this condition the tree flourishes at high altitudes. In Assam and in upper Burma there are extensive forests of *Ficus elastica*, but to a large extent the trees have been damaged by careless tapping.

Large plantations have been formed by the Government of India both in Assam and Bengal, but most of the rubber exported is still obtained from the forest trees. It has been found that although the tree grows well in many different countries and different localities it only furnishes a satisfactory yield of rubber in mountainous districts, such as those of Assam and certain parts of Ceylon and Java. The trees are tapped when about ten years old, and as a rule annually furnish from 5-10 lb of rubber per tree. The latex flows fairly well, but is usually allowed to dry on the tree.

The rubber, if of good quality, sells at prices only slightly inferior to that of Para. When the plantations of *Ficus* in India are in bearing it is possible that this tree may attract more attention, as the plantation rubber is likely to be of superior quality owing to the greater care taken in its preparation. It seems at present doubtful however, whether the establishment of plantations of *Ficus* will be profitable under ordinary conditions in India.

In addition to the trees described above there are numerous plants of some importance as rubber producers. Among these are mentioned the *Landolphia* vines, which are still the chief source of African rubber. The vines grow upon forest trees, and their stems are periodically tapped. There are numerous species of the climbing plants, of which the most important as furnishing rubber are *Landolphia ovariensis* (see fig. 7), which occurs through-

FIG. 7.—*Landolphia owariensis*. 1, twig with flowers; 2, fruit.

of E. Africa. Other species of *Landolphia*, including *Landolphia florida*, abundant in both E. and W. Africa, furnish rubber of inferior quality.

Among other shrubs and vines which yield rubber of fair quality may be mentioned *Willughbeia edulis* and *Urceola elastica* and *Parameria glandulifera*, which occur in Burma and Malaya.

The *Sapium* of Colombia and Guiana are large trees resembling *Hevea*, and certain species furnish good rubber, especially the *Sapium Jenmani* of Guiana. Most of the native *Sapium*s have been destroyed by reckless tapping, and the merits of this genus have been somewhat overlooked and deserve reinvestigation. The same applies to certain species of *Hevea*, other than *H. brasiliensis*, which are known to produce good rubber in tropical America.

Pernambuco or Mangabeira rubber is obtained from *Ilancornia speciosa*, Gom., an apocynaceous tree common on the S. American plateau in Brazil from Pernambuco to Rio de Janeiro, at a height of 3000 to 5000 ft. above the sea. It is about the size of an ordinary apple tree, with small leaves like the willow, and a drooping habit like a weeping birch, and has an edible fruit like a yellow plum called "mangaba" for which, rather than for the rubber, the tree is cultivated in some districts. Only a small quantity of this rubber comes to England, and it is not much valued, being a "wet" rubber. It is produced in "biscuits" or "sheets." The caoutchouc is collected in the following manner: about eight oblique cuts are made all round the trunk, but only through the bark, and a tin cup is fastened at the bottom of each incision by means of a piece of soft clay. The cups when full are poured into a larger vessel, and solution of alum is added to coagulate the latex. In two or three minutes coagulation takes place, and the rubber is then exposed to the air on sticks, and allowed to drain for eight days. About thirty days afterwards it is sent to market. Pernambuco rubber, as is the case with most rubbers coagulated by saline solutions, contains a large quantity of water. The tree has been planted in other countries, but has so far not received much attention. It will grow on a dry sandy soil, dislikes much moisture, and needs no shade.

*Forsteronia gracilis* of Guiana is a climbing plant which also belongs to the Apocynaceae. Like the *Forsteronia floribunda* of Jamaica it yields rubber of good quality. *Ficus Vogelii* of W. Africa yields rubber of variable quality. The production of rubber by this tree merits further investigation, as it grows readily in nearly every district of W. Africa and the Sudan.

Specimens of the best known and of many of the lesser known rubbers are included in the Colonial and Indian Collections and Sample Rooms of the Imperial Institute, and many of the authentic specimens have been chemically and technically examined in the Scientific and Technical Department of the Institute and commercially valued. Reports on many of the lesser known rubbers have been published in the *Bulletin of the Imperial Institute*.

### Chemistry of Rubber.

Rubber is chiefly composed of the soft, solid, elastic substance known as caoutchouc. It is usually assumed that this substance is present as such in the latex. The globules in the latex, however, consist more probably of a distinct liquid substance which readily changes into the solid caoutchouc. The coagulation of the latex often originates with the "curdling" of the proteids present, and this alteration in the proteid leads to the solidification of the globules into caoutchouc. The latter, however, is probably a distinct effect. Under certain conditions, as when latex is allowed to stand or is centrifugalized, a cream is obtained consisting of the liquid globules, which may be washed free from proteid without change, but, either by mechanical agitation or by the addition of acid or other chemical agent, the liquid gradually solidifies to a mass of solid caoutchouc. The phenomenon therefore resembles the change known to the chemist as polymerization, by which through molecular aggregation a liquid may pass into a solid without change in its empirical composition. The effect may, however, also be due to chemical change known as condensation, and be accompanied by the elimination of the elements of water. So far the chemical nature of the liquid globules of the latex is unknown, and the exact character of the change into solid caoutchouc remains to be determined. The watery liquid known as rubber milk or latex is an emulsion consisting chiefly of a weak watery solution of proteids, carbohydrates and salts holding the liquid globules in suspension. In connexion with the production of rubber the most important factor is the proportion of caoutchouc it contains. In a good rubber this ranges from 70-90% and over. The proportion and nature of the proteids or albuminous materials varies considerably in different latices. The proteids should be as far as possible removed during the preparation of the rubber, as these substances are chiefly responsible for the objectionable smell and colour of "native" rubbers, and their presence leads to subsequent change in the commercial material. All crude rubber contains more or less proteid, and in the opinion of some technical experts its presence even affords strength to the material, but this cannot be accepted as proved. The dissolved salts (potassium, sodium, ammonium, calcium, magnesium, &c.) of the latex are generally nearly entirely absent from the well-prepared rubber. Of considerable importance to the value of the rubber is the absence of the resinous constituents which are present in greater or smaller proportion in all latices. The presence of more than a small percentage of resin in the latex leads to the production of rubber containing much resin, which seriously depreciates its commercial value for most purposes. The percentage of resin in a good rubber should be as small as possible, and should in any case be less than 10%. There is no feasible method at present known of preventing the inclusion of the resin of the latex with the rubber during coagulation, and although the separation of the resin from the solid caoutchouc by means of solvents is possible, it is not practicable or profitable commercially. A complete examination of a series of different latices has shown that, in many cases, e.g. *Hevea* and *Castilloa*, the resin is present in large proportion in the latex derived from young trees, and diminishes in amount as the tree ages. This is one reason why young trees should not be tapped. The composition of latex and of typical rubbers is given below:—

### RUBBERS

Para Latex (Ceylon).	Para Rubber (Ceylon).	Para Rubber (Ceylon).	Castillo Rubber (Ceylon).	Picus Elastica (Bengal).	Landolphia Kirkii (E. Africa).
Water . . . 55.15	Caoutchouc 0.65	7.15	8.75	8.75	80.2
Caoutchouc 41.20	Resin 2.65	20.05	12.45	11.8	6.9
Proteids . . . 2.18	Proteids 1.75	2.01	0.87	0.8	0.3
Sugar, etc. 0.36	Ash . . . 0.14	2.46	0.20	0.8	7.7
Ash (salts) 0.41	Moisture . . 0.85	2.20	0.38	0.8	..

The chemical analysis of crude rubber is an important guide to its value. At present, however, the methods of analysis usually employed are not sufficiently delicate to afford all the necessary information as to the intrinsic value of the higher grades of rubber, and do not go much beyond the exclusion of inferior rubber. The tests of the physical properties of crude rubber usually applied to determine its value in the market are also very rough and cannot be relied upon. The development of the rubber industry has now reached a stage at which more exact methods of determining the chemical composition and physical properties (strength and elasticity) of rubber are required. At present the caoutchouc present in crude rubber is usually estimated indirectly, and it is possible that what generally passes as caoutchouc may be in some instances a mixture of similar chemical substances, which if separated would be found to differ in those physical properties on which the technical value of rubber depends.

It is already certain that some commercial rubbers contain a variable proportion of a substance of the nature of caoutchouc, but having different properties.

True caoutchouc, the principal constituent of all rubbers, is probably essentially one and the same substance, from whatever botanical source it may have been derived. This is an elastic solid, almost transparent in thin sheets, composed entirely of carbon and hydrogen, the empirical composition of which is represented by

the formula  $C_5H_8$ . It thus possesses the same composition as the hydrocarbon of gutta-percha and as that of oil of turpentine and other terpenes which are the chief components of essential oils. The properties of caoutchouc clearly show, however, that its actual molecular structure is considerably more complex than is represented by the empirical formula, and that it is to be regarded as the polymer of a terpene or similar hydrocarbon and composed of a cluster of at least ten or twenty molecules of the formula  $C_5H_8$ .

When solid caoutchouc is strongly heated it breaks down, without change in its ultimate composition, into a number of simpler liquid hydrocarbons of the terpene class (dipentene, di-isoprene, isoprene, &c.), of which one, isoprene ( $C_5H_8$ ), is of simpler structure than oil of turpentine ( $C_{10}H_{16}$ ), from which it can also be obtained by the action of an intense heat.

When this volatile liquid hydrocarbon (isoprene) is allowed to stand for some time in a closed bottle, it gradually passes into a substance having the principal properties of natural caoutchouc. The same change of isoprene into caoutchouc may also be effected by the action of certain chemical agents. It may therefore be said that caoutchouc has been already artificially or synthetically prepared, and the possibility of producing synthetic rubber cheaply on a commercial scale remains the only problem. At present the change of isoprene into caoutchouc is mainly of scientific interest in indicating possibilities with regard to the conversion of the liquid globules of the latex into rubber and to the formation of rubber by plants. The exact chemical nature of caoutchouc is, however, not determined, and recent researches point to the view that its molecular structure may even be somewhat different from that of the terpenes.

The exact manner in which isoprene passes into caoutchouc is also not understood. These problems are, however, certain to be solved in the near future, and then probably caoutchouc may be formed in other ways than from isoprene.

The question as to whether synthetic rubber will ever be produced cheaply on a commercial scale is therefore the important one for those who are largely interested in the rubber-planting industry. No definite answer can be given to this question at the present time. Its settlement will depend in part on the cost of producing rubber from plants, which from their point of view it is to the interests of planters to reduce as far as possible. There are many substances produced by plants which can be synthetically prepared by chemical means, but, as with quinine, the process involved is too costly to enable the synthetic product to compete with the natural product.

The chief properties of caoutchouc and its employment for technical purposes may now be considered.

Caoutchouc is not dissolved by water or alcohol, and is not affected except by the strongest acids. Alkalies have little effect on it under ordinary circumstances, although prolonged contact with ammonia results in a partial change. The best solvents for rubber are carbon bisulphide, benzol and mineral naphtha, carbon tetrachloride and chloroform. These liquids, either alone or mixed, are employed in making the rubber solutions used for technical purposes. Vegetable and other oils rapidly penetrate caoutchouc and lead to deterioration of its properties. Sulphur when warmed with caoutchouc combines with it, and on this fact the vulcanization of rubber depends, and also the production, with an excess of sulphur, of the hard black material known as vulcanite or ebonite.

Caoutchouc is a soft elastic resilient solid. In this respect it differs from gutta-percha, which, like caoutchouc, is derived from the latices of certain plants. The technical value of caoutchouc chiefly depends on the extent to which it is capable of being stretched without breaking, and the extent to which it at once returns to its original dimensions. Caoutchouc is a bad conductor of heat and electricity, and alone or mixed with other materials is employed as an electrical insulator.

When caoutchouc is heated slightly above the temperature of boiling water it becomes softer and loses much of its elasticity, which, however, it recovers on cooling. At about  $150^{\circ}$ - $200^{\circ}$  C. caoutchouc melts, forming a viscous liquid which does not solidify on cooling. This viscous liquid is present in small proportion in some commercial rubbers owing to overheating during their preparation. It appears to be the principal cause of stickiness or the "tacky" condition of some rubbers, which considerably depreciates their commercial value. There is some evidence that "tackiness" may be induced by a kind of fermentation which takes place in crude rubber.

At higher temperatures the viscous liquid suffers decomposition with the formation of various liquid hydrocarbons, principally members of the terpene series. Similar products are also formed by heating gutta-percha which closely resembles caoutchouc in its chemical structure.

Rubber slowly absorbs oxygen when exposed to air and light, the absorption of oxygen being accompanied by a gradual change in the characteristic properties of rubber, and ultimately to the production of a hard, inelastic, brittle substance containing oxygen. Ozone at once attacks rubber, rapidly destroying it. If ozone is passed into a solution of rubber in chloroform the caoutchouc combines with a molecule of ozone forming a compound of the empirical composition  $C_5H_8O_3$ . When this compound is acted on

by water, hydrogen peroxide and levulinic aldehyde are formed, the aldehyde being subsequently oxidized by the hydrogen peroxide, forming levulinic acid. The hydrocarbon of gutta-percha yields similar results and is therefore closely related to caoutchouc.

The study of the action of ozone on caoutchouc has thrown new light on the complex question of the chemical structure of this substance, and discloses relationships with the sugars and other carbohydrates from certain of which levulinic acid is obtained by oxidation.

Caoutchouc, like other "unsaturated" molecules, forms compounds with chlorine, bromine, iodine and sulphur.

#### Commercial Treatment of Rubber.

In the industrial working of indiarubber, the various impurities present in the crude "wild" rubber (bark, dirt) and the principal impurities derived from the latex, except resin) are removed by the following process: The lumps of crude caoutchouc are first softened by the prolonged action of hot water, and then cut into slices by means of a sharp knife—generally by hand, as thus any large stones or other foreign substances can be removed. The softened slices are now repeatedly passed between grooved rollers, known

FIG. 8.—Roller of Washing Machine.

as washing rollers (fig. 8), a supply of hot or cold water being made to flow over them. Solid impurities speedily become crushed, and are carried away by the water, while the rubber takes the form of an irregular sheet perforated by numerous holes. The loss on washing ranges from 10-15% with "fine Para" to 40% with other "wild" rubbers. In the future this washing of "wild" rubber may be conducted in the tropics, thus furnishing the manufacturer with rubber which, like "plantation" rubber, need not be subjected to this process in the factory. The washed product contains in its pores a notable proportion of water, which is removed by hanging the rubber for some days in a warm room. It is now ready either for incorporation with sulphur and other materials, or for agglomeration into solid masses by means of the masticating machine—an apparatus which consists of a strong cylindrical cast-iron casing, inside which there revolves a metal cylinder with a fluted or corrugated surface. Some of the rubber having been placed in the annular space between the inner cylinder and the outer casing, the former is made to revolve; and the continued kneading action to which the rubber is subjected works it into a solid mass, something like a gigantic sausage. Before commencing the mastication it is generally necessary to warm the apparatus by means of steam; but as the operation proceeds the heat produced requires to be moderated by streams of cold water flowing through channels provided for the purpose. The inner cylinder is generally placed somewhat eccentrically in the outer casing, in order to render the kneading more perfect than would otherwise be the case.

To convert the masticated rubber into rectangular blocks, it is first softened by heat, and then forced into iron boxes or moulds. The blocks are cut into thin sheets by means of a sharp knife, which is caused to move to and fro about two thousand times per minute, the knife being kept moistened with water, and the block fed up to it by mechanical means. Cut sheets are largely used for the fabrication of certain classes of rubber goods—these being made by cementing the sheets together with a solution of rubber in naphtha or benzol. Most articles made of cut sheet rubber would, however, be of very limited utility were they not hardened or vulcanized by the action of sulphur or some compound of that element. After vulcanization, rubber is no longer softened by a moderate heat; a temperature of  $160^{\circ}$  C. scarcely affecting it, nor is it rendered rigid by cold, and the ordinary solvents fail to dissolve it. It must, however, be distinctly understood that it is not the mere admixture but the actual combination of sulphur with indiarubber that causes vulcanization. If an article made of cut sheet be immersed for a few minutes in a bath of melted sulphur, maintained at a temperature of  $120^{\circ}$  C., the rubber absorbs about one-tenth of its weight of that element, and, although somewhat yellowish in colour from the presence of free sulphur, it is still unvulcanized, and unaltered as regards general properties. If, however, it be now subjected for an hour or so to a temperature of  $140^{\circ}$  C., a combination occurs, and vulcanized caoutchouc is the result. When a manufactured article has been saturated with sulphur in the melted sulphur bath, the heat necessary for vulcanization may be obtained either by high-pressure steam, by heated glycerin, or by immersion in a sulphur bath heated to about  $140^{\circ}$  C. In this last case absorption of the sulphur and its intimate combination with the rubber occur simultaneously. Cut sheets, or articles made from them, may be

saturated by being laid in powdered sulphur maintained for some hours at about 110° C. Sheets sulphured in this way can be made up into articles and joined together either by warming the parts to be united, or by means of indiarubber solution; after which the true vulcanization, or "curing," as it is termed, can be brought about in the usual way.

Another method of vulcanizing articles made from cut sheet rubber consists in exposing them to the action of chloride of sulphur. Either they are placed in a leaden cupboard into which the vapour is introduced, or they are dipped for a few seconds in a mixture of one part of chloride of sulphur and forty parts of carbon disulphide or purified light petroleum. Vulcanization takes place in this instance without the action of heat; but it is usual to subject the goods for a short time to a temperature of 40° C. after their removal from the solution, in order to drive off the liquid which has been absorbed, and to ensure a sufficient action of the chloride of sulphur. Treatment with a warm alkaline solution is afterwards advisable, in order to remove traces of hydrochloric acid generated during the process. Another very excellent method of vulcanizing cut sheet goods consists in placing them in a solution of the polysulphides of calcium at a temperature of 140° C. Rubber employed for the manufacture of cut sheets is often coloured by such pigments as vermilion, oxide of chromium, ultramarine, orpiment, antimony, lamp black, or oxide of zinc, incorporation being effected either by means of the masticator or by a pair of rollers heated internally by steam, and so geared as to move in contrary directions at unequal

FIG. 9.—The Mixing Rollers.

speed (fig. 9). Most of the rubber now manufactured is not combined with sulphur when in the form of sheets, but is mechanically incorporated with about one-tenth of its weight of that substance by means of the mixing rollers—any required pigment or other matter, such as whiting or barium sulphate, being added. The mixed rubber thus obtained is readily softened by heat, and can be very easily worked into any desired form or rolled into sheets by an apparatus known as the calendaring machine. Vulcanization is then ensured by exposure for half an hour or more to a temperature of 135°–150° C., usually in closed iron vessels into which high-pressure steam is admitted (fig. 10). Tubes are generally made up around mandrels, and allowed throughout the curing to remain imbedded in pulverized French chalk, which affords a useful support for many articles that tend to lose their shape during the process. Of late years a considerable amount of seamless tubing has been made, much in the same way as lead piping, by forcing the mixed rubber through a die, and curing as above. The calendared sheets are generally cured between folds of wet cloth, the markings of which they retain;

FIG. 10.—A Vulcanizer.

and hollow articles, such as playing balls or injection bottles, are vulcanized in iron or brass moulds, tinned inside and very slightly greased. Before it is put in, the article is roughly put together, and the expansion of the included air forces the rubber into contact with the internal surface of the mould, or a little carbonate of ammonia is enclosed. Belting intended for driving machinery is built up of canvas which has been thoroughly frictioned with the soft mixed rubber, and is cured by placing it in a kind of press kept by means of steam at a dry heat of about 140° C. Packing for the stuffing boxes of steam engines is similarly prepared from strips of

rubber and frictioned canvas, as also are the so-called insertion sheets, in which layers of rubber alternate with canvas or even wire gauze. Indiarubber stereotypes are now extensively made use of as hand stamps, and attempts have been made to introduce them for press and machine printing. A plaster cast of the type is, when dry, saturated with shellac varnish and redried. Rubber mixed in the usual way with about 10% of sulphur is now softened by heat, forced into the mould, and retained there by pressure during the operation of curing, which is usually effected in an iron box heated over a gas burner to 140° C.

The ordinary macintosh or waterproof cloth is prepared by spreading on the textile fabric layer after layer of indiarubber paste or solution made with benzol or coal-naphtha. If cotton or linen is used, it is usual to incorporate sulphur with the paste, and to effect vulcanization by steam heat; but, when silk or wool is employed, no sulphur is added to the paste, the dried coating of rubber being merely brought into momentary contact with the mixture of chloride of sulphur and carbon disulphide already mentioned. Double texture goods are made by uniting the rubber surfaces of two pieces of the coated material. Air goods, such as cushions, beds, gas bags, and so forth, are made of textile fabrics which have been coated with mixed rubber either by the spreading process above described, or by means of heated rollers, the curing being then effected by steam heat. The manufacture of overshoes and fishing boots is an analogous process, only the canvas base is more thickly coated with a highly pigmented rubber of low quality. The articles are first fashioned by joining the soft material; they are then varnished, and afterwards cured in ovens heated to about 135° C. The fine vulcanized "spread sheets" are made by spreading layers of indiarubber solution, already charged with the requisite proportion of sulphur, on a textile base previously prepared with a mixture of paste, glue and treacle. Vulcanization is then effected by steam heat, and, the preparation on the cloth being softened by water, the sheet of rubber is readily removed. The required thickness of the spread sheet is very often secured by the rubber-faced surfaces of two cloths being united before curing. The threads used in making elastic webbing are usually cut from spread sheets. The manufacture of springs, valves and washers does not require any very special notice, these articles being generally fashioned out of mixed rubber, and vulcanized either in moulds or in powdered French chalk. Rollers are made to adhere to their metal spindles by the intervention of a layer of ebonite, and after vulcanization they are turned. In order to make spongy or porous rubber, some material is incorporated which will give off gas or vapour at the vulcanizing temperature,—such as carbonate of ammonia, crystallized alum, and finely ground damp sawdust. Uncombined sulphur is injurious, and often leads to the decay of vulcanized goods, but an excess of sulphur is generally required in order to ensure perfect vulcanization. Sometimes the excess is partially removed by boiling the finished goods with a solution of caustic soda, or some other solvent of sulphur. In other cases the injurious effects of free sulphur are obviated by using instead of it a metallic sulphide,—generally the orange sulphide of antimony; but, for the best results, it is necessary that this should contain from 20 to 30% of uncombined sulphur.

It will thus be seen that for nearly all practical purposes, including tires, vulcanized rubber mixed with mineral matter is employed. Such articles contain varying proportions of rubber (12–60%), about 1–2% of combined sulphur, and from 25–70% of mineral matter. Vulcanized rubber is also now largely used as an electrical insulator for the construction of cables, &c., instead of gutta-percha.

When the vulcanization of rubber is carried too far, from the presence of a very large proportion of sulphur and an unduly long action of heat, the caoutchouc becomes hard, horn-like, and often black. Rubber hardened by over-vulcanization is largely manufactured under the name of ebonite or vulcanite. It is usually made by incorporating about 40% of sulphur with purified Borneo rubber by means of the usual mixing rollers, shaping the required articles out of the mass thus obtained, and heating for six, eight or ten hours to from 135° to 150°. Ebonite takes a fine polish, and is valuable to the electrician on account of its insulating properties, and to the chemist and photographer because vessels made of it are unaffected by most chemical reagents. A kind of vulcanite which contains a large proportion of vermilion or other mineral pigment is used, under the name of dental rubber, for making artificial gums and supports for artificial teeth.

**RUBBLE**, broken stone, of irregular size and shape. This word is closely connected in derivation with "rubbish," which was formerly also applied to what we now call "rubble." The earlier Middle English form was *robeuz* or *robous*. It would appear that the original is an O. Fr. *robel*. *Roba* (older form *robba*) is found in Italian in the sense of refuse, trash. *Robba* is explained by Florio as a gown, or mantle, robe, wealth, goods, trash. The original sense was "spoil." Thus, "robe," "rob," "rubbish" and "rubble" are all cognate.

"Rubble-work" is a name applied to several species of masonry (*q.s.*). One kind, where the stones are loosely thrown together in a wall between boards and grouted with mortar almost like concrete, is called in Italian *muraglia di getto* and in French *bocage*. Work executed with large stones put together without any attempt at courses is also called rubble.

**RUBELLITE**, a red variety of tourmaline (*q.s.*) used as a gem-stone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia, whence it is sometimes called *siberite*, or passes under the misleading name of "Siberian ruby." The mills at Ekaterinburg, where it is cut and polished, draw most of their supplies from the Ural Mountains—chiefly from Mursinka, Sarapulskaya and Shaitanka, near Ekaterinburg—but specimens are occasionally found at Nerchinsk in Transbaikalia. Burma is famous for rubellite, but little was known as to the conditions of its occurrence there until after the British annexation, when the old workings were visited and described by C. Barrington Brown and by F. Noetling. The pits which yield rubellite are dug in alluvial deposits in the Mōng-long valley, some miles to the S.E. of Mogok, the centre of the ruby country. It was here that the Chinese obtained the rubellite so much valued in China for buttons of the caps of mandarins of certain rank. In the British Museum there is a remarkable specimen of crystallized rubellite of large size and fine form, but of poor colour, which was presented by the king of Ava to Colonel Michael Symes on the occasion of his mission in 1795. Very fine rubellite is found in the United States, notably at Mount Mica, near Paris, Oxford Co., Maine, where the crystals are often red at one end and green at the other. Mount Rubellite, near Hebron, and Mount Apatite at Auburn, are other localities in the same state from which fine specimens are obtained. Chesterfield and Goshen, Mass., also yield red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego Co., California. In Europe rubellite occurs sparingly at a few localities, as at San Piero in Elba and at Penig in Saxony; but the mineral is rarely if ever fit for the lapidary. (F. W. R.)\*

**RUBENS, PETER PAUL** (1577-1640), Flemish painter, was born at Siegen, in Westphalia, on the 29th of June 1577. His father, Johannes Rubens, a druggist, although of humble descent was a man of learning, and councillor and alderman in his native town (1562). A Roman Catholic by birth, he became a zealous upholder of the Reformation, and we find him spoken of as *le plus docte Calviniste qui just pour lors au Bas Pays*. After the plundering of the Antwerp churches in 1566, the magistrates were called upon for a justification. While openly they declared themselves devoted sons of the church, a list of the followers of the Reformed creed, headed by the name of Anthony Van Stralen, the burgomaster, got into the hands of the duke of Alva. This was a sentence of death for the magistrates, and Johannes Rubens lost no time in quitting Spanish soil, ultimately settling at Cologne (October 1568) with his wife and four children.

In his new residence he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Thrown into the dungeons of Dillenburg, Rubens lingered there for many months, his wife, Maria Pypelinckx, never relaxing her endeavours to get the

undutiful husband restored to freedom. Two years elapsed before the prisoner was released, and then only to be confined to the small town of Siegen. Here he lived with his family from 1573 to 1578, and here Maria Pypelinckx gave birth to Philip, afterwards town-clerk of Antwerp, and Peter Paul. A year after (May 1578) the Antwerp lawyer got leave to return to Cologne, where he died on the 18th of March 1587, after having, it is said, returned to Roman Catholicism.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. He was an excellent Latin scholar, and also proficient in French, Italian, Spanish, English, German and Dutch. Part of his boyhood he spent as a page in the household of the countess of Lalaing, in Brussels; but tradition adds that his mother allowed him to follow his proper vocation, choosing as his master Tobias Verhaecht. Not the slightest trace of this first master's influence can be detected in Rubens's works. Not so with Adam Van Noort, to whom the young man was next apprenticed. Van Noort, whose aspect of energy is well known through Van Dyck's beautiful etching, was the highly esteemed master of numerous painters—among them Van Balen, Sebastian Vrancx, and Jordaens, later his son-in-law.

Rubens remained with Van Noort for the usual period of four years, thereafter studying under Otto Vaenius or Van Veen, a gentleman by birth, a most distinguished Latin scholar and a painter of very high repute. He was a native of Leiden, and only recently settled in Antwerp. Though Rubens never adopted his style of painting, the tastes of master and pupil had much in common, and some pictures by Otto Vaenius can be pointed out as having inspired Rubens at a more advanced period. For example, the "Magdalene anointing Christ's Feet," painted for the cathedral at Malaga, and now at the Hermitage in St Petersburg, closely resembles in composition the very important work of Otto Vaenius in the church at Bergues near Dunkirk.

In 1598, Adam Van Noort acting as dean of the Antwerp guild of painters, Rubens was officially recognized as "master"—that is, was allowed to work independently and receive pupils. His style at this early period may be judged from the by no means satisfactory "Holy Trinity" at Antwerp Museum, which already shows his bold, vigorous handling, and the "Portrait of a Youth" in the Munich Pinakothek.

From 1600 to the latter part of 1608 Rubens belonged to the household of Vincenzo Gonzaga, duke of Mantua. The duke, who spent some time at Venice in July 1600, had his attention drawn by one of his courtiers to Rubens's genius, and immediately induced him to enter his service. The influence of the master's stay at Mantua was of extreme importance, and cannot be too constantly kept in view in the study of his later works.

Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by the archduke Albrecht of Austria, sovereign of the Spanish Netherlands, and once, when he was a cardinal, the titular of that see. A copy of "Mercury and Psyche" after Raphael is preserved in the museum at Pesth. The religious paintings—"The Invention of the Cross," "The Crowning with Thorns" and "The Crucifixion"—are to be found in the hospital at Grasse in Provence (Alpes Maritimes).

At the beginning of 1603, "The Fleming," as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian's masterpieces. Of his own works, known to belong to the same period, in the Madrid Gallery, are "Heracitus" and "Democritus." Of Rubens's abilities so far back as 1604 we get a more complete idea from an immense picture now in the Antwerp Gallery, the "Baptism of Our Lord," originally painted for the Jesuits at Mantua. Here it may be seen to what degree Italian surroundings had influenced the household painter of Vincenzo Gonzaga. Vigorous to the extreme in design, he reminds us of Michelangelo as much as any of the degenerate masters of the Roman school.

while in decorative skill he seems to be descended from Titian and in colouring from Giulio Romano. Equally with this picture, "The Transfiguration," now in the museum at Nancy, and the portraits of "Vincenzo and his Consort, kneeling before the Trinity," in the library at Mantua, claim a large share of attention.

Two years later we meet a very large altar-piece of "The Circumcision" at St Ambrogio at Genoa, the "Virgin in a Glory of Angels," and two groups of Saints, painted on the wall, at both sides of the high altar in the church of Santa Maria in Valicella in Rome. These works remind us of a saying of Baglione, who was acquainted with Rubens in Italy: *Appreso egli buon gusto, e diede in una maniera buona Italiana.*

While employed at Rome in 1608, Rubens received most alarming news as to the state of his mother's health. The duke of Mantua was then absent from Italy, but the dutiful son, without awaiting his return, at once set out for the Netherlands. When he arrived in Antwerp, Maria Pypelinckx was no more. His however strong his wish might now be to return to Italy, his purpose was overruled by the express desire of his sovereigns, Albrecht and Isabella, to see him take up a permanent residence in the Belgian provinces. On the 3rd of August 1609 Rubens was named painter in ordinary to their Highnesses, with a salary of 500 livres, and "the rights, honours, privileges, exemptions," &c., belonging to persons of the royal household, not to speak of the gift of a gold chain. Not least in importance for the painter was his complete exemption from all the regulations of the guild of St Luke, entitling him to engage any pupils or fellow-workers without being obliged to have them enrolled—a favour which has been of considerable trouble to the historians of Flemish art.

Although so recently returned to his native land, Rubens seems to have been, with one accord, accepted by his countrymen as the head of their school, and the municipality was foremost in giving him the means of proving his acquirements. The first in date among the numerous repetitions of the "Adoration of the Magi" is a picture in the Madrid Gallery, measuring 12 ft. by 17, and containing no fewer than eight-and-twenty life-size figures, many in gorgeous attire, warriors in steel armour, horsemen, slaves, camels, &c. This picture, painted in Antwerp, at the town's expense, in 1609, had scarcely remained three years in the town hall when it went to Spain as a present to Don Rodrigo Calderon, count of Oliva. The painter has represented himself among the horsemen, bare-headed, and wearing his gold chain. From a letter written in May 1611 we know that more than a hundred young men were desirous to become his pupils, and that many had, "for several years," been waiting with other masters until he could admit them to his studio.

Apart from the success of his works, another powerful motive had helped to detain the master in Antwerp—his marriage with Isabella Brant (October 1609). Many pictures have made us familiar with the graceful young woman who was for seventeen years to share the master's destinies. We meet her at the Hague, St Petersburg, Berlin, Florence, at Grosvenor House, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvas. "His wife is very handsome," observes Sir Joshua Reynolds, "and has an agreeable countenance;" but the picture, he adds, "is rather hard in manner." This, it must be noted, is the case with all those pictures known to have immediately followed Rubens's return, when he was still dependent on the assistance of painters trained by others than himself. Even in the "Raising of the Cross," now in the Antwerp cathedral, and painted for the church of St Walburga in 1610, the dryness in outline is very striking.

According to the taste still at that time prevailing, the picture is tripartite, but the wings only serve to develop the central composition, and add to the general effect. In Witdoeck's beautiful engraving the partitions even disappear. Thus, from the first, we see Rubens quite determined upon having his own way, and it is recorded that, when he painted

the "Descent from the Cross," "St Christopher," the subject chosen by the Arquebusers, was altered so as to bring the artistic expressions into better accordance with his views. Although the subject was frequently repeated by the great painter, this first "Descent from the Cross" has not ceased to be looked upon as his masterpiece. Begun in 1611, the celebrated work was placed in 1614, and certainly no more striking evidence could be given of the rapid growth of the author's abilities. Rubens received 2400 forins for this picture. In many respects, Italian influence remains conspicuous in the "Descent from the Cross." Rubens had seen Ricciarelli's fresco at the Trinita de' Monti, and was also acquainted with the grandiose picture of Baroccio in the cathedral of Perugia, and no one conversant with these works can mistake their influence. But in Rubens's strength of personality could not be overpowered by reminiscence; and in type, as well as in colouring, the "Descent from the Cross" may be termed thoroughly Flemish and Rubenesque.

If Sir Dudley Carleton could speak of Antwerp in 1616 as *Magna civitas, magna solitudo*, there was no place nevertheless which could give a wider scope to artistic enterprise. Spain and the United Provinces were for a time at peace; almost all the churches had been stripped of their adornments; monastic orders were powerful and richly endowed, guilds and corporations eager to show the fervour of their Catholic faith, now that the "monster of heresy" seemed for ever quelled. Gothic churches began to be decorated according to the new fashion adopted in Italy. Altars magnified to monuments, sometimes reaching the full height of the vaulted roof, displayed, between their twisted columns, pictures of a size hitherto unknown. No master seemed better fitted to be associated with this kind of painting than Rubens. The temple erected by the reverend fathers in Antwerp was almost entirely the painter's work, and if he did not, as we often find asserted, design the front, he certainly was the inspirer of the whole building. Hitherto no Fleming had undertaken to paint ceilings with foreshortened figures, and blend the religious with the decorative art after the style of those buildings which are met with in Italy, and owe their decorations to masters like Titian, Veronese and Tintoretto. No fewer than forty ceiling-panels were composed by Rubens, and painted under his direction in the space of two years. All were destroyed by fire in 1718. Sketches in water-colour were taken some time before the disaster by de Wit, and from these were made the etchings by Du Pont which alone enable us to form a judgment of the grandiose undertaking. In the Madrid Gallery we find a general view of the church in all its splendour. The present church of St Charles in Antwerp is, externally, with some alteration, the building here alluded to.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality. . . . I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he was very soon called upon to demonstrate most strikingly by a series of twenty-four pictures, illustrating the life of Marie de Médicis, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is not exhibited in the Louvre. Drawings, it seems, had been asked from Quentin Varin, the French master who incited Poussin to become a painter, but Rubens was ultimately preferred. This preference may in some degree be ascribed to his former connexion with the court at Mantua, Marie de Médicis and the duchess of Gonzaga being sisters. From the cradle to the day of her reconciliation with Louis XIII., we follow Marie de Médicis after the manner in which it was customary in those days to consider personages of superior rank. The Fates for her have spun the silken and golden thread; Juno watches over her birth and entrusts her to the town of Florence; Minerva, the Graces and Apollo take charge of her education; Love

exhibits her image to the king, and Neptune conveys her across the seas; Justice, Health and Plenty endow her son; Prudence and Generosity are at her sides during the regency; and, when she resigns the helm of the state to the prince, Justice, Strength, Religion and Fidelity hold the oars. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being entrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On the 13th of May 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the "Felicity of the Regency" was painted to replace another, the "Departure of the Queen," which had caused some offence. Richelieu gave himself some trouble to get part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpina, but did not succeed in his endeavours. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which, the "Triumph of Henry IV.," now in the Uffizi Gallery, is one of the noblest works of Rubens or of any master.

On the 11th of May 1625, Rubens was present at the nuptials of Henrietta Maria at Notre Dame in Paris, when the scaffolding on which he stood gave way, and he tells us he was just able to catch an adjoining tribune.

No painter in Europe could now pretend to equal Rubens either in talent or in renown. Month after month productions of amazing size left the Antwerp studio; and to those unacquainted with the master's pictures magnificent engravings by Vorsterman, Pontius and others had conveyed singularly striking interpretations. "Whatever work of his I may require," writes Moretus, the celebrated Antwerp printer, "I have to ask him six months before, so as that he may think of it at leisure, and do the work on Sundays or holidays; no week days of his could I pretend to get under a hundred florins."

Of the numerous creations of his brush, none, perhaps, will more thoroughly disclose to us Rubens's comprehension of religious decorative art than the "Assumption of the Virgin" at the high-altar of Antwerp cathedral, finished in 1625. It is, of twenty repetitions of this subject, the only example still preserved at the place for which it was intended. In spirit we are here reminded of Titian's "Assunta" in the cathedral at Verona, but Rubens's proves perhaps a higher conception of the subject. The work is seen a considerable way off, and every outline is bathed in light, so that the Virgin is elevated to dazzling glory with a power of ascension scarcely, if ever, attained by any master.

Although able to rely so greatly on his power as a colourist, Rubens is not a mere decorator. He penetrates into the spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The "Massacre of the Innocents," in the Munich Gallery, is a composition that can leave no person unmoved—mothers defending their children with nails and teeth. When St Francis attempts to shelter the universe from the Saviour's wrath (Brussels Gallery), Rubens recalls to our memory that most dramatic passage of the *Iliad* when Hecuba, from the walls of Troy, entreats her son Hector to spare his life. Rubens was a man of his time; his studies of Italian art in no way led him back to the Quattrocentisti nor the Raffaeleschi; their power was at an end. The influence of Michelangelo, Titian, Tintoretto, more especially Baroccio, Polidoro, and even Parmigiano, is no less visible with him than with those masters who, like Spranger, C. Schwartz and Goltzius, stood high in public estimation immediately before his advent.

In the midst of the rarest activity as a painter, Rubens was now called upon to give proofs of a very different kind

of ability. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; Archduke Albrecht died the same year. His widow sincerely wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The painter's comings and goings, however, did not remain unheeded, for the French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the infant. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens was to fail in his efforts to bring about an arrangement with the Netherlands, other events enabled him to render great service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the Crowns of England and Spain. The infants willingly consented, and King Philip, who much objected to the interference of an artist, gave way on hearing, through his aunt, that the negotiator on the English side, Sir Balhazar Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier very soon met in Holland. Matters went on very well, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). Nine months were thus spent at Madrid; they rank among the most important in Rubens's career. He had brought with him eight pictures of various sizes and subjects as presents from the infant, and he was also commissioned to paint several portraits of the king and royal family. An equestrian picture of Philip IV., destroyed by fire in last century, became the subject of a poem by Lope de Vega, and the description enables us to identify the composition with that of a painting now in the Palazzo Pitti, ascribed to Velazquez.

Through a letter to Peiresc we hear of the familiar intercourse kept up between the painter and the king. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. An artistic event of some importance connected with the sojourn in Spain is the meeting of Rubens and Velazquez, to the delight, and, it may be added, advantage of both.

Great as was the king's admiration of Rubens as a painter, it seems to have been scarcely above the value attached to his political services. He now commissioned the painter to go to London as bearer of his views to Charles I., and Rubens, honoured with the title of secretary of the king's privy council in the Netherlands, started at once on his new mission. Although he stopped but four days in Antwerp, he arrived in London just as peace had been concluded with France. Received by Charles with genuine pleasure, he very soon was able to ingratiate himself so far as to induce the king to pledge his royal word to take part in no undertakings against Spain so long as the negotiations remained uncompleted, and all the subsequent endeavours of France, Venice and the States for the king immovable in this resolution. The tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his despatches is very bitter. But he speaks with the greatest admiration of England and the English, regretting that he should only have come to know the country so late. His popularity must have been very great, for on the 23rd of September 1629 the university of Cambridge conferred upon him the honorary degree of master of arts, and on the 21st of February 1630 he was knighted, the king presenting him with the sword used at the ceremony, which is still preserved by his descendants of the artist.

Although, it seems, less actively employed as an artist in England than in Spain, Rubens, besides his sketches for the decoration of the Banqueting Hall at Whitehall, painted the admirable picture of "The Blessings of Peace" now in the

**National Gallery.** There is no reason to doubt, with Smith, that "His Majesty sat to him for his portrait, yet it is not a little remarkable that no notice occurs in any of the royal catalogues, or the writers of the period, of the existence of such a portrait." While in England, Rubens very narrowly escaped drowning while going to Greenwich in a boat. The fact is reported by Lord Dorchester in a letter to Sir Isaac Wake (Sainsbury, cxvii.). At the beginning of March the painter's mission came to a close.

Rubens was now fifty-three years of age; he had been four years a widower, and before the end of the year (December 1630) he entered into a second marriage with a beautiful girl of sixteen, named Helena Fourment. She was an admirable model, and none of her husband's works may be more justly termed masterpieces than those in which she is represented (Munich, St Petersburg, Blenheim, Liechtenstein, the Louvre, &c.).

Although the long months of absence could not be termed blanks in Rubens's artistic career, his return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best paintings. Brightness in colouring, breadth of touch and pictorial conception, are specially striking in those works we know to have been painted in the latter part of his lifetime. Could anything give a higher idea of Rubens's genius than, for example, the "Feast of Venus," the portrait of "Helena Fourment ready to enter the Bath," or the "St Ildefonso"? This last picture—now, as well as the two others just alluded to, in the Vienna Gallery—was painted for the church of the convent of St Jacques, in Brussels. On the wings are represented the archdukes in royal attire, under the protection of their patron saints. The presence of these figures has led to some mistake regarding the date of the production, but it has been proved beyond doubt, through a document published by Mr Castan (1884), that the "St Ildefonso" (at Vienna—there is another resembling it at St Petersburg) belongs to the series of works executed after the journeys to Spain and England. Archduke Albrecht had been dead ten years. The picture was engraved by Witdoeck in 1638.

Isabella died in 1633, and we know that to the end Rubens remained in high favour with her, alike as an artist and as a political agent. The painter was even one of the gentlemen she deputed to meet Marie de Médicis at the frontier in 1631, after her escape from France.

Spain and the Netherlands went to war again, the king never ceasing to look upon the Dutch as rebels, and much trouble and suspicion came upon the great artist. As to the real nature of his communings with Frederick Henry of Orange, whom he is known to have interviewed, nothing as yet has been discovered.

Ferdinand of Austria, the cardinal-infant of Spain, was called to the government of the Netherlands on the death of his aunt. He was the king's younger brother, and arrived at Antwerp in May 1635. The streets had been decorated with triumphal arches and "spectacula," arranged by Rubens, and certainly never equalled by any other works of the kind.<sup>1</sup> Several of the paintings detached from the arches were offered as presents to the new governor-general, a scarcely known fact, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, &c.). Rubens was at the time laid up with gout, but Prince Ferdinand was desirous of expressing his satisfaction, and called upon the painter, remaining a long time at his house. Rubens and Ferdinand had met at Madrid, and only a short time elapsed before the painter was confirmed in his official standing—a matter of small importance, if we consider that the last years of his life were almost exclusively employed in working much more for the king than for his brother. About a hundred and twenty

<sup>1</sup> Many sketches of the arches are still preserved in the museums in Antwerp, St Petersburg, Cambridge, Windsor, &c. All the compositions were etched under the direction of Rubens by his pupil J. Van Thulden and published under the title of *Pompa introitus honoris serenissimis Principis Ferdinandi Austriaci S. R. E. card. a S. P. Q. Antwerp. decreta et ordinata.*

paintings of considerable size left Antwerp for Madrid in 1637, 1638 and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand wrote to Madrid that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on the 30th of May 1640.

More fortunate than many artists, Rubens left the world in the midst of his glory. Not the remotest trace of approaching old age, not the slightest failing of mind or skill, can be detected even in his latest works, such as the "Martyrdom of St Peter," at Cologne, the "Martyrdom of St Thomas" at Prague, or the "Judgment of Paris" at Madrid, where his young wife appears for the last time.

Rubens has little of the Italian grace and refinement; he was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired, and who themselves have little, if anything, in common with Raphael. But it must be borne in mind how completely his predecessors were frozen into stiffness through italianization, and how necessary it was to bring back the Flemish school to life and nature. Critics have spoken of Rubens's historical inproprieties. Of course nobody could suppose that his classical learning did not go far enough to know that the heroines of the Old Testament or of Roman history were not dressed out as ladies of his time; but in this respect he only follows the example of Titian, Paolo Veronese, and many others. In no other school do we find these animated hunts of lions, tigers, and even the hippopotamus and the crocodile, which may be reckoned among the finest specimens of art, and here again are life and nature displayed with the utmost power. "His horses are perfect in their kind," says Reynolds; his dogs are of the strong Flemish breed, and his landscapes the most charming pictures of Brabantine scenery, in the midst of which lay his seat of Steen. As a portrait painter, although less refined than Van Dyck, he shows that eminent master the way; and his pure fancy subjects, as the "Garden of Love" (Madrid and Dresden) and the "Village Feast" (Louvre), have never been equalled.

For nearly one hundred years the Flemish school may be said to have been but a reflection of the Rubenese principles. Although Jordaens and Erasmus Quellin lived till 1678, the school might be termed a body without soul.

Some etchings have been ascribed to Rubens, but except a head of Seneca, the only copy of which is in the Print Room at the British Museum, and a beautiful figure of St Catherine, we can admit none of the other plates said to proceed from Rubens as authentic. Rubens nevertheless exercised an immense influence on the art of engraving. Under his direct guidance Soutman, Vorsterman, Pontius, Witdoeck, the two Bolsverters, Peter de Jode, N. Lauwers, and many others of less note, left an immense number of beautiful plates, reproducing the most celebrated of his paintings. To give an idea of what his influence was capable of accomplishing, pictorially speaking, it might be sufficient to notice the transformation undergone by the Antwerp school of engraving under Rubens; even the modern school of engraving, in more than one respect, is a continuation of the style first practised in Antwerp (see LINE ENGRAVING). His influence is scarcely less apparent in sculpture, and the celebrated Luke Fayd'herbe was his pupil.

Never did the Flemish school find a second Rubens. None of his four sons became a painter, nor did any of his three daughters marry an artist. According to Rubens's will, his drawings were to belong to that one of his sons who might become a painter, or in the event of one of his daughters marrying a celebrated artist, they were to be her portion. The valuable collection was dispersed only in 1659, and of the pictures sold in 1640 thirty-two became the property of the king of Spain. The Madrid Gallery alone possesses now sixty of his works. Four years after her husband's death, Helena Fourment married J. B. Van Brouckhoven de Berghyck, knight of St James, member of the privy council, &c. She died in 1673. In 1746 the male line of Rubens's descendants was completely extinct. In the female line more than a hundred families of name in Europe trace their descent from him.

The paintings of Rubens are found in all the principal galleries in Europe: Antwerp and Brussels, Madrid, Paris, Lille, Dresden, Berlin, Munich, Vienna, St Petersburg, London, Florence, Milan, Turin exhibit several hundreds of his works. J. Smith's *Catalogue gives descriptions of more than thirteen hundred compositions.*

**RUBIACEAE**, in botany, a large natural order of seed plants, belonging to the series Rubiales of the subclass Sympetalae (Gamopetalae) of Dicotyledons, and containing about 350 genera with about 4500 species. It is mainly a tropical family of trees, shrubs and herbs, but some of the tribes, especially Galieae, to which the British representatives belong and which contains only herbs, are more strongly developed in temperate regions; some species of *Galium* reach the Arctic zone and are found at high elevations on mountains in the tropics.

The most striking characteristic of the family are the opposite-decussate, generally entire, stipulate leaves. The stipules are very varied in form; they generally stand between the petioles of a pair of leaves (interpetiolar). The two stipules of adjacent leaves are usually united, and in the Galieae, as well shown in the British species, are enlarged and leaf-like, forming with the two leaves an apparent whorl; by fusion or branching of the stipules the number of leaves in the whorl varies from four to eight or more. The flowers are rarely solitary, terminal or axillary, as in *Gardenia*; generally they are arranged in cymes or panicles or crowded into heads, and are often showy; in British members of the family they are very small, but may be conspicuous from their numbers, as in lady's bedstraw (*Galium-verum*). The flowers are hermaphrodite and regular with parts in fours or fives; the four or five sepals, petals and stamens are placed above the ovary, which consists of two carpels, contains one to indefinite ananopous ovules in each of the two chambers, and is crowned by a simple style ending in a head or in two lobes. The sepals are often small, sometimes reduced to a narrow ring encircling the top of the ovary or altogether absent. The united petals form a corolla which varies widely in form in the different genera; it is often funnel- or salver-shaped, the honey, which is secreted by a disk round the base of the style, being at the bottom of a longer or shorter tube, in which case the flowers are adapted for pollination by Lepidoptera or bees, as in *Gardenia*, *Mussaenda*, *Guetlardia*, &c.; in other cases it is bell-shaped or, as in *Galium*, rotate, with a short tube and sharply spreading segments; the honey is in these cases freely exposed or only slightly concealed and the flowers are pollinated by flies. The stamens are attached to the corolla-tube and alternate in position with its segments; the flowers are often dimorphic (or heterostyled) with short-styled and long-styled forms as in *ipecaacuanha* (see fig.).

The fruit also varies widely in form and is dry or fleshy. When dry it forms a capsule with septicidal or loculicidal dehiscence, or is a schizocarp separating when dry into two one-seeded mericarps which, as in the British cleavers (*Galium Aparine*), sometimes bear hooked appendages which aid their dispersal.

Some genera show a remarkable association with ants. Thus *Myrmecodia*, *Hydnophytum* are epiphytic plants, in which the base of the stem forms a large tuber, which is attached to the support by numerous adventitious roots. The substance of the tuber is penetrated by numerous cork-lined cavities communicating by galleries, which are inhabited by ants. There is no evidence that the presence of the ants is of any service to the plant.

The order is divided into a large number of tribes based on the number of ovules in each ovary-chamber, the character of the fruit seed and ovule, and the aestivation of the corolla. These may be arranged in three families as follows:—

**Cinchoneae**, often woody plants with scale-like stipules, and numerous ovules in each ovary-chamber; the fruit is generally a capsule. To this belong *Cinchona* (q.v.), a genus of large trees with handsome flowers containing about forty species in the Andes of South America—it is well known as the source of Peruvian bark. An allied genus, *Bouvardia* (q.v.), from tropical America, is cultivated for its flowers. The species of *Uncaria* climb by means of hooks which are modified inflorescence-axes.

**Mussaenda, Gardenia** (q.v.), and other genera are characterized by having a fleshy fruit.

**Coffeae**, often woody or shrubby plants with scale-like stipules; each ovary-chamber contains only one ovule. *Coffea* (q.v.), a genus of shrubs with about twenty-five species in the Old World tropics, includes the coffee plant (*C. arabica* and *C. liberica*); the fruit is a two-seeded drupe, the seed is the "coffee-bean." The thickened root of *Uragoga ipecaacuanha* yields ipecaacuanha (q.v.).

**Stellateae**, herbaceous plants with leaf-like stipules; each ovary-chamber contains one ovule only. Includes the four British genera *Rubia*, one species of which, *R. tinctorum*, is madder; *Galium*, including *G. verum* (lady's bedstraw); *G. Aparine* (goose-grass or

cleavers), and other British species; *Asperula*, including *A. odorata* (woodruff) and *Sherardia*.

The order is closely allied to Caprifoliaceae, the chief distinction being the absence of stipules in the latter.

Ipecaacuanha Plant.

**RUBICON**, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena, and formed the boundary between Italy and the province of Cisalpine Gaul. Hence Caesar's crossing of it in 49 B.C. was tantamount to a declaration of war against Rome as represented by Pompey and the Senate. The historic importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action. There has been much controversy as to the identification of the stream; it appears that its upper course is represented by that of the Pisciatello (called Rubigone in the 11th or 12th century and now Rugone or Urgone), and its lower portion by the Fiumicino, which the Urgone once joined. The point was marked by a station on the Via Aemilia below their confluence, 12 m. N.W. of Ariminum, bearing the name *ad Confluentes*; and here is still preserved a three-arched bridge, larger than is necessary for the water carried by the present Fiumicino.

**RUBIDIUM** [symbol Rb, atomic weight 85.45 (O=16)], a metallic element belonging to the group of the alkali metals. It is found in the minerals lepidolite, petalite and in various specimens of mica and of carnallite, and in some mineral waters. It also occurs in tea, cocoa, coffee, tobacco and in the ashes of beetroot. It was discovered by R. Bunsen and Kirchhoff (*Ann.*, 1860, 113, p. 337), in the spectroscopic examination of the residues obtained on evaporation of water from a mineral spring at Dürkheim, being characterized by two distinctive red lines. The best source of rubidium salts is the residue left after extracting lithium salts from lepidolite, the method of separation being based on the different solubilities of the platino-chlorides of potassium, rubidium and caesium

in water (R. Bunsen, *Ann.*, 1862, 122, p. 351). A somewhat similar process based on the varying solubilities of the corresponding alums has also been devised by Redtenbacher (*Jour. prak. Chem.*, 1865, 95, p. 148). The metal is prepared by distilling the carbonate with carbon (an explosive compound similar to that obtained from potassium and carbon monoxide is liable to be formed simultaneously), by reducing the hydroxide with aluminium:  $4\text{RbOH} + 2\text{Al} = \text{Rb}_2\text{O Al}_2\text{O}_3 + 2\text{Rb} + 2\text{H}_2$  (N. Beketoff, *Ber.*, 1888, 21, p. 424 ref.); by reducing the carbonate (C. Winckler, *Ber.*, 1890, 23, p. 51) or the hydroxide with magnesium (H. Erdmann and P. Kätliner, *Ann.*, 1899, 294, p. 55); and by heating the fused chloride with calcium in an exhausted glass tube at 400–500° C. (L. Hackspill, *Comptes rendus*, 1905, 141, p. 101). The metal was first obtained electrolytically in 1910 by electrolyzing the fused hydroxide in a nickel vessel, with an iron wire cathode and iron cylinder anode; the product on cooling being opened under pyridine cooled by a freezing mixture (G. von Hevesy, *Zeit. anorg. Chem.*, 1910, 67, p. 242). It is a silvery white metal which melts at 38.5° C. and has a specific gravity of 1.52. It oxidizes rapidly on exposure to air, and decomposes cold water very rapidly. It closely resembles caesium and potassium in its general properties. The rubidium salts are generally colourless, mostly soluble in water and isomorphous with the corresponding potassium salts.

Rubidium hydride, RbH, was obtained in the form of colourless needles by H. Moissan (*Comptes rendus*, 1903, 136, p. 587) from the direct combination of its constituent elements. It rapidly dissociates when heated in vacuo to 300° C. The existence of the oxide Rb<sub>2</sub>O appears to be doubtful, the results of Erdmann and Köstner (*loc. cit.*) pointing to the formation of Rb<sub>2</sub>O<sub>2</sub> by the direct union of the metal with dry oxygen. E. Rengade (*Comptes rendus*, 1907, 144, p. 920), by partially oxidizing the metal in a current of dry oxygen and removing excess of metal by distillation in vacuo, has obtained oxides of composition Rb<sub>2</sub>O<sub>2</sub> (yellowish white), Rb<sub>2</sub>O<sub>3</sub> (black) and Rb<sub>2</sub>O<sub>4</sub> (yellow). Rubidium hydroxide, RbOH, is a colourless solid which is formed by the action of rubidium on water, or by the addition of baryta water to a solution of rubidium sulphate. It is readily soluble in water, the solution being very alkaline and caustic. It melts at 301°. Evaporation of the aqueous solution at 15° C. deposits a crystalline hydrated hydroxide of composition RbOH·2H<sub>2</sub>O (R. de Forcrand, *Comptes rendus*, 1909, 149, p. 1341). Rubidium chloride, RbCl, is formed on burning rubidium in chlorine, or on dissolving the hydroxide in aqueous hydrochloric acid. It crystallizes in colourless cubes and volatilizes when heated very strongly. It is soluble in water and combines with many metallic chlorides to form double salts. It combines also with iodine chloride and bromine and with bromine chloride and with bromine (H. L. Wells and H. L. Wheeler, *Amer. Jour. Sci.*, 1891 (3), 43, p. 473).

Rubidium sulphate, Rb<sub>2</sub>SO<sub>4</sub>, is formed by the action of sulphuric acid on the carbonate or hydroxide of the metal, or by the action of milk of lime on rubidium alum, the excess of lime being precipitated by rubidium carbonate and the solution neutralized by sulphuric acid. It forms large colourless hexagonal crystals. Several sulphides of the metal have been described by W. Biltz and E. Wilke-Dörfurt (*Zeit. anorg. Chem.*, 1906, 48, p. 297). The normal sulphide, Rb<sub>2</sub>S·4H<sub>2</sub>O, is colourless, and when heated in aqueous solution with the requisite amount of sulphur is transformed into the yellow tetrasulphide, Rb<sub>2</sub>S<sub>4</sub>·2H<sub>2</sub>O. A pentasulphide, Rb<sub>2</sub>S<sub>5</sub>, which crystallizes in red prisms melting at 223° C., is also obtained by the direct union of the normal sulphide with sulphur. When heated in a current of hydrogen it is transformed into the colourless disulphide, whilst if the heating be carried out in a current of nitrogen it yields the trisulphide, Rb<sub>2</sub>S<sub>3</sub>·H<sub>2</sub>O. These sulphides are much less hygroscopic than the corresponding caesium compounds. Rubidium nitrate, RbNO<sub>3</sub>, obtained by the action of nitric acid on the carbonate, crystallizes in needles or prisms and when strongly heated is transformed into a mixture of nitrite and oxide. Rubidium ammonium, RbNH<sub>2</sub>, was prepared by H. Moissan (*Comptes rendus*, 1903, 136, p. 1177) by the action of liquid ammonia on rubidium. The product combines with acetylene to form rubidium acetylacetylene, Rb<sub>2</sub>C<sub>2</sub>C<sub>2</sub>H<sub>2</sub>, which on heating in vacuo loses acetylene and leaves a residue of rubidium carbide Rb<sub>2</sub>C<sub>2</sub> (*ibid.*, p. 1217). Rubidium carbonate, Rb<sub>2</sub>CO<sub>3</sub>, formed by the addition of ammonium carbonate to rubidium hydroxide, is a crystalline mass which melts in its water of crystallization when heated.

The atomic weight of rubidium was determined by R. Bunsen (*Pogg. Ann.*, 1861, 113, p. 339), Picard (*Zeit. anal. Chem.*, 1862, 1, p. 519) and Godeffroy (*Ann.*, 1876, 181, p. 185), the methods being based on the conversion of rubidium halides into the corresponding silver salt, and the values obtained vary from 85.40 to 85.50. The

determination of E. H. Archibald (*Jour. Chem. Soc.*, 1904, 85, p. 776) from the analysis of the chloride and bromide gives the mean value as 85.485 (O = 16).

**RUBINSTEIN, ANTON GRIGOROVICH** (1829–1904), Russian pianist, born of Jewish parentage on the 28th of November 1829 at Wechwotynetz, in Podolia, was the son of a pencil manufacturer who migrated to Moscow. The Rubinstein family, at the dictate of Anton's grandfather Roman Rubinstein, had all been baptized at the time of the ukase against the Jews issued in 1830 by the Tsar Nicholas. Anton was then one year old. Besides his mother he had but one teacher, the piano master Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1838 Rubinstein appeared in the theatre of the Petrowski Park at Moscow; and in the year following he went to Paris after Villoing, and in 1840 played before Liszt. For some time after this Rubinstein travelled in Holland, Germany and Scandinavia, and reached England in 1842, where on the 20th of May he made his first appearance at a Choral Fund concert. In 1845, after a brief visit to Moscow in 1843, he went with his family (including his brother Nikolaus) to Berlin in order to complete his musical education. Dehn was their master, and Mendelssohn, whom Rubinstein had met previously in London, their best friend. The sudden death of Rubinstein's father necessitated the withdrawal of his mother and Nikolaus to Moscow, while Anton, on Dehn's advice, went to Vienna to seek a livelihood. Hence, after more hard study for nearly two years, he went with the flautist Heindl, and later alone, on a concert tour in Hungary; and the outbreak of the revolution in Vienna preventing his return there, he went via Berlin to St Petersburg, where the Grand Duchess Hélène appointed him Kammervirtuos. About this time an unfortunate error of the police nearly caused his expatriation to Siberia, from which he was saved by his patroness. During the next eight years Rubinstein spent most of his time in St Petersburg studying, playing and composing. His opera *Dmitri Donskoi* was produced there in 1851, and *Toms der Narr* in 1853. *Die Sibirischen Jäger*, written about the same time, was not produced. On the advice of his patroness and Count Wilhorskii he visited Hamburg and Leipzig, and arrived for the second time in London in 1857, when at a Philharmonic concert he introduced his own concerto in G. In the following year he was in London again, having in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862, in collaboration with Carl Schuberth, he founded the St Petersburg Conservatorium, of which he was director until 1867. In 1868 he travelled in Germany, France and England, and remained for some time in Vienna, where he introduced a large number of his own compositions. Thence he went to America in 1872 and 1873, when he returned to Russia, and after a short rest set off once more on concert tours. In this manner the rest of his life was spent, until in 1885 he began a series of historical recitals of immense interest, which he gave in most of the chief European capitals. He died on the 20th of November 1894.

In addition to the works already named, Rubinstein left compositions in almost every known form. Among other of his operas are *Die Kinder der Heide*, *Feramos* (*Lalla Roukh*), *Nero*, *Der Dämon* and *Die Makhdäer*, this last perhaps more frequently played than all the others, of which the chief defect is their lack of dramatic point. On the subject of oratorio Rubinstein held original views, though his attempt to realize them in *Moses* and *Christus* was not completely successful, while his efforts in Berlin and London to found a Sacred Theatre failed entirely. Nevertheless he himself regarded the *Christus* as his greatest achievement. The most familiar of his five symphonies are the "Ocean" and the "Dramatic." He wrote scores on scores of pianoforte works, from complex concertos to the most commonplace *solonstücke*; abundance of concerted chamber-music, and a number of songs and duets, which enjoyed some popularity. He also published several books, including his *Reminiscences* and *Die geistliche Oper*.

Rubinstein's fame as one of the greatest of pianists will live in history. His technique bore comparison with that of Liszt; he possessed a power for interpreting the most different kinds of music which has not been surpassed.

His brother NIKOLAUS (1835-1881) was also a remarkable pianist, and a marvellous teacher of music. He founded the conservatorium of music at Moscow.

Cronk, *The Works of Anton Rubinstein* (London, 1900).

**RUBRIC** (Fr. *rubrique*, Lat. *rubrica*, *ruber*, red), in its earliest and original sense, red earth or ochre, ruddle, and hence applied to words written or printed in red lettering, in MSS. or printed books, such as chapter headings, paragraphs, initial letters, &c., thus marking in a distinctive manner that to which attention is to be drawn. The term was also applied to the passages so marked, and more especially to the directions or rules as to the conduct of divine service in liturgical books. This is the chief current usage of the term (see **LITURGY**).

**RUBRUQUIS** (or **RUBROUCK**), **WILLIAM OF** (c. 1215-1270; fl. 1253-55), Franciscan friar, one of the chief medieval travellers and travel-writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Fratri Willielmi de Rubruquis") is found in the imperfect MS. printed by Hakluyt in his collection, and followed in his English translation, as well as in the completer issue of the English by Purchas. Writers of the 16th, 17th and 19th centuries have called the traveller *Risbrocke* and *Rysbrokius* (*Rysbroek* and *Rysbroek* in the *Biographie universelle* and *Nouv. biog. générale*)—an error founded on the identification of his name of origin with Ruysbroeck in Brabant (a few miles south of Brussels) and perhaps promoted by the fame of John of Ruysbroeck or Rysbroeck (1294-1381), a Belgian mystic, whose treatises have been reprinted as late as 1848. It is only within the last twenty years that attention has been called to the fact that Rubrouck is the name of a village and commune in old (medieval) French Flanders, belonging to the canton of Cassel in the department du Nord, and lying some 8½ m. N.E. of St Omer. In the library of the latter city many medieval documents exist referring expressly to de Rubroucks<sup>1</sup> of the 12th and 13th centuries. It may be fairly assumed that Friar William came from this place;<sup>2</sup> thus Hakluyt's conclusion is justified, as expressed in the title he gives to Lord Lumley's MS. printed by him, now in the British Museum, MSS. Reg., 14 C. xiii. fol. 225 r.-36 r. (*Itinerarium fratris Willielmi de Rubruquis de ordine fratrum Minorum, Galli, Anno gratie 1253, ad partes Orientales*).

Friar William went to Tartary under orders from Louis IX. (St Louis). That king, at an earlier date, viz. December 1248, when in Cyprus, had been visited by alleged envoys from Elchigaday (Ilchikadai, Ilchikdai), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Lonjumeau and other ecclesiastics, who carried presents and letters for both Ilchikadai and the Great Khan. They reached the court of the latter in the winter of 1249-50, when there was no actual khan on the throne; and they returned, along with Tatar envoys, bearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the king repented sorely of having sent such a mission ("li rois se

repenti fort quant il y envola." Joinville, *Histoire de Saint Louis*, pp. 148-49, in Paris edition of 1858 by F. Michel, Paulin Paris and F. Didot). These returned envoys reached the king when he was at Caesarea, therefore between March 1251 and May 1252. But not long after the king, hearing that the Tatar prince Sartak, son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William, of Rubrouck. The former rebuff had made the king chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St Sophia's on Palm Sunday (i.e. April 13th) 1253, disclaimed that character.

Various histories of St Louis, and other documents, give particulars of the despatch of the mission of Friar Andrew from Cyprus, but none mention that of Friar William; and the first dates given by the latter are those of his sermon at Constantinople, and of his entrance into the Black Sea (May 7th, 1253). He must therefore have received his commission at Acre, where the king was residing from May 1252 to the 29th of June 1253; but he had travelled by way of Constantinople, as has just been indicated, and there received letters to some of the Tatar chiefs from the emperor, who was at this time Baldwin de Courtenay, the last of the Latin dynasty.

The narrative of the journey is everywhere full of life and interest. The vast conquests of Jenghiz Khan were still in nominal dependence on his successors, at this time represented by Mangu Khan, reigning on the Mongolian steppes, but practically these conquests were splitting up into several great monarchies. Of these the Ulus of Juji, the eldest son of Jenghiz, formed the most westerly, and its ruler was Batu Khan, established on the Volga. Sartak is known in the history of the Mongols as Batu's eldest son, and was appointed his successor, though he died immediately after his father (1256). The story of Sartak's Christianity seems to have had some foundation; it was currently believed among Asiatic Christians, and it is alleged by Armenian writers that he had been brought up and baptized among the Russians. Pope Innocent IV. (August 29, 1254) refers with enthusiasm to Sartak's baptism, of which he had just heard from a priest whom the khan had sent as envoy to the papal court.

Rubrouck and his party landed at Soldais, or Sudak, on the Crimean coast, then a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts (i.e. the nomad camps) of Scacatai (Kadan?), Sartak and Batu, thus crossing the Don and arriving at the Volga: of both these rivers Friar William gives vivid and interesting sketches. Batu kept the travellers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5000 m., and the return journey to Lajazzo in Cilicia would be longer by 500 to 700 m. The chief dates to be gathered from the narrative are as follows: the envoys embark on the "Euxine," May 7th, 1253; reach Soldais, May 21st; set out thence, June 1st; reach the camp of Sartak, July 31st; begin the journey from the camp of Batu E. across the steppes, September 16th; turn S.E., November 1st; reach the Talas river, November 8th; leave Caliac<sup>3</sup> (S. of Lake Balkash), November 30th; reach the camp of the Great Khan, December 27th; leave the camp of the Great Khan on or about July 10th, 1254; reach camp of Batu again, September 16th; leave Batu's camp at Sarai, November 21st; arrive at the Ircs Gate (Derbent), November 13th; Christmas spent at Nakhshivan or Nakhichevan (under Ararat); reach Antioch (from Lajazzo, Lays, or Ayas, of Cilicia, via Cyprus), June 29th, 1255; reach Tripoli, August 15th.

<sup>3</sup> Caliac, where Rubrouck halted twelve days, is undoubtedly the Kayalik of the historians of the Mongols, the position of which is somewhat indefinite. The narrative of Rubrouck shows that it must have been near the modern Kopal.

<sup>1</sup> A detailed notice of such documents was published by M. E. Coussemaeker of Lille. See remarks by M. d'Arvezac in *Bull. de la Soc. de Géog.*, 2nd vol. for 1868, pp. 569-70.

<sup>2</sup> The county of Flanders was at this time a fief of the French crown (see Natalis de Wailly, *Notes on Joinville*, p. 576). William's mother-tongue may have been Flemish. From his representation to Mangu Khan (p. 361) that certain "Teutonici" who had been carried away as slaves by a Tatar chief were "nostrae lingue," Dr. Franz Max Schmidt inclines to think this certain.

The camp of Batu was first reached near the northernmost point of his summer marches, therefore about Ukek or Uvyek, near Saratov (see Marco Polo, Paris ed. of 1824, p. 3). Before the camp was left they had marched with it five weeks down the Volga. The point of departure would lie on that river somewhere between 48° and 50° N. The route taken lay E. by a line running N. of the Caspian and Aral basins; then from about 70° E. to the basin of the Talas river; thence across the passes of the Kirghiz Ala-tau and S. of the Balkash Lake to the Ala-kul and the Baratula Lake (Ebi-nor). From this the travellers struck N. across the Barluk, or the Orkochnik Mountains, and thence, passing S. of the modern Kobdo, to the valley of the Jabkan river, whence they emerged on the plain of Mongolia, coming upon the Great Khan's camp at a spot ten days' journey from Karkorum and bearing in the main S. from that place, with the Khangai Mountains between.

This route is of course not thus defined in the narrative, but is a deduction from the facts stated therein. The key to the whole is the description given of that central portion intervening between the basin of the Talas and Lake Ala-kul, which enables the topography of that region, including the passage of the Ili, the plain S. of the Balkash, and the Ala-kul itself, to be identified past question.<sup>1</sup>

The return journey, being made in summer, after retraversing the Jabkan valley,<sup>2</sup> lay apparently farther to the N., and passed N. of the Balkash, probably with a fairly straight course, to the mouths of the Volga. Thence the party travelled S. by Derbent, and so by Shamakhi to the Araxes, Nakhshivan, Erzincan, Sivas and Iconium, to Lajazzo, Layas, or Ayas, where they embarked for Cyprus and Syria. St Louis had returned to France a year before.

We have alluded to Roger Bacon's mention of Friar William. Indeed, in the geographical section of the *Opus Majus* (c. 1262) he cites the traveller repeatedly and copiously, describing him as "frater Wilhelmus quem dominus rex Francie misit ad Tartaros. Anno Domini 1253. . . qui perlustravit regiones orientis et aequilonis et loca in medio his annexa, et scripsit haec praedicta illi regi; quem librum diligenter vidi et cum ejus auctore contuli" (see *Opus Majus*, Oxford edition of 1897, i. 353-66). Add to this William's own incidental particulars as to his being—like his precursor, Friar John de Plano Carpini—a very heavy man (*ponderosus valde*), and we know no more of his personality, except the abundant indications of character afforded by the story itself. These point for us an honest, pious, stout-hearted, acute and most intelligent observer, keen in the acquisition of knowledge, the author of one of the best narratives of travel in existence. His language indeed is dog-Latin of the most un-Ciceronian quality; but it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties of communication, and of the badness of his *turgemannus* or dragoman,<sup>3</sup> he gathered a mass of particulars, wonderfully true or near the truth, not only as to Asiatic nature, geography, ethnography and manners, but as to religion and language. Of his geography a good example occurs in his account of the Caspian (eagerly caught up by Roger Bacon), which is perfectly accurate, except that he places the hill country occupied by the Mulahids, or Assassins, on the E. instead of the S. shore. He explicitly corrects the allegation of Isidore that it is a gulf of the ocean: "non est verum quod dicit Ysidorus . . . nusquam enim tangit oceanum, sed unumquod circumdat terra" (265).<sup>4</sup> Of his interest and acumen in matters of language we may cite examples. The language of the Pascatir (or Bashkirs) and of the Hungarians is the same as he had

learned from Dominicans who had been among them (274).<sup>5</sup> The language of the Ruthenians, Poles, Bohemians and Slavonians is one, and is the same with that of the Vandals, or Wends (275). In the town of Equius (immediately beyond the Ili, perhaps Aspara)<sup>6</sup> the people were Mahomedans speaking Persian, though so far remote from Persia (281). The Uighurs (or Yugurs) of the country about Caliac (see note above) had formed a language and character of their own, and in that language and character the Nestorians of that tract used to perform their office and write their books (281-82). The Uighurs are those among whom are found the fountain and root of the Turkish and Comanian tongue (289). Their character has been adopted by the Mongols. In using it they begin writing from the top and write downwards, whilst line follows line from left to right (286). The Nestorians say their service, and have their holy books, in Syriac, but know nothing of the language, just as some of our monks sing the mass without knowing Latin (293). The Tibet people write as we do, and their letters have a strong resemblance to ours. The Tangut people write from right to left like the Arabs, and their lines advance upwards (329). The current money of Cathay is of cotton paper, a palm in length and breadth, and on this they print lines like those of Mangu Khan's seal:—"imprimunt lineas sicut est sigillum Mangu"—a remarkable expression. They write with a painter's pencil and combine in one character several letters, forming one expression:—"faciunt in una figura plures literas comprehendentes unam dictionem,"—a still more remarkable utterance, showing an approximate apprehension of the nature of Chinese writing (379).

Yet this sagacious observer is denounced as an untruthful blunderer by Isaac Jacob Schmidt (a man of useful learning, of a kind rare in his day, but narrow, wrong-headed, and in natural acumen and candour far inferior to the 13th-century friar) simply because Rubrouck's evidence as to the Turkish dialect of the Uighurs traversed a pet heresy, long since exploded, which Schmidt entertained, viz. that the Uighurs were by race and language Tibetan.<sup>7</sup> Léon Cahun (*Introduction à l'histoire de l'Asie*, pp. 353-55, 384-86, 392) also shows a strange perversity in depreciating Rubrouck; all this detraction may be contrasted with Oscar Peschel's admirably fair judgment (*Geschichte der Erdkunde*, p. 165, &c.). At the same time, Rubrouck may be considered inferior as a politician and diplomatist to Carpini; and the latter's remarkable work has in its turn suffered from undiscriminating eulogy of his successor's *Itinerarium*. An attempt has been made to strike a balance in the judgment of these two great pioneers in the *Dawn of Modern Geography*, ii. 375-81.

The narrative of Rubrouck, after Roger Bacon's copious use of it, seems to have dropped out of sight, though five MSS. are still known to exist: the chief of these are (1) Corp. Chr. Coll., Cambridge, No. 66, fols. 67 v.-110 v. of about 1320; (2) No. 181 of the same library, fols. 321-98, of about 1270-90; (3) Leiden Univ. Libr., No. 77 (formerly 104), fols. 160 r.-190 r. of about 1290. It has no place in the famous collections of the 14th century, nor in the earlier *Speculum Historiale* of Vincent of Beauvais, which gives so much attention to the 13th-century intercourse of Latin Christendom with Tartary. It first appeared imperfectly in Hakluyt (1598 and 1599), as we have mentioned. But it was not till 1839 that any proper edition of the text was published. In that year the *Recueil de Voyages de la Paris Geographical Society*, vol. iv., contained an edition of the Latin text, and a collation of the MSS. put forth by M. d'Avezac, with the assistance of two young scholars, since of high distinction, viz. Francisque Michel and Thomas Wright. But there is no commentary on the subject-matter, such as M. d'Avezac attached to his edition of Friar John de Plano Carpini in the same volume. Something has been done to supply this deficiency by the two editions in the Hakluyt Society's publications, (i.) *William of Rubrouck . . . John of Pian de Carpino*, texts and edited by William W. Rockhill (London, 1900); (ii.) *Translations and Versions of . . . Carpini and . . . Rubricus . . .*, edited by C. Raymond Beazley (London, 1903). Richtofen in his *China*, i. 602-4, has briefly but justly noticed Rubrouck. A French version with some notes, issued at Paris in 1877, in the *Bibliothèque orientale Elzévirienne* hardly deserves mention. Dr Franz Max Schmidt's admirable monograph, *Über Rubrük's Reise* (Berlin, 1885), has been separately

<sup>1</sup> See details in *Cathay and the Way Thither*, pp. cccxi-ccciv, and Schuyler's *Turkistan*, i. 402-5. Mr Schuyler points out the true identification of Rubrouck's river with the Ili, instead of the Chu, which is a much smaller stream; and other amendments have been derived from Dr F. M. Schmidt (see below).

<sup>2</sup> This meaning may be put on Rubrouck's words: "Our going was in winter, our return in summer, and that by a way lying very much farther north, only that for a space of fifteen days' journey in going and coming we followed a certain river between mountains, and on these there was no grass to be found except close to the river." The position of the Chagan Takoi or upper Jabkan seems to suit these facts best; but Mr Schuyler refers them to the upper Irtysh, and Dr F. M. Schmidt to the Üliungur.

<sup>3</sup> "Ego enim percepit postea, quando incepti aliquantulum intelligere idioma, quod quando dicebam unum ipse totum aliud dicebat, secundum quod ei occurreret. Tum videns periculum loquendi per ipsum, elegi magis tacere" (248-49).

<sup>4</sup> The page references in the text are to d'Avezac's edition of the Latin (see below).

<sup>5</sup> The Bashkirs now speak a Turkish dialect; but they are of Finnish race, and it is quite possible that they then spoke a language akin to Magyar. There is no doubt that the Mussulman historians of that age identified the Hungarians and the Bashkirs (e.g. see extracts from Juvaini and Rashiduddin in App. to D'Ohsson's *Hist. des Mongols*, ii. 620-23). The Bashkirs are also constantly coupled with the *Majär* by Abulghazi. See Fr. tr. by Desmaisons, pp. 19, 140, 180, 189.

<sup>6</sup> *Asp = Equius*. Aspara is often mentioned by the historians of Timur and his successors; its exact place is uncertain, but it lay somewhere on the Ili frontier. Dr F. M. Schmidt thinks this identification impossible; but one of his reasons—viz. that Equius was only one day from Caliac—appears to be a misapprehension of the text.

**RUBY** (Lat. *rubeus*, red), the most valued of all gem-stones, a red transparent variety of corundum, or crystallized alumina. It is sometimes termed "oriental ruby" to distinguish it from the spinel ruby, which is a stone of inferior hardness, density and value (see SPINEL). When the word ruby is used without any qualifying prefix, it is always the true or so-called oriental stone that is meant in modern nomenclature. Ancient writers, relying chiefly on colour, classed together under a common name several brilliant red stones, such as the ruby, spinel and garnet: thus the *ἀσπαρ* of Theophrastus and the *Carbunculus* of Pliny were names which seem to have been applied to several distinct minerals. Although the word ruby is used in the English translation of the Old Testament it is improbable that the true ruby was known to the ancient Hebrews.

The ruby crystallizes in the hexagonal system (see CORUNDUM). The crystals have no true cleavage, but tend to break along certain gliding planes. The colour of ruby varies from deep cochineal to pale rose-red, in some cases with a tinge of purple, the most valued tint being that called by experts pigeon's-blood colour. On exposure to a high temperature, the ruby becomes green, but regains its original colour on cooling. The red colour of ruby may be due to chromium. When a ruby of the most esteemed tint is examined with the dichroscope, one image is generally seen to be carmine and the other aurora-red, the red colour inclining to orange. This test serves to distinguish the true ruby from spinel and from garnet, since these minerals, being cubic, are not dichroic. Another means of distinction is afforded by the specific gravity of ruby (about 4), which is higher than that of spinel and garnet, whilst the superior hardness of the ruby (about 9) furnishes yet another test. The high refractivity of ruby is also characteristic, the mean ordinary index being 1.77 and the extraordinary 1.76. When cut and polished the ruby is therefore a brilliant stone, but having weak dispersive power it lacks fire. Subjected to radiant discharge in a Crookes tube, the ruby, like other forms of corundum, phosphoresces with a vivid red glow.

The oriental ruby is a mineral of very limited distribution. Its most famous localities are in Upper Burma, but until the British annexation of the country in 1886 the mines were so jealously guarded that little was known as to the conditions under which the mineral occurred. Soon after the annexation, the ruby districts were officially visited, and reported on, by Mr C. Barrington Brown, and specimens from the mines were exhaustively studied by Professor J. W. Judd. The principal district is situated in the neighbourhood of Mogok, 90 m. N.E. of Mandalay. The ruby occurs in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; and it is from the anorthite, or lime-felspar, and the associated minerals in the pyroxene-gneisses, that the corundum, spinel and calcite, may, according to Judd, have been derived. Probably the felspar is first altered to scapolite, and this on decomposition would yield calcium carbonate and hydrous aluminium silicates, from which the anhydrous alumina might ultimately be separated. The limestone contains (in addition to the ruby) spinel, garnet, graphite, wollastonite, scapolite, felspar, mica, pyrrhotite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diaspore, which by further alteration and union with silica, &c., may yield margarite, vermiculite, chlorite and other hydrous silicates.

The Burmese rubies are not generally worked in the limestone matrix, but are mostly found loose in detrital matter, which is clayey and sandy in character and yellowish-brown

in colour, and is known locally as "byon." Some of the deposits occur in limestone caverns, where they may, like cave-earth, represent the insoluble residue of the limestone. Workings in the cave-deposits are called "loodwins" (crooked mines). In the alluvium of the valleys, the ruby-pits are known as "twinloons" (round pits), whilst workings in the ruby-earth on the hillsides are termed "hmyauawins" (water mines). The byon contains, with the ruby, other coloured corundums and spinels. Burmese rubies are found also in crystalline limestone in the hills near Sagyin, about 20 m. N. of Mandalay, and it is of mineralogical interest to note that the limestone here contains chondrodite.

Rubies are found in Siam, at several localities in the provinces of Chantabun and Krat; and Professor H. Louis has described their occurrence at Moung Klung in this region. The rubies are found with sapphires and spinels, in gravels, resting in some cases on basic igneous rocks. The Siam rubies are generally of dark colour, often inclining to a deep reddish brown. Rubies occur, with sapphires and other minerals, in the gem-gravels of Ceylon, but are not usually of such good colour as the Burmese stones. A cloudy variety, which, when cut with a convex surface, exhibits a luminous star, is known as star-ruby (see ASTERIAS). In peninsular India rubies are rarely found, though they have been reported from the corundum deposits of Madras and Mysore. The ruby is known, however, to occur in a micaceous limestone at Jagdalak, near Kabul in Afghanistan.

Rubies, generally of pale colour, are found with the sapphires of Montana, especially at Yogo Gulch near Utica. In the corundum deposits of N. Carolina ruby is occasionally met with, especially at Cowee Creek, Macon county, where it occurs in crystals of tabular, rhombohedral and prismatic habit. These crystals, sometimes of fine colour, are found in gravels resting on a soft rock called apolite, which results from the weathering of certain basic igneous rocks; and it is notable that the ruby crystals are associated with the variety of garnet termed rhodolite, as described by Professor Judd and W. E. Hidden. Australia has occasionally yielded rubies, but mostly of small size and inferior quality. In New South Wales and in Victoria they have been found in drift gravels, and a magenta-coloured turbid variety from Victoria has been described under the name of barklyite.

Rubies have been produced artificially with much success. At one time it was the practice to fuse together small fragments of the natural stone; and gems cut from such material were known as reconstructed rubies. This process has given way to Professor A. Verneuil's method of forming artificial ruby from purified ammonia-alum with a certain proportion of chrome-alum. The finely powdered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon's-blood colour, the synthetical ruby contains about 2.5% of chromic oxide. The manufactured ruby possesses the physical characters of corundum, but may generally be distinguished by microscopic bubbles and striæ. The manufacture is carried out commercially. (For other processes, see GEM, ARTIFICIAL.)

It should be noted that several minerals known popularly as rubies have no relation to the true red corundum. Thus, "Cape rubies" from the South African diamond mines, "Australian rubies" from South Australia, and "Arizona rubies" are merely fine garnets; "Siberian ruby" is red tourmaline (see RUBELLITE), and "Balas ruby" is spinel (*q.v.*). Ruby silver is a name applied to light red silver ore, or proustite; ruby copper is merely cuprite, in brilliant crystals; and ruby-blende is a clear red variety of zinc sulphide.

**RUBY MINES**, a district in the Mandalay division of Upper Burma, lying along the Irrawaddy river between the Bhamo district on the N., the Shan States on the E., Mandalay district on the S. and Katha on the W. Including the Shan state of Mongmit, which is temporarily administered as part of the district, the total area is 5476 sq. m.; pop. (1901) 87,604. The district geographically forms part of the Shan plateau, and is to a great extent a mass of hills with a general N. and S. direction. It contains considerable numbers of Kaehins (13,300) and Palaungs (16,400). The annual rainfall at Mogok averages 98 in. The administrative headquarters are at Mogok, which is also the centre of the ruby-mining industry. It stands in the centre of a valley 4000 ft. above sea-level, and is reached by a cart-road from Thabeikkyin, 61 m. distant, on the Irrawaddy. The Ruby Mines Company employs about 44 Europeans and Eurasians in its works, which are situated at the north end of the town. The company has constructed a dam across the Yeni stream and set up an electric installation of about 450 horse-power, which works pumps and the washing machinery. The mines were worked under Burmese rule, but were discontinued on account of the small profit. Now they seem to be established on a sound financial basis. The system adopted is to excavate large open pits, from which the ruby-earth or *byon* is removed *en masse* and washed and crushed by machinery. Spinel and sapphires are found with the rubies. In 1904, the produce of rubies alone was 200,000 carats, valued at £80,000, most of which were sent to London for sale. In addition, some mining is carried on by natives, working under a licence which does not permit the use of machinery. The district contains 904 sq. m. of reserved forests.

**RÜCKERT, JOHANN MICHAEL FRIEDRICH** (1788–1866), German poet, was born at Schweinfurt on the 16th of May 1788, the eldest son of a lawyer. He was educated at the gymnasium of his native place and at the universities of Würzburg and Heidelberg. For some time (1816–17) he worked on the editorial staff of the *Morgenblatt* at Stuttgart. Nearly the whole of the year 1818 he spent in Rome, and afterwards he lived for several years at Coburg. He was appointed a professor of Oriental languages at the university of Erlangen in 1826, and in 1841 he was called to a similar position in Berlin, where he was also made a privy councillor. In 1849 he resigned his professorship at Berlin, and went to live on his estate Neuses near Coburg. He died on the 31st of January 1866. When Rückert began his literary career, Germany was engaged in her life-and-death struggle with Napoleon; and in his first volume, *Deutsche Gedichte*, published in 1814 under the pseudonym "Frelmund Raimar," he gave, particularly in the powerful "Geharnichte Sonette," vigorous expression to the prevailing sentiment of his countrymen. In 1815–18 appeared *Napoleon, eine politische Komödie in drei Stücken* (only two parts were published), and in 1817 *Der Kranz der Zeit*. He issued a collection of poems, *Östliche Rosen*, in 1822; and in 1834–38 his *Gesammelte Gedichte* were published in six volumes, a selection from which has passed through many editions. Rückert, who was master of thirty languages, made his mark chiefly as a translator of Oriental poetry and as a writer of poems conceived in the spirit of Oriental masters. Much attention was attracted by a translation of Hariri's *Makamen* (1826), *Nal und Damajanti*, an Indian tale (1828), *Kostem und Suhrab, eine Heldengeschichte* (1838), and *Hamasa, oder die ältesten arabischen Volkslieder* (1846). Among his original writings dealing with Oriental subjects are *Morgenländische Sagen und Geschichten* (1837), *Erbauliches und Beschauliches aus dem Morgenland* (1836–38), and *Brakmanische Erzählungen* (1839). The most elaborate of his works is *Die Weisheit der Brakmanen*, published in six volumes in 1836–39. This last of the *Liebesfrübling* (1844), a cycle of love-songs, are the best known of all Rückert's productions. In 1843–45 he issued the dramas *Saul und David* (1843), *Herodes der Grosse* (1844),

*Kaiser Heinrich IV.* (1845) and *Christoforo Colombo* (1845), all of which are greatly inferior to the work to which he owes his place in German literature. At the time of the Danish war in 1864 he wrote *Ein Hundert Kampflieder für Schleswig-Holstein*, which, although published anonymously, produced a considerable impression. After his death many poetical translations and original poems were found among his papers, and several collections of them were published. Rückert had a splendour of imagination which made Oriental poetry congenial to him, and he has seldom been surpassed in rhythmic skill and metrical ingenuity. There are hardly any lyrical forms which are not represented among his works, and in all of them he wrote with equal ease and grace.

A complete edition of Rückert's poetical works appeared in 12 vols. in 1868–69. Subsequent editions have been edited by L. Laistner (1896), C. Beyer (1896), G. Ellinger (1897). See B. Portlage, *P. Rückert und seine Werke* (1867); C. Beyer, *Friedrich Rückert, ein biographisches Denkmal* (1868), *Neue Mitteilungen über Rückert* (1873), and *Nachgelassene Gedichte Rückerts und neue Beiträge zu dessen Leben und Schriften* (1877); V. Bockberger, *Rückert-Studien* (1878); P. de Lagarde, *Erinnerungen an F. Rückert* (1886); F. Muncker, *Friedrich Rückert* (1890); G. Voigt, *Rückerts Gedankensprache* (1891).

**RÜDAGI** (d. 954). Farid-eddin Mahommed 'Abdallah, the first great literary genius of modern Persia, was born in Rüdagi, a village in Transoxiana, about 870–900. Most of his biographers assert that he was totally blind, but the accurate knowledge of colours shown in his poems makes this very doubtful. The fame of his accomplishments reached the ear of the Sāmānid Nasr II. bin Ahmad, the ruler of Khorāsān and Transoxiana (913–42), who invited the poet to his court. Rüdagi became his daily companion, rose to the highest honours and amassed great wealth. In spite of various predecessors, he well deserves the title of "father of Persian literature," "the Adam or Sultan of poets," since he was the first who impressed upon every form of epic, lyric and didactic poetry its peculiar stamp and its individual character. He is also said to have been the founder of the "dīwān"—that is, the typical form of the complete collection of a poet's lyrical compositions in a more or less alphabetical order which prevails to the present day among all Mahomedan writers. Of the 1,300,000 verses attributed to him, there remain only 52 kasidas, ghazals and rubā'is; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaffa's Arabic version of the old Indian fable book *Kalilah and Dimnah*, which he put into Persian verse at the request of his royal patron. Numerous fragments, however, are preserved in the Persian lexicon of Asad of Tus (ed. P. Horn, Göttingen, 1897). In his kasidas, all devoted to the praise of his sovereign and friend, Rüdagi has left us unequalled models of a refined and delicate taste, very different from the often bombastic compositions of later Persian encomiasts. His didactic odes and epigrams express in well-measured lines a sort of Epicurean philosophy of human life and human happiness; more charming still are the purely lyrical pieces in glorification of love and wine. Rüdagi survived his royal friend, and died poor and forgotten by the world.

There is a complete edition of all the extant poems of Rüdagi, in Persian text and metrical German translation, together with a biographical account, based on forty-six Persian MSS., in Dr H. Ethé's "Rüdagi der Sāmānidendichter." (*Göttinger Nachrichten*, 1873, pp. 663–742); see also his "Neupersische Literatur" in Geiger's *Grundriss der iranischen Philologie* (ii.); P. Horn, *Gesch. der persischen Literatur* (1901), p. 73; E. G. Browne, *Literary History of Persia*, i. (1902); C. J. Pickering, "A Persian Chaucer" in *National Review* (May 1890).

**RUDD**, or RED-EYE (*Leuciscus erythrophthalmus*), a fish of the Cyprinid family, spread over Europe, N. and S. of the Alps, also found in Asia Minor, and common in localities where there are still waters with muddy bottom. The rudd and the roach are very similar and frequently confused by anglers; the former differs principally in the more posterior dorsal fin, which is situated exactly opposite the space between the ventral and anal fins. It is a fine fish, but little esteemed for food,

and rarely exceeds 12 in. in length and 2 lb in weight. It feeds on small freshwater animals and soft vegetable matter, and spawns in April or May. It readily crosses with the white bream, and more rarely with the roach and bleak.

**RUDDER** (O.E. *Rother*, i.e. rower), that part of the steering apparatus of a ship which is fastened to the stern outside, and on which the water acts directly. The word may be found to be used as if it were synonymous with "helm." But the helm (A.S. *Hilff*, a handle) is the handle by which the rudder is worked. The tiller, which is perhaps derived from a provincial English name for the handle of a spade, has the same meaning as the helm. In the earliest times a single oar, at the stern, was used to row the vessel round. In later times oars with large blades were fixed on the sides near the stern. In Greek and Roman vessels two sets were sometimes employed, so that if the pitching of the ship lifted the after pair out of the water, the foremost pair could still act. As these ancient ships were, at least in some cases, sharp at both ends and could sail either way, steer (or steering) oars were fixed both fore and aft. The steer oar in this form passed through a ring on the side and was supported on a crutch, and was turned by a helm, or tiller. Norse and medieval vessels had, as far as we can judge, one steer oar only placed on the right side near the stern—hence the name "starboard," i.e. steerside, for the right side of the ship looking forward. In the case of small vessels the steer oar possesses an advantage over the rudder, for it can bring the stern round quickly. Therefore it is still used in whaling boats and rowing boats which have to work against wind and tide, and in surf when the rudder will not act. It is not possible to assign any date for the displacement of the side rudder by the stern rudder. They were certainly used together, and the second displaced the first in the course of the 14th century when experience had shown that the rudder was more effective at the stern than at the side. The rudder of a wooden ship when fully developed was composed of four pieces. The first or main piece was hung on to the stern post of the ship. Its upper portion was known as the rudder head, and was at first an oval shaft which passed into the ship through the rudder port, and to which the helm was fixed. A canvas bag called a rudder coat covered the opening to exclude the water. In later days Sir R. Seppings introduced the cylindrical form in order to prevent the water from coming into the round rudder port. Three back pieces were fastened to the main piece longitudinally. The whole were fastened together by iron bands called pintle straps, which had at the forward end a pin or pintle, which fitted into braces, i.e. fixed rings on the stern post, so that the rudder hung on hinges. The lower part of the main piece was bevelled, and so was the stern post, so as to allow the rudder to swing freely. A projecting piece called a chock or wood-lock was fixed in the head outside the ship in order to prevent the rudder from being lifted by the water out of its hinges. A small vessel can be steered by the helm or tiller, but in a larger it is necessary to apply a mechanical leverage. This was secured by carrying ropes, or in later times chains, to the sides of the ship, and then through blocks to the upper deck, round a barrel which is worked by the wheel. The principle of the rudder cannot alter, but the means employed to work it have been altered by the introduction of the screw, and by the increased size of ships. A single screw is placed in an open space before the stern post. As the opening thus created prevents the water from flowing directly on to the rudder, a screw steamer is sometimes difficult to steer. In order to make the rudder more manageable, it has been balanced, i.e. pivoted, on a shaft placed at about a third of its length from the foremost edge. In a double screw there is no opening, but the balanced rudder is still used, and the ship can be turned by reversing one of the screws. The need for more power to work the helm has led to the introduction of steam, and hydraulic steering apparatus which can be set in motion by a small wheel.

See Bury's *Falconer's Dictionary* (London, 1830), Torr's *Ancient Ships* (Cambridge, 1894); Nares, *Seamanship* (Plymouth, 1882).

**RUDDIMAN, THOMAS** (1674–1757), Scottish classical scholar, was born in October 1674, at Raggal, Banffshire, where his father was a farmer. He was educated at Aberdeen University, and through the influence of Dr Archibald Pitcairne he was made assistant in the Advocates' Library, Edinburgh. His chief writings at this period were editions of Florence Wilson's *De Animi Tranquillitate Dialogus* (1707), and the *Canticis Solomonis Paraphrasis Poetica* (1709) of Arthur Johnston (1587–1641), editor of the *Deliciae Poetarum Scotorum*. On the death of Dr Pitcairne he edited his friend's Latin verses, and arranged for the sale of his valuable library to Peter the Great of Russia. In 1714 he published *Rudiments of the Latin Tongue*, which was long used in Scottish schools. In 1715 he edited, with notes and annotations, the works of George Buchanan in two volumes folio. As Ruddiman was a Jacobite, the liberal views of Buchanan seemed to him to call for frequent censure. A society of scholars was formed in Edinburgh to "vindicate that incomparably learned and pious author from the calumnies of Mr Thomas Ruddiman"; but Ruddiman's remains the standard edition, though George Logan, John Love, John Man and others attacked him with great vehemence. He died (1755) a successful printing business, and in 1728 was appointed printer to the university. He acquired the *Caledonian Mercury* in 1729, and in 1730 was appointed keeper of the Advocates' Library, resigning in 1752. He died in Edinburgh, on the 19th of January 1757.

Besides the works mentioned, the following writings of Ruddiman deserve notice: An edition of Gavin Douglas's *Aeneid* of Virgil (1710); the editing and completion of Anderson's *Selectus Diplomatum et Numismatum Scotiae Thesaurus* (1739); *Catalogue of the Advocates' Library* (1733–42); and a famous edition of Livy (1751). He also helped Joseph Ames with the *Typographical Antiquaries*. Ruddiman was for many years the representative scholar of Scotland. Writing in 1766, Dr Johnson, after reproving Boswell for some bad Latin, significantly adds—"Ruddiman is dead." When Boswell proposed to write Ruddiman's life, "I should take pleasure in helping you to do honour to him," said Johnson.

See Chalmers's *Life of Ruddiman* (1794); *Scots Magazine*, January 7, 1757.

**RUDE, FRANÇOIS** (1784–1855), French sculptor, was born at Dijon on the 4th of June 1784. Till the age of sixteen he worked at his father's trade as a stovemaker, but in 1809 he went up to Paris for the Dijon school of art, and became a pupil of Castellier, obtaining the Grand Prix in 1812. After the second restoration of the Bourbons he retired to Brussels, where he got some work under the architect Van der Straeten, who employed him to execute nine bas-reliefs in the palace of Tervueren. At Brussels Rude married Sophie Fremiet, the daughter of a Bonapartist compatriot to whom he had many obligations, but gladly availed himself of an opportunity to return to Paris, where in 1827 a statue of the Virgin for St Gervais and a "Mercury fastening his Sandals" (now in the Louvre) obtained much attention. His great success dates, however, from 1833, when he received the cross of the Legion of Honour for his statue of a "Neapolitan Fisher Boy playing with a Tortoise," which also procured for him the important commission for all the ornament and one group in the Arc de l'Étoile. This group, the "Départ des volontaires de 1792," a work full of energy and fire, immortalizes the name of Rude. Amongst other productions we may mention the statue of the mathematician Gaspard Monge (1848), Jeanne d'Arc, in the gardens of the Luxembourg (1852), a Calvary in bronze for the high altar of St Vincent de Paul (1855), as well as "Hebe and the Eagle of Jupiter," "Love Triumphant" and "Christ on the Cross," all of which appeared at the Salon of 1857 after his death. He died suddenly on the 3rd of November 1855.

See also P. G. Hamerton, *Modern Frenchmen*, *see biographies* (1878); Carl Adolf Rosenberg, *François Rude* (1884); Louis Coze, *Les Chefs d'œuvre des musées de France* (Paris, 1900); L. de Foucaud, *François Rude, sculpteur* (Paris, 1904).

**RUDERAL** (Lat. *rudus*, rubbish), a botanical term for plants growing on rubbish heaps or in waste places.

**RÜDESHEIM**, a town of Germany in the Prussian Rhine province on the right bank of the Rhine, 19 m. S.W. of

Wiesbaden by the main line from Frankfort-on-Main to Cologne. Pop. (1905) 4773. Its situation, at the lower end of the famous vineyard district of the Rheingau, opposite Bingen and just above the romantic gorge of the Rhine, renders it a popular tourist centre. Behind the town rises the majestic Niederwald (985 ft.), on the crest of which stands the national monument, "Germania," commemorating the war of 1870-71. Rüdeshelm has some interesting towers. The Brömsersburg, or Niederburg, a massive structure built in the 13th century, formerly belonging to the archbishops of Mainz; the Boosenburg, or Oberburg, which was rebuilt in 1868, with the exception of the keep; the Adlerturm, a relic of the fortifications of the town; and the Vorderburg, the remains of an old castle. The Gothic church of St James has some interesting paintings and monuments, and there is also a Protestant church. The town has electrical works, but its industries are mainly concerned with the preparation of wine, the best kinds being Rudesheimer Berg, Hinterhaus and Rottland.

See J. P. Schmelzets, *Rüdesheim im Rheingau* (Rüdesheim, 1887); and Heiderlinden, *Rüdesheim und seine Umgebung* (Rüdesheim, 1888).

**RUDINI, ANTONIO STARABBA, MARQUIS DI** (1839-1908). Italian statesman, was born at Palermo on the 6th of April 1839. In 1859 he joined the revolutionary committee which paved the way for Garibaldi's triumphs in the following year; then after spending a short time at Turin as attaché to the Italian foreign office he was elected mayor of Palermo. In 1866 he displayed considerable personal courage and energy in quelling an insurrection of separatist and reactionary tendencies. The prestige thus acquired led to his appointment as prefect of Palermo, and while occupying that position he put down brigandage throughout the province; in 1868 he was prefect of Naples. In October 1869 he became minister of the interior in the Menabrea cabinet, but he fell with that cabinet a few months later, and although elected member of parliament for Canicatti held no important position until, upon the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration proved vacillating, but it initiated the economies by which Italian finances were put on a sound basis and also renewed the Triple Alliance. He was overthrown in May 1892 by a vote of the Chamber and succeeded by Giolitti. Upon the return of his rival, Crispi, to power in December 1893, he resumed political activity, allying himself with the Radical leader, Cavallotti. The crisis consequent upon the disaster of Adowa (1st March 1896) enabled Rudini to return to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Green-book on Abyssinian affairs. To satisfy the anti-colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. His internal policy was marked by continual yielding to Radical pressure and by persecution of Crispi. By dissolving the Chamber early in 1897 and favouring Radical candidates in the general election, he paved the way for the outbreak of May 1898, the suppression of which entailed considerable bloodshed and necessitated a state of siege at Milan, Naples, Florence and Leghorn. Indignation at the results of his policy led to his overthrow in June 1898. During his second term of office he thrice modified his cabinet (July 1896, December 1897, and May 1898) without strengthening his political position. In many respects Rudini, though leader of the Right and nominally a Conservative politician, proved a dissolving element in the Italian Conservative ranks. By his alliance with the Liberals under Nicotera in 1891, and by his understanding with the Radicals under Cavallotti in 1894-98; by abandoning his Conservative colleague, General Ricotti, to whom he owed the premiership in 1896; and by his vacillating action after his fall from power, he divided and demoralized a constitutional party which, with greater

sincerity and less reliance upon political cleverness, he might have welded into a solid parliamentary organization. At the same time he was a thorough gentleman and *grand seigneur*. One of the largest and wealthiest landowners in Sicily, he managed his estates on liberal lines, and was never troubled by agrarian disturbances. The marquis, who had not been in office since 1893, died on the 6th of August 1908, leaving a son, Carlo, who married a daughter of Mr Henry Labouchere.

**RUDOK**, a small town on the Ladakh frontier of Tibet, through which all the trade of Tibet passes to Leh, and at which is maintained the Chinese outpost that for many years persistently interfered with European exploration. Rudok is picturesquely situated on the side of a hill standing isolated in the plain near the E. end of Lake Pangong, across which the official boundary between Tibet and Kashmir runs. The houses are built in tiers, whitewashed and walled in. At the top of the hill are a large palace and several monasteries painted red. About a mile away from the foot of the hill is another monastery. Rudok is about 13,300 ft. above sea-level, and the greatest altitude on the route connecting it with Lhasa at the pass of Mariom la (the water-parting between the Brahmaputra and the Sutlej) is 15,500 ft. The winter climate of Rudok and of all the towns of the Tsangpo basin, owing to the intense dryness of the air and the light fall of snow, seems to be bracing and exhilarating rather than severe. The thermometer never approaches the minimum record of Puetra (in the same latitude and at half the absolute elevation), according to the observations of native surveyors.

**RUDOLF** (otherwise known as **BASSO NOROK** and **GALLOP**), a large lake of E. equatorial Africa, forming the centre of an inland drainage system, occupying the S. of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the N. of the great East African rift valley, between the parallels of 2° 26' and 5° N., while the meridian of 36° E. is slightly W. of the centre of the northern wider part, the narrower southern portion bending to 36½° E. The length along the curved axis is 185 m., the maximum width 37, and the area roughly 3500 sq. m. Its altitude is 1250 ft. Towards the S. it seems to be deep, but it is comparatively shallow in the N. Its water is brackish, but drinkable. The country bordering the lake on almost every side is sterile and forbidding. The S. end, for some 50 m. on the W. and for a longer distance on the E., is shut in by high cliffs—the escarpments of a rugged lava-strewn country, which shows abundant signs of volcanic activity, great changes having been reported since 1889. In particular, the great volcano of Lubburua (Teliki's volcano) at the S. end of the lake is said to have been destroyed between 1889 and 1897 by a sudden explosion. The highest point of the S.E. side of the lake is Mount Kulal, 7812 ft., while the culminating height within the basin of the lake is Mount Sil, 9280 ft., which lies about 20 m. S. of Lubburua. Further N., on the W. side, sandy plains alternate with lines of low hills, the immediate shores (on which the water appears to have encroached in very modern times) being marked by spits of sand, which in places cut off lagoons from the main body of the lake. These are the haunt of great numbers of water-birds. In 3° 8' N. the dry bed of the Turkwell—in its upper course a large river descending the slopes of Mount Elgon—approaches the lake. Near the N. end mountains again approach the shores, the most prominent being Mount Lubbur (5200 ft.), an extinct volcano with a well-preserved crater. At the extreme N.W. corner a bay some 35 m. long (Sanderson Gulf) is almost separated from the rest of the lake by two long points of land. On the E. side, open arid plains, with few trees, occupy most of the N. country. One hill, in 3° 20' N., has a height of 3470 ft., and at the N.E. end, separating the lake from Lake Stefanie, is a hilly country, the highest point between the lakes being 3524 ft. Immediately N. of these hills rises the Hummurr Range, with one peak exceeding 7000 ft. Near the S. end is the volcanic island of Elmolo, 10 m. long, and there are a few small islets. Just N. of 4° N. is a small volcanic

island with highest point 2100 ft. At the N. end of the lake a level swampy plain is traversed by various arms of the lake and by the Nianam river. This river has been shown to be identical with the Omo, the course of which was long one of the most debated questions of African geography. Its northernmost feeders rise on the high plateau S. of the Blue Nile, in 9° 10' N., and being swollen by other streams from the E. and W., soon form a large river. During its lower course it makes two considerable bends to the W. before finally entering the lake as a deep stream a quarter of a mile wide. Lake Rudolf (previously known on the east coast by report) was discovered in 1888 by Count Samuel Teleki and Lieutenant Ludwig von Höhnel. It was subsequently visited by Dr Donaldson Smith, Vittorio Bottego, H. S. H. Cavendish, H. H. Austin, and others, and by 1905 its shores and the neighbouring country had become fairly well known. In 1907, by an agreement between the powers concerned, the N.E. end of the lake, into which the Omo debouches, was assigned to Abyssinia, the rest of the lake to Great Britain.

**AUTHORITIES.**—*Geographical Journal* (September 1896, April 1898, August 1899, May 1904); the last-named issue contains a map by Captain P. Maud, R.E.; Ludwig von Höhnel, *Discovery of Lakes Rudolf and Stefanie* (London, 1894); A. Donaldson Smith, *Through Unknown African Countries* (London, 1897); A. H. Neumann, *Elephant-Hunting in East Equatorial Africa* (London, 1898); L. Vannutelli and C. Citerri, *L'Omo* (Milan, 1899); M. S. Wobey, *Tuist Sirdar and Mendisli* (London, 1901); H. H. (E. Hx.)

**RUDOLPH I.** (1218–1291), German king, son of Albert IV. count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg on the 1st of May 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 he married Gertrude, daughter of Burkhard III. count of Hohenberg. He paid frequent visits to the court of his godfather the emperor Frederick II., and his loyalty to Frederick and to his son Conrad IV. was richly rewarded by grants of land, but in 1254 was excommunicated by Pope Innocent IV. The disorder in Germany after the fall of the Hohenstaufen afforded an opportunity for Rudolph to increase his possessions. His wife was an heiress; and on the death of his childless uncle, Hartmann VI. count of Kyburg, in 1264, he seized his valuable estates. Successful feuds with the bishops of Strassburg and Basel further augmented his wealth and his reputation; rights over various tracts of land were purchased from abbots and others; and he was also the possessor of large estates in the regions now known as Switzerland and Alsace.

These various sources of wealth and influence had rendered Rudolph the most powerful prince in S.W. Germany when, in the autumn of 1273, the princes met to elect a king. His election at Frankfurt on the 29th of September 1273 was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by betrothing them to two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on the 24th of October 1273, and the feast which followed has been described by Schiller in *Der Graf von Hapsburg*. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but persuaded Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. In November 1274 it was decided by the diet at Nuremberg that all crown estates seized since the death of the emperor Frederick II. must be restored, and that Ottakar of Bohemia must answer to the diet for not recognizing the new king. Ottakar refused to appear or to restore the provinces of Austria, Styria, Carinthia and Carniola which he had seized. He was

placed under the ban; and in June 1276 war was declared against him. Having detached Henry I. duke of lower Bavaria from his side, Rudolph compelled the Bohemian king to cede the four provinces in November 1276. Ottakar was then invested with Bohemia by Rudolph, and his son Wenceslaus was betrothed to a daughter of the German king, who made a triumphant entry into Vienna. Ottakar, however, raised questions about the execution of the treaty, made an alliance with some Polish chiefs and procured the support of several German princes, including his former ally, Henry of lower Bavaria. To meet this combination Rudolph entered into alliance with Ladislaus IV. king of Hungary, and gave additional privileges to the citizens of Vienna. On the 26th of August 1278 the rival armies met on the banks of the river March near Dürnkrut, and Ottakar was defeated and killed. Moravia was subdued and its government entrusted to Rudolph's representatives, while Wenceslaus was again betrothed to one of his daughters.

Rudolph's attention was next turned to his new possessions in Austria and the adjacent countries. He spent several years in establishing his authority there, but found some difficulty in making these provinces hereditary in his family. At length the hostility of the princes was overcome, and in December 1282 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and so laid the foundations of the greatness of the house of Habsburg.

Turning to the west he compelled Philip I. count of upper Burgundy to cede some districts to him in 1281, forced the citizens of Berne to pay the tribute which they had previously refused, and in 1289 marched against Philip's successor, Otto IV., and compelled him to do homage. In 1281 his first wife died, and on the 5th of February 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. Rudolph was not very successful in restoring internal peace to Germany. Orders were indeed issued for the establishment of landpeaces in Bavaria, Franconia and Swabia, and afterwards for the whole of Germany; but the king lacked the power, or the determination, to enforce them, although in December 1289 he led an expedition into Thuringia where he destroyed a number of robber-castles. In 1291 he attempted to secure the election of his son Albert as German king; but the princes refused on the pretext of their inability to support two kings, but perhaps because they feared the increasing power of the Habsburgs. Rudolph died at Spire on the 15th of July 1291 and was buried in the cathedral of that city. He had a large family, but only one of his sons, Albert, afterwards the German king Albert I., survived him. Rudolph was a tall man with pale face and prominent nose. He possessed many excellent qualities, bravery, piety and generosity; but his reign is memorable rather in the history of the house of Habsburg than in that of the kingdom of Germany.

**BIBLIOGRAPHY.**—The original authorities relating to the time and life of Rudolph are found in the *Monumenta Germaniae historica. Scriptores*, Band xvii. (Hanover and Berlin, 1826 fol.). The following should also be consulted: *Acta imperii selecta, Urkunden deutscher Könige und Kaiser*, edited by J. F. Böhmer (Innsbruck, 1870); *Acta imperii inedita seculi XIII et XIV, Urkunden und Briefe zur Geschichte des Kaiserreichs*, edited by E. Winkelmann (Innsbruck, 1885); *Aktenstücke zur Geschichte des deutschen Reichs unter den Königen Rudolf I. und Albrecht I.*, edited by F. Kaltenbrunner (Vienna, 1889); M. Gerbert, *Codes epistolares Rudolphi I.* (Sanblas, 1772); F. J. Bodmann, *Codes epistolares Rudolphi I. Romanorum regis* (Leipzig, 1806).

The best modern authorities are K. Hagen, *Deutsche Geschichte von Rudolf von Habsburg bis auf die neueste Zeit* (Frankfurt, 1854–5); O. Lorenz, *Geschichte Rudolfs von Habsburg und Adolfs von Nassau* (Vienna, 1863–67); Th. Lindner, *Deutsche Geschichte unter den Habsburgern und Luxemburgern* (Stuttgart, 1888–93); A. Huber, *Rudolf von Habsburg vor seiner Thronbesteigung* (Vienna, 1873); J. Hirn, *Rudolf von Habsburg* (Vienna, 1874); H. von Zeissberg, *Ueber das Rechtsverfahren Rudolfs von Habsburg gegen Ottakar von Böhmen* (Vienna, 1882); H. Otto, *Die Beziehungen Rudolfs von Habsburg zu Papst Gregor X.* (Erlangen, 1893); A. Bussacq, *Der Krieg von 1278 und die Schlacht bei Dürnkrut* (Vienna, 1880); and O. Redlich, *Rudolf von Habsburg* (Innsbruck, 1903).

**RUDOLPH II.** (1552-1612), Roman emperor, son of the emperor Maximilian II. by his wife Maria, daughter of the emperor Charles V., was born in Vienna on the 18th of July 1552. In 1563 he was sent to Spain, where his natural abilities were improved by a good education, but he lacked the frank and tolerant spirit of his father, resembling rather his uncle Philip II. of Spain. In 1572 he was crowned king of Hungary, three years later king of Bohemia; and in October 1575 he was chosen king of the Romans, or German king, at Regensburg, becoming emperor on his father's death in October 1576. The importance of Rudolph's reign is negative rather than positive, consisting more in what he did not do than in what he did; although it is questionable whether any ruler could have prevented the religious struggles of Germany and the Thirty Years' War.

The more active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defence of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. As a convinced Roman Catholic he forwarded the progress of the counter-reformation, and in general the tolerant policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; the administration was conducted by Germans; and the result was a considerable amount of discontent which became very pronounced about the opening of the 17th century. Concurrently with the growth of this unrest Rudolph had become increasingly subject to attacks of depression and eccentricity, which were so serious as to amount almost to insanity. In 1604, after a war with Turkey had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Bocskay as their prince. By this time the members of the Habsburg family were thoroughly alarmed at the indifference or incompetence of the emperor; and their anxieties were not diminished by the knowledge that he was in feeble health, was unmarried, and had refused to take any steps towards securing the election of a successor. In April 1606 they declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having already with the emperor's reluctant consent taken the conduct of affairs into his own hands, made peace by granting extensive concessions to the rebellious Hungarians, and concluded a treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with the Turks; a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1609 he acceded to the popular wishes by issuing the Letter of Majesty (*Majestätsbrief*), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolph's cousin, the archduke Leopold (1586-1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on the 20th of January 1612, and was succeeded as emperor by Matthias.

Rudolph was a clever and cultured man, greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something

of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular, while even in his best days the temper of his mind was that of a recluse rather than of a ruler.

The sources for the life and times of Rudolph II. are somewhat scanty, as many of the official documents of the reign, which were kept at Prague and not at Vienna, were destroyed, probably during the Thirty Years' War. The best authorities, however, are *Rudolph II. epistolae ineditae*, edited by F. Comte de Pace (Vienna, 1771); M. Ritter, *Quellenbeiträge zur Geschichte des Kaisers Rudolf II.* (Munich, 1872); and *Deutsche Geschichte im Zeitalter der Gegenreformation und des dreissigjährigen Krieges* (Stuttgart, 1887 fol.); L. von Ranke, *Zur deutschen Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege* (Leipzig, 1868); A. Gindely, *Rudolf II. und seine Zeit* (Prague, 1862-68); F. Stieve, *Die Verhandlungen über die Nachfolge Kaiser Rudolfs II.* (Munich, 1880), in the *Allgemeine Deutsche Biographie*, Band xxx (Leipzig, 1889); and *Der Ursprung des dreissigjährigen Krieges* (Munich, 1875). F. von Bezold, *Kaiser Rudolf II. und die heilige Liga* (Munich, 1886); I. Janssen, *Geschichte des Deutschen Volks seit dem Ausgang des Mittelalters* (Freiburg, 1878 fol.), of which there is an English translation by M. A. Mitchell and A. M. Christie (London, 1896 fol.); and H. Moritz, *Die Wahl Rudolfs II.* (Marburg, 1895).

**RUDOLPH**, or **RAOUL** (d. 936), king of the Franks and duke of Burgundy, was a son of Richard duke of Burgundy, and was probably a member of the Carolingian family. He became duke of Burgundy on his father's death in 921, and having married Emma, daughter of Robert duke of the Franks, assisted his father-in-law to drive the Frankish king, Charles III. (the Simple), from his throne. Robert then became king of the Franks, and when he was killed in battle in June 923 he was succeeded by Rudolph, who was crowned at Soissons in the following month. Giving Burgundy to his brother-in-law Giselbert of Vergi (d. 956), the new king was fully occupied in resisting the attacks of the Normans, and in combating the partisans of Charles the Simple; but his enterprises were mainly unsuccessful, and his authority was not generally recognized. But when engaged in a struggle with his brother-in-law, Herbert II. count of Vermandois, over the possession of the county of Laon, Rudolph experienced happier fortunes. At Limoges a great victory was gained over the Normans, whose duke, William I., did homage to him in 933; invasions of Aquitaine led to his recognition as king by the powerful lords of that district; and Herbert of Vermandois was defeated and put to flight. In 935 peace was made between these rivals, and on the 14th of January 936 Rudolph died at Auxerre, leaving no sons.

See W. Lippert, *König Rudolf von Frankreich* (Leipzig, 1886).

**RUDOLPH** (d. 1080), German king, and duke of Swabia, opponent of the emperor Henry IV., was a son of Kuno count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia from Agnes, regent and mother of the young king, Henry IV., in 1057, and two years later married the king's sister Matilda (1045-1060), and was made administrator of the kingdom of Burgundy, or Arles. Differences soon arose between the king and his brother-in-law, whose loyalty was suspected during the Saxon War of 1073. When Henry was excommunicated and deposed by pope Gregory VII., the princes met at Forchheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his family, and was crowned at Mainz on the 27th of March 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On the 15th of October 1080, Rudolph was severely wounded at Hohenmölsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, *Die Wahl Rudolfs von Rheinfelden zum Gegenkönig* (Leipzig, 1880).

**RUDOLPH**, or **RAOUL**, known as **RUDOLPH GLABER** (*Rudolph the Bald*) (d. c. 1050), French chronicler, was born in

Burgundy about 985, and was in turn an inmate of the monasteries of St Leger at Chamepeaux and St Bénigne at Dijon, afterwards entering the famous abbey of Cluny, and becoming a monk at St Germain at Auxerre before 1039. He also appears to have visited Italy. His *Historiarum sui temporis libri V.*, dedicated to St Odilon, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy. Rudolph was a strong believer in the approaching end of the world.

The *Historiarum* was first printed in 1596, and published by A. Duchesne in the *Historiae Francorum Scriptores*, tome iv. (Paris, 1639-49). Extracts are printed in the *Monumenta Germaniae Historica*, Band vii.; but perhaps the best edition of the work is the one edited by M. Prou in the *Collection de textes pour servir à l'étude et à l'enseignement de l'histoire* (Paris, 1886). Rudolph also wrote a *Vita S. Guilelmi, abbatis S. Benigni*, published by J. Mabillon in the *Acta Sanctorum*, tome vi. (Paris, 1668).

See A. Molinier, *Les Sources de l'histoire de France*, tome ii. (Paris, 1902); and A. Potthast, *Bibliotheca historica* (Berlin, 1896).

**RUDOLSTADT**, a town of Germany, capital of the principality of Schwarzburg-Rudolstadt, and the chief residence of the prince, lies on the left bank of the Saale, 18 m. S.W. of Jena, by the railway Grossheringen-Saalfeld, in one of the most beautiful districts of Thuringia. Pop. (1905) 12,394. The picturesque town is a favourite tourist resort. Besides containing the government buildings of the little principality, Rudolstadt is well provided with schools and other institutions, including a library of 65,000 volumes. The residence of the prince is the Heidecksburg, a palace on an eminence 200 ft. above the Saale, which was rebuilt after a fire in 1735, and contains a picture gallery, a magnificent banqueting hall and a library. The Ludwigsburg, another palace in the town, built in 1742, accommodates the natural history collections belonging to the prince. The principal church dates from the end of the 15th century and contains tombs and effigies of many former princes. In the Anger, a public park between the town and the river, is the theatre. The Rudolstadt—a handsome hydropathic establishment with a richly decorated interior—lying amidst extensive grounds, is also noticeable. Various memorials in and near the town commemorate the visits of Schiller to the neighbourhood in 1787 and 1788. The industries of the place include the manufacture of porcelain, chocolate and dyestuffs, wool-spinning and bell-founding.

The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing into the possession of the German kings and then of the rulers of Orlamünde and of Weimar, it came into the hands of the counts of Schwarzburg in 1335. Its civic rights were confirmed in 1404, and since 1599 it has been the residence of the ruling house of Schwarzburg-Rudolstadt.

See Renovanz, *Chronik von Rudolstadt* (Rudolstadt, 1860); Anemüller, *Geschichtsbilder aus der Vergangenheit Rudolstadts* (Rudolstadt, 1888); and Woertl, *Rudolstadt* (2nd ed., Leipzig, 1890).

**RUDRA** (probably from the root *rud*, "to howl," hence "the howler?"), in Hindu Vedic mythology, a storm god, and father of the Maruts who are frequently called Rudriyas. He shoots tempests at the earth, but is not essentially a malevolent deity, being invoked as a protector of cattle. In the Atharvaveda he is lord of life and death, and in later Hinduism one of the Hindu trinity, the god Siva.

See A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); Sir William Muir, *Original Sanskrit Texts*, iv. 299-420.

**RUE** (Fr. *rue*, Lat. *ruta*, from Gr. *ῥύτις*, the Peloponnesian word for the plant known as *ῥύτις*), the name of a woody or bushy herb, belonging to the genus *Ruta*, especially *Ruta graveolens*, the "common rue," a plant with bluish green spotted leaves and greenish yellow flowers. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in medieval and later medicine as a stimulative and irritant drug. It was commonly supposed to be much used by witches. From its association with "rue," sorrow, repentance (O. Eng. *hræow*, from *hræowan*, to be sorry

for, cf. Ger. *reuen*), the plant was also known as "herb of grace," and was taken as the symbol of repentance.

**RUEDA**, LOPE DE (1510?-1565?), Spanish dramatist, was born early in the 16th century at Seville, where, according to Cervantes, he worked as a metal-beater. His name first occurs in 1554 as acting at Benavente, and between 1558 and 1561 he was manager of a strolling company which visited Segovia, Seville, Toledo, Madrid, Valencia and Córdoba. In the last-named city Rueda fell ill, and on the 21st of March 1565 made a will which he was too exhausted to sign; he probably died shortly afterwards, and is said by Cervantes to have been buried in Córdoba cathedral. He was twice married; first to a disreputable actress named Mariana, who became the mistress of the duke de Medinaceli; and second to Rafaela Angela, who bore him a daughter. His works were issued posthumously in 1567 by Timoneda, who toned down certain passages in the texts. Rueda's more ambitious plays are mostly adapted from the Italian; in *Enfemias* he draws on Boccaccio, in *Madora* he utilizes Giancarrli's *Zingara*, in *Armelina* he combines Raineri's *Attilia* with Cecchi's *Servigiale*, and in *Los Engañados* he uses *GI'ingannati*, a comedy produced by the *Intronati*, a literary society at Siena. These follow the original so closely that they give no idea of Rueda's talent; but in his *pasos* or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. His predecessors mostly wrote for courtly audiences or for the study; Rueda with his strollers created a taste for the drama which he was able to gratify, and he is admitted both by Cervantes and Lope de Vega to be the true founder of the national theatre.

His works have been reprinted by the marquis de la Fuensanta del Valle in the *Colección de libros raros ó curiosos*, vols. xxxiii. and xxiv.

**RUEIL**, a town of N. France, in the department of Seine-et-Oise, at the W. foot of Mt Valérien, 6 m. W. of Paris by tramway. Pop. (1906) 10,439. Rueil has a church rebuilt under Napoleon III. in exact imitation of a previous church in the Renaissance style, and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. In the 17th century Richelieu built a château which no longer exists. Rueil has important photographic works and manufactures of lime and cement, &c. Close to the town is the château of Malmaison, a building of the 18th century famous as the residence of the empress Josephine. It was afterwards occupied by Maria Christina, queen of Spain, and by the empress Eugénie. In 1900 the owner, Daniel Osiris, presented it and the park to the nation; the apartments have been as far as possible restored to the condition in which they were when inhabited by Josephine and Napoleon.

**RUFF**, a bird so called from the very beautiful and remarkable frill of elongated feathers that, just before the breeding-season, grow thickly round the neck of the male, who is considerably larger than the female, known as the reeve. In many respects this species, the *Tringa pugnax* of Linnaeus and the *Machetes pugnax* of modern ornithologists, is one of the most singular in existence. The best account is that given in 1813 by G. Montagu (*Suppl. Orn. Dictionary*), who seems to have been struck by the peculiarities of the species, and, to investigate them, visited the fens of Lincolnshire, possibly excited thereby by the example of T. Pennant, whose information, collected there in 1769, was of a kind to provoke further inquiry, while Daniel (*Rural Sports*, iii. p. 234) had added some other particulars, and subsequently G. Graves in 1816 repeated in the same district the experience of his predecessors. Since that time the great changes produced by the drainage of the fen-country have banished this species from nearly the whole of it, so that R. Lubbock (*Obs. Fauna of Norfolk*, pp. 68-73) and H. Stevenson (*Birds of Norfolk*, ii. pp. 261-271) can alone be cited as modern witnesses of its habits in England, while the trade of netting or snaring ruffs and fattening them for the table has for many years practically ceased.

The cock bird, when, to use the fennman's expression, he has

not "his show on," and the hen at all seasons, offer no very remarkable deviation from ordinary sandpipers; outwardly<sup>1</sup> there is nothing, except the unequal size of the two sexes, to rouse suspicion of any abnormal peculiarity. But when spring comes all is changed. In a surprisingly short time the feathers clothing the face of the male are shed, and their place is taken by *papillae* or small caruncles of bright yellow or pale pink. From each side of his head sprouts a tuft of stiff curled feathers, while the feathers of the throat change colour, and beneath and around it sprouts the frill or ruff already mentioned as giving the bird his name. The feathers which form this remarkable adornment are, like those of the "ear-tufts," stiff and incurved at the end, but much longer—measuring more than 2 in. They are closely arrayed, capable of depression or elevation, and form a shield to the front of the breast impenetrable by the bill of a rival.<sup>2</sup> More extraordinary than this, from one point of view, is the great variety of coloration that obtains in these temporary outgrowths. Considering the really few colours that the birds exhibit, the variation is something marvellous, so that fifty examples may be compared without finding a very close resemblance between any two of

Ruff.

them, while the individual variation is increased by the "ear-tufts," which generally differ in colour from the frill. The colours range from deep black to pure white, passing through chestnut or bay, and many tints of brown or ashy-grey, while often the feathers are more or less closely barred with some darker shade, and the black is very frequently glossed with violet, blue or green—or, in addition, spangled with white grey or gold-colour. The white, on the other hand, is not rarely freckled, streaked, or barred with grey, rufous-brown or black. In some examples the barring is most regularly concentric, in others more or less broken-up or undulating, and the latter may be said of the streaks. It was ascertained by Montagu, and has since been confirmed by A. D. Bartlett, that every ruff assumes tufts and frill exactly the same in colour and markings as those he wore in the preceding season; and thus, polymorphic as is the male as a species, as an individual he is unchangeable. The white frill is said to be the rarest, and birds exhibiting it have white necks even in winter.

That all this wonderful "show" is the consequence of the polygamous habit of the ruff can scarcely be doubted. No

other species of Limicoline bird has, so far as is known, any tendency to it. Indeed, in many species of *Limicolae*, as the dotterel, the godwits (*g.w.*), phalaropes and perhaps some others, the female is larger and more brightly coloured than the male, who in such cases seems to take upon himself some at least of the domestic duties. Both Montagu and Graves, to say nothing of other writers, state that the ruffs, in England, were far more numerous than the reeves; and their testimony can hardly be doubted; though in Germany J. F. Naumann (*Vög. Deutschland's*, vii. p. 544) considers that this is only the case in the earlier part of the season, and that later the females greatly outnumber the males. By no one have the ruff's characteristics been more happily described than by J. Wolley, in a communication to W. C. Hewitson (*Eggs of Brit. Birds*, 3d ed., p. 346), as follows:—

"The ruff, like other fine gentlemen, takes much more trouble with his courtship than with his duties as a husband. Whilst the reeves are sitting on their eggs, scattered about the swamps, he is to be seen far away flitting about in flocks, and on the ground dancing and sparring with his companions. Before they are confined to their nests, it is wonderful with what devotion the females are attended by their gay followers, who seem to be each trying to be more attentive than the rest. Nothing can be more expressive of humility and ardent love than some of the actions of the ruff. He throws himself prostrate on the ground, with every feather on his body standing up and quivering; but he seems as if he were afraid of coming too near his mistress. If she flies off, he starts up in an instant to arrive before her at the next place of alighting, and all his actions are full of life and spirit. But none of his spirit is expended in care for his family. He never comes to see after an enemy. In the [Lapland] marshes, a reeve now and then flies near with a scarcely audible *ka-ka-kuk*; but she seems a dull bird, and makes no noisy attack on an invader."

The breeding-grounds of the ruff extend from Great Britain across N. Europe and Asia; but the birds become less numerous towards the E. They winter in India, reaching even Ceylon, and Africa as far as the Cape of Good Hope. The ruff also occasionally visits Iceland, and there are several well-authenticated records of its occurrence on the E. coast of the United States, while an example is stated (*Ibis*, 1875, p. 332) to have been received from the N. of S. America. (A. N.)

**RUFFIAN** (Fr. *ruffian*, It. *ruffiano*), a brutal, violent person, a swaggering, low bully. The etymology is obscure, but the word has been connected with "ruffler," a bully, swaggerer, one who "ruffles" (M. Du. *roffeln*, to pander). An early derivation, quoted in Du Cange, derives it from Lat. *rufus*, red, as the hair of the *meretrices*, with whom the *ruffians* were generally associated, was red or gold, as contrasted with the black hair of sober matrons.

**RUFFO, FABRIZIO** (1744-1827), Neapolitan cardinal and politician, was born at San Lucido in Calabria on the 16th of September 1744. His father, Litterio Ruffo, was duke of Baranello, and his mother, Giustiniana, was of the family of Colonna. Fabrizio owed his education to his uncle, the cardinal Thomas Ruffo, then dean of the Sacred College. In early life he secured the favour of Giovanni Angelo Braschi di Cesera, who in 1775 became Pope Pius VI. Ruffo was placed by the pope among the *chierici di camera*—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. Ruffo's conduct in office was diversely judged. Colletta, the historian of Naples, speaks of him as corrupt, and Jomini repeats the charge. Ruffo's biographer, Sachinelli, says that he incurred hostility by restricting the feudal powers of some of the landowners in the papal states. In 1791 he was removed from the treasurer's post, but was created cardinal on the 29th of September, though he was not in orders. He never became a priest. Ruffo went to Naples, where he was named administrator of the royal domain of Caserta, and received the abbey of S. Sophia in Benevento *in commendam*. When in December 1798 the French troops advanced on Naples, Ruffo fled to Palermo with the royal family. He was chosen to head a royalist movement in Calabria, where his family, though impoverished by debt, exercised large feudal powers. He was named vicar-general on the 25th of January 1799. On the 8th of February he landed at

<sup>1</sup> Internally there is a great difference in the form of the posterior margin of the sternum, as long ago remarked by Nitzsch.

<sup>2</sup> This "ruff" has been compared to that of Elizabethan or Jacobean costume, but it is essentially different, since that was open in front and widest and most projecting behind, whereas the bird's decorative apparel is most developed in front and at the sides and scarcely exists behind.

La Cortona with a small following, and began to raise the so-called "army of the faith" in association with Fra Diavolo and other brigand leaders. Ruffo had no difficulty in upsetting the republican government established by the French, and by June had advanced to Naples (see NAPLES and NELSON). The campaign has given rise to much controversy. Ruffo appears to have lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Cassero, and during the second French conquest and the reigns of Joseph Bonaparte and Murat he lived quietly in Naples. Some notice was taken of him by Napoleon, but he never held an important post. After the restoration of the Bourbons he was received into favour. During the revolutionary troubles of 1822 he was consulted by the king, and was even in office for a very short time as a "loyalist" minister. He died on the 13th of December 1827.

The account of Ruffo given in Colletta's *History of Naples* (English translation, Edinburgh, 1860) must be taken with caution. Colletta was a violent liberal partisan, who wrote in exile, and largely from memory. He has been corrected by the Duca de Lauria, *Intorno alla storia del Regno di Napoli di Pietro Colletta* (Naples, 1877). Ruffo's own side of the question is stated in *Memorie Storiche sulla vita del Cardinale Fabrizio Ruffo*, by Domenico Sacchinelli (Naples, 1836). See also *Fabrizio Ruffo: Revolution and Gegen-Revolution von Neapel*, by Baron von Helfert (Vienna, 1882).

**RUFII**, a large river of German East Africa, entering the sea by a considerable delta, between  $7^{\circ} 45'$  and  $8^{\circ} 13'$  S. Its upper basin, which extends from N. to S. through over 300 m., is drained by three main branches, which unite to form the lower Rufji. Of the three upper branches, the two southern, the Luvegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry a greater volume of water, as they come from a more rainy region, and by their junction in  $8^{\circ} 35'$  S.,  $37^{\circ} 25'$  E., the Rufji proper may be said to be formed.

The Luvegu rises  $10^{\circ} 50'$  S.,  $35^{\circ} 50'$  E., and flows N.E. in a wooded valley, generally narrow, and bordered by a broken country in great part uninhabited and covered with thin forest. In its lower course it is a large stream—100 to 150 yds. wide.

The Ulanga is formed by a number of streams descending from the outer escarpment of the high plateau which runs N.E. from the head of Lake Nyasa and in Uhehe becomes broken up in ranges of mountains. The most important head-stream, the Ruhudye, rises in about  $9^{\circ} 30'$  S.,  $34^{\circ} 40'$  E. As a whole, the Ulanga valley is broad, level and swampy, the river running in a very winding course and sending off many diverging arms. It is navigable throughout the greater part of its course, having even in the dry season a general depth of 3 to 12 ft., with a width of 40 to 120 yds. In April and May nearly all the streams overflow their banks and cover a great part of the plain.

Just below the junction of the Luvegu and Ulanga, the Rufji flows through a narrow pass by the Shuguli falls, and continues N.E. in a fairly straight course to the junction of the Ruaha, in  $7^{\circ} 55'$  S.,  $37^{\circ} 52'$  E. The most remote branches of the Ruaha rise N of Lake Nyasa in the Livingstone mountains. The united stream makes a wide sweep to the N. of the Uhehe mountains, from which it receives various tributaries, finally flowing S.E. and E. to the Rufji. A little below the junction the Rufji is broken by the Pangani falls, but is thence navigable by small steamers to its delta. In this part of its course the river receives no large tributaries but sends out divergent channels. The country on either side is a generally level plain, inundated, on the south, in the rains, and the river varies in width from 100 to 400 yds., with an average current of 3 m. an hour. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Much of the delta is suited for rice-growing.

**RUFINUS, TYRANNIUS**, presbyter and theologian, was born at or near Aquileia at the head of the Adriatic, probably between 340 and 345. In early manhood he entered the cloister as a catechumen, receiving baptism about 370. About the same time a visit of Jerome to Aquileia led to a close friendship between the two, and shortly after Jerome's departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt, hearing the lectures of Didymus, the Origenistic head of the catechetical school at Alexandria, and also cultivating friendly relations with Macarius the elder and other ascetics in the desert. In Egypt, if not even before leaving Italy, he

had become intimately acquainted with Melania, a wealthy and devout Roman widow; and when she removed to Palestine, taking with her a number of clergy and monks on whom the persecutions of the Arian Valens had borne heavily, Rufinus (about 378) followed her. While his patroness lived in a convent of her own in Jerusalem, Rufinus, at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time to the study of Greek theology. This combination of the contemplative life and the life of learning had already developed in the Egyptian monasteries. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome on different sides; and, though three years afterwards a formal reconciliation was brought about between Jerome and John, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 397 Rufinus embarked for Rome, where, finding that the theological controversies of the East were exciting much interest and curiosity, he published a Latin translation of the *Apology* of Pamphilus for Origen, and also (398-99) a somewhat free rendering of the *repl. ἀρχαία* (or *De Principiis*) of that author himself. In the preface to the latter work he referred to Jerome as an admirer of Origen, and as having already translated some of his works with modifications of ambiguous doctrinal expressions. This allusion annoyed Jerome, who was exceedingly sensitive as to his reputation for orthodoxy, and the consequence was a bitter pamphlet war, very wonderful to the modern onlooker, who finds it difficult to see anything discreditable in the accusation against a biblical scholar that he had once thought well of Origen, or in the countercharge against a translator that he had avowedly exercised editorial functions as well. At the instigation of Theophilus of Alexandria, Anastasius (pope 398-402) summoned Rufinus from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written *Apologia pro fide sua*. The pope in his reply expressly condemned Origen, but left the question of Rufinus's orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (cf. the *Decretum Gelasii*, § 30) in spite of his services to Christian literature. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?); thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

The original works of Rufinus are—(1) *De Adulteratione Librorum Origenis*—an appendix to his translation of the *Apology* of Pamphilus, and intended to show that many of the features in Origen's teaching which were then held to be objectionable arose from interpolations and falsifications of the genuine text. (2) *De Benedictioibus XII Patriarcharum Libri II*—an exposition of Gen. xix. (3) *Apologia s. Inveictarum in Hieronymum Libri II*, (4) *Apologia pro Fide Sua ad Anastasium Pontificem*, (5) *Historia Eremitica*—consisting of the lives of thirty-three monks of the Nitrian desert. (6) *Expositio Symboli*, a commentary on the creed of Aquileia comparing it with that of Rome, which is valuable for its evidence as to church teaching in the 4th century. (7) *Historia Ecclesiastica Libri XI* of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi) down to the death of Theodosius the Great. The other translations of Rufinus are—(1) the *Instituta Monachorum* and some of the *Homilies* of Basil. (2) the *Apology* of Pamphilus, referred to above; (3) Origen's *Principes*. (4) Origen's *Homilies* (Gen.-Kings, also Cant and Rom.). (5) *Opuscula* of Gregory of Nazianus; (6) the *Sententiae* of Sixtus, an unknown Greek philosopher, (7) the *Sententiae* of Evagrius; (8) the *Clementinae Recognitiones* (the only form in which that work is now extant); (9) the *Canon Paschalis* of Anatolius Alexandrinus. We can hardly overestimate the influence which Rufinus exerted on Western theologians by thus putting the great Greek fathers into the Latin tongue. D. Vallarsi's uncompleted edition of Rufinus (vol. i. fol. Verona, 1745) contains the *De Benedictioibus*, the *Apologies*, the

**RUFUS, GAIUS VALGIUS**, Latin poet, friend of Horace and Maecenas, and consul in 12 B.C. He was known as a writer of elegies and epigrams, and his contemporaries believed him capable of great things in epic. The author of the panegyric on Messalla declares Rufus to be the only poet fitted to be the great man's Homer. Rufus did not, however, confine himself to poetry. He discussed grammatical questions by correspondence, translated the rhetorical manual of his teacher Apollodorus of Pergamum, and began a treatise on medicinal plants, dedicated to Augustus. Horace addressed to him the ninth ode of the second book.

Fragments in R. Weichert, *Poetarum Latinorum Vitae et Carminum Reliquiae* (1850); R. Unger, *De C. Valgii Rufi Poematis* (1848); O. Ribbeck, *Geschichte der römischen Dichtung* (1899), ii. 1; M. Schanz, *Geschichte der römischen Literatur* (1899), ii. 1; Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 241.

**RUFUS, LUCIUS VARIUS** (c. 74-14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tucca prepared the *Aeneid* for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace speaks of him as a master of epic and the only poet capable of celebrating the achievements of Vipsanius Agrippa (*Odes*, i. 6); Virgil (under the name of Lycidas, *Ecl.* ix. 35) regrets that he had hitherto produced nothing comparable to the work of Varius or Helvius Cinna. From Macrobius (*Saturnalia*, vi. 1, 39; 2, 19) we learn that Varius composed an epic poem *De Morte*, some lines of which are quoted as having been imitated or appropriated by Virgil; Horace (*Sat.* i. 10, 43) probably alludes to another epic, and, according to the scholiast on *Epistles*, i. 16, 27-29, these three lines are taken bodily from a panegyric of Varius on Augustus. But his most famous literary production was the tragedy *Thyestes*, which Quintilian (*Inst. Orat.* x. 1, 98) declares fit to rank with any of the Greek tragedies. The didascalus (which is preserved in a Paris MS.) informs us that it was produced at the games celebrated (29 B.C.) by Augustus in honour of the victory at Actium, and that Varius received a present of a million sesterces from the emperor.

Fragments in E. Bährens, *Frag. Poetarum Romanorum* (1886); monographs by A. Weichert (1836) and R. Unger (1870, 1878, 1898); M. Schanz, *Geschichte der römischen Literatur* (1899), ii. 1; Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 223.

**RUG**, a term of Scandinavian origin (cf. Swed. *rugg*, rough hair; Norw. dial. *rugga*, rough), and probably connected with "rough" and "rag," originally for a kind of coarse woollen material, like frieze; hence it is used of a piece of thick material used as a wrap or covering for the knees or body in travelling or in bed, and especially for a thick mat or small-sized carpet laid on the floor (see CARPET).

**RUGBY**, a market town in the Rugby parliamentary division of Warwickshire, England, finely situated on a tableland rising from the S. bank of the Avon, near the Oxford Canal. Pop. of urban district (1901), 16,830. It is an important junction on the London & North-Western railway, by which it is 8½ m. N.W. from London; it is served also by the Great Central railway and by a branch of the Midland railway from Leicester.

The boys' school, ranking as one of the most famous public schools in England, was founded and endowed under the will (1567) of Laurence Sheriff, a merchant grocer and servant to Queen Elizabeth, and a native either of Rugby or of the neighbouring village of Brownsover. The endowment consisted of the parsonage of Brownsover, Sheriff's mansion house in Rugby, and one-third (8 acres) of his estate in Middlesex, near the Foundling Hospital, London, which, being let on building leases, gradually increased to about £5000 a year. The full

endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the S. side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771-1830); the chapel, dedicated to St Lawrence, was added in 1820. At the tercentenary of the school in 1867 subscriptions were set on foot for founding scholarships, building additional schoolrooms, rebuilding or enlarging the chapel and other objects. The chapel was rebuilt and reconsecrated in 1872, and further additions were made in 1898. A swimming bath was erected in 1876; the Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading-room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1880, and a new big school and class-rooms were erected in 1885. From about 70 to 1777 the numbers attending the school have increased to nearly 600. A great impulse was given to the progress of the school during the headmastership of Thomas Arnold, 1827-42. Among Arnold's successors were Archibald Campbell Tate and Frederick Temple, both afterwards archbishops of Canterbury.

The parish church of St Andrew was rebuilt from designs by W. Butterfield and reconsecrated in 1879. A tower and spire were added in 1895. An aisle commemorates John Moultrie (1790-1874), rector, widely known as the "poet pastor." The church of Holy Trinity is by Sir G. G. Scott, and the Roman Catholic church of St Marie by A. W. Pugin. Trade is mainly agricultural; there is a large cattle market, and several fairs are held annually.

The early history of Rugby is obscure, but a settlement of the Danes is presumed from the name, and from the neighbouring tract of Dunsmore Heath (Danesmoor). Rugby was originally a hamlet of the adjoining parish of Clifton-on-Dunsmore, and is separately treated of as such in Domesday Book. Ernalud de Bosco (Ernalud de Bois), lord of the manor of Clifton, seems to have erected the first chapel in Rugby, in the reign of Stephen, about 1140. It was afterwards granted by him, with certain lands, to endow the abbey of St Mary, Leicester, which grant was confirmed by his successors and by royal charter of Henry II. In the second year of King John (1200) a suit took place between Henry de Rokeby, lord of the manor of Rugby, and Paul, abbot of St Mary, Leicester, which resulted in the former obtaining possession of the advowson of Rugby, on condition of homage and service to the abbot of Leicester. By virtue of this agreement the chapel was converted into a parish church and the vicarage into a rectory.

**RUGE, ARNOLD** (1802-1880), German philosopher and political writer, was born at Bergen, in the island of Rügen, on the 13th of September 1802. He studied at Halle, Jena and Heidelberg, and became an adherent of the party which sought to create a free and united Germany. For his zeal he was confined for five years in the fortress of Kolberg, where he studied Plato and the Greek poets. On his release in 1830 he published *Schill und die Seinen*, a tragedy, and a translation of *Oedipus in Colonus*. Ruge settled in Halle, where in 1837 with E. T. Echtermeyer he founded the *Hallesche Jahrbücher für deutsche Kunst und Wissenschaft*. In this periodical he discussed the questions of the time from the point of view of the Hegelian philosophy. The *Jahrbücher* was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon government in 1843. In Paris Ruge tried to act with Karl Marx as co-editor of the *Deutsch-Französische Jahrbücher*, but had little sympathy with Marx's socialistic theories, and soon left him. In the revolutionary movement of 1848 he organized the Extreme Left in the Frankfort parliament, and for some time he lived in Berlin as the editor of the *Dis Reform*. The Prussian government intervened and Ruge soon afterwards left for Paris, hoping, through his friend Alexandre Ledru-Rollin, to establish relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Giuseppe Mazzini and other advanced politicians, they formed a "European Democratic Committee." From this Ruge soon withdrew, and in 1850 went to Brighton, where he supported himself by teaching and writing. In 1866 and 1870 he vigorously

supported Prussia against Austria, and Germany against France. In his last years he received from the German government a pension of 1000 marks. He died on the 31st of December 1880.

Ruge was a leader in religious and political liberalism, but did not produce any work of enduring importance. In 1846-48 his *Gesammelte Schriften* were published in ten volumes. After this time he wrote, among other books, *Unser System*, *Revolutionsnovellen*, *Die Loge des Humanismus*, and *Aus früherer Zeit* (his memoirs). He also wrote many poems, and several dramas and romances, and translated into German various English works, including the *Letters of Junius* and Buckle's *History of Civilization*. His *Letters and Diary* (1825-80) were published by Paul Nerlich (Berlin, 1885-87). See A. W. Bolin's *L. Feuerbach*, pp. 127-52 (Stuttgart, 1891).

**RUGELEY**, a market town in the Lichfield parliamentary division of Staffordshire, England, in the Trent valley. Pop. of urban district (1901), 4447. The London & North-Western railway has stations on the main line (Trent Valley, 124½ m. N.W. from London), and at the town, on a branch line to Walsall. The Grand Trunk canal here follows the Trent. To the S.W. lie the hills of Cannock Chase. The church of St Augustine is modern; of the parish church of the 14th century only the tower and chancel remain. The municipal offices, market hall and assembly-room are contained in one building (1879). A grammar school was founded in 1611. There are ironfoundries, corn-mills and tanneries; and the parish includes several collieries.

**RÜGEN**, an island of Germany, in the Baltic, immediately opposite Stralsund, 1½ m. off the north-west coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund, or Bodden. Its shape is exceedingly irregular, and its coastline is broken by numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the south-east; and the chief neighbouring islands are Ummanz and Hiddensee, both off the north-west coast. Rügen is the largest island in Germany. Its greatest length from N. to S. is 32 m.; its greatest breadth is 2½ m.; and its area is 377 sq. m. The surface gradually rises towards the west to Rugard (335 ft.)—the "eye of Rügen"—near Bergen, but the highest point is the Hertaburg (505 ft.) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. Though much of Rügen is flat and sandy, the fine beech woods which cover a great part of it, and the bold northern coast scenery combine with the convenient sea-bathing offered by the various villages around the coast to attract large numbers of visitors. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubbenkammer (Slavonic for "rock steps"), a sheer chalk cliff, the summit of which, the Königstuhl, is 420 ft. above the sea. The east of Jasmund is clothed with an extensive beech wood called the Stubbenitz, in which lies the Borg, or Herta Lake. Connected with Jasmund by the narrow isthmus of Schabe to the west is the peninsula of Wittow, the most fertile part of the island. At its north-west extremity rises the height of Arcona, with a lighthouse.

A ferry connects the island with Stralsund, and from the landing-stage at Altefähr a railway traverses the island, passing the capital Bergen to Sassnitz, on the north-east coast. Hence a regular steamboat service connects with Trelleborg in Sweden, thus affording direct communication between Berlin and Stockholm. The other chief places are Garz, Sagard, Gingst and Putbus, the last being the old capital of a broony of the princes of Putbus. Sassnitz, Göhren, Sellin and Lauterbach-Putbus are among the favourite bathing resorts. Schoritz was the birthplace of the patriot and poet, Ernst Moritz Arndt.

Ecclesiastically Rügen is divided into 75 parishes, in which the pastoral succession is said to be almost hereditary. The inhabitants are distinguished from those of the mainland by peculiarities of dialect, costume and habits; and even the various peninsulas differ from each other in these particulars. The peninsula of Mönchgut has best preserved its peculiarities; but there, too, primitive simplicity is yielding to the influence of the annual stream of summer visitors. The inhabitants raise some cattle, and Rügen has long been famous for its geese; but the only really considerable industry is fishing—the herring-fishery being especially important. Rügen, with the neighbouring islands, forms a governmental department, with a population (1905) of 47,023.

The original Germanic inhabitants of Rügen were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stubbenitz and elsewhere Huns' or giants' graves are common; and near the Hertha Lake are the ruins of an ancient edifice which some have sought to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On Arcona in Wittow are the remains of an ancient fortress, enclosing a temple which was destroyed in 1168 by the Danish king Waldemar I., when he made himself master of the island. Rügen was ruled then by a succession of native princes, under Danish supremacy, until 1218. After being for a century and a half in the possession of a branch of the ruling family in Pomerania, it was finally united with that duchy in 1478, and passed with it into the possession of Sweden in 1648. With the rest of Western Pomerania Rügen has belonged to Prussia since 1815.

Arndt, *Fairy Tales from the Isle of Rügen* (London, 1896).

**RUHLA**, a town of Germany, partly in the duchy of Saxe-Weimar and partly in that of Saxe-Coburg-Gotha. Pop. (1905) 7017. It stretches along the valley of the Erb in the Thuringian forest 8 m. S. of Eisenach, and attracts a number of visitors owing to its beautiful natural surroundings and its mineral springs. Its staple industry is the making of wooden and meerschaum pipes; it has also electrical works, and some small manufactures. Ruhla, which is known locally as *Die Ruhla*, was famous in the middle ages for its armourers, and subsequently for its cutlers.

See Ziegler, *Das Thüringerwaldes Rukko* (Dresden, 1876).

**RUHNKEN**, DAVID (1723-1798), one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1723. His parents had him educated for the church, but after two years at the university of Wittenberg he determined to live the life of a scholar. At Wittenberg Ruhnken lived in close intimacy with the two most distinguished professors, Ritter and Berger. To them he owed a thorough grounding in ancient history and Roman antiquities and literature; and from them he learned a pure and vivid Latin style. At Wittenberg, too, Ruhnken derived valuable mental training from study in mathematics and Roman law. Probably nothing would have severed him from his surroundings there but a desire which daily grew upon him to explore the inmost recesses of Greek literature. Neither at Wittenberg nor at any other German university was Greek in that age seriously studied. It was taught in the main to students in divinity for the sake of the Greek Testament and the early fathers of the church. F. A. Wolf is the real creator of Greek scholarship in modern Germany, and Porson's gift that "the Germans in Greek are sadly to seek" was barbed with truth. It is significant of the state of Hellenic studies in Germany in 1743 that their leading exponents were Gesner and Ernesti. Ruhnken was well advised by his friends at Wittenberg to seek the university of Leiden, where, stimulated by the influence of Bentley, the great scholar Tiberius Hemsterhuis had founded the only real school of Greek learning which had existed on the Continent since the days of Joseph Scaliger and Isaac Casaubon.

Perhaps no two men of letters ever lived in closer friendship than Hemsterhuis and Ruhnken during the twenty-three years which passed from Ruhnken's arrival in the Netherlands in 1743 to the death of Hemsterhuis in 1766. A few years made it clear that Ruhnken and Valckenaer were the two pupils of the great master on whom his inheritance must devolve. As his reputation spread, many efforts were made to attract Ruhnken back to Germany, but after settling in Leiden, he only left the country once, when he spent a year in Paris, ransacking the public libraries (1755). For work achieved, this year of Ruhnken may compare even with the famous year which Ritschl spent in Italy. In 1757 Ruhnken was appointed lecturer in Greek, to assist Hemsterhuis, and in 1761 he succeeded Oudendorp, with the title of "ordinary professor of history and eloquence," but practically as Latin professor. This promotion drew on him the enmity of some native Netherlanders, who deemed themselves (not without some show of reason) to possess stronger claims for a chair of Latin. The only defence made by Ruhnken was to publish works on Latin literature which eclipsed and silenced his rivals. In 1766 Valckenaer succeeded Hemsterhuis in the Greek chair. The intimacy between the two colleagues was only broken by Valckenaer's death in 1785, and stood without strain the test of common candidature for the office (an important one at Leiden) of university librarian, in which Ruhnken was successful. Ruhnken's later years were clouded by severe domestic misfortune, and by the political commotions which, after the outbreak of the war with England in 1780, troubled the Netherlands without ceasing, and threatened to extinguish the university of Leiden. He died in 1798.

Personally, Ruhnken was as far as possible removed from being a recluse or a pedant. He had a well-knit and even handsome frame, attractive manners (though sometimes tinged with irony), and a nature simple and healthy, and open to impressions from all sides. Fond of society, he cared little to what rank his associates belonged, if they were genuine men in whom he might find something to learn. His biographer even says of him in his early days that he knew how to sacrifice to the Sirens without proving traitor to the Muses. Life in the open air had a great attraction for him; he was fond of sport, and would sometimes devote to it two or three days in the week. In his bearing towards other scholars Ruhnken was generous and dignified, distributing literary aid with a free hand, and meeting onslaughts for the most part with a smile. In the records of learning he occupies an important position. He forms a principal link in the chain which connects Bentley with the modern scholarship of the Continent. The spirit and the aims of Hemsterhuis, the great reviver of Continental learning, were committed to his trust, and were faithfully maintained. He greatly widened the circle of those who valued taste and precision in classical scholarship. He powerfully aided the emancipation of Greek studies from theology; nor must it be forgotten that he first in modern times dared to think of rescuing Plato from the hands of the professed philosophers—men presumptuous enough to interpret the ancient sage with little or no knowledge of the language in which he wrote.

Ruhnken's principal works are editions of (1) Timaeus's *Lexicon of Platonic Words*, (2) Thalesaeus and other Greek commentators on Roman law, (3) Rutilius Lupus and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato and the Greek and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the work of Apianes on rhetoric a large piece of a work by Longinus was embedded. Modern views of the writings attributed to Longinus have lessened the interest of this discovery without lessening its merit. The biography of Ruhnken was written by his great pupil, Wyttenbach, soon after his death. (J. S. R.)

**RUHR**, a river of Germany, an important right-bank tributary of the lower Rhine. It rises on the north side of the Winterberg in the Sauerland, at a height of about 200 ft. above the sea. It first takes a northerly and north-westerly course, and in a deep and well-wooded valley winds past the romantically

situated town of Arnsberg. Shortly after reaching Neheim it bends to the south-west, courses through the miring district around Hagen, and receives from the left the waters of the Lenne. Hence in a tortuous course it works its way past Witten, Steele, Kettwig and Mülheim, and, after a course of 142 m., discharges itself into the Rhine at Ruhrort. From this place the Ruhr canal connects it with Duisburg. The river is navigable from Witten downwards (43 m.), by the aid of eleven locks; but navigation is often greatly impeded through dearth of water.

**RUHRORT**, a town of Germany, in the Prussian Rhine province, situated at the junction of the Ruhr and the Rhine, in the midst of a productive coal district, 15 m. N. of Düsseldorf and 12 E. of Crefeld by rail. Ruhrort has the largest river harbour in Europe, with quays extending nearly 5 m. along the river, and it is the principal shipping port for the coal of the Westphalian coalfield, which is despatched in the fleet of steam-tugs and barges belonging to the port. The coal is sent principally to South Germany and the Netherlands. Grain and timber are also exported and iron ore is imported. In 1905 the port was entered and cleared by over 27,000 vessels of 7,418,065 tons. The industries of the town include large iron and steel works, ship-building yards and tanneries. Ruhrort has three Evangelical and three Roman Catholic churches, and several schools and public institutions.

Ruhrort is first mentioned in 1379, and obtained civic rights in 1551. Having been in the possession of the counts of La Marck, it passed into that of Brandenburg in 1614. In 1905 it was united with Duisburg and Melferich to form a single municipality, the joint population being 41,416.

See *Geschichte der Stadt Ruhrort* (Ruhrort, 1882).

**RUIZ, JUAN** (c. 1283-c. 1350), Spanish poet, was born probably at Alcalá de Henares, and became arch-priest of Hita. Though he draws his physical portrait in the *Libro de buen amor*, he gives no exact biographical details. It may be inferred from his writings that he was not an exemplary priest, and one of the manuscript copies of his poems states that he was imprisoned by order of Gil Albornoz, archbishop of Toledo. It is not known whether he was sentenced for his irregularities of conduct, or on account of his satirical reflections on his ecclesiastical superiors. Nor is it possible to fix the precise date of his imprisonment. Albornoz nominally occupied the see of Toledo from 1337 to 1368, but he fell into disgrace in 1351 and fled to Avignon. A consideration of these circumstances points to the probable conclusion that Ruiz was in prison from 1337 to 1350, but this is conjecture. What seems established is that he finished the *Libro de buen amor* in 1343 while in gaol, and that he was no longer arch-priest of Hita in January 1351; it is assumed that he died shortly before the latter date.

Ruiz is by far the most eminent poet of medieval Spain. His natural gifts were supplemented by his varied culture; he clearly had a considerable knowledge of colloquial (and perhaps of literary) Arabic; his classical reading was apparently not extensive, but he knew by heart the *Disticha* of Dionysius Cato, and admits his indebtedness to Ovid and to the *De Amore* ascribed to Pamphilus; his references to Blanchefleur, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes the *fabliaux* with remarkable deftness; lastly, he adapts fables and apologues from Aesop, from Pedro Alfonso's *Disciplina clericalis*, and from medieval bestiaries. All these heterogeneous materials are fused in the substance of his verified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz, in fact, offers a complete picture of picaresque society in Spain during the first half of the 14th century, and his impartial irony lends a deeper tone to his rich colouring. He knows the weaknesses of both clergy and laity, and he dwells with equal complacency on the amorous adventures of great ladies, on the perverse intrigues arranged by demure nuns behind their convent walls, and on the simpler instinctive animalism of country lasses and Moorish dancing-girls. In addition to the faculty of genial observation Ruiz has the gift of creating characters and presenting types of human nature: from his Don Furón is derived

the hungry gentleman in *Lazarillo de Tormes*, in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the *Celestina*, and Celestina herself is developed from Ruiz' *Trota-conventos*. Moreover, Ruiz was justly proud of his metrical innovations. The *Libro de buen amor* is mainly written in the *cuaderna vía* modelled on the French alexandrine, but he imparts to the measure a variety and rapidity previously unknown in Spanish, and he experiments by introducing internal rhymes or by shortening the fourth line into an octosyllabic verse; or he boldly recasts the form of the stanza, extending it to six or seven lines with alternate verses of eight and five syllables. But his technical skill never sinks to triviality. All his writing bears the stamp of a unique personality, and, if he never attempts a sublime flight, he conveys with contagious force his enthusiasm for life under any conditions—in town, country, vagabondage or gaol.

His influence is visible in *El Corbacho*, the work of another jovial goiardi, Alphonso Martinez de Toledo, arch-priest of Talavera, who wrote more than half a century before the *Libro de buen amor* was imitated by the author of the *Celestina*. Ruiz is mentioned with respect by Santillana, and that his reputation extended beyond Spain is proved by the surviving fragments of a Portuguese version of the *Libro de buen amor*. By some strange accident he was neglected, and apparently forgotten, till 1790, when an expurgated edition of his poems was published by Tomás Antonio Sanchez; from that date his fame has steadily increased, and by the unanimous verdict of all competent judges he is now ranked as the greatest Spanish poet of his century.

An accurate edition of his works was published by M. Jean Ducamin at Toulouse in 1901, and he is the subject of Sr. D. Julio Puyol y Alonso's critical study, *El Arcipreste de Hita* (Madrid, 1906). (J. F.-K.)

**RUKWA** (sometimes also Rikwa and Hikwa), a shallow lake in German East Africa, lying 2650 ft. above the sea in a N.W. continuation of the rift-valley which contains Lake Nyasa. The sides of the valley here run in steep parallel walls 30 to 40 m. apart, from S.E. to N.W., leaving between them a level plain extending from about  $7\frac{1}{2}^{\circ}$  to  $8\frac{1}{2}^{\circ}$  S. This whole area was probably once covered by the lake, but this has shrunk so that the permanent water occupies only a space of 30 m. by 12 at the S. immediately under the E. escarpment. In the rains it extends some 40 m. farther N., and the north of the plain is likewise then covered with water to a depth of about 4 ft. The rest of the plain is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. But in 1903-4 the level of the lake rose so that the waters covered the whole depression. The lake has two large feeders, one coming from the W., the other from the S.E. The W. feeder, the Saisi, or Momba, rises in  $80^{\circ} 50' S.$ ,  $31^{\circ} 30' E.$ , and traverses a winding valley cut out of the high plateau between lakes Nyasa and Tanganyika. It enters the lake on its N.W. side. The other chief feeder, the Songwe, rises in  $9^{\circ} 8' S.$ ,  $33^{\circ} 30' E.$  on the same plateau as the Saisi and flows N.W., entering Rukwa at its S. end. The Songwe is joined about 50 m. about its mouth by the Rupa, whose head-waters are in the high-lying land N.E. of Rukwa. The maximum depth of the lake is about 10½ ft. Its water is very brackish and of a milky colour from the mud stirred up by the wind. It contains great quantities of fish. First seen from the north by Joseph Thomson in 1880, it was visited by Dr Kaiser, a German, in 1882, and has since been thoroughly explored by various British and German travellers.

See "Begleitworte zu der Karte der Gebiete am südlichen Tanganjika- und Rukwa-See," by Paul Sprigade, in *Mitteil. v. Forsch. u. Geobotan. a. d. deutschen Schutzgebieten* (Berlin, 1904), with map on the scale of 1:500,000.

**RULHIÈRE** (or RULHIÈRES), **CLAUDE CARLOMAN DE** (1735-1791), French poet and historian, was born at Bondy, near Paris, on the 12th of June 1735. He became aide-de-camp to Marshal Richelieu, whom he followed through the Hanoverian campaign of 1757 and to his government at Bordeaux in 1758; and at twenty-five he was sent to St Petersburg as secretary of legation. Here he actually saw the revolution which seated

Catherine II. on the throne, and thus obtained the facts of *Anecdotes sur la révolution de Russie en 1762*. Catherine made repeated efforts to secure the destruction of the MS., which remained unpublished until after the empress's death. Rulhière became secretary to the comte de Provence (afterwards Louis XVIII.) in 1773, and he was admitted to the Academy in 1787. The later years of his life were spent chiefly in Paris, where he held an appointment in the Foreign Office and went much into society; but he visited Germany and Poland in 1776. His unfinished *Histoire de l'anarchie de Pologne* (4 vols., 1807) was published posthumously under the editorship of P. C. F. Daunou. The only important historical work which he published during his lifetime was his *Éclaircissements historiques sur les causes de la révocation de l'édit de Nantes* . . . (2 vols., 1788), undertaken in view of the restoration to the Protestants of their civil rights. Rulhière died at Bondy on the 30th of January 1791.

His short sketch of the Russian revolution is justly ranked among the masterpieces of the kind in French. Of the larger *Poland* Carlyle, as justly, complains that its allowance of fact is too small in proportion to its bulk. The author was also a fertile writer of *vers de société*, short satires, epigrams, &c., and he had a considerable reputation among the witty and ill-natured group also containing Nicolas Chamfort, Antoine de Rivarol, Louis René de Champenetz, &c. On the other hand he has the credit of caring for J. J. Rousseau in his morose old age, until Rousseau as usual quarrelled with him.

Rulhière's works were edited, with a notice by P. R. Anguiss, in 1819 (Paris, 6 vols. 8vo). The *Russian Revolution* may be found in the *Chefs-d'œuvre historiques* of the Collection Didot, and the *Poland*, with title altered to *Révolutions de Pologne*, in the same collection. See also a notice by Eugène Assé prefixed to an edition (1890) of Rulhière's *Anecdotes sur le Maréchal de Richelieu; Saint-Beuve, Causeries du lundi* (vol. iv.).

**RULLUS**, **PUBLIUS SERVILIUS**, Roman tribune of the people in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. Its professed object was to clear Rome of the large number of pauper citizens, who formed a standing menace to peace. The members of the commission were to be invested with powers so extensive that Cicero spoke of them as ten "kings." They were to be elected for five years by seventeen of the tribes chosen by lot from the thirty-five; the imperium was to be conferred upon them by the *lex curiata*, together with judicial powers and the rank of praetor. Only those were eligible who personally gave in their names, a clause obviously intended to exclude Pompey, who was at the time absent in the East. In fact, the commission as a whole was intended to act as a counterpoise to his power. The only land available for the purposes of the bill was the Ager Campanus and the Ager Stellatis, where 5000 citizens were to be settled at once, but as these were utterly insufficient, other lands were to be acquired by purchase. The necessary money was to be found by the sale of all the public property in Italy which had been ordered to be sold by resolutions of the senate (in 81, or subsequently), but which the fear of unpopularity had deterred the consuls from selling; by the sale of lands, &c., in the provinces which had become public property since 88, and even of the domains acquired during the Mithradatic war. A special article, the object of which was to pacify those who had received grants of land from Sulla, declared such possessions to be private property, for which compensation was to be paid in case of surrender. The revenues of the provinces which were now being organized by Pompey, and the booty and money taken or received by generals during war were also to be applied to this purpose. The places to which colonies were to be sent were not specified (with the exception mentioned above), so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property.

Cicero delivered four speeches against the bill, of which three are still extant, although the first is mutilated at the beginning. The second is the most important for the history of the bill; nothing is known of the fourth. Very little enthusiasm was shown in the matter by the people, who preferred the distribution of doles in the city to the prospect of distant allotments. One of the tribunes even threatened to put his veto on the bill, which was withdrawn before the voting took place. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome a proposal by Caesar himself, an expectation fulfilled by the passing of the *lex Julia* in 59, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of Cicero *De lege agraria*, with the introduction in G. Long's edition, and the same author's *Decline of the Roman Republic*, in p. 241; Mommsen, *Hist. of Rome*, bk. v. ch. 5; art. AGRARIAN LAWS.

**RUM, or RUM** (Arab. *ar-Rûm*), a very indefinite term in use among Mahomedans at different dates for Europeans generally and for the Byzantine empire in particular; at one time even for the Seljuk empire in Asia Minor, and now for Greeks inhabiting Ottoman territory. When the Arabs met the Byzantine Greeks, these called themselves *Ῥωμαῖοι*, or Romans, a reminiscence of the Roman conquest and of the founding of the new Rome at Byzantium. The Arabs, therefore, called them "the Rûm" as a race-name (already in Kor. xxx. 1), their territory "the land of the Rûm," and the Mediterranean "the Sea of the Rûm." The original ancient Greeks they called "Yûnân" (Ionians), the ancient Romans, "Rûm" and sometimes "Latîniyûn" (Latins). Later, inasmuch as Muslim contact with the Byzantine Greeks was in Asia Minor, the term Rûm became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljuks of Rûm. But as the Mediterranean was "the Sea of the Rûm," so all peoples on its N. coast were called sweepingly, "the Rûm." In Spain any Christian slave-girl who had embraced Islâm was named Rûmîya, and we find the crew of a Genoese vessel being called Romans by a Muslim traveller. The crusades introduced the Franks (*Ifranja*), and later Arabic writers recognize them and their civilization on the N. shore of the Mediterranean W. from Rome; so Ibn Khaldûn in the latter part of the 14th century. But *Rûmî* is still used in Morocco for a Christian or European in general, instead of the now elsewhere commoner *Ifranji*. (D. B. MA.)

**RUM** (according to Skeat, a corruption of Malay *brum or brass*; the adjective "rum," i.e. "queer," being a distinct word, in Gipsy rom), a potable spirit distilled chiefly from fermented cane-sugar. It is mainly the produce of the West Indian Islands, notably Jamaica, and of Demerara. There are two kinds of Jamaica rum, namely, "common" or "clean" rum, and "flavoured" or "German" rum. The latter is used almost entirely for purposes of blending with lighter types of spirit. Compared with other potable spirits such as whisky and brandy, the Jamaica rums are distinguished by their very high proportion of secondary products, particularly of the compound esters. Among the latter butyric "ether" (ethyl butyrate) predominates. The Demerara rums are of a lighter character. Rum has a deep brown colour imparted by caramel or by storage in sherry casks, or, most generally, by both. "Tafia" is an inferior quality of rum produced in the French colonies. "Negro" rum, which is the lowest quality of all, and into the wash for which the *débris* of the sugar-cane enters, is consumed locally by the coloured workers. The spirit prepared from beet-sugar molasses cannot be regarded as rum, for, unless it is highly rectified, it possesses a disagreeable odour and taste. Pictitious rum is, however, sometimes prepared from highly rectified beet spirit and rum "essence"—a mixture of artificial esters (ethyl butyrate, &c.), birch bark oil and so on. Highly rectified

beet spirit is also occasionally used for blending with genuine rum, particularly with the "flavoured" or "German" rum. The latter name originated in the fact that this kind of rum was exported very largely to Germany for the purpose of blending. The general composition of various kinds of rum is manifest from the annexed table. The consumption of rum in the United Kingdom has fallen off considerably of late years, concurrently with the general tendency of the public towards lighter and "drier" alcoholic beverages (see SPIRITS).

COMPOSITION OF DIFFERENT VARIETIES OF RUM  
(Analyses by W. Collingwood Williams; cf. *J. Soc. Chem. Ind.* 1907, p. 498.)

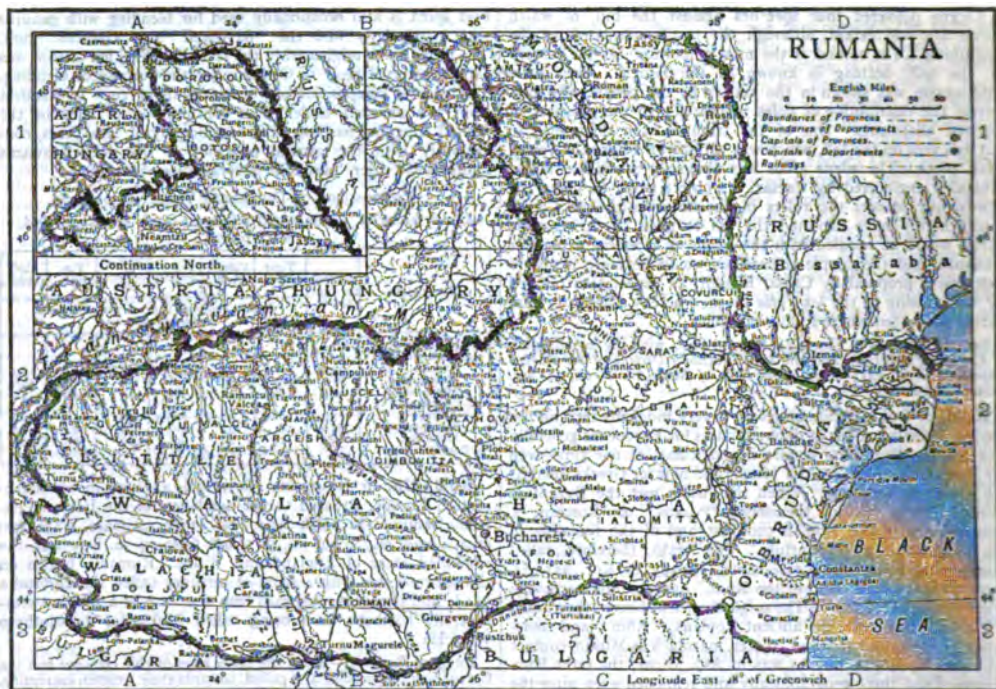

Description.	Alcohol per cent by vol.	Total Acid.	Volatile Acid.	Esters.	Higher Alcohols.	Furfural.	Aldehydes.
(Results expressed in grams per 100 litres of absolute alcohol.)

**RUMANIA, or ROUMANIA** [*România*], a kingdom of south-eastern Europe, situated to the north-east of the Balkan Peninsula, and on the Black Sea. Pop. (1910, estimate) 6,850,000; area, about 50,720 sq. m., or about 6500 sq. m. less than the combined areas of England and Wales. Rumania begins on the seaward side with a band of territory called the Dobrudja (q.v.); and broadens westward into the form of a blunted crescent, its northern horn being called Moldavia, its southern Walachia.

**Physical Features.**—Along the inner edge of this crescent run the Carpathian Mountains, also called, towards their western extremity, the Transylvanian Mountains (q.v.) or Transylvanian Alps; and the frontier which marks off Rumania from Hungary is drawn along their crests. The eastern boundary is formed by the river Pruth (*Prut*), between Moldavia and Russia; farther south by the Kilia mouth of the Danube (*Dimarwa*), between the Dobrudja and Russia, and by the Black Sea. In the extreme south-east, an irregular line, traced from Iltâlc, 10 m. S. of Mangalia, on the coast, as far as the Danube at Siliestria, 85 m. inland, separates the Dobrudja from Bulgaria. Otherwise, the Danube constitutes the whole southern frontier: its right bank being Bulgarian for 290 m., and Servian, in the extreme west, for 50 m. The Danube (q.v.) enters Rumania through the Verciorova or Kazan Pass. It here resembles a long lake, overshadowed by precipitous mountains, which vary from 1000 to 2000 ft. in height, and are covered by birches and pines. In this neighbourhood the channel contracts to about 116 yds. in width, with a depth of 30 fathoms. At the eastern end of the pass are the celebrated Iron Gates, a rapid so named by the Turks, not from the surrounding heights, which here descend gradually to the river, but from the number of submerged rocks in the waterway. As it flows eastward from the frontier, the Danube gains in breadth and volume. Islands are frequent; the banks recede and become lower until, after 50 m., they stand almost level with the water. Henceforward, for 290 m., the Rumanian shore is a desolate fen-country, varied only by a few hills, by cities, and by lagoons often 15 m. long. East of Bucharest, a chain of lagoons and partially drained marshes stretches inland for 45 m. At Siliestria the river bends N.N.E. for 110 m. with the Dobrudja on its right, and a barren plain, called the Baragan Steppe, on its left. It here encloses two large swamped islands, the upper being 57 m., the lower 43 m. long. Both have an average breadth of 10 m. Beyond Galatz, the river again turns eastward, branching out, near Tulcea, into three great waterways, which wind through a low-lying alluvial delta to the sea. The northern estuary is named the Kilia Mouth; the central, the Sulina; the southern, the St George's. Between Verciorova and the Sulina Mouth, the Danube traverses 540 m. Its current is rapid, and supplies the motive

<sup>1</sup> In 1904, in a lecture read before the Rumanian Geographical Society, M. A. Sturdza showed that Rumania should not be included in the Balkan Peninsula, where it is placed by many writers and cartographers. This view was accepted by the Society, and a copy of the lecture was forwarded to all similar associations in Europe. See A. Sturdza, *La Roumanie s'appartient pas à la péninsule balkanique* (Bucharest, 1904).

<sup>2</sup> I.A. Cauldron.

power for thousands of floating watermills, which lie moored in the shallows. It is fed by many tributaries, which rise in the Carpathians as mountain torrents, growing broad and sluggish as they flow south-eastward through the central Rumanian plain. In Walachia, it is joined by the Jiu (or Schyl) opposite Rahova; by the Olt (ancient Aluta) at Turnu Magurele; by the united streams of the Dimbovitza (*Dambovița*) and Argeș (*Argeș*) at Oltenitza; by the Jalomitza (*Jalomița*) opposite Hirsova. The Olt pierces the Carpathians, by way of the Rothenthurn Pass, and forms the boundary of Little (i.e. western) Walachia, or Oitland. The Sereth (*Siret* or *Sereth*) flows for about 340 m. from its Transylvanian source through Moldavia, and meets the Danube near Galatz, after receiving the Moldova, Bistritza (*Bistrița*), Trotsoh (*Trotosă*), Milcovu, Putna, Râmnicu and Buzău on the west; and the Bérlad (*Bérlad*) on the east. The Milcovu was the former boundary between Walachia and Moldavia. The Pruth rises on the northern limit of Moldavia, forms the eastern frontier for 330 m., and falls into the Danube 10 m. E. of Galatz. Its chief Rumanian tributaries are the Basheu (*Basui*) and Jijia, rivers of the north. The Dobrudja (q.v.) or Dobrogea covers about 2900 sq. m. between the Black Sea and the lower reaches of the Danube. Its high crystalline rocks, covered with sedimentary formations, descend abruptly towards the delta, but more gradually towards the south, where the Bulgarian steppes encroach upon Rumanian soil. The few small rivers which drain the hills generally flow seaward, but those of the delta and steppes belong to the Danubian system. The coast is a low-lying region of sandhills, meres and marshes with one lagoon, 42 m. long, connected by a short stream with the St George Mouth. Its outlet on the sea is named the Fortidje Mouth (*Gura portului*) of the Danube. North of this, the lagoon is called Lake Razim; while its southern half, shut off by three long islands, is the Blue Lake (*Sinice Oștro*, in Bulgarian).

Apart from the Dobrudja, the whole of Rumania is included in the northern basin of the lower Danube. It consists of a single inclined plane stretching upwards, with a north-westerly direction, from the left bank of the river to the summits of the Carpathians. It is divided into three zones—steppe, forest and alpine. The first begins beyond the mud-flats and reed-beds which line the water's edge, and is a vast monotonous lowland, sloping so gently as to seem almost level. The surface is a yellow clay, with patches of brown or dark grey, outliers of the Russian "black earth." Cereals, chiefly maize, with green crops and fields of gourds, alternate with fallow land overgrown by coarse grasses, weeds and stunted shrubs. Among

the scanty trees, willows and poplars are commonest. The second zone extends over the foothills and lower ridges of the Carpathians. This region, called by Rumans "the district of vines," is the most fertile portion of the country. In it grow most fruits and flowers which thrive in a temperate climate. Oaks, elms, firs, ashes and beeches are the principal forest trees. The third zone covers the higher mountains on their southern and eastern sides, whose violently contorted strata leave many transverse valleys, though usually inclining laterally towards the south-east. The birch and larch woods of this zone give way to pine forests as the altitude increases; and the pines to mosses, lichens and alpine plants, just below the jagged iron-grey peaks, many of which attain altitudes of 6000 to 8000 ft.

**Geology.**—The axis of the Transylvanian Alps consists of sericite schists and other similar rocks; and these are followed on the south by Jurassic, Cretaceous and Early Tertiary beds. The Jurassic and Cretaceous beds are ordinary marine sediments, but from the Cenomanian to the Oligocene the deposits are of the peculiar facies known in the Alps and Carpathians as Flysch. Farther north, the Flysch forms practically the whole of the Rumanian flank of the Carpathians. Along the foot of the Carpathians lies a broad trough of Miocene salt-bearing beds, and in this trough the strata are sometimes horizontal and sometimes strongly folded. Outside the band of Miocene beds the Sarmatian, Pontian and Levantine series, often concealed by Quaternary deposits, cover the great part of the Danube plain. Even the Pontian beds are sometimes folded. In the Dobrudja crystalline rocks, presumably of ancient date, rise through the Tertiary and recent deposits and form the hills which lie between the Danube and the Black Sea.<sup>1</sup>

**Climate.**—The Rumanian climate alternates between extreme cold in winter, when the thermometer may fall to -20° Fahrenheit and extreme heat in summer, when it may rise to 100° in the shade. Autumn is the mildest season; spring lasts only for a few weeks. Spring at Bucharest has a mean temperature of 53°; summer

Stefanescu, *Étude sur les terrains tertiaires de Roumanie* (1897); J. Bergeron, "Observations relatives à la structure de la haute vallée de la Jalomita (Roumanie) et des Carpathes roumaines," *Bull. Soc. Géol. France*, ser. 4, vol. iv. (1904), pp. 54-77.

72-5°; autumn, 65°; winter, 37-5°. For about 155 days in each year. Rumania suffers from the bitter north-east wind (*crivest*) which sweeps over south Russia; while a scorching west or south-west wind (*ostrid*) blows for about 126 days. Little snow falls in the plains, but among the mountains it may lie for five months. The frosts are severe, the Danube being often icebound for three months. The rainfall, which is heaviest in summer, averages about 15-20 in.

**Fauna.**—In its fauna, Walachia has far more affinity to the lands lying south of the Danube than to Transylvania, although several species of *Claudiæ*, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan Steppes resemble the Russian prairies in their variety of molluscs and the lower kinds of mammals. Over 40 species of freshwater mussels (Unionidae) have been observed in the Rumanian rivers. The lakes of the Dobruja likewise abound in molluscs; parent forms, in many cases, of species which reappear, greatly modified, in the Black Sea. Insect life is somewhat less remarkable; but besides a distinctive genus of Orthoptera (*Jasquita Hesperoda*), there are several kinds of weevils (*Curculionidae*) said to be peculiar to Rumania. Birds are very numerous, including no fewer than 4 varieties of crows, 5 of warblers, 7 of woodpeckers, 8 of buntings, 4 of falcons, and 5 of eagles; while among the hosts of waterfowl which people the marshes of the Danube are 9 varieties of ducks, and 4 of rails. Roe-deer, foxes and wolves find shelter in the forests, where bears are not uncommon; and chamois frequent the loftiest and most inaccessible peaks.

**Minerals.**—The mineral wealth of Rumania lies chiefly in the mountains. Petroleum, salt, lignite and brown coal are largely worked. Deposits of rock-salt, a valuable government monopoly, stretch from the department of Suceava in northern Moldavia to that of Gorjiu in Walachia, and are mined in the departments of Bacau, Prahova and Râmnicul Sârât. The presence of petroleum, indicated by many ancient workings in the shape of shallow hand-dug wells, can be traced continuously at the foot of the Transylvanian Alps, from Turnu Severin into Bukovina. Rumania claim for their product a higher percentage of pure oil than is found in the Americas, Galician and Caucasian wells; and, although American competition nearly destroyed this industry between 1873 and 1895, improved methods and legislation favouring the introduction of foreign capital enabled it to recover. At the beginning of the 20th century the Rumanian petroleum deposits were among the most important in the world. The industry is carried on by private producers as well as by the state, the American Standard Oil Company being largely interested. The total output, coming chiefly from the departments of Bacau, Buzeu, Dimbovitza and Prahova, was 250,000 metric tons in 1900, 615,000 in 1905, and 1,300,000 in 1909. Associated with petroleum is ozokerite, converted by the peasantry into candles. Lignite is used as fuel on the railways. The chief anthracite beds, those in the Gorjiu department, are leased until 1975 to an English capitalist, who has the right to construct railways. Extensive coalfields exist in the Dobruja, and the Dimbovitza, Mehedinți, Muscel, Prahova and Vâlcea departments. Iron, copper, lead, mercury, cinnabar, cobalt, nickel, sulphur, arsenic and china clay also occur. Among the mountains, gold was perhaps worked under Trajan, who first appointed a *Procurator Metallorum*, or overseer of mines, for Dacia; certainly in the 14th century, when immigrant Saxon miners established a considerable trade with Ragusa, in Dalmatia. Under the Turks, gold-washing was carried on by gipsy slaves, but it has long been abandoned as unprofitable. Until 1896 building materials were chiefly imported; but, after that year, many quarries were opened to develop the native resources of limestone, sandstone, serpentine, red, yellow and green granite, and marbles of all colours, including the white marble from Dorna in Suceava, said by Rumanians to rival that of Carrara in Italy. Clear amber is found beside the Buzeu and its affluents, with brown and grey clouded amber, and a blue fluorescent variety, of considerable value.

Rumania has long been noted for its mineral springs. Ruins of a Roman bath exist near Curtea de Argeș. In the Vâlcea department, besides many other iodine, sulphur and mud baths, there are the state-supported spas of Calimaneștil, Caculata and Govora, situated among some of the finest Carpathian scenery. Most famous of all is Sinaia (g.v.), the summer residence of the Court; while important springs exist at Lake Sarat, near Braila; at Slanic, in the Prahova department, where flooded and abandoned salt-mines are fitted up as baths; at the Tekir Ghiol mere, near Constantza; and at Balzatesti (*Balzești*), in the Neamtz (*Neamț*) department, a favourite resort of invalids from many parts of eastern Europe.

**Agriculture.**—That, in 1900, Rumania ranked third, after the United States and Russia, among the grain-growing countries of the world, is due partly to the fertile soil, whose chemical constituents are the same as in the "black earth" region of Russia, though even

richer in nitrates; partly also to the improved methods and appliances introduced in the last quarter of the 19th century. The frail wooden ploughs with a lance-headed share that only scratched the surface soil, were then superseded by iron ploughs; steam threshers replaced the oxen which trod out the corn, and modern implements were widely adopted. Vast harvests of wheat and maize ripen on the plains and lower hills. Apart from cereals, the principal crops are beans, potatoes, beetroot and tobacco. Among the wine-producing countries of Europe, Rumania stood fifth in 1900, despite the ravages of *phylloxera*, old-fashioned viticulture, lack of storage and other drawbacks. The red wines of Moldavia, especially the brand known as *Piscul Cerbului*, resemble Bordeaux. The best white wines came from Cotnari in the Jassy department, but here *phylloxera* ruined the vineyards. Golden Cotnari was akin to Tokay. To combat the *phylloxera*, the government ordered the destruction of all infected vines, distributed immune American stocks and established schools of viticulture. On the upland fruit farms, although apples, pears, medlars, cherries, plums, peaches, apricots and melons thrive, the chief attention is given to damsons, from which is extracted a mild spirit (*tsinca*), highly esteemed throughout Rumania. This industry began to decline after 1860, but revived with the establishment of government schools of fruit-culture in many villages. Further instruction was given at various horticultural institutes in the towns, notably the Botanic Gardens and Institute of Bucharest, where the experiments in planting figs, almonds, hops and cotton yielded favourable results. Tobacco is largely cultivated, under state supervision.

There are three breeds of Rumanian oxen, besides the peculiar black buffaloes, with horns lying almost flat along their necks. Cheap transit enables the Rumanian farmers to compete successfully in the meat-markets of Austria, Germany and Holland. The southern Dobruja and the Baragan Steppes, with the mountain pastures of Argeș, Buzeu, Dimbovitza, Muscel and Prahova, are occupied by large sheep-runs; 1200 farms were created in the Baragan by the Land Act of 1889. In winter the flocks are driven from the highlands to the plains. Cheeses of ewe's milk, packed in sheepskins or bark, are in great demand. Swine and pork are largely exported to Russia and Austria-Hungary. Besides the Moldavian and Servian breeds, thousands of so-called "swamp hogs" run wild among the marshes and on the islands of the Danube. Silkworm-rearing, once an important household industry, had been almost abandoned, when, in 1891, the government established mulberry nurseries, and distributed silkworms free of charge. Silkworm-rearing is taught in the monasteries and agricultural schools, especially in the College of Agriculture and Sylviculture, at Ferestru, near Bucharest. Similar measures were adopted to check the decline of bee-keeping, and a model apiary was founded in 1890, under government control.

**Forests.**—The forests of Rumania were long either neglected or exploited in the most reckless fashion. Large tracts of woodland were cleared near the railways, and the communal rights of grazing and gathering firewood destroyed the aftergrowth. Nevertheless, in 1910 there were 2,760,000 acres under forests, chiefly in the mountains of north-western Moldavia. More than 1,000,000 acres are state property. Under King Charles, an ardent forester, the wholesale destruction of timber was arrested, and new plantations met with success. Lumber is floated down the rivers of the Carpathian watershed to the Danube, and so exported to Turkey and Bulgaria; casks, shaped planks and petroleum drums go chiefly to Austria and Russia. Wood-carving is taught in many schools, and a special school of forestry exists at Branești in the Ilfov department. Estates in private hands are liable to state control, under the Forests Act of 1886.

**Land Tenure.**—The Rumanian system of land tenure dates from 1864, when most of the land was held in large estates, owned privately or by the state or by monasteries. There was also a small class of peasant proprietors, called *moștenitori* in Walachia, *obștaci* in Moldavia, living and working in family communities; but the great mass of the peasantry cultivated the lands of the large proprietors, giving a certain number of days' work to their manorial lord, in addition to a tithe of the raw produce. They received in return a plot of ground proportionate to the number of animals they owned, and had also rights of grazing and of collecting fuel in the forests. In 1864, under the government of Prince Cuza, a new law was promulgated, conferring on each peasant family freehold property in lots varying from 7½ to 15 acres, according to the number of oxen that they owned. The man with no cattle received the minimum; the owner of 2 oxen got 10 acres, and the possessor of 4 received 12½ to 15 acres. The price of the land, which was calculated on the basis of the value of the forced labour to which the landlord had been entitled, was about £1, 16s. per acre, paid to the landlord by the state as compensation, and subsequently recovered from the peasants in fifteen annual instalments. In the first distribution, which took place almost immediately after the law was passed, 280,000 families in Walachia and about 127,000 in Moldavia became freeholders, holding nearly 4 million acres or one-third of the cultivated area of the country. These peasant plots were all declared inalienable for thirty years. The law of emancipation, although passed with the best of motives, did not to any great

<sup>1</sup>The relative importance of Rumania was afterwards lessened by the development of wheat-culture in Canada, Argentina and elsewhere.

extent benefit the peasantry. The limited size of their farms, and the necessity for buying wood and paying for pasturage, both of which were formerly free, prevented them from obtaining complete independence of the large proprietors, on whose estates they still had to work for payment in money or kind, while their improvidence soon got them into the hands of Jewish money-lenders, who, fortunately for the peasants, were by law unable to become proprietors of the soil. In 1866 and 1872 laws were passed for still further improving the position of these small proprietors; and in 1879 a measure was carried for allotting lands to 48,000 recently married couples, and for restoring to many peasant families lands which had been alienated.

By the Land Act of 1889, the state domains, amounting to nearly one-third of the total area of Rumania (originally the property of the church and the convents, confiscated by Prince Cuza in 1866), were distributed among the peasantry. The land was divided into lots of 12½, 25 and 37½ acres. Peasants having no land might purchase the smaller lots on very easy terms. Those who already held less than 12½ acres might purchase up to that amount. When a change of residence became necessary to enable the peasant to take up the new allotment, the state advanced £6 to each family to defray expenses. The price to be paid for the land differed in different districts, and was to be paid to the state in small annual instalments. If any land remained after satisfying the wants of the peasants, it was to be sold by public auction in lots of 30 to 62½ acres. All lots in both cases were declared inalienable for thirty years. The sale of the larger lots gave rise to so many abuses that in 1896 a law was passed abolishing their further sale. As a result of these measures the majority of Rumanians are peasant proprietors; but the smallness of the holdings renders scientific farming difficult except by co-operation, and many proprietors can only live by working for the owners of large estates. Thus, though the average value of agricultural land increased by 60% between 1870 and 1900, the position of the peasantry is far from satisfactory, and the resultant discontent was the chief cause of the agrarian rising in 1907.

**Fisheries.**—Among European freshwater fishing-grounds, the Danube is only surpassed by the Volga; the most valuable fish being sturgeon and sterlet, mostly netted in the St George mouth; carp, often weighing 50 lb; pike, perch, tench and eels. By an act of 1895, a close period was instituted, the lakes and rivers restocked, and the state fisheries, which are either farmed by private companies or directly administered, were set in order. The coarse-grained grey Rumanian caviare is forwarded to Berlin, and there blended with Russian caviare. Flounders and mullet are caught in the Black Sea, and there are oyster-beds in the delta and on the Dobrudja littoral. The principal markets for Rumanian fish are Turkey, Russia and Austria-Hungary. Fish of inferior quality is imported, chiefly from Russia.

**Manufactures and Commerce.**—The native mines, fields and forests provide raw material for most of the few factories which exist. These include petroleum refineries, iron foundries, distilleries, flour mills, sugar refineries, sawmills, paper mills, chemical works, glass works, soap and candle works, &c. A law passed in 1887 provided that any one undertaking to found an industrial establishment with a capital of at least £5,000, or employing at least 25 workmen (of whom two-thirds should be Rumanians), should be granted 12 acres of state land, exemption for a term of years from all direct taxes, freedom from customs dues for machinery and raw material imported, exemption from road taxes, reduction in cost of carriage of materials on the state railways, and preferential rights to the supply of manufactured articles to the state.

The following table shows the value of Rumanian imports and exports for five years:—

Year.	Imports.	Exports.
1904	£12,455,000	£10,475,000
1905	13,310,000	18,284,000
1906	16,885,000	19,654,000
1907	17,220,000	22,157,000
1908	16,563,000	15,158,000

The principal imports are metals and machinery (£5,510,000 in 1908), textiles, silk, wool, hair and hides. Grain (£11,297,000 in 1908), petroleum (£1,543,000) and timber (£1,039,000) are by far the most important exports, the remainder consisting of live-stock the animal products, fruit, vegetables and mineral waters. In 1908 the chief consumers of Rumanian goods were (in order) Belgium, Great Britain and Italy; the chief exporters to Rumania were Germany, Austria-Hungary, Great Britain and France. The wide fluctuations in Rumanian commerce are largely due to the dependence of the country on the grain harvest.

**Finance.**—The state revenue is derived from customs; from public works and public land; from indirect taxes in the shape of stamp, inheritance, beer, spirit, petroleum and other duties; from direct taxes on land and buildings, with road-tolls, licences for the sale of alcohol and traders' registration fees; from the tobacco, salt, match, playing-card and cigarette-pape monopolies; and from the postal, telegraphic and telephonic services. The chief items of expenditure are interest on the national debt; and the cost of defence, public works and education.

The following table shows the estimated revenue and expenditure for five years:—

Year.	Revenue.	Expenditure.
1906-7	49,537,000	49,509,000
1907-8	10,099,000	9,979,000
1908-9	16,440,000	16,390,000
1909-10	17,427,000	17,146,000
1910-11	18,443,000	18,443,000

The great increase after 1907-8 is due to the inclusion of railway receipts and expenditure, with some other items not previously enumerated.

In May 1905 the outstanding public debt, which amounted to about £54,000,000, mainly placed in Germany and bearing interest at an average rate of 5%, was converted into a uniform 4% stock. Besides this reduction of interest, the state secured an extension of fourteen years in each of the various periods allotted for repayment of the component loans. But a considerable increase in the total debt was involved, because a bonus of 104% in new 4% stock, issued at par, was offered to induce bondholders to convert, while, to cover the bonus, an additional 2% loan was raised at 90-70, amounting to £4,000,000, redeemable in 1945. At the beginning of the fiscal year 1909-10 (March 31st, O.S.) the total outstanding debt was £58,367,000, and the debt charges for the year were estimated at £3,518,000.

**Banks and Currency.**—Apart from the General Bank of Rumania (capital £200,000), which is owned by a syndicate mainly of Germans, the largest credit establishments belong to the state. They include the National Bank (capital and reserves in 1910, £1,560,000), founded in 1880; the Agricultural Loan Bank, founded in 1894; the Rural and Urban Land Credit Institutes, which lend money on agricultural and building land respectively; the Cassa Rurala, which buys estates for resale in small lots; savings banks in all the principal towns; and the Deposit and Trust Fund, which takes charge of estates left vacant through intestacy, surplus departmental and communal funds, securities given by contractors for public works, &c.

After the Crimean War, a bimetallic currency was adopted, with the lei (franc) of 100 bani (centimes) as the unit of value. But after 1878 the Russian silver rouble was rated so highly as to drive the native coins out of circulation; and in 1880 Rumania joined the Latin Monetary Union and adopted a gold standard. Besides the silver pieces worth ½, 1, 2 and 5 lei, gold coins of 5, 10 and 20 lei are used. Silver is legal tender only up to 50 lei. All taxes and customs dues must be paid in gold, and, owing to the small quantities issued from the Rumanian mint, foreign gold is current, especially French 20-franc pieces (equal at par to 20 lei), Turkish gold lire (22-70), Old Russian Imperials (20-60) and English sovereigns (25-22). Besides bronze coins of less value than ½ lei, nickel pieces worth 5, 10 and 20 bani were authorized by a law of 1900. The French decimal system is in use for weights and measures, together with Turkish standards. On the railways and in post offices the Gregorian calendar is employed; elsewhere the Julian remains in use.

**Chief Towns.**—The chief towns, with their estimated population in 1910, are Bucharest, the capital (500,000); Jassy, the capital of Moldavia (80,000); Galatz (66,000), Braila (60,000), Iasi (50,000), Craiova (46,000), Botosani (34,000), Bihari (25,000), Ploiesti (25,000), Tulcea (20,000), Constantza (16,000), Giurgewo (15,000). Other towns which, like the foregoing, are described in separate articles are Alexandria, Bahadag, Bacau, Buzen, Calafat, Calarasi, Campulung, Caracal, Curtes de Argesh, Doroboi, Dragasani, Falticeni, Hushi, Mangalia, Neamtzu, Otiteniza, Piatra, Pitesti, Râmnicu Sîrat, Râmnicu Valcea, Roman, Sinaia, Sulina, Tirgu Jiu, Tirgu Ocna, Trgovistea, Tecuci, Turan Magarele, Turus Severin and Vaslui.

**Communications.**—Until the 19th century, traffic was carried on in Rumania chiefly by means of ox-wagons, over the roughest of roads. After 1830, however, many highways were opened, these being usually excellent among the mountains but deteriorating as they descend into the lowlands, where stone is dear. Highways are maintained by the state, department or commune, according to their size and importance. In 1869, the first Rumanian railway was opened, between Bucharest and Giurgevo, its port. Other lines followed rapidly; some built by private enterprise, others by the state, which by 1888 had bought the entire system. This centres in one main line, carried southwards from Sucezava in Bukovina through the whole length of Moldavia, and turning westwards through Walachia to meet the Hungarian frontier at Vercoiorova. Branch lines extend, on one side, up the lateral valleys of the Carpathians, and, on the other, to Jassy and the principal Danubian ports. A direct line connects Jassy with Galatz; another traverses the Dobrudja from Constantza to Cernavoda, where it crosses the Danube and proceeds north-west to join the main line. The double bridge of Cernavoda, with the viaducts leading to it, stretches for 12½ m across the river and surrounding marshes. Besides the junctions at Sucezava and Vercoiorova, the Rumanian system meets the Hungarian through the Gyimes, Rothenthurm and Velka Passes; the Russian by lines from Jassy and Galatz to Kishinev in Bessarabia; the Bulgarian and Servian by means of Siskiew

ferries. Rumania has no canals, and the canalisation of its rivers is impeded by drought and floods. The Pruth and Sereth are navigable for a short distance by small sailing craft: the conservancy of the Danube (q.v.) is controlled by a European commission, which sits at Galatz. Besides river services, the state maintains lines of sea-going ships from Constantza to Constantinople and the Aegean Islands, and from Braila to Rotterdam. In 1908 the ports of Rumania were entered by 32,888 vessels of 9,269,000 tons, of which 30,504 of 6,529,000 tons belonged to the river (Danubian) trade. The merchant navy of Rumania comprised about 495 vessels of 145,000 tons, including 88 steamers.

*Population.*—The population of Rumania numbered 5,012,520 in 1899, and about 6,850,000 in 1910. Fully 6,000,000 of these were Rumans or Vlahs (q.v.). The population of foreign descent comprises many Jews, Armenians, gipsies, Greeks, Germans, Turks, Tatars and Magyars, Servians and Bulgarians. The Jews increase more rapidly than any of these peoples except the Armenians. They usually congregate in the larger towns, though in northern Moldavia there are a few purely Jewish villages, recalling those of Poland.

The bitter feeling against them in Rumania is not so much due to religious fanaticism as to the fear that if given political and other rights they will gradually possess themselves of the whole soil. In many towns in northern Moldavia the Jews are in a majority, and their total numbers in Rumania are about 300,000, i.e. about one-twentieth of the entire population, a larger ratio than exists in any other country in the world. In many places they have the monopoly of the wine and spirit shops, and retail trade generally; and as they are always willing to advance money on usury, and are more intelligent and better educated than the ordinary peasant, there is little doubt that in a country where the large landowners are proverbially extravagant, and the peasant proprietors needy, the soil would soon fall into the hands of the Jews were it not for the stringent laws which prevent them from owning land outside the towns. When in addition it is considered that the Moldavian Jews, who are mostly of Polish and Russian origin, speak a foreign language, wear a distinguishing dress and keep themselves aloof from their neighbours, the antipathy in which they are held by the Rumanians generally may be understood.

The gipsies, who are mostly converts to the Orthodox Church, still, as a rule, cling to their vagabond existence, though their skill at all handicrafts finds them ready employment in the towns. During their centuries of slavery, they were organized into castes, as musicians, metal workers, masons, &c.; but after about 1850 the bonds of caste were gradually relaxed and gipsies began to intermarry with Rumans. The Greeks form a floating population of merchants and small traders, anxious to amass a fortune and return home. German and Austrian business men visit the country in large numbers, and colonies of German farmers flourish among the mountains of Little Walachia. In central Moldavia there is a large population of Magyar descent, and the Servian and Bulgarian elements are strong near the Danube. The interior of the Dobrudja is occupied largely by Turks and Bulgarians, with Tatars, Russians and Armenians, but here the Ruman steadily gains ground at the expense of the alien. At Megidia, a flourishing town of about 10,000 inhabitants, which sprang up after 1860 between Cernavoda and Constantza, the Tatars predominate. Russians of the Lipovan sect live in exile in Bucharest and other cities, earning a livelihood as cab-drivers, and wearing the long coats and round caps of their countrymen.

*National Characteristics.*—Two dissimilar types are noticeable among the Rumans. One is fair-haired, florid and blue-eyed; the other, more frequent among the Carpathians, is dark, resembling the southern Italians. Both alike are hardy, though rarely tall; both, when of the peasant class, frugal and inured to toil amid the rigours of their native climate. Proud of their race and country, they acquired, with their independence, an ardent sense of nationality; and they look forward to the day which will reunite them to their kinsmen in Transylvania and Bessarabia. They have been taught, originally in the interests of Transylvanian Roman Catholicism,

to regard themselves as true descendants of the Romans. The peasants retain their distinctive dress, long discarded, except on festivals and at court, by the wealthier classes. Men wear a long linen tunic, leather belt, white woollen trousers and leather gaiters, above Turkish slippers or sandals. The lowlanders' head-dress is generally a high cylindrical cap of rough cloth or felt, while the mountaineers prefer a small round straw hat. Sundays and holidays bring out a sleeveless jacket, embroidered in red and gold; and both sexes wear sheepskins in cold weather. The linen dresses of women are fastened by a long sash or girdle, wound many times round the waist; the holiday attire being a white gown covered with embroideries, one or more brightly coloured aprons and necklaces of beads or coins. The standard of comfort is lowest along the Danube and in parts of the Dobrudja. As the land becomes higher, the dwellings improve; but, despite the presence of a doctor in each commune, disease is everywhere rife. Many villages are wholly built of timber and thatch, especially amongst the Carpathians, the floors being frequently raised on piles, several feet above the ground. The inner walls are often hung with hand-woven tapestries, which harmonize well with the smoke-blackened rafters, the primitive loom and the huge Dutch stove characteristic of a prosperous Rumanian farm. Many pagan beliefs linger on in the country, where vampires, witches and the evil eye are dreaded by all. The peasants reassure themselves by the use of charms and spells, and by a strict observance of the forms which their creed prescribes. A cross guards every well or spring; every home has its *ikons* or sacred pictures. Church festivals and fasts are kept with equal care. For months together a Ruman will subsist on vegetables and *mamaliga*, the maize porridge that forms his staple diet. Beef and mutton are rarely touched, and in some districts pork is only eaten on St Hilary's day (the 30th of December, O.S.). Veal is the one kind of meat generally consumed. Wine and plum-spirit, or the more powerful brandy distilled from grain, are drunk in great quantities by the townsfolk, more sparingly by countrymen; Rumans generally being more sober than the western Europeans. The ceremonies which accompany a wedding preserve the tradition of marriage by capture; a peasant bride must enter her new home carrying bread and salt, and in parts of Walachia a flower is painted on the outer wall of cottages in which there is a girl old enough to marry. Young men swear eternal brotherhood; girls, eternal sisterhood; and the Church ratifies their choice in a service at which the feet of the pair are chained together. This relationship is morally and legally regarded as not less binding than kinship by birth. The dead are borne to the grave with uncovered faces, and a Rumanian funeral is a scene of much barbaric display. All classes delight in music and dancing. Women hold spinning-parties at which the leader begins a ballad, and each in turn contributes a verse. A number of satirical folk-tales (largely of Turkish origin) are current at the expense of Jew, gipsy or parish priest. The Rumanian folk-songs, sung and often improvised by the villagers, or by a wandering guitar-player (*cobzar*), are of exceptional interest and beauty (see *Literature*, below). The national dances and music closely resemble those of the Southern Slavs (see MONTENEGRO and BULGARIA).

*Constitution.*—In 1866, Prince Charles of Hohenzollern-Sigmaringen was chosen prince of Rumania by a constituent assembly elected under universal suffrage. This body at the same time drew up a constitution, which remains in force, though modified in 1879 and 1884. In 1881, Prince Charles was proclaimed king. As he proved childless, the succession was accepted by his brother, Prince Leopold, on behalf of his son William; and in 1888 William renounced his claim in favour of Ferdinand his younger brother. Thus the monarchy became hereditary in the family of Hohenzollern-Sigmaringen. No woman may ascend the throne; and, in default of a male heir, the representatives of the people can choose a king among the royal families of western Europe.

Parliament consists of a senate, elected for eight years, and

a chamber of deputies, elected for four years. Senators must be forty years old and possess an income of 9400 lei (£376). They are chosen by two colleges of electors; one composed of citizens with an income of £80; the other, of citizens with incomes varying from £32 to £80. The heir-apparent, the two archbishops, the six bishops and the rectors of both universities, sit *ex officio* in the senate. For the chamber of deputies, all citizen taxpayers of full age may vote, being organized for the purpose into three colleges. All persons with an income of £50 vote in the first; all residents in an urban commune who pay taxes amounting to sixteen shillings yearly, with those who have been through the primary course of education, and all members of the liberal professions, retired officers and state pensioners, vote in the second. The third college is formed of the remaining taxpayers. - Those who can read and write vote directly, the rest indirectly. Every fifty indirect electors choose a delegate, who votes along with the direct electors. The naturalization of Jews and Moslems is hedged about by many technical difficulties, and requires a separate vote of the legislature in every individual case. Deputies must be not less than twenty-five years of age. Both senators and deputies receive 20 lei for each day of actual attendance, and travel free on the railways. The king may temporarily veto any measure passed by parliament. Executive power is vested in a council under the presidency of a prime minister, and representing the ministers of foreign affairs; justice; the interior; religion and education; war; finance; agriculture, trade, industry and public domains; and public works. Entire liberty of speech, assembly and the press is guaranteed by the constitution, by which also the titles and privileges of the boiars or nobles were abolished.

For purposes of local government, Rumania is divided into 32 departments, each controlled by a prefect, and subdivided into sub-prefectures and communes. The sub-prefectures (*plăși*) correspond with the French *arrondissements*. Prefects and sub-prefects are appointed by the state, but the chief civic officials are elected. Very heavy *octroi* duties provide the means of municipal administration.

**Law and Justice.**—Until the 17th century justice was administered according to custom and precedent, or, in ecclesiastical cases, by the rules of an ill-defined canon law. The first change was introduced by Matthew Bassaraba, prince of Walachia (1633-54), and by Basil the Wolf, prince of Moldavia (1634-53). Basil drew up a criminal code, on the principle of "an eye for an eye." Thus, a man guilty of arson was burned alive. No idea of equality before the law as yet existed: nobles might only be beheaded or banished. Bassaraba, besides reforming the canon law, issued a similar criminal code, with a number of civil enactments, based on Roman law, and regulating testaments, guardianship, &c. The next great advance began with the Russian protectorate over Rumania (1828-56), when magistrates were made irremovable, and new tribunals created, including a petty court in each rural commune. But nothing was yet done to modify the relative positions of noble and serf. The growth of the present system dates from the union of Moldavia and Walachia in 1859. The main provisions of Rumanian law are drawn from the codes of western powers, especially the *Code Napoléon*. Besides the communal courts there are quarter-sessions, or circuit courts, where simple cases are decided. An appeal from these lies to the departmental courts, which sit in every capital of a department, and in which sessions are held, at stated times, for the trial by jury of serious offences. Any appeal from the departmental courts is brought before the appeal courts of Bucharest, Craiova, Galatz or Jassy; and thence, if necessary, to the supreme tribunal, or court of cassation (*Curtea de Casatie*), which sits in Bucharest.

**Defence.**—At the accession of Prince Charles, the Rumanian army consisted of raw levies, led by adventurers from any country, provided with no uniform, and, in many cases, armed only with pikes or sabres. Under Prince Charles universal and compulsory service was introduced. The present system, in which his reforms culminated, rests upon a law of 1891, modified in 1900 and 1908.

By this law the forces are divided into three sections. The first is composed of men between the ages of 21 and 30, enrolled in the field army and its reserves. Every citizen capable of bearing arms must serve from his 30th to his 36th year in the second section, or territorial militia, which musters in spring for shooting-practice and in the autumn for field manoeuvres. In the militia are included soldiers who have served their time in the ranks, and recruits chosen by lot from the yearly contingent of conscripts but not immediately summoned for duty in the field army. Finally, every citizen between the ages of 36 and 46 belongs to the third section, called the *Gloata* (*Landsturm*), which can only be called upon for

home service in war. In time of peace the field army consists of four complete army corps, with headquarters at Craiova, Bucharest, Jassy and Galatz; besides an independent brigade in the Dobruja, and a separate cavalry division with headquarters at Bucharest. Its peace strength in 1909-10 was 4415 officers, 89,227 non-commissioned officers and men, and 18,920 horses. The infantry was armed with the Mannlicher magazine rifle (model 1893), the cavalry with the Mannlicher carbine, the horse and field artillery with Krupp quick-firing guns. On a war footing the field army would contain 225,000 combatants. It was estimated that the militia should ultimately furnish an additional force of 100,000 men, but up to 1910 this branch of the service was not completely organized. The arrangements for mobilization are otherwise very complete, and the field army is maintained in a high state of efficiency. The war budget for 1909-10 was £2,271,300.

The fortifications designed in 1882 by the Belgian engineer, General Brialmont, and completed at a cost of more than £4,000,000, form the keystone of the national defences. They consist of the Sereth Line, an entrenchment extending over a front of 45 m. from Galatz to Focshani, and intended to cover an army of defence against invaders from the north-east, and of the outworks which make Bucharest the largest fortified camp in the world, except Paris. All these fortifications, including the additional works at Galatz and Focshani, are strongly armed with Krupp and Gruson guns.

The Rumanian navy is divided into two squadrons: one for the Danube, with headquarters at Galatz; one for the Black Sea, with headquarters at Constantza. In 1909-10 the fleet comprised one cruiser, seven gunboats, eight torpedo-boats, six coast-guard vessels, a training-ship, a despatch-boat, a ship for the mining service and numerous vessels for naval police. The state possesses a floating dock and a marine arsenal at Galatz.

**Religion.**—The State Church of Rumania, which is governed by a Holy Synod, professes the Orthodox Oriental creed. Its independence was formally recognized by the oecumenical patriarch of Constantinople, in 1885. The Rumanian Church had claimed its independence from very ancient times, but under the Turkish suzerainty and Phanariote hospodars Greeks were generally elected as bishops, and the influence of the Greek patriarch at Constantinople came to be more and more felt. In 1864 it declared itself independent of all foreign prelates. In 1872 a law was passed by which the bishops were elected by the senate, the chamber of deputies, and the synod, sitting as an assembly (the only other occasion on which provision is made for such an assembly is in the event of the throne becoming vacant without any apparent heir). It was subsequently decided to consecrate the holy oil in Rumania instead of procuring it from Russia or Constantinople; but the Greek patriarch protested. Secret negotiations were entered into which came to a successful issue. The patriarch feared on the one hand that the growing influence of the Russian Church would give a colour of Slavism to the whole church, and that a Russian might eventually be appointed oecumenical patriarch at Constantinople, while the Rumanians hoped by means of the independence of their church to deprive the Russians of all excuse for interfering in their internal affairs under the pretext of religion. The Rumanians, although obtaining complete independence, agreed to recognize the patriarch at Constantinople as the chief dignitary of the Orthodox Church.

The metropolitan archbishop of Bucharest, officially styled metropolitan primate of Rumania, presides over the Holy Synod; the other members being the metropolitan of Jassy (primate of Moldavia), the six bishops of Râmnicul Vâlcea, Roman, Hushi, Buzeu, Curtea de Arges and the Lower Danube (Galatz); together with eight bishops *in partibus*, their coadjutors. Metropolitans and bishops are elected by the senate and deputies, sitting together. In Hungary there are a unite metropolitan and three bishops belonging to the Rumanian church. The secular clergy marry before ordination; and only regular clergy (*calugari*) are eligible for high preferment. Although many convents had been closed and utilized for secular purposes, there were in 1910 no less than 168, including nunneries. The older convents are usually built in places difficult of access and are strongly fortified; for in troublous times they served as refuges for the peasants or rallying-places for demoralized troops. The sequestration of the monastic estates, which in 1864 covered nearly one-third of Rumania, was due to flagrant abuses. Many estates were held by alien foundations, such as the convents of Mount Athos and Jerusalem; while the revenues of many more were spent abroad by the patriarch of Constantinople. Religious liberty is accorded to all churches, Jews, Moslems, Roman Catholics, Protestants, Armenians and Lipovans having their own places of worship.

**Education.**—Primary education is free and compulsory, "where schools are available," for children between seven and eleven years of age. At the close of the 19th century, however, the accommodation was insufficient, the attendance limited in consequence, and the percentage of illiterates high; reaching 88.5% in some of the rural communes. Great improvements were effected between 1900 and 1907, the number of schools increasing from 3643 to 4463, and the pupils from 298,000 to 515,000. The state contributes to the maintenance of elementary schools, for the Vlachs in Macedonia, Bulgaria and Transylvania.

Secondary and higher education are also free. There are gymnasia, or grammar schools of four classes, roughly corresponding with the German sub-gymnasia; and lycæums of eight classes, which answer to the German gymnasia. Up to the fourth class all pupils are taught alike in the lycæums; in the fifth, however, they are divided into a literary or "humanist" section, and a scientific or "realist" section. The four upper classes are taught French and German; English and Italian being added for the "realists," Greek and Latin for the "humanists." Technical instruction is given in the agricultural schools; in various arts and crafts institutes, such as those of Bucharest and Jassy; in the veterinary and engineering colleges of Bucharest; in numerous commercial schools, and in schools of domestic economy for girls. In 1900-10 there were four ecclesiastical seminaries, seven training schools for teachers and eight military schools. The cost of education is largely borne by the communes, as well as by the state. At Bucharest and Jassy there are universities with faculties of law, philosophy, science and medicine and theology.

**Antiquities.**—The history of primitive civilization in Rumania can be traced back to the Neolithic Age; numerous remains of this period have been found at Vodastra in the Romanatzi department. Roman rule left a deep imprint on the country. The following Roman towns have been identified: (1) in the Dobruja, Cius (Hirsova), Troesmis (Igitza), Arubium (Machin), Viodunum (Isakcha), Istrus (Karaharman), Troapeum (Adam Klissi), Kallatis (Mangalia), Tomi (Constanza); (2) in Moldavia, Dinogetia (Tigina); (3) in Walachia, Drobetæ (Turmu Severin), Malva (Celciu), Castra Nova (Craiova), Romula (Resca), Sorium (Roshiori de Vede), Pelendava (Bradesci), Acidava (Jenueshti), Rusidava (Dragasani), Castra Traiana (Râmnicu Vâlcea), Arutela (Bivolari), Pons Vetus (Caineni), Komidava (Petrossa), Ramidava (Buzeu). A great military road encircled the Dobruja hills and skirted the Bulgarian shore of the Danube. It was linked by a ferry at Celciu to two lesser roads; one striking northwards into Transylvania, up the Olt valley, the other bending southwards until it reached the Jiu, and there diverging southwards to Turmu Severin, and northwards to the Vulcan Pass. The plains near the Olt and Jiu estuaries are rich in Roman remains, notably in the towns of Caracal, Grodjidob and Islaz. Ruins and inscriptions may be seen at Resca, a temple at Slaveni, villas and a statue of the emperor Commodus (A. D. 161-92) at Celciu. All these lie within a radius of 60 m. Two ramparts, known as Trajan's wall, can be discerned, one on either side of the railway from Cernavoda to Constanza; and there were bridges over the Danube at Turmu Severin and Turmu Magurele. The *Troapeum Trajani*, or Adam Klissi monument (found near Rasova in the Dobruja and removed to Bucharest museum), is a round stone structure of 100 ft. circumference and 40 ft. high, carved in low relief with scenes representing Trajan's conquest of Dacia. (See G. Tocilescu, *Das Monument von Adam Klissi*, Vienna, 1895.) Few monuments were left by the barbarian invaders who ravaged Rumania from the 3rd century to the 14th save some vestiges of Gothic culture at Buzeu, and at Petrossa, close by. The celebrated treasure of Petrossa (commonly written Petrossa), preserved in Bucharest museum, consists of embossed and jewelled gold plate, and probably dates from the 6th century (see PLATE). Medieval tapestries, with ecclesiastical vestments, ornaments and some fine pieces of early woodwork, are also preserved in Bucharest museum. The attempt to create a national style of architecture, based on Greek and Byzantine models, began under Stephen the Great of Moldavia (1457-1504), lasting until the 17th century, when it was arrested, first by political disorders, and, later, by the commercial development which caused a demand for cheap and rapid building. Its chief accomplishment is the cathedral of Curtea de Argesh (q.v.). Painting and sculpture, like modern Rumanian architecture, are still in their infancy.

**BIBLIOGRAPHY.**—A list of the numerous statistical and other official publications issued at Bucharest in Rumanian or French is given yearly in *Annual statistique al României*. The final results of the census of 1899 were published by the ministry of agriculture in 1905, with introduction by Dr L. Colescu. See also G. J. Lahovari, *Marele dicționar geografic al României* (vols. 1-5, Bucharest, 1899-1902); A. de Gubernatis, *La Roumanie et les Roumains* (Florence, 1898); E. de Martonne, *La Valachie, essai de monographie géographique*; J. Samuelson, *Rumania, Past and Present* (London, 1882); G. Beuger, *Rumania in 1900* (trans. from the German by A. H. Keane (London, 1901)); A. Creanga, *Grundbesitzverteilung und Bauernfrage in Rumänien* (Leipzig, 1907); C. Baicoianu, *Histoire de la politique douanière de la Roumanie de 1870-1903* (2 vols., Bucharest, 1904). (X.)

## HISTORY

(1) **Introduction.**—The earliest record of the lands which constitute the kingdom of Rumania begins with the period immediately preceding their conquest by the Romans.

**Dacia.** For information upon this period, and upon the subsequent centuries of Roman or Byzantine rule, see

**DACIA.** From the 6th to the 12th century, wave after wave of barbarian conquerors, Goths, Tatars, Slavs and others, passed over the country, and, according to one school of historians, almost obliterated its original Daco-Roman population; the modern Vlachs, on this theory, representing a later body of immigrants from Transdanubian territory. According to others, the ancient inhabitants were, at worst, only submerged for a time, and their direct descendants are the Rumans of to-day. Each of these conflicting views is supported by strong evidence; and the whole controversy, too large and too obscure for discussion here, is considered under the heading **VLACHS.**

Towards the close of the 13th century, Walachia and Moldavia were occupied by a mixed population, composed partly of Vlachs, but mainly of Slavs and Tatars; in Great Walachia,<sup>1</sup> also called Muntenia, the Petchenegs and Cumanians predominated. Rumanian historians have striven, by piecing together the stray fragments of evidence which survive, to prove that their Vlach ancestors had not, as sometimes alleged, been reduced to a scattered community of nomadic shepherds, dwelling among the Carpathians as the serfs of their more powerful neighbours. The researches of Hasdeu, Xenopol and other historians tend to show the existence of a highly organized Vlach society in Transylvania, Oltland and certain districts of Hungary and Moldavia; of a settled commonalty, agricultural rather than pastoral; and of a hereditary feudal nobility, bound to pay tribute and render military service to the Hungarian crown, but enjoying many privileges, which were defined by a distinct customary law (*ius valahicum*). Although the characteristic titles of *voivode*, *knez* and *ban* (all implying military as well as civil authority) are of Slavonic origin, and perhaps derived from the practice of the later Bulgarian (or Bulgaro-Vlachian) empire, the growth of Vlach feudal institutions is attributed to German influences, which permeated through Hungarian channels into the Vlach world, and transformed the primitive tribal chiefs into a feudal aristocracy of *boiars* or *boyards*<sup>2</sup> (nobles).

With the 13th century, at latest, begins the authentic political history of the Vlachs in Rumania, but it is not the history of a united people. The two principalities of Walachia and Moldavia developed separately, and each has its separate annals. About the year 1774 it first becomes possible to trace the progress of these Danubian Principalities in a single narrative, owing to the uniform system of administration adopted by the Turkish authorities, and the rapid contemporary growth of a national consciousness among the Vlachs. At last, in 1859, the two principalities were finally united under the name of Rumania. The subjoined history of the country is arranged under the four headings: *Walachia*, *Moldavia*, the *Danubian Principalities* and *Rumania*, in order to emphasize this historical development.

(2) **Walachia.**—Tradition, as embodied in a native chronicle of the 16th century, entitled the *History of the Ruman Land since the arrival of the Rumans (Istoria fiercii Românesce de Fondaciunea sau descălcarea României)*, gives a precise account of the founding of the Walachian state by Radu Negru, or Rudolf the Black (otherwise known as Negru Voda, the Black Prince), voivode of the Rumans of Fogaras in Transylvania, who in 1290 descended with a numerous people into the Transalpine plain and established his capital first at Câmpulung and then at Curtea de Argesh. Radu dies in 1310, and is succeeded by a series of voivodes whose names and dates are duly given; but this early chapter of Walachian history has been rudely handled by critical historians. A considerable body of Vlachs doubtless emigrated from Hungary at this time, and founded in Walachia a principality dependent

<sup>1</sup> i.e. Walachia east of the Olt, not to be confused with the *Μεγάλη Βλαχία* in southern Macedonia (see BALKAN PENINSULA).

<sup>2</sup> In later Rumanian history there arose a class who obtained their rank by merit or favour, and did not necessarily bequeath it to their heirs. But the hereditary aristocracy also survived, and feudalism remained characteristic of Rumanian society up to 1869.

The Vlachs in the 13th century.

Growth of Rumanian nationality.

on the Hungarian crown; but material is lacking for a detailed description of the movement.

In 1330 the voivode John Bassaraba<sup>1</sup> or Bazarab the Great (1310-38) succeeded in inflicting a crushing defeat on his suzerain King Charles I. of Hungary, and for fourteen years Walachia enjoyed complete independence. Louis the Great (1342-82) succeeded for a while in restoring the Hungarian supremacy, but in 1367 the voivode Vlad or Vladislav inflicted another severe defeat on the Hungarians, and succeeded for a time in ousting the Magyar governor of Turnu Severin, and thus incorporating Oltland in his own dominions. Subsequently, in order to retain a hold on the loyalty of the Walachian voivode, the king of Hungary invested him with the title of duke of Fogaras and Omlas, Ruman districts in Transylvania.

Under the voivode Mircea (1386-1418), whose prowess is still celebrated in the national folk-songs, Walachia played for a while a more ambitious part. This prince during the earlier part of his reign sought a counterpoise to Hungarian influence in close alliance with King Ladislaus V. of Poland. He added to his other titles that of "count of Severin, despot of the Dobrudja, and lord of Silistria," and both Vidin and Sistora appear in his possession. A Walachian contingent, apparently Mircea's, aided the Serbian tsar Lazar in his vain endeavour to resist the Turks at Kosovo (1389); later he allied himself with his former enemy Sigismund of Hungary against the Turkish sultan Bayezid I., who inflicted a crushing defeat on the allied armies at Nikopolis in 1396. Bayezid subsequently invaded and laid waste a large part of Walachia, but the voivode succeeded in inflicting considerable loss on the retiring Turks and the capture of Bayezid by Timur in 1402 gave the country a reprieve. In the interecine struggle that followed amongst the sons of Bayezid, Mircea espoused the cause of Musa; but, though he thus obtained for a while considerable influence in the Turkish councils, this policy eventually drew on him the vengeance of the sultan Mahomet I., who succeeded in reducing him to a tributary position.

During the succeeding period the Walachian princes appear alternately as the allies of Hungary or the creatures of the Turk. In the later battle of Kosovo of 1448, between the Hungarians, led by Hunyadi János and the sultan Murad II., the Walachian contingent treacherously surrendered to the Turks; but this did not hinder the victorious sultan from massacring the prisoners and adding to the tribute a yearly contribution of 3000 javelins and 4000 shields. In 1453 Constantinople fell; in 1454 Hunyadi died; and a year later the sultan invaded Walachia to set up Vlad IV. (1455-62), the son of a former voivode. The father of this Vlad had himself been notorious for his ferocity, but his son, during his Turkish sojourn, had improved on his father's example. He was known in Walachia as *Dracul*, or the Devil, and has left a name in history as Vlad the Impaler. The stories of his ferocious savagery exceed belief. He is said to have feasted amongst his impaled victims. When the sultan Mahomet, infuriated at the impalement of his envoy, the pasha of Vidin, who had been charged with Vlad's deposition, invaded Walachia in person with an immense host, he is said to have found at one spot a forest of pales on which were the bodies of men, women and children. The voivode Radu (1462-75) was substituted for this monster by Turkish influence, and constrained to pay a tribute of 12,000 ducats; but Vlad returned to the throne in 1476-77.

The shifting policy of the Walachian princes at this time is well described in a letter of the Hungarian king Matthias Corvinus (1458-90) to Casimir of Poland. "The voivodes," he writes, "of Walachia and Moldavia fawn alternately upon the Turks, the Tatars, the Poles and the Hungarians, that among so many masters their perfidy may remain unpunished." The

<sup>1</sup> A. Sturdza gives a genealogical table, showing that Radu belonged to the great native dynasty of Bassarab (*q.v.*) or Bassaraba, which continued, though not in unbroken succession, to rule in Walachia until 1658, and in Moldavia until 1669.

prevalent laxity of marriage, the frequency of divorce, and the fact that illegitimate children could succeed as well as those born in lawful wedlock, by multiplying the candidates for the voivodeship and preventing any regular system of succession, contributed much to the internal confusion of the country. The elections, though often controlled by the Turkish Divan, were still constitutionally in the hands of the boiars, who were split up into various factions, each with its own pretender to the throne. The princes followed one another in rapid succession, and usually met with violent ends. A large part of the population led a pastoral life, and at the time of Verantius's visit to Walachia in the early part of the 16th century, the towns and villages were built of wood and wattle and daub. *Tirgovishta* alone, at this time the capital of the country, was a considerable town, with two stone castles.

A temporary improvement took place under Neagoe Bassarab (1512-21). Neagoe was a great builder of monasteries; he founded the cathedrals of Curtea de Argesh (*q.v.*) and *Tirgovishta*, and adorned Mount Athos with his pious works. He transferred the direct allegiance of the Walachian Church from the patriarchate of Ochrida in Macedonia to that of Constantinople. On his death, however, the brief period of comparative prosperity which his architectural works attest was tragically interrupted, and it seemed for a time that Walachia was doomed to sink into a Turkish pashalic. The Turkish commander, Mahmud Bey, became treacherously possessed of Neagoe's young son and successor, and, sending him a prisoner to Stambul, proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately, elected Radu, a kinsman of Neagoe, voivode, and succeeded with Hungarian help in defeating Mahmud Bey at Grumatz in 1522. The conflict was prolonged with varying fortunes until in 1524 the dogged opposition of the Walachians triumphed in the sultan's recognition of Radu.

But the battle of Mohacs in 1526 decided the long preponderance of Turkish control. The unfortunate province served as a transit route for Turkish expeditions against Hungary and Transylvania, and was exhausted by continual requisitions. Turkish settlers were gradually making good their footing on Walachian soil, and mosques were rising in the towns and villages. The voivode Alexander, who succeeded in 1591, and like his predecessors had bought his post of the Divan, carried the oppression still further by introducing a janissary guard and farming out his possessions to his Turkish supporters. Meanwhile the Turkish governors on the Bulgarian bank never ceased to ravage the country, and again it seemed as if Walachia must share the fate of the Balkan States and succumb to the direct government of the Ottoman.

In the depth of the national distress the choice of the people fell on Michael, the son of Petrushko, ban of Craiova, the first dignitary of the realm, who had fled to Transylvania to escape Alexander's machinations. Supported at Constantinople by two influential personages, Sigismund Báthory, prince of Transylvania (1581-98 and 1601-2), and the English ambassador, Edward Barton, and aided by a loan of 200,000 florins, Michael succeeded in procuring from the Divan the deposition of his enemy and his own nomination.

The genius of Michael "the Brave" (1593-1601) secured Walachia for a time a place in universal history. The moment for action was favourable. The emperor Rudolph II. had gained some successes over the Turks, and Sigismund Báthory had been driven by Turkish extortions to throw off the allegiance to the sultan. But the first obstacle to be dealt with was the presence of the enemy within the walls. By previous concert with the Moldavian voivode Aaron, on the 13th of November 1594, the Turkish guards and settlers in the two principalities were massacred at a given signal. Michael followed up these "Walachian Vespers" by an actual invasion of Turkish territory, and, aided by Sigismund Báthory, succeeded in carrying by assault Rústchuk, Silistria and other places on the right bank of the lower Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was successfully defeated;

the Tatar khan withdrew with the loss of his bravest followers, and, in the great victory of Mantin on the Danube (1595), the Turkish army was annihilated, and its leader, Mustafa, slain. The sultan now sent Sinan Pasha, "the Renegade," to invade Walachia with 100,000 men. Michael withdrew to the mountains before this overwhelming force, but, being joined by Báthory with a Transylvanian contingent, the voivode resumed the offensive, stormed Bucharest, where Sinan had entrenched a Turkish detachment, and, pursuing the main body of his forces to the Danube, overtook the rearguard and cut it to pieces, capturing enormous booty. Sinan Pasha returned to Constantinople to die, it is said, of vexation, and in 1597, the sultan, weary of a disastrous contest, sent Michael a red flag in token of reconciliation, reinvested him for life in an office of which he had been unable to deprive him, and granted the succession to his son.

In 1599, on the abdication of Sigismund Báthory in Transylvania, Michael, in league with the imperialist forces, and in connivance with the Saxon burghers, attacked and defeated his successor Andreas Báthory near Hermannstadt, and, seizing himself the reins of government, secured his proclamation as prince of Transylvania. The emperor consented to appoint him his viceroy (*locum tenens per Transylvaniam*), and the sultan ratified his election. As prince of Transylvania he summoned diets in 1599 and 1600, and, having expelled the voivode of Moldavia, united under his sceptre three principalities. The partiality that he showed for the Ruman and Sekler parts of the population alienated, however, the Transylvanian Saxons, who preferred the direct government of the emperor. The imperial commissioner General Basta lent his support to the disaffected party, and Michael was driven out of Transylvania by a successful revolt, while a Polish army invaded Walachia from the Moldavian side. Michael's coolness and resource, however, never deserted him. He resolved to appeal to the emperor, rode to Prague, won over Rudolph by his singular address, and, richly supplied with funds, reappeared in Transylvania as imperial governor. In conjunction with Basta he defeated the superior Transylvanian forces at Gorosló, expelling Sigismund Báthory, who had again aspired to the crown, and taking one hundred and fifty flags and forty-five cannon. But at the moment of his returning prosperity Basta, who had quarrelled with him about the supreme command of the imperial forces, procured his murder on the 10th of August 1601. Not only had Michael succeeded in rolling back for a time the tide of Turkish conquest, but for the first and last time in modern history he united what once had been Trajan's Dacia, in its widest extent, and with it the whole Ruman race north of the Danube, under a single sceptre.

Michael's wife Florika and his son Nicholas were carried off into Tatar captivity, and Șerban, of the Bassaraba family, was raised to the voivodeship of Walachia by imperialist influences, while Sigismund resumed the government of Transylvania. On his deposition by the Porte in 1610, there followed a succession of princes who, though still for the most part of Ruman origin, bought their appointment at Stambul. Walachian contingents were continually employed by the Turks in their Polish wars, and the settlement of Greeks in an official or mercantile capacity in the principality provoked grave discontent, which on one occasion took the form of a massacre.

The reign of the voivode Matthias Bassaraba (1633-54) was an interval of comparative prosperity. Matthias repulsed his powerful rival, Basil the Wolf, the voivode of Moldavia and his Tatar and Cossack allies. His last days were embittered, however, by an outbreak of military anarchy. His illegitimate son and successor, Constantine Șerban (1654-58), was the last of the Bassaraba dynasty to rule over Walachia; and on his death the Turkish yoke again weighed heavier on his country. The old capital, Tirgovishte, was considered by the Divan to be too near the Transylvanian frontier, and the voivodes were accordingly compelled to transfer their residence to Bucharest, which was finally made the seat of government in 1698.

The mechanical skill of the Walachians was found useful by the Turks, who employed them as carpenters and pontonniers; and during the siege of Vienna in 1683 the Walachian contingent, which, under the voivode Șerban Cantacuzene, had been forced to co-operate with the Turks, was entrusted with the construction of the two bridges over the Danube above and below Vienna. The Walachian as well as the Moldavian prince, who had been also forced to bring his contingent, maintained a secret system of communication with the besieged, which was continued by Șerban after his return to Walachia. The emperor granted him a diploma creating him count of the empire and recognizing his descent from the imperial house of Cantacuzene, Șerban meanwhile collecting his forces for an open breach with the Porte. His prudence, however, perpetually postponed the occasion, and Walachia enjoyed peace to his death in 1688. This peaceful state of the country gave the voivode leisure to promote its internal culture, and in the year of his death he had the satisfaction of seeing the first part of a Walachian Bible issue from the first printing-press of the country, which he had established at Bucharest. He had also caused to be compiled a history of Walachia, and had called to the country many teachers of the Greek language, whose business it was to instruct the sons of the boiars in grammar, rhetoric and philosophy.

Immediately on Șerban's death the boiars, to prevent the Porte from handing over the office to the Greek adventurer who bid the highest, proceeded to elect his sister's son Constantine Brancovan. The Turkish envoy then in Bucharest was persuaded to invest Brancovan with the *caftan*, or robe of office, in token of Turkish approval, and the patriarch of Constantinople, who was also present, and the archbishop of Walachia, Theodosius, consecrated him together at the high altar of the cathedral, where he took the coronation oath to devote his whole strength to the good of his country and received the boiars' oath of submission. Brancovan, it is true, found it expedient to devote his predecessor's treasure to purchasing the confirmation of his title from the Divan, but the account of his coronation ceremony remains an interesting landmark in the constitutional history of the country. In his relations with the Habsburg power he displayed the same caution as the voivode Șerban. In spite of defeats inflicted on the Turks by the imperial troops at Pozharevats, Nish and Vidin, in 1689, it was only by an exercise of force that they secured winter quarters in Walachia; and though, after the battle of Poltava in 1709, Brancovan concluded a secret treaty with the tsar Peter the Great, he avoided giving open effect to it. The tranquillity which he thus obtained was employed by Brancovan as by his predecessor in furthering the internal well-being of the country, with what success is best apparent from the description of Walachia left by the Florentine Del Chiaro, who visited the country in 1709 and spent seven years there. He describes the stoneless Walachian plain, with its rich pastures, its crops of maize and millet, and woods so symmetrically planted and carefully kept by Brancovan's orders that hiding in them was out of the question. Butter and honey were exported to supply the sultan's kitchen at Stambul; wax and cattle to Venice; and the red and white wine of Walachia, notably that of Pitesci, to Transylvania. The Walachian horses were in demand among the Turks and Poles. Near Ribnik and elsewhere were salt-mines which supplied all the wants of the Transdanubian provinces of Turkey; there were considerable copper mines at Maidan; and iron was worked near Tirgovishte. The gipsy community was bound to bring fifteen pounds weight of gold from the washings of the Argesh. Many of the boiars were wealthy, but the common people were so ground down with taxation that "of their ancient Roman valour only the name remained." To avoid the extortion of their rulers numbers had emigrated to Transylvania and even to the Turkish provinces. The principal Walachian city was Bucharest, containing a population of about 50,000; but, except for two large *kass* or merchants' halls built by Brancovan and his

Șerban Cantacuzene

Constantine Brancovan

Del Chiaro's description of Walachia

predecessor, and the recently erected palace, which had a marble staircase and a fine garden, the houses were of wood. The dress of the men was thoroughly Turkish except for their lamb-skin caps, that of the women half Greek, half Turkish. The houses were scrupulously clean and strewn with sweet herbs. Del Chiaro notices the great imitative capacity of the race, both artistic and mechanical. A Walachian in Venice had copied several of the pictures there with great skill; the copper-plates and wood engravings for the new press were executed by native hands. The Walachians imitated every kind of Turkish and European manufacture; and, though the boiars imported finer glass from Venice and Bohemia, a glass manufactory had been established near Tirgovishta which produced a better quality than the Polish. From the Bucharest press, besides a variety of ecclesiastical books, there were issued in the Ruman tongue a translation of a French work entitled *The Maxims of the Orientals* and *The Romance of Alexander the Great*. In 1700 Brancovan had a map of the country made and a copperplate engraving of it executed at Padua.

The prosperity of Walachia, however, under its "Golden Bey," as Brancovan was known at Stambul, only increased the Turkish exactions; and, although all demands were punctually met, the sultan finally resolved on the removal of his too prosperous vassal. Brancovan was accused of secret correspondence with the emperor, the tsar, the king of Poland and the Venetian republic, of betraying the Porte's secrets, of preferring Tirgovishta to Bucharest as a residence, of acquiring lands and palaces in Transylvania, of keeping agents at Venice and Vienna, in both of which cities he had invested large sums, and of striking gold coins with his effigy.<sup>1</sup> An envoy arrived at Bucharest on the 4th of April 1714, and proclaimed Brancovan *masil*, i.e. deposed. He was conducted to Constantinople and beheaded, together with his four sons. A scion of the rival Cantacuzenian family was elected by the pasha's orders, and he, after exhausting the principality for the benefit of the Divan, was in turn deposed and executed in 1716.

From this period onwards the Porte introduced a new system with regard to its Walachian vassals. The line of national princes ceased. The office of voivode or hospodar was sold to the highest bidder at Stambul, to be farmed out from a purely mercenary point of view. The princes who now succeeded one another in rapid succession were mostly Greeks from the Phanar quarter of Constantinople who had served the palace in the quality of dragoman (interpreter), or held some other court appointment. They were nominated by imperial firman without a shadow of free election, and were deposed and transferred from one principality to another, executed or reappointed, like so many pashas. Like pashas they rarely held their office more than three years, it being the natural policy of the Porte to multiply such lucrative nominations. The same hospodar was often reappointed again and again as he succeeded in raising the sum necessary to buy back his title. Constantine Mavrocordato was in this way hospodar of Walachia at six different times, and paid on one occasion as much as a million lion-dollars (£40,000) for the office. The princes thus imposed on the country were generally men of intelligence and culture. Nicholas Mavrocordato, the first of the series, was himself the author of a Greek work on duties, and maintained at his court Demeter Prokopios of Moschopolis in Macedonia, who wrote a review of Greek literature during the 17th and beginning of the 18th centuries. Constantine Mavrocordato was the author of really liberal reforms. He introduced an *arbarium* or land law, limiting to 24 the days of *angaria*, or forced labour, owed yearly by the peasants to their feudal lord. In 1747 he decreed the abolition of serfdom, but this enactment was not carried

into effect. But the rule of the Phanariotes could not but be productive of grinding oppression, and it was rendered doubly hateful by the swarms of Greek adventurers who accompanied them. Numbers of the peasantry emigrated, and the population rapidly diminished. In 1745 the number of tax-paying families, which a few years before had amounted to 147,000, had sunk to 70,000. Yet the taxes were continually on the increase, and the hospodar Scarlat Ghica (1758-61), though he tried to win some popularity by the removal of Turkish settlers and the abolition of the *wakaril* or tax on cattle and horses, which was peculiarly hateful to the peasantry, raised the total amount of taxation to 25,000,000 lion-dollars, about £1,000,000. The Turks meantime maintained their grip on the country by holding on the Walachian bank of the Danube the fortresses of Giurgevo, Turnu Severin and Orsova, with the surrounding districts.

But the tide of Ottoman dominion was ebbing fast. Already, by the peace of Passarowitz Posharevats in 1718, the banat of Craiova had been ceded to the emperor, though by the peace of Belgrade in 1739 it was recovered by the Porte for its Walachian vassal. In 1760 the Russian general Romanzov occupied the principality, the bishops and clergy took an oath of fidelity to the empress Catherine, and a deputation of boiars followed. The liberties of the country were guaranteed, taxation reformed and in 1772 the negotiations at Fokshani between Russia and the Porte broke down because the empress's representatives insisted on the sultan's recognition of the independence of Walachia and Moldavia under a European guarantee. Turkish rule was, however, definitely restored by the treaty of Kutchuk Kainardji, in 1774; and as from this period onwards Walachian history is closely connected with that of Moldavia, it may be convenient before continuing this review to turn to the earlier history of the sister principality.

(3) *Moldavia*.—According to the native traditional account, as first given by the Moldavian chroniclers of the 16th, 17th and 18th centuries, Dragosh the son of Bogdan, the founder of the Moldavian principality, emigrated with his followers from the Hungarian district of Marmaros in the northern Carpathians. The dates assigned to this event vary from 1299, given by Urechia, to 1342, given by the monastic chronicle of Putna. The story is related with various fabulous accompaniments. From the aurochs (*simbura*), in pursuit of which Dragosh first arrived on the banks of the Moldova, is derived the or-head of the Moldavian national arms, and from his favourite bound who perished in the waters the name of the river. From the Hungarian and Russian sources, which are somewhat more precise, the date of the arrival of Dragosh, who is confused with the historical Bogdan Voda (1349-1365), appears to have been 1349, and his departure from Marmaros was carried out in defiance of his Hungarian suzerain.

These legendary accounts seem to show that the Moldavian voivodate was founded, like that of Walachia, by Vlach immigrants from Hungary, during the first half of the 14th century. Its original strength lay probably in the compact Ruman settlements among the eastern Carpathians, first mentioned by Nicetas of Chonae, about 1164. The Moldavian lowlands were still held by a variety of Tatar tribes, who were only expelled after 1350, by the united efforts of Andrew Laszkovich, voivode of Transylvania, and Bogdan Voda, the first independent prince of Moldavia. Coins bearing the name of Bogdan are still extant; and there is an inscription over his tomb at the monastery of Radautzi, in Bukovina, placed there by Stephen the Great of Moldavia (1457-1504).

In the agreement arrived at between Louis of Hungary and the emperor Charles IV. in 1372, the voivodate of Moldavia was recognized as a dependency of the crown of St Stephen.

The overlordship over the country was, however, contested by the king of Poland, and their rival claims were a continual source of dispute between the two kingdoms. In 1412 a remarkable agreement was arrived at between Sigismund, in his quality of king of Hungary, and King Ladislaus II. of Poland, by which both parties

<sup>1</sup> One of these, with the legend "CONSTANTINVS BASSARABA DE BRANCOVAN D.G. VOEVODAE PRINCEPS VALACHIAE TRANSALPINAЕ," and having on the reverse the crowned shield of Walachia containing a raven holding a cross in its beak between a moon and a star, is engraved by Del Chiaro. They were of 2, 3 and 10 ducats weight.

consented to postpone the question of suzerainty in Moldavia. Should, however, the Turks invade the country, the Polish and Hungarian forces were to unite in expelling them, the voivode was to be deposed, and the Moldavian territories divided between the allies. During the first half of the 15th century Polish influence was preponderant, and it was customary for the voivodes of Moldavia to do homage to the king of Poland at his cities of Kameniec or Snyatin.

In 1456 the voivode Peter, alarmed at the progress of the Turks, who were now dominant in Servia and Walachia, offered the sultan Mahomet II. a yearly tribute of 2000 ducats. On his deposition, however, in 1457 by Stephen, known as "the Great," Moldavia became a power formidable alike to Turk, Pole and Hungarian. Throughout the long reign of this voivode, which lasted forty-six years, from 1458 to 1504, his courage and resources never failed. In the early part of his reign he appears, in agreement with the Turkish sultan and the king of Poland, turning out the Hungarian vassal, the ferocious Vlad, from the Walachian throne, and annexing the coast cities of Kilia and Cetatea Alba or Byelgorod, the Turkish Akkerman. These cities he refused to cede to the sultan, and, about this period, he entered into negotiations with Venice and the shah of Persia, in the vain hope of organizing a world-wide coalition against the Turks. In the autumn of 1474 the sultan Mahomet entered Moldavia at the head of an army estimated by the Polish historian Dlugosz at 120,000 men. The voivode Stephen withdrew into the interior at the approach of this overwhelming host, but on the 17th of January 1475, turned to bay at Rahova (Podul Inalt, near Vaslui) and gained a complete victory over the Turks. Four pashas were among the slain; over a hundred banners fell into the Moldavian hands; and only a few survivors succeeded in reaching the Danube. In 1476 Mahomet again invaded Moldavia, but, though successful in the open field, the Turks were sorely harassed by Stephen's guerilla onslaughts, and, being thinned by pestilence, were again constrained to retire. In 1484 the same tactics proved successful against an invasion of Bayezid II. Three years later a Polish invasion of Moldavia under John Albert with 80,000 men ended in disaster, and shortly afterwards the voivode Stephen, aided by a Turkish and Tatar contingent, laid waste the Polish territories to the upper waters of the Vistula, and succeeded in annexing for a time the Polish province of Pokutia, between the Carpathians and the Dniester.

Exclusive of this temporary acquisition, the Moldavian territory at this period extended from the river Milcovu, which formed the boundary of Walachia, to the Dniester. It included the Carpathian region of Bukovina, literally "the beechwood," where lay Sereth and Suciava (Suczawa), the earliest residences of the voivodes, the maritime district of Budzak (the later Bessarabia), with Kilia, Byelgorod and the left bank of the lower Danube from Galatz to the Sulina mouth. The government, civil and ecclesiastical, was practically the same as that described in the case of Walachia, the officials bearing for the most part Slavonic titles derived from the practice of the Bulgaro-Vlachian tsardom. The church was Orthodox Oriental, and depended from the patriarch of Ochrida. In official documents the language used was Slavonic, the style of a Moldavian ruler being *Nachalnik i Voivoda Moldovlasi*, prince and duke (= Ger. *Fürst* and *Herzog*) of the Moldovlachs. The election of the voivodes, though in the hands of the boiars, was strictly regulated by hereditary principles, and Cantemir describes the extinction of the house of Dragosh in the 16th century as one of the unsettling causes that most contributed to the ruin of the country. The Moldavian army was reckoned 40,000 strong, and the cavalry were especially formidable. Verantius of Sebenico, an eye-witness of the state of Moldavia at the beginning of the 16th century, mentions three towns of the interior provided with stone walls—Suciava, Chotim (Khotin) and Ncamtau; the people were barbarous, but more warlike than the Walachians and more tenacious of their national costume, punishing with death any who adopted the Turkish

In 1504 Stephen the Great died, and was succeeded by his son, Bogdan III. "the One-eyed." At feud with Poland about Pokutia, despairing of efficacious support from hard-pressed Hungary, the new voivode saw no hope of safety except in a dependent alliance with the advancing Ottoman power, which already hemmed Moldavia in on the Walachian and Crimean sides. In 1513 he agreed to pay an annual tribute to the sultan Selim in return for the sultan's guarantee to preserve the national constitution and religion of Moldavia, to which country the Turks now gave the name of Kara Bogdan, from their first vassal. The terms of Moldavian submission were further regulated by a firman signed by the sultan Suleiman at Budapest in 1520 by which the yearly present or *bachshish*, as the tribute was euphoniouly called, was fixed at 4000 ducats, 40 horses and 25 falcons, and the voivode was bound at need to supply the Turkish army with a contingent of 1000 men. The Turks pursued much the same policy as in Walachia. The tribute was gradually increased. A hold was obtained on the country by the occupation of various fortresses on Moldavian soil with the surrounding territory—in 1538 Cetatea Alba, in 1592 Bender, in 1702 Chotina (Khotin). Already by the middle of the 16th century the yoke was so heavy that the voivode Elias (1546-51) became Mahommedan to avoid the sultan's anger.

At this period occurs a curious interlude in Moldavian history. In 1561 the adventurer and impostor Jacob Basilicus succeeded with Hungarian help in turning out the voivode Alexander Lupasheanu (1552-61 and 1563-68) and seizing on the reins of government. A Greek by birth, adopted son of Jacob Heraklides, despot of Paros, Samos and other Aegean islands, acquainted with Greek and Latin literature, and master of most European languages; appearing alternately as a student of astronomy at Wittenberg, whither he had been invited by Count Mansfeld, as a correspondent of Melancthon, and as a writer of historical works which he dedicated to Philip II. of Spain, Basilicus, finding that his Aegean sovereignty was of little practical value beyond the crowning of poet laureates, fixed his roving ambition on a more substantial dominion. He published an astounding pedigree, in which, starting from "Hercules Triptolemus," he wound his way through the royal Servian line to the kinship of Moldavian voivodes, and, having won the emperor Ferdinand to his financial and military support, succeeded, though at the head of only 1600 cavalry, in routing by a bold dash the vastly superior forces of the voivode, and even in purchasing the Turkish confirmation of his usurped title. He assumed the style of *Basileus Moldavias*, and eluded the Turkish stipulation that he should dismiss his foreign guards. In Moldavia he appeared as a moral reformer, endeavouring to put down the prevalent vices of bigamy and divorce. He erected a school, placed it under a German master, and collected children from every part of the country to be maintained and educated at his expense. He also busied himself with the collection of a library. But his taxes—a ducat for each family—were considered heavy; his orthodoxy was suspected, his foreign counsellors detested. In 1563 the people rose, massacred the Hungarian guards, the foreign settlers, and finally Jacob himself.

The expelled voivode Alexander was now restored by the Porte, the schools were destroyed, and the country relapsed into its normal state of barbarism under Bogdan IV. (1568-72). Bogdan's successor, John the Terrible (1572-74), was provoked by the Porte's demand for 120,000 ducats as tribute instead of 60,000 as heretofore to rise against the oppressor; but after gaining three victories he was finally defeated and slain (1574), and the country was left more than ever at the mercy of the Ottoman. Voivodes were now created and deposed in rapid succession by the Divan, but the victories of Michael the Brave in Walachia infused a more independent spirit into the Moldavians. The Moldavian dominion was now disputed by the Transylvanians and Poles, but in 1600 Michael succeeded in annexing it to his "Great Dacia" realm. On Michael's murder the Poles under Zamoyksi again

Moldavia tributary to the Turks.

Jacob Basilicus.

asserted their supremacy, but in 1618 the Porte once more recovered its dominion and set up successively two creatures of its own as voivodes—Gratiani, an Italian who had been court jeweller, and a Greek custom-house official, Alexander.

As in Walachia at a somewhat later date, the Phanariote régime seemed now thoroughly established in Moldavia, and it became the rule that every three years the voivode should procure his confirmation by a large baksheesh, and every year by a smaller one. But Prince Basil the Wolf (Vasilie Lupul), an Albanian, who succeeded in 1634, showed great ability, and for twenty years maintained his position on the Moldavian throne. He introduced several internal reforms, codified the written and unwritten laws of the country, established a printing press, Greek monastic schools, and also a Latin school. He brought the Moldavian Church into more direct relation with the patriarch of Constantinople, but also showed considerable favour to the Latins, allowing them to erect churches at Sutiava, Jassy and Galatz. The last voivode of the Bassaraba family, Elias Voda, reigned from 1667 to 1669.

During the wars between Sobieski, king of Poland (1674-96), and the Turks, Moldavia found itself between hammer and anvil, and suffered terribly from Tatar devastations. The voivode Duka was forced like his Walachian contemporary to supply a contingent for the siege of Vienna in 1683. After Sobieski's death in 1666, the hopes of Moldavia turned to the advancing Muscovite power. In 1711 the voivode

*Demetrius Cantemir.* Demetrius Cantemir, rendered desperate by the Turkish exactions, concluded an agreement with the

tsar Peter the Great by which Moldavia was to become a protected and vassal state of Russia, with the enjoyment of its traditional liberties, the voivodship to be hereditary in the family of Cantemir. On the approach of the Russian army the prince issued a proclamation containing the terms of the Russian protectorate and calling on the boiars and people to aid their Orthodox deliverers. But the long Turkish terrorism had done its work, and at the approach of a Turkish and Tatar host the greater part of the Moldavians deserted their voivode. The Russian campaign was unsuccessful, and all that Peter could offer Cantemir and the boiars who had stood by him was an asylum on Russian soil.

In his Russian exile Cantemir composed in a fair Latin style his *Descriptio Moldaviæ*, the counterpart, so far as Moldavia is concerned, to Del Chiaro's contemporary description of Walachia. The capital of the country was now Jassy, to which city Stephen the Great had transferred his court from Suciava, the earlier residence of the voivodes. It had at this time forty churches—

some of stone, some of wood. Fifty years before it had contained 12,000 houses, but Tatar devastations had reduced it to a third of its former size. The most important commercial emporium was the Danubian port of Galatz, which was frequented by vessels from the whole of the Levant from Trebizond to Barbary. The cargoes which they here took in consisted of Moldavian timber (oak, deal and cornel), grain, butter, honey and wax, salt and nitre. Kilia, at the north mouth of the Danube, was also frequented by trading vessels, including Venetian and Ragusan. Moldavian wine was exported to Poland, Russia, Transylvania, and Hungary; that of Cotnar was in Cantemir's opinion superior to Tokay. The excellence of the Moldavian horses is attested by a Turkish proverb; and annual droves of as many as 40,000 Moldavian oxen were sent across Poland to Danzig. Moldavia proper was divided into the upper country or *T'erra de sus*, and the lower country, or *T'erra de josu*. Bessarabia had been detached from the rest of the principality and placed under the direct control of the military authorities. It was divided into four provinces: that of Budzak, inhabited by the Nogai Tatars; that of Cetatea Alba, the Greek Monkastron, a strongly fortified place; and those of Ismailia and Kilia. The voivodes owed their nomination entirely to the Porte, and the great officers of the realm were appointed at their discretion. These were the

Great Logothete (*Marele Logofetu*) or chancellor; the governor of Lower Moldavia—*Vorniculu de l'erra de josu*; the governor of Upper Moldavia—*Vorniculu de l'erra de sus*; the *Hatman* or commander-in-chief; the high chamberlain—*Marele Postelnicu*; the great *Spathar*, or sword-bearer; the great cup-bearer—*Marele Paharnicu*; and the treasurer, or *Vistiernicu*, who together formed the prince's council and were known as *Boiari de Svatu*. Below these were a number of subordinate officers who acted as their assessors and were known as boiars of the Divan (*Boiari de Divanu*). The high court of justice was formed by the prince, metropolitan and boiars: the *Boiari de Svatu* decided on the verdict; the metropolitan declared the law; and the prince pronounced sentence. The boiars were able to try minor cases in their own residences, but subject to the right of appeal to the prince's tribunal. Of the character of the Moldavian people Cantemir does not give a very favourable account. Their best points were their hospitality and, in Lower Moldavia, their valour. They cared little for letters, and were generally indolent, and their prejudice against mercantile pursuits left the commerce of the country in the hands of Armenians, Jews, Greeks and Turks. The pure-blood Ruman population, noble and plebeian, inhabited the cities and towns or larger villages; the peasantry were mostly of Little Russian and Hungarian race, and were in a servile condition. There was a considerable gipsy population, almost every boiar having several Zingar families in his possession; these were mostly smiths.

From this period onwards the character of the Ottoman domination in Moldavia is in every respect analogous to that of Walachia. The office of voivode or hospodar was farmed out by the Porte to a succession of wealthy Greeks from the Phanar quarter of Constantinople. All formality of election by the boiars was now dispensed with, and the princes received their *caftan* of office at Constantinople, where they were consecrated by the Greek patriarch. The system favoured Turkish extortion in two ways: the presence of the voivode's family connexions at Stambul gave the Porte so many hostages for his obedience; on the other hand the princes themselves could not rely on any support due to family influence in Moldavia itself. They were thus mere puppets of the Divan, and could be deposed and shifted with the same facility as so many pashas—an object of Turkish policy, as each change was a pretext for a new levy of baksheesh. The chief families that shared the office during this period were those of Mavrocordato, Ghica, Callimachi, Ypsilanti and Mursi. Although from the very conditions of their creation they regarded the country as a field for exploitations, they were themselves often men of education and ability, and unquestionably made some praiseworthy attempts to promote the general culture and well-being of their subjects. In this respect, even the Phanariote régime was preferable to mere pasha rule, while it had the further consequence of preserving intact the national form of administration and the historic offices of Moldavia. Gregory Ghica (1774-77), who himself spoke French and Italian, founded a school or "gymnasium" at Jassy, where Greek, Latin and theology were taught in a fashion. He encouraged the settlement of German Protestant colonists in the country, some of whom set up as watchmakers in Jassy, where they were further allowed to build an evangelical church. J. L. Carra, a Swiss who had been tutor to Prince Ghica's children, and who published in 1781 an account of the actual state of the principalities, speaks of some of the boiars as possessing a taste for French literature and even for the works of Voltaire, a tendency actively combated by the patriarch of Constantinople.

The Russo-Turkish War, which ended in the peace of Kutchuk Kainardji (1774), was fatal to the integrity of Moldavian territory. The house of Austria, which had already annexed Galicia in 1772, profited by the situation to arrange with both contending parties for the peaceful cession of Bukovina to the Habsburg monarch. This richly wooded Moldavian province, containing Suciava

(Suczawa), the earliest seat of the voivodes, and Cernantil or Cernovicz, was in 1774 occupied by Habsburg troops with Russian connivance, and in 1777 Baron Thugut procured its formal cession from the sultan.

(4) *The Danubian Principalities: 1774-1859.*—By the treaty of Kutchuk Kainardji Russia consented to hand back the principalities to the sultan, but by Article xvi. *Treaty of Kutchuk* several stipulations were made in favour of the *Walachians* and Moldavians. The people of the principalities were to enjoy all the privileges that they had possessed under Mahomet IV.; they were to be freed from tribute for two years, as some compensation for the ruinous effects of the last war; they were to pay a moderate tribute; the agents of Walachia and Moldavia at Constantinople were to enjoy the rights of national representatives, and the Russian minister at the Porte should on occasion watch over the interests of the principalities. The stipulations of the treaty, though deficient in precision (the Walachians, for instance, had no authentic record of the privileges enjoyed under Mahomet IV.), formed the basis of future liberties in both principalities; but for the moment all reforms were postponed.

The treaty was hardly concluded when it was violated by the Porte, which refused to recognize the right of the Walachian boiars to elect their voivode, and nominated Alexander Ypsilanti, a creature of its own. In 1777 Constantine Murusi was made voivode of Moldavia in the same high-handed fashion. The Divan seemed intent on restoring the old system of government in its entirety, but in 1783 the Russian representative extracted from the sultan a decree (*hattisherif*) defining more precisely the liberties of the principalities and fixing the amount of the annual tribute—for Walachia 619 purses exclusive of various "presents" amounting to 130,000 piasters, and for Moldavia 135 purses and further gifts to the extent of 115,000 piasters. By the peace of Jassy in 1792 the Dniester was recognized as the Russian frontier, and the privileges of the principalities as specified in the *hattisherif* confirmed. In defiance of treaties, however, the Porte continued to change the hospodars almost yearly and to exact extraordinary installation presents. The revolt of Pasvan Oglu in Bulgaria was the cause of great injury to Walachia. The rebels ravaged Little Walachia in 1801-2, and their ravages were succeeded by those of the Turkish troops, who now swarmed over the country. Exaction followed exaction, and in 1802 Russia resolved to assert her treaty rights in favour of the oppressed inhabitants of the principalities. On the accession of Constantine Ypsilanti (1802-6) in Walachia, and of Alexander Murusi (1802-6) in Moldavia, the Porte was constrained to issue a new *hattisherif* by which every prince

*Russian protection.* was to hold his office for at least seven years, unless the Porte satisfied the Russian minister that there were good and sufficient grounds for his deposition. This clause of the *hattisherif* was not enforced. All irregular contributions were to cease, and all citizens, with the exception of the boiars and clergy, were to pay their share of the tribute. The Turkish troops then employed in the principalities were to be paid off, and one year's tribute remitted for the purpose. The boiars were to be responsible for the maintenance of schools, hospitals and roads; they and the prince together for the militia. The number of Turkish merchants resident in the country was limited. Finally, the hospodars were to be amenable to representations made to them by the Russian envoy at Constantinople, to whom was entrusted the task of watching over the Walachian and Moldavian liberties. This, it will be seen, was a veiled Russian protectorate.

In 1804 the Serbs under Karageorge rose against the Turkish dominion, and were secretly aided by the Walachian voivode Ypsilanti. The Porte, instigated by Napoleon's ambassador Sebastiani, resolved on Ypsilanti's deposition, but the hospodar succeeded in escaping to St Petersburg. In the war that now ensued between the Russians and the Turks, the Russians were for a time successful, and even demanded that the Russian territory should extend to the Danube. They occupied the principalities from 1806 to 1812. In 1808 they formed a

governing committee consisting of the metropolitan, another bishop, and four or five boiars under the presidency of General Kusnikov. The seat of the president was at Jassy, and General Engelhart was appointed as vice-president at Bucharest. By the peace of Bucharest, however, in 1812, the principalities were restored to the sultan under the former conditions, with the exception of Bessarabia, which was ceded to the tsar. The Pruth thus became the Russian boundary.

The growing solidarity between the two Ruman principalities received a striking illustration in 1816, when the Walachian and Moldavian hospodars published together a code applicable to both countries, and which had been elaborated by a joint commission. The Greek movement was now beginning to assume a practical shape. About 1780 Riga Velestiniul, a Hellenized Vlach from Macedonia who is also known by the purely Greek name of Rigas Pheoros, had founded in Bucharest a patriotic and revolutionary association known as the Society of Friends (*ἑταῖρια τῶν φίλων*) which gradually attained great influence. In 1810 Ignatius, the metropolitan of Walachia, founded a Greek literary society in Bucharest which soon developed into a political association, and many similar bodies were formed throughout the Greek world, and finally united into one powerful secret society, the Hetairia. Some of the members even cherished the fantastic hope of restoring the ancient Byzantine empire. In 1821 Alexander Ypsilanti, a son of the voivode, and an aide-de-camp of the tsar Alexander I., entered Moldavia at the head of the Hetaerists, and, representing that he had the support of the tsar, prevailed on the hospodar Michael Sutzcu to aid him in invading the Ottoman dominions. To secure Walachian help, Ypsilanti advanced on Bucharest, but the prince, Theodore Vladimirescu, who represented the national Ruman reaction against the Phanariotes, repulsed his overtures with the remark "that his business was not to march against the Turks, but to clear the country of Phanariotes." Vladimirescu was slain by a Greek revolutionary agent, but Ypsilanti rashly continuing his enterprise after he had been repudiated by the Russian emperor, his forces were finally crushed by the Turks at Dragashani, in Walachia, and at Skuleni, in Moldavia; and the result of his revolt was a Turkish occupation of the principalities. In 1822 the Turkish troops, who had committed great excesses, were withdrawn on the combined representations of Russia, Austria and Great Britain. The country, however, was again ravaged by the retiring troops, quarters of Jassy and Bucharest burnt, and the complete evacuation delayed till 1824, when the British government again remonstrated with the Porte (see EASTERN QUESTION; GREECE; YPSILANTI; ALEXANDER).

By the convention of Akkerman between the Russians and the Turks in 1826 the privileges of the principalities were once more confirmed, and they were again ratified in 1829, under Russian guarantee, by the peace of Adrianople. *Peace of Adrianople, 1829.* By this peace all the towns on the left bank of the Danube were restored to the principalities, and the Porte undertook to refrain from fortifying any position on the Walachian side of the river. A Russian army occupied the country until the Porte fulfilled its promises. The principalities were to enjoy commercial freedom, and the right of establishing a quarantine cordon along the Danube or elsewhere. The internal constitution of the countries was to be regulated by an "Organic Law," which was drawn up by assemblies of bishops and boiars at Jassy and Bucharest, acting, however, under Russian control. The Organic Law thus elaborated was by no means of a liberal character, and amongst other abuses maintained the feudal privileges of the boiars. It was ratified by the Porte in 1834, and the Russian army of occupation thereupon withdrew. The newly elected hospodars, Alexander Ghica (1834-42) and George Bibescu (1842-48) in Walachia, and Michael Sturdza (1834-49) in Moldavia, ruled in accordance with the Organic Law. Their reigns were marked by the social, financial and political predominance of Russia, which had steadily increased since 1711. The treaty of 1774 had given Russia a firm foothold in Rumanian politics. This

had been strengthened by the *halls* of 1802; while the treaties of 1812, 1826 and 1829 had respectively yielded up Bessarabia, the Sulina mouth of the Danube and the St George mouth to the tsar. From 1834 to 1848 the Russian consul at Bucharest was all-powerful.

The revolutionary movement of 1848 extended from the Rumanians of Hungary and Transylvania to their kinsmen of the Transalpine regions. Here its real object was the overthrow of Russian influence. In Moldavia the agitation was mostly confined to the boiars, and the hospodar Michael Sturdza succeeded in arresting the ringleaders. In Walachia, however, the outbreak took a more violent form. The people assembled at Bucharest, and demanded a constitution. Prince Bibescu, after setting his signature to the constitution submitted to him, fled to Transylvania, and a provisional government was formed. The Turks, however, urged thereto by Russian diplomacy, crossed the Danube, and a joint Russo-Turkish dictatorship restored the Organic Law. By the Balta-Liman convention of 1849 the two governments agreed to the appointment of Barbü Stirbeü (Stirbey) as prince of Walachia, and Gregory Ghica for Moldavia.

On the entry of the Russian troops into the principalities in 1853, the hospodars fled to Vienna, leaving the government in the hands of their ministers. During the Danubian campaign that now ensued great suffering was inflicted on the inhabitants, but in 1854 the cabinet of Vienna induced the Russians to withdraw. Austrian troops occupied the principalities, and the hospodars returned to their posts. One important consequence of the revolution had been the banishment of many rising politicians to western Europe, where they were brought into contact with a higher type of civilization. The practice initiated by the more liberal Phanariotes of sending Rumanian students to the French, German and Italian universities tended in the same direction. Statesmen such as I. C. Bratianu, D. A. Sturdza, S. I. Ghica, D. Ghica and Lascar Catargiu (whose biographies are given under separate headings) received their political training abroad, and returned to educate their countrymen. To this fact the surprisingly rapid progress of Rumania, as compared with the Balkan States, may very largely be attributed.

By the treaty of Paris in 1856 the principalities with their existing privileges were placed under the collective guarantee of the contracting Powers, while remaining under the suzerainty of the Porte—the Porte on its part engaging to respect the complete independence of their internal administration. A strip of southern Bessarabia was restored to Moldavia, so as to push back the Russian frontier from the Danube mouth. The existing laws and statutes of both principalities were to be revised by a European Commission, sitting at Bucharest, and their work was to be assisted by a Divan or national council which the Porte was to convoke for the purpose in each of the two provinces, and in which all classes of Walachian and Moldavian society were to be represented. The European commission, in arriving at its conclusions, was to take into consideration the opinion expressed by the representative councils; the Powers were to come to terms with the Porte as to the recommendations of the commission; and the final result was to be embodied in a *halls* of the sultan, which was to lay down the definitive organization of the two principalities. In 1857 the commission arrived, and the representative councils of the two peoples were convoked. On their meeting in September they at once proceeded to vote with unanimity the union of the two principalities into a single state under the name of Romania (Rumania), to be governed by a foreign prince elected from one of the reigning dynasties of Europe, and having a single representative assembly. The Powers decided to undo the work of national union. By the convention concluded by the European congress at Paris in 1858, it was decided that the principalities should continue as heretofore to be governed each by its own prince. Walachia and Moldavia were to have separate assemblies, but a central

commission was to be established at Fokhani for the preparation of laws of common interest, which were afterwards to be submitted to the respective assemblies. In accordance with this convention the deputies of Moldavia and Walachia met in separate assemblies at Bucharest and Jassy, but the choice of both fell unanimously on Prince Alexander John Cuza (January 1859).

(A. J. E.; X.)

(5) *Rumania*.—Thus the union of the Rumanian nation was accomplished. A new conference met in Paris to discuss the situation, and in 1861 the election of Prince Cuza was ratified by the Powers and the Porte. The two assemblies and the central commission were preserved till 1862, when a single assembly met at Bucharest and a single ministry was formed for the two countries. The central commission was at the same time abolished, and a council of state charged with preparing bills substituted for it. In May 1864, owing to difficulties between the government and the general assembly, the assembly was dissolved, and a statute was submitted to universal suffrage giving greater authority to the prince, and creating two chambers (of senators and of deputies). The franchise was now extended to all citizens, a cumulative voting power being reserved, however, for property, and the peasantry were emancipated from forced labour. Up to this point the prince had ruled wisely; he had founded the universities of Bucharest and Jassy; his reforms had swept away the last vestiges of feudalism and created a class of peasant freeholders. But the closing years of his reign were marked by an attempt to concentrate all power in his own hands. He strove to realize his democratic ideals by despotic methods. His very reforms alienated the goodwill of all classes; of the nobles, by the abolition of forced labour; of the clergy, by the confiscation of monastic estates; of the masses, by the introduction of a tobacco monopoly and the inevitable collapse of the inflated hopes to which his agrarian reforms had given rise. His own dissolute conduct increased his unpopularity, and at last the leading statesmen in both provinces, who had long believed that the national welfare demanded the election of a foreign prince, conspired to dethrone him. In February 1866 he was compelled to abdicate; and a council of regency was formed under the presidency of Prince Ion Ghica. The count of Flanders, brother to the king of the Belgians, was proclaimed hospodar of the united provinces, but declined the proffered honour.

Meanwhile a conference of the Powers assembled at Paris and decided by a majority of four to three that the new hospodar should be a native of the country. The principalities, however, determined to elect Prince Charles, the second son of Prince Charles Antony of Hohenzollern-Sigmaringen. On a referendum, 685,969 electors voted in his favour, against 224 dissentients. Prince Charles was an officer in the Prussian army, twenty-seven years of age, and was related to the French imperial family as well as to the royal house of Prussia: his nomination obtained not only the tacit consent and approval of his friend and kinsman King William of Prussia, but also the warm and more open support of Napoleon III. The king of Prussia, however, had agreed that the new hospodar should be a native of the principalities, and could not therefore openly approve of Prince Charles's election. Acting on the advice of Bismarck, the prince asked for a short leave of absence, resigned his commission in the Prussian army on crossing the frontier, and hastened down the Danube to Rumania, under a feigned name and with a false passport. On the 20th of May he landed at Turn Severin, where he was enthusiastically welcomed. He reached Bucharest on the 22nd, and on the same day, in the presence of the provisional government, took the oaths to respect the laws of the country and to maintain its rights and the integrity of its territory. In October Prince Charles proceeded to Constantinople and was cordially received by his suzerain, the sultan, who bestowed on him the firman of investiture, admitted the principle of hereditary succession in his family, and allowed him the right of maintaining an army of 30,000

men. Rumania was to remain part of the Ottoman empire within the limits fixed by the capitulations and the treaty of Paris.

The first Rumanian ministry formed under the new prince was composed of the leading statesmen of all political parties,

*Foreign and domestic politics, 1866-76.* care being taken that the two provinces should be equally represented. A new constitution was unanimously passed by the chamber on the 11th of July. It provided for an Upper and Lower House of Representatives, and conferred on the prince the right of an absolute and unconditional veto on all legislation. Other reforms were urgently needed. There was an empty treasury, and the floating debt amounted to £7,000,000; maladministration was rampant in every department of the state; the national guard was mutinous, while the small army of regulars was badly organized and inefficient. The existence of famine and cholera added to the difficulties of the government, and in March 1867 the Lower House, by a majority of three, passed the laconic resolution, "The chamber inflicts a vote of blame on the government." As the result of this vote M. Kretzulescu, a Moderate Conservative, was called to the head of affairs, and I. C. Bratianu entered the government as minister of the interior. The new ministry, of which Bratianu was the leading spirit, showed considerable energy: a concession was granted for the construction of the first Rumanian railway, from Bucharest to Giurgevo, and the reorganization of the army was undertaken. Among other less judicious measures, a decree was passed ostensibly directed against all vagabond foreigners, but really aimed at the Jews, large numbers of whom, including many respected landowners and men of business, were imprisoned, or expelled, from Jassy, Bacau and other parts of Moldavia. This harsh treatment created intense indignation abroad, especially in France and Great Britain; and the emperor Napoleon wrote personally to Prince Charles, protesting against the persecution. The country could not afford to lose the goodwill of the emperor of the French, at that time one of the most powerful factors in Europe—in July 1869 Bratianu, although immensely popular, found it necessary to resign office, and with him fell the rest of the cabinet.

On the 15th of September 1869, Prince Charles married Princess Elizabeth of Wied, afterwards celebrated under her literary name of *Carmen Sylva*.<sup>1</sup> In the same year the army was reorganized, and a rural police created. Every able-bodied citizen was rendered liable to give three days' work yearly towards the construction of roads, or to pay a small tax as an equivalent. An important railway concession, which subsequently caused grave political complications, was granted to the German contractors Strausberg and Offenheim.

Much excitement was aroused in Rumania by the outbreak of the war between Prussia and France. The sympathies of the Rumanians were entirely on the side of the French, whom they regarded as a kindred Latin race, while those of the prince were naturally with his native country. The excitement culminated in a revolutionary outbreak at Ploesci, where a hot-headed deputy, Candianu Popescu, after the mob had stormed the militia barracks, issued a proclamation deposing Prince Charles and appointing General Golescu regent. Owing to the loyalty of the regular army the insurrection was speedily quelled. But the feeling in the country was strong against the German sovereign, who seriously thought of abdicating when a jury acquitted the accused rebels. On the 7th of December he wrote confidentially to the sovereigns whose representatives had signed the treaty of Paris, suggesting that the future of Rumania should be regulated by a European congress.

A few days subsequently the prince learned that the German railway contractor Strausberg was unwilling or unable to pay the coupons of the railway bonds due on the 1st of January 1871, which were mostly held by influential people in Germany. This threw the responsibility of payment on Rumania, and was a severe blow to the prince, through whose instrumentality the loan had been placed. Matters were brought to a crisis by the Prussian government threatening to force the Rumanian government to provide for the unpaid coupons. The country was financially in no condition to comply. Bitter indignation prevailed against everything German, and culminated in an attack on the German colony in Bucharest on the 22nd of March 1871. On the following morning the prince summoned the members of the council of regency of 1866, and informed them of his intention to place the government in their hands. Lascar Catargiu and General Golescu, the only two members present, as well as Dimitrie Sturdza and other influential persons, declined to accept the responsibility. Catargiu offered to unite the different sections of the Conservative party in order to deal with the crisis. The prince accepted his offer. The elections took place early in May 1871, and the government, to which all the most respectable elements in the country had rallied, obtained a large majority. When parliament met in May the prince had a most enthusiastic reception. The anti-German feeling in the country had greatly subsided, in consequence of the crushing defeat of France; and in January 1872 the chambers passed a law by which Rumania undertook to pay the railway coupons. The German syndicate was satisfied, and the railway crisis ended.

Catargiu's ministry was the tenth that had held office in the five years since the prince's arrival, but it was the first one that was stable. In March 1875 the budget for 1876, amounting to £4,000,000, nearly double in amount that of the year 1866, was passed without difficulty, and on the 28th of the month the parliamentary session closed. It was the first occasion in Rumania that the same chamber had sat for the whole constitutional period of four years, and also the first time that the same ministry had opened and closed the same parliament.

Only the fall of the Catargiu ministry saved the country from revolution. The leading Liberals had promoted a conspiracy for the arrest and expulsion of the prince, and the formation of a provisional government under General Dabija. The prospect of a return to power put an end to these machinations. Catargiu's ministry was succeeded by an administration under General Florescu, known as the "cabinet of the generals," and, a month later, by the so-called "ministry of conciliation" under M. Jepureanu. A commission of the chambers drew up an indictment against Catargiu and his late colleagues, accusing them of violating the constitution and the public liberties, squandering the state revenues, and other abuse of power. Unable to stem the tide of popular passion, which was crying for the impeachment of Catargiu, Jepureanu resigned office, and Bratianu formed a new Liberal cabinet, destined to guide the country through many eventful years.

But the re-opening of the Eastern Question was destined to bring to a climax the great struggle of Rumania for existence and independence, and temporarily to throw into the shade all domestic questions. The insurrection in Bulgaria, with its accompanying horrors, followed by the deposition of sultan Murad and the succession of the sultan Abdul Hamid, contributed to indicate the near approach of a Russo-Turkish war. Russia had shown symptoms of anger against Rumania for not having taken up a decided attitude in the approaching struggle, and the Russian ambassador Ignatiev had some months previously threatened that his government would seize Rumania as a pledge as soon as the Turks occupied Servia and Montenegro. Prince Charles decided to send a mission, composed of Bratianu and Colonel Slaniceanu (the minister of war), to the imperial headquarters at Livadia. They were well received by the emperor (October 1876), but in spite of mixed threats and cajoleries on the part of Gorchakov, Ignatiev and others, Bratianu returned without having definitively committed his country to active measures.

On the 14th of November six Russian army corps were mobilized to form the army of the south under the grand duke

Nicholas. A few days later two secret envoys arrived at Bucharest, the one M. de Nelidov, to negotiate on the part of the Russian government for the passage of their army through Rumania, the other Ali Bey, to arrange on behalf of the sultan a combination with Rumania against Russia. Prince Charles cleverly temporized with both powers. Negotiations with Russia were continued, and Bratianu was sent to Constantinople to put pressure upon Turkey to secure certain rights and privileges which would practically have made Rumania independent, except that it would still have paid a fixed tribute; but the conference of the powers assembled at that capital came to a definite end on the 10th of January 1877, when the Turkish government declined every proposal of the conference. Meanwhile the Porte, in issuing Midhat Pasha's famous scheme of reforms, had greatly irritated Rumanian politicians by including their country in the same category as the other privileged provinces, and designating its inhabitants as Ottoman subjects. A secret convention was signed between Russia and Rumania on the 16th of April, by which Rumania allowed free passage to the Russian armies, the tsar engaging in return to maintain its political rights and to protect its integrity, while all matters of detail connected with the passage of the Russian troops were to be regulated by a special treaty. On the 23rd of April Russia declared war against Turkey, and the grand duke Nicholas issued a proclamation to the Rumanian nation, announcing his intention of entering their territory in the hope of finding the same welcome as in former wars. The Rumanian government made a platonic protest against the crossing of the frontier, and the Rumanian troops fell back as the Russians advanced; provisions and stores of all kinds were supplied to the invading army against cash payments in gold, and the railways and telegraphs were freely placed at its disposal. The Rumanian chambers were assembled on the 26th of April, and the convention with Russia was sanctioned. The Ottoman government immediately broke off diplomatic relations with Rumania, and on the 11th of May the chambers passed a resolution that a state of war existed with Turkey. (For a detailed account of the subsequent campaign, in which Prince Charles and the Rumanian army contributed greatly to the success of the Russian arms, see RUSSO-TURKISH WARS, and PLEVNA.) The fall of Plevna left the Russian army free to march on Constantinople, and on the 31st of January 1878 the preliminaries of peace were signed at Adrianople. They stipulated that Rumania should be independent and receive an increase of territory.

Peace between Russia and Turkey was signed at San Stefano on the 3rd of March. On the 29th of January the Rumanian agent at St Petersburg was officially informed of the intention of the Russian government to regain possession of the Rumanian portion of Bessarabia, *i. e.* that portion which was ceded to Moldavia by Russia after the Crimean War. Rumania was to be indemnified at the expense of Turkey by the delta of the Danube and the Dobrudja as far as Constantza. The motive assigned was that this territory had not been ceded to Rumania, but to Moldavia, and had been separated from Russia by the almost obsolete treaty of Paris (1856). But the proposed exchange of territory aroused the most bitter indignation at Bucharest. Bratianu and Cogălniceanu were sent to Berlin to endeavour to prevail on the representatives of the Powers there assembled in June 1878 to veto the cession of Bessarabia to Russia; but the Rumanian delegates were not permitted to attend the sittings of the congress until the Powers had decided in favour of the Russian claim. The treaty of Berlin in dealing with Rumania decided to recognize its independence, subject to two conditions: First (Art. xlv.), that the principality should restore to the emperor of Russia that portion of the Bessarabian territory detached from Russia by the treaty of Paris in 1856, bounded on the west by the mid-channel of the Pruth, and on the south by the mid-channel of the Kilia branch and the Staryi Stambul mouth. Second (Art. xlv.), that absolute freedom of worship should be granted to all persons in Rumania;

that no religious beliefs should be a bar to the enjoyment of any political rights; and, further, that the subjects of all the powers should be treated in Rumania on a footing of perfect equality. Article xlvii. declared that the islands forming the delta of the Danube, the Isle of Serpents, and the province of Dobrudja, as far as a line starting from the east of Silistria and terminating on the Black Sea south of Mangalia, should be added to Rumania. Other articles defined the international position of Rumania, while Article liii. decreed that it should have a representative on the European commission of the Danube. Bratianu wrote with some truth that the Great Powers by sacrificing Rumania were able to obtain more concessions for themselves from Russia, and Lord Beaconsfield was constrained to admit that "in politics ingratitude is often the reward of the greatest services." The Rumanians submitted reluctantly to the retrocession of Bessarabia; and the Dobrudja was occupied by Rumanian troops on the 26th of November 1878.

But Article xlv. of the treaty of Berlin caused tremendous agitation throughout the country, and almost provoked a revolution. Article vii. of the constitution of 1866 laid down that "only Christians can become citizens of Rumania"—in other words, all Jews were excluded from the rights of citizenship; and as no foreigner could own land in Rumania outside the towns, no Jew could become a country proprietor. Public opinion in Rumania rendered it almost impossible for any government to carry out the wishes of the Berlin tribunal. To do so involved a change in the constitution, which could only be effected by a specially elected constituent assembly. This body met on the 3rd of June, and sat through the entire summer. The irritation of the powers at the unexpected delay was so great that Great Britain proposed a collective note on the subject; to be executed by the Austrian cabinet; while Prince Bismarck threatened, if the Berlin proposition were not carried out, to refer to the suzerain power at Constantinople. At last, however, on the 18th of October, Article vii. was repealed, and it thus became possible for Rumanian Jews to become naturalized and to hold land. It was further decided to admit to naturalization the 883 Jewish soldiers who had served in the war; but with all other Jews individual naturalization was required, and this was hedged about by so many difficulties, a special vote of the legislature being required, with a two-thirds majority in each individual case, that although the compromise thus effected was accepted by the powers, the actual result was that, from 1880 to 1884, out of 385 persons who were naturalized in Rumania, only 71 were Rumanian Jews. As the process of naturalization has never been accelerated, the 300,000 Jews said to inhabit Rumania are still regarded as foreigners; and although liable to military service and to the payment of taxes, are unable to own rural land or possess electoral or other civil rights.

Italy was the first of the Powers to notify its recognition of Rumanian independence (December 1879); but Bismarck succeeded in prevailing on the Western Powers not to give official recognition until Rumania should have purchased the railways from their German owners. This unpopular measure caused some delay; but Great Britain, France and Germany formally recognized the independence of the country on the 20th of February 1880. Early in 1881 it was generally felt that the time had arrived for Rumania to be created a kingdom. On the 13th of March the tsar Alexander II. was assassinated, and the Rumanian opposition chose this occasion to accuse the Liberal government of aiming at republican and anti-dynastic ideals. To refute this charge, the ministry proposed the elevation of the Rumanian principality into the kingdom of Rumania. The prince accepted the resolution; within ten days the new kingdom was recognized by all the Great Powers, and the coronation took place at Bucharest on the 22nd of May 1881. The royal crown was constructed of steel made from Turkish cannon captured at Plevna.

*The Berlin settlement. I. Cession of Bessarabia.*

*J. The Jewish question.*

*J. Establishment of the Rumanian Kingdom.*

Rumania was now comparatively, but not entirely, free from fears of serious foreign complications. Austria and Russia alike resented the decision to fortify Bucharest and the Sereth line, adopted by the Rumanian government in 1882. Relations with Russia had remained strained ever since the war. The delimitation of the Dobrudja frontier was still unsettled, and owing to Russian opposition was not finally disposed of till 1884. Expenses incurred during the war led to much controversy, especially when the Russian government claimed the return of £120,000 advanced to enable the Rumanians to mobilize, and considered by them as a free gift. A compromise was made, both parties withdrawing their claims, in April 1882.

Relations with Austria-Hungary were also on a very unpleasant footing. There were two principal subjects of discord—the navigation of the Danube (*q.v.*) and the “national question,” i.e. the status of the Vlach communities outside Rumania, and especially in Transylvania and Macedonia (see VLACHS and MACEDONIA). The Danube question became acute in 1881, 1883 and 1889; the national question is a more permanent source of trouble, affecting Austria-Hungary, Greece, Turkey and Bulgaria. King Charles, who naturally favoured the ally of Germany, and Bratianu, who regarded Russian policy with suspicion, endeavoured to promote a better understanding with Austria-Hungary. But there was a strong anti-German party in the country, especially among the old boiars and the peasantry. Community of creed, ancient traditional influence, the entire absence of Russian merchants, and the consequent avoidance of many small commercial rivalries, contributed to bring about a sort of passive preference for Russia, while the bitter disputes that had occurred with Germany on the question of railway finance had left a very hostile feeling.

In March 1883 the government decided to introduce various important changes into the constitution. Three electoral colleges were formed instead of four; a considerable addition was made to the numbers of the senate and chamber; trial by jury was established for press offences, except those committed against the royal family and the sovereigns of foreign states; these were to be tried by the ordinary tribunals without jury. A bill was passed endowing the crown with state lands, giving an annual rent of £24,000 in addition to the civil list fixed in 1866 at £49,000; another measure granted free passes on the railways and an allowance of £1 daily during the sitting of parliament to all senators and deputies. The revision of the constitution had estranged the two heads of the Liberal party, I. C. Bratianu, who was mainly responsible for the new measures, and C. A. Rosetti, who unsuccessfully advocated reforms of a far more democratic character. These two had been united by a most intimate friendship. One had never acted without the other. Rosetti was said to be the soul whilst Bratianu was the voice of the same personality. Henceforward Bratianu had sole control of the Liberal government. The revising chambers having fulfilled their special mandate, were dissolved in September 1884, and a new parliament assembled in November, the government, as usual, obtaining a large majority in both houses.

Since 1876 Bratianu had exercised an almost dictatorial power, and anything like a powerful parliamentary opposition had ceased to exist. But he had been too long in power; the numerous state departments were exclusively filled with his nominees; and some pecuniary scandals, in which the minister of war and other high officials were implicated, helped to augment his fast-growing unpopularity. New parties were formed in opposition, and the National Liberal and Liberal-Conservative parties combined to attack him. The first of these maintained that the government should be essentially Rumanian, and, while maintaining friendly relations with foreign Powers, should in no wise allow them to interfere with internal affairs. They also advocated reduction of expenditure and the inde-

pendence of the magistracy. The Liberal-Conservatives held generally the same views, but had as their ideal of foreign policy a guaranteed neutrality. Another party which now attracted considerable attention was that of the Junimists, or Young Conservatives. The name was taken from the Junimea, a literary society formed in Jassy in 1874 by P. Carp, T. Rosetti, and Maiorescu, and transformed into a political association in 1881. Their programme for home affairs involved the amelioration of the position of the peasantry and artisan classes, whose progress they considered had been overlooked, the irremovability of the magistracy, and a revision of the communal law in the sense of decentralization. In financial matters they advocated the introduction of a gold standard and the removal of the agio on gold, also the introduction of foreign capital to develop industries in the country; and as regards foreign policy, they were strong advocates of intimate and friendly relations with Austria-Hungary. Elections for a new chamber took place in February 1888, and the whole of the leaders of the opposition were elected, including Dimitrie Bratianu, the premier's brother, and Lascar Catargiu. I. C. Bratianu definitely retired on the 4th of April, after having held the premiership for twelve eventful years. Had he continued much longer in office it is probable that there would have been a revolutionary movement against the dynasty. During the previous parliament a Conservative manifesto, signed by Catargiu, D. Bratianu and other leaders of the opposition, openly threatened that if the ministers were not removed before the general election, the responsibility would be thrown, “not on those who served the crown, but on him who bore it”; and the name of Prince George Bibescu had been openly mentioned as a possible successor.

In the new chamber elected in October 1888 only five members of Bratianu's party retained their seats. The most prominent statesman in the new Conservative-Junimist administration was P. Carp, who in the spring of 1889 succeeded in passing a bill which authorized the distribution of state lands among the peasantry. Despite this admirable measure, he was unable to retain office, and three changes of ministry followed. The Conservative-Junimist parliament nevertheless restored tranquillity to the country. On the 22nd of May 1891, the 25th anniversary of the king's accession was celebrated with great enthusiasm. Meanwhile the gold standard had been introduced (1889), and the financial situation was regarded as satisfactory. In December 1891 a stable cabinet was at last formed by Lascar Catargiu. The new ministry during their four years' tenure of office passed several useful measures through parliament. The state credit was improved by the conversion of the public debt; the sale of the state lands to the peasantry was actively continued; a law was passed making irremovable the judges of the court of appeal and the presidents of tribunals, and other important judicial reforms were carried out; a mining law was passed with the object of introducing foreign capital; and the commercial marine was developed by the formation of a state ocean service of passenger and cargo steamers. Great reforms, which had been unsuccessfully attempted by former governments, were made in the service of public instruction and in the organization of the clergy. In 1893 and 1894 commercial and extradition treaties and a trade-mark convention were made with Great Britain, Austria-Hungary and Germany. Meanwhile the Liberal opposition was being reorganized. On the death of I. C. Bratianu, in 1891, his brother Dimitrie was proclaimed chief of the united Liberal party, but he also died in June 1892, and the veteran statesman Dimitrie Sturdza was recognized as the head of the Liberals. In 1894 he started a very violent agitation in favour of the Rumanians in Hungary. Another popular opposition cry was “Rumania for the Rumanians.” The new mining law, among other concessions, gave foreigners the right to lease lands for long periods for the working of petroleum, and this was denounced by the opposition as being hostile to national interests, and also as being against the spirit of the constitution,

*Revision of the Constitution, 1883-84.*

*The Conservative-Junimist coalition, 1888-88.*

which prohibited foreigners from holding lands. The bill was carried by the government in April 1895, as well as another important measure favouring the construction of local railways by private contractors. The Liberal opposition protested, retired from the chamber, and took no further part in legislative proceedings. The Liberal party had been out of office for eight years, the Conservative-Junimist coalition had practically carried out its complete programme, and legislation was at a deadlock owing to the abstention of the Liberal opposition. As the electorate showed itself in favour of a change of ministry, Catargiu resigned, and a new Liberal government was formed by D. Sturdza.

The advent to power of a statesman who had recently been making such violent attacks on the Hungarian government

caused some anxiety in Austria-Hungary. When once office was obtained, it was to the interest of the new government that the agitation should subside. The official opening by the emperor of Austria of the new channel through the Iron Gates of the Danube, on the 27th of September 1896, was the means of bringing about a great improvement in the relations between the two countries. It led to an exchange of visits between the emperor and King Charles, who also visited the tsar Nicholas II. in August 1898. The visit was the symbol of a reconciliation between the Rumanians and the Russians, the relations between whom had been the reverse of cordial since 1878. As regards home politics, the overwhelming majority of the Liberal party at the elections of 1895, instead of being a source of strength, proved the very reverse. It caused the party to split up into factions—Sturdzists, Aurelianists and Flevists, so called after the names of their respective chiefs. Sturdza himself soon had to retire. The head of the Orthodox Church, the metropolitan Gennadius, had for some years past, as head of the philanthropic establishments founded by the princess Brancovan, desired to obtain the entire management of these wealthy foundations, and had made violent attacks on the two administrators, Prince George Bibescu and Prince Stirbei, both members of the Brancovan family. In the quarrel that ensued the prelate was openly accused of simony, of heresy, and other matters more suitable for a criminal court. After a public trial before the Holy Synod, he was found guilty of certain canonical offences, and sentenced to be deposed. The same night, he was seized by the police, and removed by force to a neighbouring monastery. This harsh treatment of the head of the Church led to an attack on Sturdza. On the 3rd of December 1896, the president of the council, M. Aurelian, was called on to reconstitute a Liberal cabinet, with the principal object of calming public opinion by the settlement of this question. Aurelian then appealed to the patriotic sentiments of the Conservative party to help to solve the difficulty, and with the aid of Lascar Catargiu and Tache Ionescu the following decision was reached: the Holy Synod was to reverse its judgment, and the metropolitan was to be restored to his ecclesiastical rank; but, after holding it for a few days, he was voluntarily to resign and to receive as compensation a handsome pension. Calm was thus restored, but Aurelian and his colleagues were not inclined to hand over their portfolios to Sturdza and his partisans. The struggle terminated in the success of Sturdza, who in April 1897 returned to power and remained president of the council until 1899. Few of the important measures promised in the Liberal programme were passed, one for the reform of public instruction being the most noteworthy. Sturdza's government, which had risen to power mainly on the national question, was also destined to fall on it. A popular agitation was raised on the subject of certain subsidies made by the Rumanians for the support of the Rumanian schools at Kronstadt in Transylvania, and Sturdza was accused of too great subservience to the Hungarian government. The agitation culminated in street riots at Bucharest. On the same evening that Sturdza tendered his resignation to the king (April 1899) the veteran Conservative statesman Lascar Catargiu suddenly died.

The Conservatives, led by G. G. Cantacuzene, returned to

office with an overwhelming majority. They were immediately confronted by an acute economic crisis. The financial position of the country had hitherto on the surface been very satisfactory. The public debt, mostly placed in Germany, amounted to about £51,000,000. The interest had been regularly paid. But the facility with which money had always been borrowed gave rise to great extravagance. Expenses which ought to have been defrayed out of the ordinary budget, such as the erection of magnificent public offices at Bucharest, were frequently defrayed out of the loans; and the custom had arisen when money was scarce of issuing treasury bonds. When the Conservatives came into office they found that the payment of 2½ millions of these bonds would shortly become due, and there were no resources in the treasury to meet them. Owing to the Transvaal War and other causes, the money market was most unfavourable, especially in Germany; and there was an almost entire failure of the harvest. The value of cereals exported in 1898 was about 9 millions sterling, in 1899 only 3½ millions. The government managed to extricate itself from its immediate difficulties in the autumn of 1899, by raising a loan of £7,000,000 in Berlin, but on very stringent terms. Besides paying a much higher rate of interest than heretofore, it bound itself not to contract any further loans until this one was paid. The Conservatives were united in wishing to meet the financial crisis by a moderate reduction of expenditure and a large increase of taxation, while the Liberal opposition advocated the permanent reduction of the annual expenditure of £800,000, which would necessitate the raising of £200,000 only by fresh taxation. The Conservative programme was naturally unpopular; Carp and the Junimists were unwilling to co-operate with the government, and, on the 26th of February 1901, D. Sturdza again became premier.

His administration lasted until the 31st of December 1904, and averted the impending bankruptcy of Rumania by a policy of strict retrenchment. In 1904 Sturdza was able to exceed the proposed limit of annual expenditure, £8,740,000, owing to a great increase in the value of the tobacco monopoly. Even a recurrence of agricultural depression during the same year left the national credit intact. Another financial reform was undertaken by the Conservatives, who returned to power on the 4th of January 1905, with G. G. Cantacuzene as prime minister, and in May floated the conversion loan, already described.

The chief causes of the agrarian insurrection in March 1907 have been outlined above (under *Land Tenure*). But an additional cause was the harsh treatment of the peasants on the state and communal lands leased to Jewish middlemen. At first an attack on the Jews alone, the rising soon became a *jacquerie* directed against all the large landowners. Numerous towns and villages were sacked and partly burned, and 140,000 soldiers were employed to suppress the revolt. On the 24th of March the Cantacuzene ministry resigned and was succeeded by a Liberal government under the leadership of D. Sturdza, who completed the restoration of order by strong military measures and afterwards initiated remedial legislation. He abolished the system by which public lands were leased to middlemen, reduced the land tax on small holdings, and granted new facilities for obtaining credit to the peasants. After a general election in June 1907, Sturdza remained in office with an overwhelming majority. To meet the cost of agrarian reform, and of the reorganization of the army (1908), he introduced various fiscal changes, notably an alteration in the budget system, by which the total revenue and expenditure were shown for the first time (see *Finance*, above).

Rumania was little affected by the political changes in the Balkan Peninsula (1908-10) coincident with the Turkish revolution, the annexation of Bosnia and Herzegovina by the Dual Monarchy, the proclamation of Bulgarian independence and the erection of Montenegro into a kingdom. South of the Danube its chief political interest centred in the Kutzo-Vlach communities in Macedonia, which were the object of a Panhellenic

propaganda most offensive to Rumanian nationalism. An *trade* of the sultan Abdul Hamid had in 1906 recognized the existence of the Kutzio-Vlachs as a religious body (*millet*), forming an integral part of the Rumanian Church. This decision was regarded by the Greeks as a blow to their own interests, and Greek revolutionary bands were accused of persecuting the Kutzio-Vlachs. (See also MACEDONIA.) Even before 1906 there was keen rivalry between Greece and Rumania, and the "Macedonian question" was the underlying cause of the disputes which, arising ostensibly from quite trivial causes, led temporarily to the rupture of diplomatic relations between Greece and Rumania in 1905, 1906 and 1910.

**BIBLIOGRAPHY.**—No scientific history of Rumania was published up to the 20th century, but the task of collecting and editing original documents was partially carried out by the Rumanian Academy and by private students, especially after 1880. The so-called *Chronicle of Hurul* is a modern forgery, and up to the 14th century the only valid authorities are Slavonic, Hungarian and Byzantine chroniclers. Thenceforward a great mass of material is available. It is partly incorporated in the yearly *Annales* of the Academy, 2nd series, from 1880; and in the 30 volumes of E. de Hurmuzaki's *Documente primare relative la istoria Românilor* (Bucharest, 1876, &c.). Other important original documents, or works containing such documents, are Verantius's 16th-century *De situ Transylvaniae, Moldaviae, et Transilvaniae*, in Kovachich's *Scriptores rerum Hungaricarum minores* (Budapest, 1798); G. Urechia's late 16th-century *Chronique de Moldavie*, ed. J. Picot (Paris, 1878); Rumanian text in Old Slavonic characters, with French translation and notes of great value; the 17th-century *Opere complete* of Miron Costiu, ed. V. A. Urechia (Bucharest, 1886); A. M. del Chiaro, *Istoria delle moderne rivoluzioni della Valachia con la descrizione del paese* (Venice, 1878); the early 18th-century *Operele principelui D. Cantemir*, issued by the Academy (Bucharest, 1872, &c.); N. Iorga, *Acte și fragmente cu privire la istoria Românilor* (Bucharest, 1895-97); M. Kogălniceanu, *Cronicele Românilor* (Bucharest, 1872-74); J. L. Carra, *Histoire de Moldavie et de Valachie, avec une dissertation sur l'état actuel de ces deux Provinces* (Jassy, 1777); A. M. Blanc de Lanaute, *Mémoires sur l'état ancien et actuel de la Moldavie, présentés à S.A.S. le prince A. Ypsilanti en 1787* (Bucharest, 1902); D. A. Sturdza, *Acte și documente relative la istoria renașterii Românilor* (Bucharest, 1900, &c.); *ibid.*, *Seriele și cîntările lui I. C. Brătianu* (Bucharest, 1903, &c.). On the Phanariote period see P. Elade, *De l'influence française sur l'Aspire public en Roumanie. Les origines. Étude sur l'état de la société roumaine à l'époque des régnes phanariotes* (Paris, 1898). For a general history of Rumania, see V. A. Urechia, *Istoria Românilor* (Bucharest, 1891, &c., 8 vols.); A. D. Xenopol, *Istoria Românilor din Dacia Traiană* (Jassy, 1888-93, 6 vols.—abridged French edition entitled *Histoire des Roumains*, 2 vols., Paris, 1896); and P. Negulescu, *Histoire du droit et des institutions de la Roumanie* (Paris, 1898, &c.). Sketches of Rumanian history are given in A. Sturdza, *La terre et les races roumaines* (Paris, 1905); and W. Miller, *The Balkans* (London, 1896). For a comprehensive bibliography of Rumanian history, see N. Iorga's introduction to vol. x. of the Hurmuzaki collection; vol. xxii. of the *Annales Bibliografice Românesce* *veche 1908-1830*, by C. Bianu and H. Hodou (Bucharest, 1903, &c.); and D. Onchil, *Originile principatelor române* (Bucharest, 1898). (H. Tr.: X.)

## LANGUAGE

Rumanian<sup>1</sup> is, geographically, an isolated eastern member of the group of Romance languages (*q.v.*), being severed from all the rest by countries in which the predominant speech is Slavonic or Magyar. It represents the original rustic Latin of the Roman provincials in Moesia and Dacia, as modified by centuries of alien rule. Structurally, its Latin characteristics have been well preserved; but its vocabulary has undergone great changes, becoming so far Slavonized that the ratio of words of Slavonic origin to words of Latin origin is approximately as three to two; large numbers of loan-words have also been added from Turkish, Greek, Magyar and other sources. It is noteworthy, however, that where Latin words have survived they are sometimes purer than in the Romance languages of the West.

<sup>1</sup> *i.e.* the so-called Daco-Rumanian, spoken by the vast majority of Rumanians over the whole of Rumania, in Transylvania, Bukovina, the Banat, Bessarabia, and some districts of Serbia and Bulgaria bordering on the Danube. The two most important dialects are the Istro-Rumanian, spoken in part of Istria but rapidly becoming extinct, and the Macedo-Rumanian, spoken by the Kutzio-Vlachs (see VLACHS). The Istro-Rumanian forms, as it were, a link—now completely severed—between the Romance of the Balkans and the Romance of the West. In the Macedo-Rumanian there are no Magyar loan-words, but there is a large Albanian element, and Greek loan-words are more numerous than Slavonic

(*e.g.* Lat. *domina* is better represented by Rum. *domnă*, "lady," than by Ital. *donna*, Span. *doña*, Port. *dona*, Fr. *dame*). Some words indeed—such as *laudare*, to praise, *ducere*, to lead—retain unaltered the forms under which they were used by Virgil and Cicero. A feature of the language which distinguishes it from all other members of the group, and appears to be of even higher antiquity than the word-forms above mentioned, is the retention of a suffix article—*e.g.* *frate*, brother, *fratele*, the brother; *si*, day, *sina*, the day. This usage seems to have survived from the pre-Roman period. A similar suffix article is retained in Albanian, which almost certainly represents the original language of the Thracio-Illyrian tribes (see ALBANIA); and these tribes belonged to the same ethnical and linguistic group as the Daco-Moesians represented by the Vlachs.

Rumanian orthography remained in a transitional state throughout the 19th century. The Latin alphabet is used, with special signs to represent sounds borrowed from Slavonic, &c. All the unaccented vowels except *e* are pronounced as in Italian; *e* has the same phonetic value as in Old Slavonic (=French *é*) and is often similarly preteritized (=ye in yet), notably at the beginning of all words except neologisms. The accented vowels *é* and *ê* are pronounced as *es* and *oes* (*pîtra*, rock; *peatra*; *mîrte*, death; *moarte*); they are written in full, as diphthongs, at the end of a word and sometimes in other positions. The sound of the Slavonic *ѣ* (a guttural *y*) is represented by *ê*, *š* or *đ*, though these letters occur as frequently in words of Latin origin (*e.g.* *clînd*=quando) as in those derived from Slavonic; *ѣ* is represented by *ê* or *î*, having the nasal sound of *sw* in French; *î* and *î* at the end of a word are mute or short. Of the consonants, *c* followed by *e* or *i*=*ch* (as in *church*), otherwise *k*; *q* or *q* resembles the English *j*; *g* is hard before *e* and *î*, otherwise soft; *k* is guttural, as *ch* in *loch*; *j* is pronounced as in French; *r* as in Russian; *z* or *z* (Slav. III) as *sh*; *z* or *z* (Slav. II.) as *ts* or *ts*; *w* is wanting. The remaining consonants have the same phonetic values as in English.

Rumanian is highly inflected. It possesses two regular substantive declensions and six cases, the vocative being in common use. The large class of heterogeneous nouns which are masculine in the singular and feminine in the plural constitute what is sometimes called the neuter declension. There are three regular conjugations, distinguished (as in Latin) according to the termination of the present infinitive in *a*, *e* or *i*; *e.g.* (1) *ara* or *arare*, to plough, (2) *a crede* or *credere*, to believe, (3) *a dormi* or *dormire*, to sleep. Verbs ending in *i*, however, are sometimes classed as a fourth conjugation. The second form of the present infinitive (*arare, credere, dormire*) is used as a noun. The so-called "simple perfect" (*perfectul simplu*) has often the force of an aorist. Compound tenses are formed by the addition of certain particles and of the auxiliary verbs—a *ave*, to have, a *fi*, to be, and a *voi*, to will. For the passive voice, a *fi* is used, with the past participle of the required verb. All tenses of reflexive verbs except the imperative and present participle are formed by prefixing the pronoun which indicates the object to the verb, in the dative or genitive case (abbreviated) as the verb may require; but in the reflexive imperative and present participle the verb precedes the pronoun; *e.g.* *a propune*, to propose, *a și propune*, to propose to oneself, but *propune și*, propose to yourself.

The accentuation of Rumanian, though complex, is governed by certain broad principles, except in the case of neologisms, many of which have been borrowed from French and Italian without change of accent. Nouns retain the accent of the nominative singular in all cases and in both numbers (*e.g.* *copîlă*, girl, vocative plur. *copîlelor*), except when a diminutive or augmentative suffix is added; the accent then shifts to the suffix. The language is very rich in diminutive and augmentative forms; *e.g.* the name *Ion* or *Iohn* (John), has the diminutives *Ionică*, *Ionțică*, *Ionășcă*, *Ianășcă*, *Ienășcă*, &c. In verbs—apart from a few exceptional tenses—the accent falls on the first syllable of the inflectional suffix, *e.g.* *am dormit*, I sleep, but *am dormit*, I had slept. For the sake of euphony, a vowel is frequently interpolated between two consonants; *e.g.* in masculine nouns terminating in a consonant, an interpolated *w* precedes *l* to form the suffix article (*om*, man, *om-ă*, the man).

Weigand, either in book form or in the *Leipzig Jahrbuch der Instituts für rumänische Sprache*, which he edited from its foundation in 1894. (X.)

## LITERATURE

The intellectual development of Rumania has never until modern times been affected by Latin culture, but it has been profoundly influenced first by Slavonic literature, then by the Greek or Byzantine literature, and last, by the Western, notably French and Italian novels. The history of Rumanian literature can be divided into three distinct periods: the Slavonic, from the beginnings of Rumanian literature in the middle of the 16th century down to 1710; the Greek, from 1710-1830, corresponding with the era of Phanariote rule; and the modern period, from 1830 to the present. The change from Slavonic to Rumanian was very gradual. Slavonic had been the language of the Church from the early middle ages, and was therefore hallowed in the eyes of the people and the clergy; through the political connexion with the Slavonic kingdoms of the south, Bulgaria and Servia, it had also been the language of the chancelleries and of the court. Even when the Rumanian language at last supplanted the Slavonic, it did not emancipate itself from the original; the new was merely a translation from the old, and at the beginning it was as literal as possible. We have therefore in the first period a medieval literature transplanted to Rumania and consisting of translations from the Slavonic. The reason of the change from Slavonic into Rumanian is to be sought in the influence the Reformation had among the Rumanian inhabitants of Transylvania.

The second period is marked by a complete waning of Slavonic influence, through the literary activity of the Greek hospodars. The Slavonic kingdoms of the south had lost their independence; they had ceased to produce anything worth having, whilst the Greeks brought with them the old literature from Byzantium and thus drove out the last remnants of Slavonic. They also treated Rumanian as an uncouth and barbarian language, and imposed upon the Church their own Greek language, Greek literature and Greek culture. This literature may be taken to represent the period of the Renaissance in the West; but when the yoke of the Phanariotes was shaken off, the link that connected Rumanian literature with Greek was also broken, and under modern influences began the romantic movement which has dominated Rumanian literature since 1830.

Much of the Rumanian literature of the first two periods has been preserved only in MSS.; few of these have been investigated, and a still smaller number have been compared with their original. The Rumanian Academy keeps jealous watch over the treasures it has accumulated, and few have had access to the riches entombed in its archives; nor has any private or public collection been catalogued. An exhaustive history of Rumanian literature is, for the time being, a pious wish.

*First Period: c. 1550-1710.*—Rumanian literature begins, like all modern European literature, with translations from the Bible. The oldest of these are direct translations from Slavonic texts, following the original word for word, even in its grammatical construction. The first impetus towards the printing of the Rumanian translations came from the princes and judges in Transylvania. It is under their orders and often at their expense that the first Slavonic printing-presses were established in places like Kronstadt (Braşov) Oragia, Sasz-Shebesch and Belgrad (Alba Julia, in Transylvania) where Slavonic and Rumanian books appeared. The foremost printer and translator was a certain Diakonou Korezi, of Greek origin, who had emigrated to Walachia and thence to Transylvania. He was assisted in his work by the "popes" (parish priests) of those places where he worked. The very first

book published in Rumanian is the Gospels printed in Kronstadt between 1560 and 1561. An absolutely identical Slavonic text of the Gospels appeared in the same year, or one year earlier, which no doubt was the original for the Rumanian translation. Following up the list of publications of the books of the Bible in chronological order, we find Diakonou Korezi immediately afterwards; the date has not yet been definitely ascertained—printing *The Acts*. A Rumanian translation of the Acts of the Apostles; in 1577 he printed at Sasz-Shebesch a Psalter in both Slavonic and Rumanian; the Rumanian follows the Slavonic verse for verse. A MS. Psalter more recently discovered shows close affinity to this edition, and, in spite of the opinions held by some critics, must be considered as a copy of it made about 1585; it even reproduces the printer's errors of Korezi's edition. To the 16th century belong also the first attempts to translate the historical books of the Old Testament which appeared in Oragia in 1582, under the title *Palma*. The example thus set could not fail to react upon the Rumanians in Walachia, with whom the Transylvanians stood in close commercial and political connexion. The Slavonic language still reigned supreme in the Church; yet once the example had been set in Transylvania, and the influence of the Slavonic nations had begun to slacken, it was inevitable that the Rumanian language should sooner or later come to its own. It was in Transylvania that the first complete Rumanian translation of the New Testament appeared (Belgrad, 1648). This translation was based upon the Slavonic original, but the text had been verified and corrected, by comparison with a Calvinistic translation, and had been collated with the Greek. The chief author of this translation, which may be termed classical, seems to have been a certain Hieromonach Sylvestre who lived in Walachia and who had undertaken, by order of the prince Bethlen-gabor of Transylvania (1613-20), translation of the whole Bible. Upon this version, no doubt, are based the editions of Iordache Cantacuzene (Bucharest, 1682), and that of Serban Greceanu (1693), in which for the first time the Greek text is printed side by side with the Rumanian; and the edition of Anthon the Iberian (1703). In these may also be traced a few reminiscences of the older version by Korezi, of which a copy, made by Radu Gramatik (1574), and once the property of Peter Cercei, is now in the British Museum. Sylvestre also prepared a new edition of the Psalter as part of his Bible (Belgrad, 1651), verifying the text by reference to the Hebrew and Greek originals. The first edition of the complete Bible was published (1688) by order of Prince Ioan Serban Cantacuzene, by Radu Greceanu, assisted by his brother Serban and by Metrofan the bishop of Buzeu. This may be considered as the supreme monument of Rumanian literature in Walachia in the 17th century. No other Rumanian translation approaches it in style and diction, although the authors, as they own, utilized the older translations, and for the New Testament and the Psalter they utilized Sylvestre's work. At least a hundred years had to pass ere a new edition of the whole Bible was undertaken, nor was the Bible used for private reading, except such passages as were included in the lessons read in church. These were translated independently by Dositheu under the title of *Pirimitia* (Jassy, 1683), and were almost the last work that came from his prolific pen. As far back as 1600 Dositheiu had made a new translation of the Psalter from the Slavonic and printed it in both languages (Jassy, 1680). Upon this translation he based the rhymed Psalter at which he had worked from 1660-73, when it appeared in Uniev. This is the first example of rhymed psalms in Rumanian, the author following the Polish rhymed version of Ian Kohanowski. Albert Molnar had translated a French rhymed Psalter into Hungarian (1607) and this served as the basis for a literal translation made by Ianos Viski (1697). About the same time Theodor Korbes attempted to versify the Psalter and dedicated his work to Peter the Great of Russia. A new translation of the Psalter from Slavonic, with a commentary, the first of its kind, was made in 1697 by Alexander Dasculul (Alexander Preceptor Polonus). All these last-mentioned Psalters are still in MS.

Turning from the Bible to homilies and the liturgy, we find the ancient collections of homilies in Rumania to be due to the same proselytizing movement. Almost the first book printed *Homilies* by Korezi (at the expense of the magistrate of Kronstadt, Foro Milklaus, c. 1570), seems to have been a translation from some Calvinistic compilation of homilies, one for every Sunday in the year. A Slavonic original sent by the metropolitan Serafim of Walachia served as the basis for a second collection of homilies known as *Evangelii învățătoare* (1580). It differs from the former in language and tendency and proves that Korezi was only a translator and printer. The first collection of homilies, henceforth known as *Casacii*, appeared in Dîlgopol, i.e. Clămpulung, in Walachia, in 1642. It was compiled by a certain Melchisedec and contained thirteen homilies. Very voluminous is the next collection, *Evangelii învățătoare Alcaniză*, translated from the Russian by Sylvestre (Govora, 1643). One year later appeared the first book printed in Moldavia, the collection of homilies *Carte românească de învățătoare* (Jassy, 1643). It is a volume of 1000 folio pages, of which the first half is absolutely identical with Sylvestre's collection. A similar unacknowledged loan was made by Meletie the Macedonian, compiler of the homilies which appeared at Deal in 1644. Of special interest

is the next publication of homilies *Chesa infelicitas*, "the Key of understanding," by the Walachian metropolitan Varlaam, translated from the Russian and printed at Bucharest in 1678. This, the first book printed in Bucharest, begins the long series of editions which have issued from the press of the "Mitropolie" in Bucharest. From this press originated also the no less important presses at Buzeu and Râmnicu Vâlcea, where in the following two centuries almost all the books for the Church service were printed. Two or three more collections may be mentioned here—once called *Sciriu de aur*, "the Golden treasury," by Ioan of Vinți (Sass-Shebesh, 1688), probably from some Hungarian Calvinistic collection of obituary sermons; and the "Pearls," *Mărgăritare*, an anthology made from the Greek homilies of St Chrysostom, Epiphanius, Anastasius Sinaita, &c., and translated from the Greek by the brothers Radu and Serban Greceanu. The only collection of original sermons is the *Didaxii* delivered by the metropolitan Anthim the Iberian (*q.v.*), the scholar, artist, translator, printer and great linguist, who was the first to issue books in Arabic and even in Georgian from his printing-presses in Bucharest. The *Didaxii* were published at Bucharest in 1838.

The Rumanian language was not yet introduced into the Church. All the service books were in Slavonic, but during this period most of them were translated, and some of them printed, although the *The Liturgy* not yet officially used. The burial service seems to have been the first to be translated. Two *Eukhologia* appeared during the second half of the 17th century, one by the bishop Dositheu (Jassy, 1679-80), which remained almost unknown, and the other based upon the Slavonic, by Ioan of Vinți (Belgrad, 1689). This *Moldavitic* (prayer-book) has been the basis of all subsequent editions of the Rumanian Prayer-book. The Liturgy proper was also translated by bishop Dositheu in 1679, but a translation from the Greek, by Jeremia Kakavela (Jassy, 1697), was the one adopted in the churches. Passing over the numerous editions of the Akathist and Katavasiar, some partly in Rumanian, we may mention the *Ceasosul* (Book of Hours), said to have been printed for the first time in Transylvania in 1606, but certainly printed or reprinted by the metropolitan Anthim (Tirgovistea, 1715). In 1604 Alexander Dascalu translated, and the bishops Mitrofan of Buseu and Kesarie of Râmnicu Vâlcea printed (among other church books) the twelve volumes of the *Minea* in Slavonic with Rumanian rubrics, and short lives of the saints, as well as the *Triod* and the *Anthologia*.

In addition to the activity of the Reformers in Transylvania, there was also a Roman Catholic propaganda in Rumania, and the Orthodox Church found it necessary to convolve a synod in Jassy for the purpose of formulating anew its own dogmatic standpoint. It was held in 1642 under the presidency of Peter of Mogila, and a formulary of the Orthodox creed was drawn up. An answer to the Lutheran Catechism of Heidelberg (translated into Rumanian and printed at Fogaras in 1648) was also prepared by Bishop Varlaam. R. Greceanu translated the formulary from Greek into Rumanian under the title *Pravoslavnică mărturisire* (Bucharest, 1692). Of a more decided polemical character is the *Lumina* of Maxim of Peloponnesus, translated from the Greek (Bucharest, 1699).

Of far greater interest is the literature of maxims, and lives of saints, real or apocryphal, intended to teach by example. Such are the *Ethical Maxims* the maxims in the *Floarea dărilor*, translated from the Greek (Sneagov, 1700), and going back to the Italian *Fiore de virtù*; the *Învățătură creștinească*, "Christian teachings," of Filoteos (*ibid.*, 1700); the short moral guide, *Cărare pre scurți*, by Ioan of Vinți (Belgrad, 1685), translated from some Hungarian original; the *Mântuirea păcătoșilor*, or "Salvation of sinners," translated from the Greek by a certain Cozma in 1682, which is a storehouse of medieval exempla; and above all the *Mirror of Kings*, ascribed to Prince Neagoe Bassaraba, written originally in Slavonic (or Greek, if the prince be really the author), and translated (*q.v.* 1650) into Rumanian. This exceeds all the other publications of its class in purity of language and excellence of style. Of the lives of saints, the *Prolog*, translated from the Slavonic at the beginning of the 17th century (MS.), and the *Vieșile Sfinților*, by Dositheu (3 vols., Jassy, 1682), are the most important. In the latter, which is his greatest work, Dositheu uses not only Greek texts, but also Slavonic legends and other MS. material; and he includes a goodly number of the apocryphal legends of saints. To this kind of literature belongs also the *Lafsaikon*, *i.e.* the *Historia Lausiaca* of Palladius, differing, however, in some points from the original. The legends of the saints of the Pecherskaya in Kiev were translated by Alexander Dascalu. All these are still in MS.

The first law-books were also compiled during this period. The Slavonic *Nomokanon*, which rests on Greek legislation and embodies the canonical and civil law, had previously been used in Rumania. In 1640 there appeared in Govora the first canonical law-book, which was at the same time the first Rumanian book printed in Walachia. This *Pravilă* (code) was probably the work of the historian Moxa or Moxalie. In 1632 Evstratie the Logofet (logothete) also translated a *Pravilă* from the Greek, which remains in MS. In 1646 appeared the *Pravilă aleasă*, or "Selected Code," compiled, no doubt, by Evstratie and published with the authority of the then reigning Prince Vasile Lupul (Basil the Wolf), hence known as the Code of Vasile. In 1652 there appeared in Bucharest

a complete code of laws, translated from the Greek and Slavonic and adapted to local needs under the direction of the prince of Walachia, Matthias Bassaraba. The *Indreptarea legii*, in which *Pravilă* of Vasile was incorporated without acknowledgment, remained the recognized code almost down to 1866. It embraces the canonical as well as the civil law. The chief authors were Uril Năsturel and Daniil M. Panoneanul.

The earliest historical works are short annals, written originally in Slavonic by monks in the monasteries of Moldavia and Walachia. In 1620 Moxa translated from the Slavonic a short history of the world down to 1498. Two other universal histories were translated from Greek and Slavonic chronographs. One by Pavel Danovici contains the history of the world told in the style of the Byzantine chroniclers; it includes the legend of Troy, the history of Pope Sylvester and the description of the various church councils; and it concludes at the year 1636. The second is the *Hronograf* of Dorotheus of Monembasia, translated by a certain Ion Buburezu. Both are still in MS. The Old Slavonic annals were later on translated and new notes were added, each subsequent writer annexing the work of his predecessor, and prefixing his name to the entire compilation. Ancient Rumanian historiography is thus difficult to unravel. In Moldavia, where the influence of Poland had been great and Western writings were accessible, we find the best chroniclers. The writers are often actors in the dramas which they describe, and often also the victims. A history of Moldavia from the earliest times to 1594 is ascribed to Nestor or to his son, Gregorie Ureche, or to Simion Dascalu. It was continued by the Evstratie mentioned above, and probably also by Missail Călugărul. The most important author whose writings rank as classical is Miron Costin, who either took up the thread where it was left by Simion and Ureche and wrote the history of Moldavia from 1594-1662, or continued the history from where (probably) Evstratie had left it (*c.* 1630-62). Nicolae Costin (*d.* 1715), son of Miron, completed the history at both ends. He starts from the creation and endeavours to fill up the lacuna from 1662 to his own time, 1714. It is doubtful, however, whether the portion from 1662-1701 is his work or whether another compiler had filled up that section. Acscintie Uricariul, 1715, brings to a close the *corpus* of Moldavian Chronicles.

The same uncertainty holds good also for Walachia. The beginnings are the work of an anonymous author, whose chronicle, continued by a certain Constantin Capitanul, describes the history of Walachia from Radu Negru (*i.e.* Rudolph the Black), *c.* 1290-1688. An addition to this Chronicle from the time of the Roman Conquest to Attila is ascribed to Tudosie Vestemianul, twice metropolitan of Walachia (1669-73, 1677-1703). The Chronicle of Capitanul was further continued by Radu Greceanu to 1707, and finally by Radu Popescu to 1720. Two works remain still to be mentioned—a comprehensive history of both principalities by an anonymous author, probably the Spatar Milescu, who finished his eventful life as ambassador of Russia to China (still in MS.), and the *Hronical Moldo-Vlachilor* of Prince Demetrius Cantemir (see CANTEMIR), more an apology for the Roman origin of the Rumanians than a true history. Cantemir wrote the original in Latin and translated it into Rumanian in 1710. His style shows an immense superiority to that of the previous historians. Of poetry there is scarcely a trace during the whole period under review except some rhymed Psalters and a few rhymed dedications to patrons.

**Second Period: 1710-1830.**—The Phanariote period has been described as one of total decay; the political degradation of Rumania was thought to be reflected in its spiritual life. But the facts do not warrant this opinion. The few who had taken the trouble to study Rumanian literature paid not the slightest attention to the vast MS. material accumulated during the years of the Phanariote dominion, and out of sheer ignorance and political bias condemned this period as sterile. Another influence was far more potent than the conduct of the Greek princes, though some of them were real benefactors of the people. In Transylvania one section of the Rumanian population had accepted the spiritual *Influence of Roman Catholicism* rule of the pope; they became now Greek-Catholic, instead of Greek Orthodox. Rome took good care to educate the priesthood far above the status of the Orthodox priests, and continued an extensive proselytizing activity. So long as the Rumanians were spiritually united with the other Orthodox nations, and so long as they used the Slavonic or Cyrillic alphabet, they would practically be cut off from the Latin West. If, however, they could be induced to discard the old Slavonic alphabet and substitute for it the Latin, and could be brought to recognize their national and ethnical unity with ancient Rome, it was hoped that then they would be more easily induced to enter into the unity of faith. Thus a great change was wrought towards the end of the 18th and in the

first half of the 19th century in the whole current of Rumanian literature. It suited the promoters of that movement to pretend that they started a new era. But the Latin or Transylvanian movement wrought great havoc in Rumanian literature and caused the greatest confusion in the language. Only now are some authors beginning to free themselves from the evil influence.

By the end of the 17th century Rumanian had become the authorized language of the Church, and the Rumanian translation of the Gospels (printed 1693) had become the Authorized Version. Most of the liturgical books officially adopted and revised in this period are still used for church services. Such are the *Coisalion*, revised by Bishop Kliment of Râmnicu Vâlcea (1745), the *Eshologion* (1764), the *Katavasiar* (1753). The monumental publication of the *Mineii*, in 12 folio volumes, by Bishops Kesarie and Filaret of Râmnicu Vâlcea (1776-80), is equal in importance if it be not superior to the no less monumental publication of the *Lines of Saints*, also in 12 huge folio volumes, published under the direction and with the assistance of the metropolitan Veniamin of Moldavia. The latter was translated from the Russian, appeared in Neamtzu (1809-12), and was reprinted in Bucharest (1835-36). In beauty, richness and lucidity of language, and in dignity of style, these two books resemble the Bible of 1688.

Slavonic having entirely disappeared from the sources of literature, writers and translators turned to Greek originals and for more than a century were busy translating into Rumanian the most important works of the older Fathers of the Church. Some of these translations were printed much later; thus the *Hexameron* of Basil the Great (and of Epiphanius) translated in the middle of the 18th century, was printed at Bucharest in 1827. The *Scala Coeli* of Joh. Klimakus, the homilies of Cyril of Alexandria, and those of Ephraem the Syrian, were printed at Neamtzu in 1818. The *Panoplia* of Euthymius Zygabenus (1775) and the *Commentary* of Theophylact were printed by Veniamin (Jassy, 1805). The homilies of Theodor Studites (MS. of 1712) were edited by Bishop Filaret and published at Râmnicu Vâlcea in 1784; a translation of Gregory of Nazianzus appeared at Bucharest in 1727. The great polemical work of Simson of Thessalonica, the Greek original of which was published by Dosithieu (Jassy, 1683), had been translated into Rumanian long before it was printed (Buzarest, 1756). The *Leitania* mentioned above, was printed at Bucharest in 1754. All these translations are written in good Rumanian. One can see how a language not originally suited for abstract problems and theological dialectics was slowly but surely improved and made capable of expressing profound and subtle ideas.

In Transylvania, with the conversion to Greek-Catholicism of Bishop Athanasius in 1701, the Greek Orthodox had to place themselves down to 1850 under the protection of the Servian metropolitan of Karlovatz. No writer of any consequence arose among them. The "United" fared better, and many a gifted young Rumanian was sent to Rome and helped from Vienna to obtain a serious education and occasionally also temporal promotion. With a view probably to counteract the literary activity in Rumania, the bishops P. P. Aaron and Ioan Bobb were indefatigable in the translation of Latin writers. First and foremost a new translation of the whole Bible was undertaken by Samuel Klain. It appeared in Blazh (1793-95). It falls short of the older version of 1688; it was modernized in its language, and no doubt a careful examination would reveal differences in the translation of those passages in which the Catholic tradition differs from the Eastern. Bobb translated Thomas à Kempis's *Imitatio Christi* (Blazh, 1812); he wrote a *Theologiche morală* (*ibid.*, 1801) and adapted the Rumanian service-books to the new order of things. Popular catechisms and various histories of the Church were then written. Mention may be made of a few more moral treatises such as the *Ușa pociniei*, "Gate of Penitence" (Kronstadt, 1812); *Oginda omului din dunturu*, "The Mirror of the Inner Man"; or *Pilde filosofesti*, "Philosophical Saws and Maxims" (Irgovsiaheta, 1715). Of greater importance was the collection of fables with their "moral" translated and modified from the Servian of Obrenovich—*Fabule moralicești*, by Tzikindeal (Budapest, 1814). These are heavy and follow the original too literally. Tzikindeal (d. 1818) and his contemporaries in Hungary had lost contact with the Rumanian literature in Walachia and Moldavia, and the same was the case with the other writers of their school. Radovici or Dinu din Golești, an enlightened Walachian boyar, who was one of the first Rumanians to describe a journey in Western Europe, is also the author of a collection of maxims and parables, *Aduinare de pilde bisericești și filosofesti* (Budapest, 1824); he left a larger collection in MS. partly edited by Zane in his *Proverbele Românilor*, vols. xi.-xvi.

After 1727 Rumanian was recognized as the language of the law-courts, and through the annexation of Bukovina by Austria (1774) and of Bessarabia by Russia (1812), codes for the civil and political administration of those provinces were drawn up in Rumanian, either in accordance with the established law of the land or in consonance with the laws of Austria and Russia.

Such legal codes reflect the German or Russian original. They were however, of importance as they served as models (to some extent) for the new legislative code compiled in Moldavia under Prince Calimach; this was originally published in Greek (1816), and afterwards translated into Rumanian with the assistance of G. Aschi (Jassy, 1833). The Walachian civil laws and local usages were collected and arranged under the direction of Prince Ypsilanti (1780) in Greek and Rumanian; and under Prince Caragea another code was published (1817), which remained in force until 1832, when the "Organic Law" changed the whole trend of legislation. One more collection, an abstract from the Greek *Basilica*, published by Donici (Jassy, 1814), must be mentioned, for through it the legal terminology of the modern codes was more or less fixed.

The last and probably the best writer of Rumanian history in the Phanariote period is Neculcea. He wrote a history of Moldavia to his own time, but for the period before 1684 his work is more or less an abstract from other writers. The original part covers the period from 1684-1743, and is to some extent an autobiography of a very adventurous life. Neculcea adds to his chronicle a collection of historical legends, many of them still found in the ballads of Moldavia. Among other historians might be mentioned N. Roset, the continuator of Neculcea. Enaki (Iancu) Cogălniceanu wrote a history of the period 1730-1774, and followed the example of Greek writers by introducing rhymes into it. He was also the author of some political satires and other poems on G. Ghica, M. Bogdan and Ioan Cuza. The historians of the time under pressure of political exigencies did not scruple to invent treaties between the Porte and the Rumanian principalities. A series of such spurious collections of treaties were submitted to the Powers for ratification; in them imaginary rights and privileges alleged to have been granted by the Turks were described, and the Rumanian representatives asked that after the peace negotiations of 1774 they should be sanctioned afresh. In Walachia there was not a single historian of importance in the first half of the 18th century. In the second we have the chronicle of Dionisie Eclesiaru (1764-1815), a simple-minded and uncritical writer who describes contemporary events. The ancestor of a great family of poets and writers, I. Văcărescu described the history of the Ottoman empire from the beginning to 1791, interpolating doggerel verses. Alexander Bekidman describes in a rhymed epic, *Eternă* (1821), the first battles between the Greeks and the Turks in Moldavia. It is a bitter satire upon the Greeks. Similar in tendency is another rhymed chronicle known under the name of *Zilote* (c. 1825).

While a political and national revival was taking place in Moldavia and Walachia, towards the beginning of the 19th century, the Latin movement went on in Transylvania. There ethical and religious tendencies got the upper hand. Three historians had been partly educated in Rome under the protection of Prince Borgia and the influence of the Jesuit Minorito and the College of the Propaganda: they were Samuel Klain, Petru Maior and George Sincal. To Klain's initiative can be traced most of the work of the three. Unfortunately his writings, with a few exceptions, are still in MS. He is the author of the first history of the Rumanians in Dacia written according to the standards of Western science. It seems to have described the wars between the Romans and the Dacians, and to have been continued down to 1795; a history of the Rumanian Church also formed part of the book. P. Maior published an almost identical history (Budapest, 1812), and it is probable that he had made use of Klain's composition. In both the tendency is the same—to trace the modern Rumanians directly from the ancient Romans and to prove their continuity in these countries from the time of Trajan to this day. Political and religious aims were combined in this new theory. A conflict was raging between the Hungarian and Rumanians, and history was required to furnish proofs of the greater antiquity of the Rumanians in Transylvania. George Sincal (1753-1816), who was an intimate friend of Klain and collaborated in most of his works, succeeded him as revisor at the printing office in Budapest. Sincal worked for nearly forty years at his monumental *History of Rumania*, which the Hungarian censor did not allow to be printed on account of its nationalist and anti-Magyar tendencies. It remained until 1853-54, when it was printed at the expense of Prince Gr. Ghica. The edition of 1886 is only a reprint, though both the original MS. and a better copy had meanwhile been discovered.

These books had no immediate influence in Walachia and Moldavia, where fiction and the drama had developed under the influence, first, of Greek and then to an increasing extent of French, Italian and German models. It was towards the end of the 18th century that Rumanian literature began to emancipate itself, very slowly of course, and to start on a career of its own in poetry and *belles lettres*. Curiously enough, the first novel to be translated was the "Ethiopic History" of Bishop Heliodorus. The *Odyssey* and *Iliad* were then translated into prose, and the *Arabian Nights*, after undergoing an extraordinary change in Italian and modern Greek, appear in Rumanian literature at the middle of the 18th century under the name of *Habases*. The Glykiis, a Greek printing firm in Venice, published many popular books in Rumanian which found their way into the principalities. The epic of Vincenzo Cornaro was translated into prose alternating

with verse, first under the name of *Eroticri* and then slightly changed as *Filaret și Amica*. Anton Pann printed it as his own composition. *Kritik și Andreișcu* (Jassy, 1794) is almost the last novel or story translated direct from the Greek. The young men of Walachia had come into contact with Western literature, which they were anxious to transplant to their own country. Some had been sent to Paris for their education, such as Poteca, Marcovici, the Voinescu, Moroiu and others, who developed an almost feverish activity in translation. Most of the writings of Florian, Marmontel, Le Sage, Montesquieu and others were rapidly translated into Rumanian. The picaresque novel *Lasarillo de Tormes* also found its translator, and appeared in 1839, *Paul and Virginia* in 1831. Campe's German *Robinson Crusoe* (1816) and his *Discovery of America* were translated by Draghici (1835). G. Asaki and Alexander Beldiman in Moldavia developed a similar activity. Beldiman copied a number of ancient chronicles, wrote a satire on the Greeks, and translated and adapted a number of French tragedies and dramas, in verse and prose.

Nowhere has the theatre played a more important rôle in the history of civilization than in Walachia and Moldavia, more in the former than in the latter. It formed the rallying-ground for the new generation which chafed under the tyranny of a

**The Drama.** Greek court. A certain Aristia, of Greek origin, but soon acclimatized to his surroundings as teacher at the high school in Bucharest, was the first to adapt foreign dramas for the Rumanian stage. These were first performed in Greek and afterwards translated into Rumanian. The plays produced on the Rumanian stage included most of the dramas of Molière, some of Corneille, Kotzebue and Metastasio, whose *Achille in Sciro* was the first drama translated into Rumanian (by Iordache Săteanu, printed at Sibiu in 1797). Schiller was also translated, and a few plays of Shakespeare (*Hamlet*, &c.) from a French version. Victor Hugo's *Angelo* and *Maria Tudor* were translated by Constantin Negrușiu. Those who kept in touch with the old literature—men such as Beldiman, Marcovici and Negrușiu—were able even in their metrical translations to do justice to the originals and at the same time not to distort the character of the Rumanian language. Among such translators was Skavinichi, who came originally from Transylvania to Jassy, and translated Regnald's *Demetrius* into verse.

The lyrical and epic poetry of the time follows somewhat the same lines, but with certain notable differences. The individuality of the authors is more marked, and they advance much

**Poetry.** sooner from translations to independent poetry. Transylvania, which awoke to a new life towards the end of the 18th century, produced some of the most popular poets. Among them were Vasile Aaron (1770-1822) and Ion Barak (1770-1848). Aaron wrote the *Passion*, in 10,000 verses (1802; often reprinted); the lyrical romances of *Paras și Tăbe* (1808) and *Sofronim și Hărăș* (1821); and the humorous *Lesenț și Dorofala*, a satire on his drunken husband, now a chapbook. Barak wrote *Răstăpina Ierusalimului* (1821), "The Destruction of Jerusalem," almost as long as Aaron's *Passion*; and he versified a Magyar folksong, *Argșir și Elena*, which has also become a chapbook, and has been interpreted as a political poem with a hidden meaning. He also translated the *Arabian Nights* from the German. In Walachia a certain Ion Budai Deleanu, a man of great learning, author of a hitherto unpublished Rumanian dictionary of great value, wrote a satirical epos in which gipsies play the chief part. It is called *Țigănașia* (1812) and consists of 12 songs and of many thousand verses. The author displays a profound knowledge of the life and the customs of the gipsies, and of Western literature from the *Batrachomyomachia* to the *Pucelle* of Voltaire.

The love-songs of the time are primitive imitations of the Neo-Greek lyric dithyrambs and rhapsodies, which through the teaching of the princes of Walachia were considered as the fountainhead of poetical inspiration. But a closer acquaintance with the West led to greater independence in poetical composition. In the three generations of the Vacarescu one can follow this process of rapid evolution. Ianache Vacarescu, author of the first native Rumanian grammar on independent lines, was also the first who tried his hand at poetry, following Greek examples. He then studied Italian, French and German poetry, and made translations from Voltaire and Goethe. His son Alecu (b. 1795) followed his example. Both were overshadowed by the grandson Ionă (b. 1818), who was more than any other man both the representative of an epoch fast vanishing and the harbinger of the new spirit that was stirring young Rumania. The collected poems of I. Vacarescu were published in 1848; but among them were some of the poems of Ianache and Alecu, which were confused with his own work. In this volume, *Colectiie din poezie domnului mare logofet I. Vacarescu*, there are odes, hymns, patriotic poems, ballads, lyrical and didactic poems, some of them among the most beautiful in the language. A contemporary of his earlier period, Paris Mumuleanu (1794-1837), wrote his *Rost de poezie* (1820) under Greek influence, but afterwards passed under the spell of Maier and Tzinkindia, whose Latin propaganda he was one of the first to advocate in Rumania. In his *Caractere* (Bucharest, 1828) Latin forms are common. One more poet, and a real one, is Vasile Cărlova (1809-1831), whose *Ruins of Țigovishte* sufficed to place him among the foremost Rumanian poets of the 19th century.

In Moldavia a similar development took place, translations leading up to independent production. The most prominent figure is that of the scholar and linguist Constantin Konaki (1777-1849), who might be termed the Rumanian Longfellow for the facility and felicity of his translations from Western poetry and for his short poems, easily set to music and very popular. His *Aldănișii și idilmeștii* appeared in 1858. Constantin Negrușiu, who was at first influenced by the Russian poets, notably Pushkin, successfully translated poems of Victor Hugo, and rivalled Konaki in his dexterity and fidelity to the original.

**Third Period: 1830-**—The agitation for the transliteration of the alphabet, the elimination of all non-Latin words from the language and the ostracism of the old literature, completely crippled all literary activity, first in Transylvania and then in Rumania. The Latin movement was first brought into Walachia by a certain George Lazar from across the mountains. Lazar was appointed teacher at the St Sava school of Bucharest, where he spread the new doctrine of the Latin origin of the Rumanians; Latinizing tendencies were, however, not yet imported into the language. Of his pupils there was one whose influence became decisive: Ion Eliade (*Heliade*), afterwards also known as I. E. Radulescu (1802-1879), a man of immense activity, of great power of initiative and of still greater imagination. He it was who ushered in the new epoch, and for close upon forty years he stood at the head of almost every literary undertaking.

There were two periods in his life—the latter the exact opposite and negation of the former. Up to 1848 he was closely connected with politics, the theatre and the school—he was the successor to Lazar; he wrote grammars, and the introductions to his grammars are models of lucidity, combined with a wide historical view. He was the founder of the first political and literary review, and he had a genius for discovering talent, and the merit of assisting it. Through his reviews he trained the middle-class to read and to take an active interest in literary problems. Through his *Curier de ambe sexe* (1837-41) he disseminated translations from political and other works, thus paving the way for the political change of 1848. About this time he turned to philology, and fell under the spell of the Transylvanian school. Slowly he developed his theories about language and writing, and he ended as a fanatic wedded to extraordinary views. He was a prolific writer and translator of dramas and novels from French and Italian, the latter appearing mostly in periodical. The number of his publications is legion.

All the prominent Rumanians of that period were politicians; they strove to obtain the emancipation of the country from Turkish dominion, and later on, the union of Walachia and Moldavia. Everything was placed at the service of this national aspiration, which is the keynote of the poems of Bolintineanu (1826-1873). He also was discovered by Radulescu, who published his first and best known poem, "The Dying Virgin." In 1848 he was exiled, together with the other leaders of the revolution, and he spent the next nine years in travels in the East. There he gathered the materials for his lyrical poems "Macdonele" and "Florile Bosforului?" Returning in 1857 to Walachia, he occupied high administrative posts, and he wrote a number of historical novels (*Trăian*, *Mircea*, *Sieșan*, &c.), dramas (*Lăpșăneanu*, *Mihnea*, *Mihail*, &c.), longer poems (*Sorin*, *Conrad*), and his politico-philosophical novel *Elena*. These mostly patriotic compositions were as a rule less felicitous than his political satires (*Nemesis*, *Menade*, &c.). His peculiar strength lay in the historical ballad, which he was the first to introduce into Rumanian poetry, and in the vivid portraiture of Oriental scenery and emotions. He died in a lunatic asylum forgotten by all, and even his writings have, save in one early edition, not been published without unwarranted alterations by the editor Sion.

A contemporary of Bolintineanu was Grigorie Alexandrescu (1812-1885), also a pupil of Eliade. Imperfect in his rhyme and rhythm, his poetry is of a didactical nature, and his best poems are rhymed fables, many of which are thinly disguised political satires. He also translated the *Aisire andreașca* (1834) and *Atropie* (1847) of Voltaire. Among his contemporaries may be mentioned G. Crețeanu (1829-1887) and A. Săhleanu (1834-1857), who left some weak poems of a sentimental and patriotic character. A Deparațianu (1835-1865), whose language shows traces of the new Latinizing school; and Nicolae Nicolaeanu (1833-1871), whose powerful poems, full of deep and often mystical reflections, lead on from Alexandrescu to Eminescu, all three being the poets of pessimism. In Teodor Serbănescu (b. 1839) we find the reflex of Bolintineanu of the earlier period, in the beauty and simplicity of his lyrical poems—not yet published in complete form. Like Serbănescu, Vasile Alecsandri (1821-1890), the greatest of Rumanian lyrical poets (see ALECSANDRI), was a Moldavian. In France, under the influence of Béranger and the romantic school, he was led to turn to popular

poetry for inspiration. He collected Rumanian popular songs and ballads (*Doine*, 1844) (*Lăcrămiore*, 1853). In *Pasteluri* (1867) he introduced admirable pictures of popular life into Rumanian poetry. In *Legende* (1871) and *Ostași noștri* (1877) he strikes the patriotic note. His fame rests on his lyrical poetry alone, which retains some of the charm of popular poetry. Alecsandri is less successful in his dramas, most of which are adaptations from French originals; the only merit of his novels is that amidst the phonetic and philological turmoil he kept to the purer language of the people.

From Alecsandri there is a natural transition to his great rival, who was also his superior in depth of thought and in mastery of form and language, the great poet of pessimism, Mihail Eminescu (g.s.). Mention may also be made of Matilde Cugler Poni (b. 1853), who published some admirable short poems in the Rumanian reviews (*Poesii*, 1888). Veronica Miclo (1853-1886) belongs to the same circle of gifted Moldavian women (*Poesii*, 1887). But all these men or women disappear with the appearance of Eminescu, who, like Bolintineanu, started a new school of poetry and left a deep and governing influence upon the new generation. His best follower, though possessing originality of his own, is A. Vlahuță (b. 1850). G. Cosbuc, who has risen more recently to fame, is the poet of the unfortunate Rumanian peasant, emancipated only in name and on paper, and a prey to greedy landowners and to a medieval administration. The poets of this school drew their inspiration from popular poetry, and all of them were sons of the lower middle class or of peasants, who by dint of heavy work and great hardship were able to rise above the narrow social conditions in which they were born.

Somewhat different has been the development of the Rumanian prose writers. They suffered in consequence of the philological confusion brought about by Eliade and his assistants, mostly men who after 1848 immigrated from Transylvania and brought with them their own prejudices and narrow intolerance. Too great influence was accorded to them, and the result was that for a long time scarcely a single Rumanian novelist or historian can be mentioned. It was only after N. Bălcescu had undertaken the edition of the ancient Walachian chronicles, and had found in them admirable prose writers, that he ventured on a continuous history (1851-52) of the Rumanians under Michael the Brave, written not as a dialectic treatise but as a poem in prose—full of colour and of energy. A. Odobescu, the friend and literary executor of Bălcescu, was a consummate scholar of ancient and medieval antiquities, and wrote a history of ancient art. His *Pseudonymetikos* is an unsurpassed model of elegant writing and of fine irony. What Alecsandri was for verse, Odobescu was for prose. He also created the Rumanian historical novel, by his *Mihnea Vodă* (1858) and *Doamna Kijaia* (1860). The first novel describing human nature in everyday life is the *Ciocoi vechi și noi* (1863) of Nicolae Filimon (1819-1865). In Moldavia where the knowledge of the old chroniclers had not entirely died out and disturbing philological influences were not so acutely felt, we find the vigorous writings of Mihail Coghăniceanu—one of the leading spirits of the 19th century, the greatest mind and the real founder of Rumania. Coghăniceanu published various reviews, some of a political, others of a more literary character, such as the *Dacia literară* (1840) and *Arhiva românească* (1845-46); he has also the great merit of having published for the first time a collection of the Moldavian chronicles. G. Asaki (1788-1871), a second Eliade, helped to inaugurate a literary reform in Moldavia; but the result was disappointing, until the literary society known as the Junimea was started, in the 'seventies, by Titu Maiorescu (b. 1839), who was then a professor at Jassy. Titu Maiorescu put a stop to the prevailing Latinism, and turned the current of Rumanian literature into a more healthy channel, by the publication of his *Critice* (1874).

Ioan Ghica, a contemporary of the revolutionaries of 1848, gathered his recollections of those agitated times into two volumes. *Amintiri* (1890) and *Scrisori către V. Alecsandri* (1887), which besides their historical value have become a model of Rumanian prose. Among writers of fiction three names stand out prominently: Ion Slavici (b. 1848) describes the life of the people, notably of the Transylvanian peasants, in short stories, *Nuvela din popor*. Barbu Ștefănescu de la Vrancea (b. 1858) also wrote short popular stories characterized by a wealth of imagery and richness of language; but the characters are all mostly unreal and exaggerated. The best known collections are *Sădănică* (1885) and *Trădătură* (1887). Ioan Caragiali (b. 1852), the most popular Rumanian dramatist of modern times, who has brought on the stage living types of the lower and middle classes, and has skillfully portrayed the effect of modern veneer on old customs, is also the author of the powerful short novel *Fația de păște*. Dobrogeanu Gherea (b. 1853) has in his *Studii critice* (1890 sqq.) been a ruthless but none the less judicious critic.

Curiously enough, there is not a single novel in the Rumanian literature with a sustained plot; none which presents a study of the development of human character amid the multifarious vicissitudes of life. The reason for this deficiency is perhaps the unsettled conditions of Rumanian life, and the lack of a profound and long-established civilization; or it may be found in the unstable and

fickle character of the people. Whichever the cause may be, while Rumanian poetry could well compare with that of any Western nation, in the domain of prose writing, and of novels in particular, one must look to the future to fill up the gap now existing.

There existed in Rumania another set of literary monuments at least as old as any of the books hitherto enumerated, but which appealed to a wider circle. Rumanian folk-literature contains both popular written books and oral songs, ballads, &c. It is advisable to group the material in three sections: (1) the romantic and secular literature; (2) the religious literature;—both of these being written—and (3) the modern collections of ballads, songs, tales, &c.

Popular  
Literature  
Folklore,  
Ballads,  
Tales.

To the first belong the oldest books, such as the *History of Alexander the Great*, which was known in Rumania in the 17th century. It rests mostly upon a Sloveno-Greek text and is of the utmost interest for the study of this cycle of legends. The first printed copy appeared in 1794, and has been reprinted in innumerable editions. Next comes the legend of Constantine, of his town and his exploits—a remarkable collection of purely Byzantine legends. In addition to these there is the history of St. Sylvester and the conversion of Constantine, &c., all still in MS. The *History of Barlaam and Ioasaf* (see BARLAAM AND JOSAPHAT) may also be mentioned here, for it appealed to the people not so much for its religious interest as for the romantic career of the hero. The parables and apologues contained in the legend were incorporated into the *Teachings of Prince Neagoe*, and were also circulated separately; they are found in many old MSS. Udriște (Uriil) Năsturel translated the *History* from the Slavonic in 1640. One of its episodes, the farewell song of the prince departing into the forest, has since become one of the most widespread popular songs. Of similar oriental origin is the *Dream of Amer*, the interpretation of which goes back to the *Panchatantra*, and must have reached Rumania early in the 18th century, probably in Slavonic. The history of *Symon and the Seven Masters* has also become a popular book. It was translated from the Greek version. To the same cycle of oriental tales belong the *Halime*, already described, which G. Gorjeanu printed (3 vols., 1835-37) as his own work. The *History of Arkir and Anadom*, printed by Anton Pann from older MSS., is the now famous Old Testament apocrypha of Akyrios the Wise, mentioned in Tobit and found in many languages. In Rumanian it rests on an older Greek-Slavonic text, and owes its great popularity to the wise and witty proverbs it contains. "Eaop," whose wonderful biography (by Planudes) agrees in many points with Arkir, has also become one of the Rumanian popular books. The history of *Bertoldo*, which, though of Italian origin, reached Rumania through a Greek translation, belongs to the same cycle of rustic wisdom and cunning, and is the last representative of an old series of legends clustering round the figures of Solomon and Ashmodai, or Solomon and Markolp. These books are of course anonymous, most of them being translations and adaptations. One man, however, stands out prominently in this section of romantic and secular folk-literature. This was Anton Pann, who was born in 1797 at Slivden, of Bulgarian parentage, and died at Bucharest in 1854. Carried away by the Russians in his early youth, he settled in Rumania, learned Church music, and became one of its best exponents, married four times, had an adventurous life, but lived among the people for whom he wrote and composed his tunes. In about twenty years he published no less than fifty books, all of them still popular. Besides his edition of the Rumanian Church service-books with musical notation, he published a series of tales, proverbs and songs either from older texts or from oral information; and he made the first collection of popular songs, *Spitalul amoroșilor*, "The Hospital of Love" (1850-53), with tunes either composed by himself or obtained from the gipsy musicians who alone performed them. Of his numerous writings two or three are of the greatest interest to folklore. His *Poesiile torbii* (first ed. 1 vol., 1847; 2nd ed. 3 vols., 1851-53) is a large collection of proverbs ingeniously connected with one another and leading up to or starting from a popular tale exemplifying the proverb. The *Fabule și istorioare* (2 vols., 1839-41) is a collection of short popular stories in rhyme. *Seztoarea la țară* (1852-53) is a description of the Rumanian *Spinnstube*, for which the peasants gather in one of their houses on a winter's night, the girls and women spinning and working, the young men telling tales, proverbs, riddles, singing songs, &c. Pann also collected the jokes of the Turkish jester, Nasreddin, under the title of *Năsdădăniile lui Nasratin Hoșar* (1853), also in rhyme. He also published a collection of Christmas carols, set to music by himself; these are still sung by boys on Christmas night.

Far larger than the secular is the religious popular literature; it comprises many apocryphal tales from the Old and the New Testaments and not a few of the heretical tales circulated by the various sects of Asia Minor and Thracia, which percolated into Rumania through the medium of Slavonic. A brief enumeration of the

chief tales must suffice. Only a few of them have hitherto been published. They exist in numerous MSS, which testify to their great popularity: in the popular songs one finds many traces of their influence upon the people's imagination. They include the *History of Adam and Eve*, the *Legend of the Cross*, the *Apocalypse of Abraham*, the *History of the Sibil*, the *Legends of Solomon*; numerous New Testament apocryphal tales, starting with legends of St John the Baptist; a very remarkable version of the *Gospel of Nicodemus*; and the *Epistle of Pilate*. Printed in tens of thousands of copies are certain apocalyptic legends dealing with eschatological problems. The ancient *Apocalypse of Peter* appears here under the name of Paul, then there is an *Apocalypse of the Virgin Mary*, like Peter, is carried by the Archangel through the torments of Hell and the bliss of Paradise, and through whose intervention sufferers are granted pardon on certain days of the year. Combined with these is the *Sunday Epistle*, sent from Heaven, enjoining strict observance, not only of Sunday, but also of Friday and Wednesday, as holy days. Most of these texts date in their Rumanian form from the 16th and 17th centuries; the *Sunday Epistle* is well known in connexion with the Flagellants. In the same pamphlet as the *Sunday Epistle* was published the legend of St Sisoë and sometimes that of Avestiza,—the former saved the children of his sister from the attacks of the devil, who had devoured them and had to restore them alive; the latter is the female child-stealing demon, who is prevented by an angel from carrying out her evil design. In both cases the repetition of the legend and the recitation of a string of mystical names serve, like some other tales, apocryphal and otherwise, as amulets, sufficient to protect from the devil. Upon the recitation of some of these texts rest many popular charms and incantations. Therein lies the importance of this written literature, for it gives us the clue to much that now lives in the mouths of the people, and is by some considered to be of immemorial antiquity. A number of apocryphal calendars and prognostics are among the best known and most widely circulated popular books, and the lives of St Alexius, Xenophon, &c. have become chapbooks.

The whole of this popular literature belongs to what may be called the cycle of the Balkan nations, in every one of which exact parallels are to be found. Not that there was any direct, deliberate borrowing by one nation from the other, but all of them seem to have stood for a long time under identical psychological influences and to have developed on similar lines. The superstitions of one are often found to be those of the others, and in such a form that they could not have been taken over independently from a third source; they show too much family likeness. Thus also the popular songs of Rumania, the "doine," the "hora," the "cântec," "colinde," "legende," i.e. the love songs, the heroic ballads, legends, songs at the ring-dance, hymns and carols, though instinct with a charm of their own, find their counterparts in many a song, ballad, &c. of the Balkan nations. The heroes are often the same: Serbs, Bulgars and Rumanians sing the heroic deeds of Baba Novak and recite the legend of the Monastery of Argeș, or the ballad of Iorgovan, found in the Malorussian Byliny. One of the first to collect these treasures of Rumanian poetry was V. Alecsandri (1837-1866) who, however, retained only their poetical beauty and did not reproduce them with that strict accuracy which modern study of folklore demands. A. M. Marienescu collected those of Transylvania (1859); S. F. Marian, those of the Bukovina (1873); T. T. Burada, those of the Dobrujia (1880); but the most complete collection is that of G. Dem. Teodorescu, *Poesii populare române* (Bucharest, 1885). The collection of fairy tales started later than that of the ballads. The first collection is the German translation of tales heard by the Brothers Schott (1845). The most important collections, now deservedly considered as classical from every point of view, are the successive publications of P. Ispirescu. The collected tales of the Moldavian Ion Creanga (1837-89) appeared in his *Opere complete* (1908). Excellent collections are those of D. Stancescu, *Basme* (1885-1893). I. G. Sbierea, *Basme* (1886), *Frâncu și Candrea* (1888). Kutzio-Vlach tales and folklore will be found in G. Weigand, *Die Aromunen*, vol. ii. The only review devoted to the study of folklore is the *Săptămână*, founded in 1892.

In recent times a kind of stagnation seems to have overtaken Rumania, and although attempts have been made to place the intellectual life of the nation on a sounder basis, the work of transition from the past to the present has hitherto absorbed more energy than appears necessary. Whatever the causes may have been, the fact remains, that now there is a great dearth of talent and great poverty in output.

Șăineanu, *Autorii români moderni* (Bucharest, 1891). (M. G.)

**RUMELIA**, or **ROUMELIA** (Turkish *Rumîli*, "the land of the Romans," i.e. the East Roman or Byzantine empire), a name commonly used, from the 15th century onwards, to denote that part of the Balkan Peninsula which was subject to Turkey.

More precisely it was the country bounded N. by Bulgaria, W. by Albania and S. by the Morea, or in other words the ancient provinces, including Constantinople and Salonica, of Thrace and Macedonia. The name was ultimately applied more especially to a province composed of central Albania and western Macedonia, having Monastir for its chief town. Owing to administrative changes effected between 1870 and 1875, the name ceased to correspond with any political division. Eastern Rumelia was constituted an autonomous province of the Turkish empire by the Berlin treaty of 1878; but on the 18th of September 1885, after a bloodless revolution, it was united with Bulgaria (q.v.).

**RUMFORD, BENJAMIN THOMPSON, COUNT** (1753-1814), British-American man of science, philanthropist and administrator, was born at Woburn, in Massachusetts, on the 26th of March 1753. The Thompson family had been settled in New England since the middle of the previous century, and belonged to the class of moderately wealthy farmers. His father died while he was very young, and his mother speedily married a second time. But he seems to have been well cared for, and he was at the age of fourteen sufficiently advanced "in algebra, geometry, astronomy, and even the higher mathematics," to calculate a solar eclipse within four seconds of accuracy. In 1766 he was apprenticed to a storekeeper at Salem, in New England, and while in that employment occupied himself in chemical and mechanical experiments, as well as in engraving, in which he attained to some proficiency. The outbreak of the American War put a stop to the trade of his master, and he thereupon left Salem and went to Boston, where he engaged himself as assistant in another store. He was at that period between seventeen and eighteen years old, and at nineteen, he says, "I married, or rather I was married." His wife was the widow of Colonel Benjamin Rolfe, and the daughter of Timothy Walker, "a highly respectable minister, and one of the first settlers at Rumford," now called Concord, in New Hampshire. His wife was possessed of considerable property, and was his senior by fourteen years.

This marriage was the foundation of his success. Soon after it he became acquainted with Governor Wentworth of New Hampshire, who conferred on him the majority of a local regiment of militia. He speedily became the object of distrust among the friends of the American cause, and it was considered prudent that he should seek an early opportunity of leaving the country. On the evacuation of Boston by the royal troops, therefore, in 1776, he was selected by Governor Wentworth to carry despatches to England. On his arrival in London Lord George Germain, secretary of state, appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years he was made under-secretary of state. His official duties, however, did not interfere with the prosecution of scientific pursuits, and in 1779 he was elected a fellow of the Royal Society. Among the subjects to which he especially directed his attention were the explosive force of gunpowder, the construction of firearms, and a system of signalling at sea. In connexion with the last, he made a cruise in the Channel fleet, on board the "Victory," as a volunteer under the command of Admiral Sir Charles Hardy. On the resignation of Lord North's administration, of which Lord George Germain was one of the least popular members, he left the civil service, and was nominated to a cavalry command in the revolted provinces of America. But the War of Independence was practically at an end, and in 1783 he finally quitted active service, with the rank and half-pay of a lieutenant-colonel. He now formed the design of joining the Austrian army, for the purpose of campaigning against the Turks, and so crossed over from Dover to Calais with Gibbon, who, writing to his friend Lord Sheffield, calls his fellow-passenger "Mr Secretary-Colonel-Admiral-Philosopher Thompson." At Strassburg he was introduced to Prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that state. Having obtained the leave of the British

government to accept the prince's offer, he received the honour of knighthood from George III., and during eleven years he remained at Munich as minister of war, minister of police, and grand chamberlain to the elector. His political and courtly employments, however, did not absorb all his time, and he contributed during his stay in Bavaria a number of papers to the *Philosophical Transactions*. But that he was sufficiently alert as the principal adviser of the elector the results of his labours in that capacity amply prove. He reorganized the Bavarian army; he immensely improved the condition of the industrial classes throughout the country by providing them with work and instructing them in the practice of domestic economy; and he did much to suppress mendicancy. The multitude of beggars in Bavaria had long been a public nuisance and danger. In one day he caused no fewer than 2600 of these outcasts and depredaters in Munich and its suburbs alone to be arrested by military patrols, and transferred by them to an industrial establishment which he had prepared for their reception. In this institution they were both housed and fed, and they not only supported themselves by their labours but earned a surplus for the benefit of the electoral revenues. The principle on which their treatment proceeded is stated by him in the following memorable words: "To make vicious and abandoned people happy," he says, "it has generally been supposed necessary first to make them virtuous. But why not reverse this order? Why not make them first happy, and then virtuous?"

In 1791 he was created a count of the Holy Roman Empire, and chose his title of Rumford from the name as it then was of the American township to which his wife's family belonged. In 1795 he visited England, one incident of his journey being the loss of all his private papers, including the materials for an autobiography, which were contained in a box stolen from off his postchaise in St Paul's Churchyard. During his residence in London he applied himself to the discovery of methods for curing smoky chimneys and the contrivance of improvements in the construction of fireplaces. But he was quickly recalled to Bavaria, Munich being threatened at once by an Austrian and a French army. The elector fled from his capital, and it was entirely owing to Rumford that a hostile occupation of the city was prevented. It was now proposed that he should be accredited as Bavarian ambassador in London; but the circumstance that he was a British subject presented an insurmountable obstacle. He, however, again came to England, and remained there in a private station for several years.

In 1798 he presented to the Royal Society his "Enquiry concerning the Source of Heat which is excited by Friction," in which he combated the current view that heat was a material substance, and regarded it as a mode of motion. In 1799 he, in conjunction with Sir Joseph Banks, projected the establishment of the Royal Institution. It received its charter of incorporation from George III. in 1800, and Rumford himself selected Sir Humphry Davy as scientific lecturer there. Until 1804 he lived at the Royal Institution in Albemarle Street, London, or at a house which he rented at Brompton, and he then established himself in Paris, marrying (his first wife having died in 1792) as his second wife the wealthy widow of Lavoisier, the celebrated chemist. With this lady he led an extremely uncomfortable life, till at last they agreed to separate. He took up his residence at Auteuil, where he died suddenly on the 21st of August 1814, in the sixty-second year of his age.

Rumford was the founder and the first recipient of the Rumford medal of the Royal Society. He was also the founder of the Rumford medal of the American Academy of Arts and Sciences, and of the Rumford professorship in Harvard University. His complete works with a memoir by G. E. Ellis were published by the American Academy of Arts and Sciences in 1870-75.

**RŪMĪ**, (1207-1273). Mahommed b. Mahommed b. Husain albakhi, better known as Maulānā Jalāl-uddīn Rūmī (or simply Jalāl-uddīn, or Jelāl-eddīn), the greatest Sōfic poet of Persia, was born on the 30th of September 1207 (604 A.H. 6th of Rab' I.) at Balkh, in Khorāsān, where his family had resided from time immemorial. He claimed descent from the caliph Abūbekr,

and from the Khwārizm-Shāh Sultān 'Alā-uddīn b. Tukush (1199-1220), whose only daughter, Malika-i-Jahān, had been married to Jalāl-uddīn's grandfather. Her son, Mahommed, commonly called Bahā-uddīn Walad, was famous for his learning and piety, but being afraid of the sultan's jealousy, he emigrated to Asia Minor in 1212. After residing for some time at Malatya and afterwards at Erzingān in Armenia, Bahā-uddīn was called to Lāranda in Asia Minor, as principal of the local college. Here young Jalāl-uddīn grew up, and in 1226 married Jauhar Khātūn, the daughter of Lālā Sharaf-uddīn of Samarkand. Finally, Bahā-uddīn was invited to Iconium by 'Alā-uddīn Kaikubād (1219-1236), the sultan of Asia Minor, or, as it is commonly called in the East, Rūm—whence Jalāl-uddīn's surname (*takhallus*) Rūmī.

After Bahā-uddīn's death in 1231, Jalāl-uddīn went to Aleppo and Damascus for a short time to study, but, dissatisfied with the exact sciences, he returned to Iconium, where he became by and by professor of four separate colleges, and devoted himself to the study of mystic theosophy. His first spiritual instructor was Sayyid Burhān-uddīn Husainī of Tirmidh, one of his father's disciples, and, later on, the wandering Sūfi Shams-uddīn of Tabriz, who soon acquired a most powerful influence over Jalāl-uddīn. Shams-uddīn's aggressive character roused the people of Iconium against him, and during a riot in which Jalāl-uddīn's eldest son, 'Alā-uddīn, was killed, he was arrested and probably executed; at least he was no more seen. In remembrance of these victims of popular wrath Jalāl-uddīn founded the order of the Maulawī (in Turkish Mevlevī) dervishes, famous for their piety as well as for their peculiar garb of mourning, their music and their mystic dance (*samā*), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of a Sūfi's fervent love to God. The establishment of this order, which still possesses numerous cloisters throughout the Turkish empire, and the leadership of which has been kept in Jalāl-uddīn's family in Iconium uninterruptedly for the last six hundred years, gave a new stimulus to his zeal and poetical inspiration. Most of his matchless odes were composed in honour of the Maulawī dervishes, and even his *opus magnum*, the *Makhnavī* (*Meznevī*), or, as it is usually called, *The Spiritual Makhnavī* (*makhnavī-i-ma'navī*), in six books or *daftar*s, with 30,000 to 40,000 double-rhymed verses, can be traced to the same source. The idea of this immense collection of ethical and moral precepts was first suggested to the poet by his favourite disciple Hasan, better known as Husām-uddīn, who in 1258 became Jalāl-uddīn's chief assistant. Jalāl-uddīn dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after its completion Jalāl-uddīn died, on the 17th of December 1273 (672 A.H. 5th of Jomādā II.). His first successor in the rectorship of the Maulawī fraternity was Husām-uddīn himself, after whose death in 1284 Jalāl-uddīn's younger and only surviving son, Shaikh Bahā-uddīn in Ahmed, commonly called Sultān Walad, and favourably known as author of the mystical *makhnavī Rabābnāma*, or the Book of the Guitar (died 1312), was duly installed as grand-master of the order.

Jalāl-uddīn's life is fully described in Shams-uddīn Ahmed Afākī's *Mandib-ul-'arīfin* (written between A.D. 1318 and 1351), the most important portions of which have been translated by J. W. Redhouse in the preface to his English metrical version of *The Merveth, Book the First* (London, 1881); there is also an abridged translation of the *Makhnavī*, with introduction on Sufism, by E. H. Whinfield (2nd ed., 1898). Complete editions have been printed at Bombay, Lucknow, Tabriz, Constantinople and in Bulaq (with a Turkish translation, 1268 A.H.), at the end of which a seventh *daftar* is added, the genuineness of which is refuted by a remark of Jalāl-uddīn himself in one of the Bodleian copies of the poem, *Qasidat* 294 (f. 328a seq.). A revised edition was made by 'Abd-ullāh between 1024 and 1032 A.H., and the same author's commentary on the *Makhnavī*, *Lah'ij-nūma'nawī*, and his glossary, *Lah'ij-ahīrī*, have been lithographed in Cawnpore (1876) and Lucknow (1877) respectively, the latter under the title *Farhang-i-makhnavī*. For the other numerous commentaries and for further biographical and literary particulars of Jalāl-uddīn, see Rieu's *Cat. of the Persian MSS*

of the Brit. Mus., vol. ii. p. 584 seq.; A. Sprenger's *Oudh Cal.*, p. 489; Sir Gore Ouseley, *Notices of Persian Poets*, p. 112 seq.; H. Ethé, in *Morgenländische Studien* (Leipzig, 1870), p. 95 seq., and in Geiger and Kuhn's *Grundriss der iranischen Philologie* (Stuttgart, 1896-1904), vol. ii. pp. 287-292. Selections from Ja'fār-ud-dīn's diwān (often styled *Diwān-i-Shams-i-Tabrīz*) are translated in German verse by V. von Rosenzweig (Vienna, 1838); into English by R. A. Nicholson (2nd ed., 1898) and W. Hastie (1903). (H. E.)

**RUMINANTIA**, a term employed by Cuvier to include all the existing artiodactyle ruminating ungulate mammals now classed under the groups Pecora, Tylopoda and Tragulina. By Professor Max Weber it is employed as a collective designation for these groups, together with the extinct Anthracotheroidea and Dichobunoidea; but its use seems best restricted to a general term rather than a definite systematic group. (See ARTIODACTYLA, PECORA, TYLOPODA.)

**RÜMCKER, CARL LUDWIG CHRISTIAN** (1788-1862), German astronomer, was born in Mecklenburg on the 28th of May 1788. He served in the British navy from 1807 until 1817, and was director of the school of navigation at Hamburg from 1819 till 1820. In 1821 he went to New South Wales as astronomer at the observatory built at Parramatta by Sir Thomas Brisbane. He returned to Europe in 1830 and took charge of the observatory at Hamburg. His chief work was concerned with the cataloguing of stars: a preliminary catalogue of the stars of the S. hemisphere was published in 1832 at Hamburg, and in 1846-52 he published his great catalogue of 12,000 stars. In 1857 he went to reside at Lisbon, where he died on the 21st of December 1862.

His son, **GEORGE FRIEDRICH WILHELM** (1832-1900), born on the 31st of December 1832, at Hamburg, was astronomer at the observatory at Durham, England, from 1853 to 1856. He then became assistant at the Hamburg observatory, and in 1862 was appointed director of the same institution. From 1884 he was the Hamburg delegate for the International Earth Measurement. He died on the 3rd of March 1900.

**RUNCIMAN, ALEXANDER** (1736-1785), Scottish historical painter, was born in Edinburgh in 1736. He studied at Foulis's Academy, Glasgow, and at the age of thirty proceeded to Rome, where he spent five years. It was at this time that he became acquainted with Fuseli. The painter's earliest efforts had been in landscape; he soon, however, turned to historical and imaginative subjects, exhibiting his "Nausicaa at Play with her Maidens" in 1767 at the Free Society of British Artists, Edinburgh. On his return from Italy, after a brief residence in London, where in 1772 he exhibited in the Royal Academy, he settled in Edinburgh, and was appointed master of the Trustees' Academy. He was patronized by Sir James Clerk, whose hall at Penicuik House he decorated with a series of subjects from Ossian. He also executed various religious paintings and an altar-piece in the Cowgate Episcopal Church, Edinburgh, and easel pictures of "Cymon and Iphigenia," "Sigismunda weeping over the Heart of Tancred," and "Agrippina landing with the Ashes of Germanicus." He died in Edinburgh on the 4th of October 1785. His works, while they show high intention and considerable imagination, are frequently defective in form and extravagant in gesture. His younger brother, **JOHN RUNCIMAN** (1744-1766), who accompanied him to Rome, and died at Naples in 1766, was an artist of great promise. His "Flight into Egypt," in the National Gallery of Scotland, is remarkable for the precision of its execution and the mellow richness of its colouring.

**RUNCORN**, a market town and river-port in the Northwick parliamentary division of Cheshire, England, on the S. of the estuary of the Mersey 16 m. above Liverpool. Pop. of urban district (1901) 16,491. It is served by the London & North-Western railway, and has extensive communications by canal. The modern prosperity of the town dates from the completion in 1773 of the Bridgewater Canal, which here descends into the Mersey by a flight of locks. Runcorn is a sub-port of Manchester, with which it is connected by the Manchester Ship Canal, and has extensive wharfrage and warehouse accommodation. The chief exports are coal, salt and pitch; but

there is also a large traffic in potters' materials. A transporter bridge between Runcorn and Widnes, with a suspended car worked by electricity to convey passengers and vehicles (the first bridge of the kind in England) was constructed in 1902. The town possesses shipbuilding yards, iron foundries, rope works, tanneries, and soap and alkali works.

Owing to the Mersey being here fordable at low water, Runcorn was in early times of considerable military importance. On a rock which formerly jutted into the Mersey Æthelfleda erected a castle in 916, but of the building there are now no remains; while the rock was removed to further the cutting of the ship canal. Æthelfleda is also said to have founded a town, but it is not noticed in Domesday. The ferry is noticed in a charter in the 12th century.

**RUMDALE** (apparently from "to run" and "dale," valley, originally something separated off, cf. "deal"), the name of a form of occupation of land, somewhat resembling the English "common field" system. The land is divided into discontinuous plots, and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In Scotland, where the system also existed, it was termed "run-rig" (from "run," and "rig" or "ridge").

**RUNEBERG, JOHAN LUDVIG** (1804-1877), Swedish poet, son of a sea-captain, was born at Jakobstad, in Finland, on the 5th of February 1804. He was brought up by an uncle at Uleåborg, and entered the university of Åbo in the autumn term of 1822. In 1823 he broke off his studies to act as tutor in two quiet Finnish villages, Saarijärvi and Ruovesi, where he gained a thorough knowledge of the popular life and poetry, and on his return to Åbo he began to contribute verses to the local newspapers. In the spring of 1827 he received the degree of doctor of philosophy. The university had been removed after the great fire of 1827 to Helsingfors, where Runeberg became, in 1830, amanuensis to the council of the university. In the same year he published at Helsingfors his first volume of *Dikter* (Poems), and a collection of *Serbiska folksånger* (Serbian folksongs) translated into Swedish. In 1831 his verse romance of Finnish life, *Grafven i Perrho* (The Grave in Perrho), received the small gold medal of the Swedish Academy, and the poet married Fredrika Charlotta Tengström, daughter of the archbishop of Finland. In the same year he was appointed university lecturer on Roman literature. In 1832 he published his beautiful little idyll, *Elgskyttarne* (The Elk-Hunters); and in 1833 a second collection of lyrical poems. He founded in 1832 the *Helsingfors Morgonblad*, a paper which dealt chiefly with aesthetic and literary questions, and exercised great influence both in Sweden and Finland. In it appeared many of his own poems and tales. His comedy, *Friaren från Landet* (The Country Lover, 1834), was not a success, but in 1836 he published *Hanna*, a charming idyll of Finnish country life, written in hexameters. In 1837 Runeberg accepted the chair of Latin at Borgå College, and resided in that little town for the rest of his life.

He was now recognized in his remote Finland retirement as second only to Tegnér among the poets of Sweden. In 1841 he published *Nadeschda*, a romance of modern Russian life, and *Julgröllen* (Christmas Eve), another idyll of Finnish life. The third volume of his *Dikter* bears the date 1843, and the noble cycle of unrhymed verse romances called *Kung Sjalor*, the setting of which is taken from old Scandinavian legend, was published in 1844. Finally, in 1848, he achieved a great popular success by his splendid series of poems on the war of independence in 1808, when Swedes and Finns fought side by side. The series bears the name of *Fänrik Sills Sägner* (Ensign Steel's Stories); a second series appeared in 1860. From 1847 to 1850 the poet was rector of Borgå College, a post which he resigned to take the only journey out of Finland which he ever accomplished, a visit to Sweden in 1851. In 1854 he collected his prose essays into a volume entitled *Smårrs Berättelser*. In the same year he was made president of a committee for the preparation of a national Psalter, which

issued, in 1857, a psalm-book largely contributed by Runeberg for public use. He once more attempted comedy in his *Kan ej* (Can't) in 1862, and tragedy, with infinitely more success, in his stately *Kungarne på Salamis* (The Kings at Salamis) in 1863. Runeberg died at Borgå on the 6th of May 1877. His writings were collected by C. R. Nyblom in six volumes in 1870, and his posthumous writings in three volumes (1878-79).

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. It is hardly possible to over-estimate the value of his patriotic poems as a link between the Swedish and Finnish nations. He has remained one of the most popular Swedish poets, although his whole life was spent in Finland.

An account of his life and works by C. R. Nyblom is prefixed to the *Samlade Skrifter* of 1870. For a minute criticism of Runeberg's principal poems, with translations, see Gosse's *Studies in the Literature of Northern Europe* (1879). A selection of his lyrical pieces was published in an English translation by Messrs Magnusson & Palmer in 1878. There are also monographs on Runeberg by Dietrichson and Rancken (Stockholm, 1864), by Cygnæus (Helsingfors, 1873), by Ljunggren (Lund, 1882-83), and Peschier (Stuttgart, 1881).

**RUNES, RUNIC LANGUAGE AND INSCRIPTIONS.** The art of writing with an alphabet appears to have been introduced into Germanic Europe in the Iron Age. Something hieratic and mysterious was involved in the idea of letters as used to convey thought, and from the earliest recorded times they were called *runes*, from the Gothic *runa* (*rûn*, in Icelandic), which originally means a secret thing, a mystery, and was later used to describe a letter of the ancient language (see ALPHABET and SCANDINAVIAN LANGUAGES). The Iron Age is supposed to have existed from *circa* 300 to *circa* 650, and it is to the close of this epoch that the beginning of the writing on Scandinavian memorials is attributed. There are runes which have been discovered in England, and some also on the Germanic mainland of Europe, but it is in the Scandinavian peninsula that the vast majority of inscribed monuments have been discovered. The custom of erecting runic monuments, *i.e.* stones engraved with more or less literary statements, over the bodies of the dead, was practised first, there can be no doubt, in Norway and Sweden, then spread to Denmark and over the whole North of Europe. It is remarkable, however, that two of the three runic alphabets from which our knowledge of the whole range of rune-literature is founded, were discovered outside Scandinavia. These three alphabets exist, the first on a thin gold *brooch* found in 1774 at Vadstena, in Sweden; the second on a bracelet, dug up at Charnoy, in Burgundy; the third on a knife, found in the Thames in 1857, and now in the British Museum. There are two principal runic alphabets, the older consisting of 24 letters, and beginning with *f*; the later of 16 letters. During the last century before the introduction of Christianity, the larger alphabet was increased by 3 letters.

The oldest runes which have been examined are those found on the Thorsbjerg Shield-buckle, which is at present in the Kiel Museum; here the writing, which runs from right to left in straight lines, is of the fourth or fifth century. Other invaluable sources of runic knowledge are the diadem of Straarur, the Vimose comb and the brooch of Himlingöje, which was found in the Vier Fen. Still greater importance has the Golden Horn, discovered at Gellehuus, near Tondern, in 1734; this monument was stolen by thieves and melted down, but fortunately not until a careful copy of it had been made, which is now in the Museum at Copenhagen. It is not until the 6th century that the runic stones begin. The most ancient are believed to be those of Einang, of Tune, of Strand, of Varnum, of Tanum and of Berga. Perhaps a little later are the stones at Vaanga, Skärkind, Skaaång, Torvik, Bø and others, too numerous to mention, but all, as seems likely, erected between 550 and 600. On the famous Tune-stone, the name of the author of the inscription is preserved, "I Wiwar made these runes," and this is not an isolated instance. The original direction of the runic writing was from left to right, like Latin, but quite early the reverse method was introduced. A union

of these forms produced more complicated systems, in which much was left to the individual taste.

From the earliest times uninscribed memorial stones in Scandinavia, *baustasteinar*, were raised to preserve the memory of the dead, and these certainly partook of a more or less religious and sacrificial character. It is evident that, during the Iron Age, stones continued to be erected which had no inscriptions, after the runic alphabets had been invented, and that at first the runes were added only in cases of great importance or solemnity. These runic stones were as a rule posed on the top of the grave, or by the side of it, on mounds, of which only one example survives, that of the stone of Einang, in Norway. But runic stones were not infrequently placed in the grave itself. These were smaller than those erected outside the grave, and they did not lend themselves to lengthy or elaborate inscriptions. The majority of graves containing such small runestones, bearing merely the name of the deceased or a magical sentence, have been found in Norway. But the antiquity of most of these is questioned, that of Vatn, which is the oldest, being now placed no earlier than the 8th century. The very important stone of Valdbý, which is the oldest Norwegian monument employing the shorter alphabet, is attributed by Wimmer to heathen times, indeed, but to a date no earlier than the second half of the 9th century. It is supposed that the most ancient of the runic stones of Sweden, those respectively of Vanga, Skärkind and Kinnevad, must have come from the interior of graves, but there is no certain proof of this. The latest criticism tends to the belief that when runes were first inscribed on Scandinavian monuments, they were placed both upon and inside graves, but that after the runic letters had been used for about a century, the latter custom tended to exclude the former. About the year 800 both customs began to invade Denmark, the practice of placing the runestones inside, however, soon getting the upper hand. It is a curious fact that in Iceland not a single runestone which can be referred back to heathen times is known to exist; the Icelandic runestones all date from a period well advanced in the middle ages. It was the old theory that the ancient stones had mouldered away under stress of weather, but that is abandoned, and it is now supposed that the aristocratic exiles from Norway, who settled in Iceland, had not yet adopted in their old home the practice of inscribed monuments to their dead. There were *baustasteinar* in Iceland, as we know, but there is no evidence that these bore runes upon them.

It is in Denmark that the runic inscriptions exist which possess the highest literary interest. These are all attributed to the beginning of the 9th century. The Kallerup Stone was discovered in 1826 at the village of Højetstrup, a Danish *muk* E. of Roskilde; it has been lifted and placed in its original position. This monument contains a statement in old Danish to the effect that it marks the grave of Hornbora, son of Swið. The Stone of Snoldelev was discovered in 1768, not far from the spot where the Kallerup Stone was found; it is now in the Archaeological Museum at Copenhagen; this has a long and important inscription in a form of old Scandinavian, allied to the classical Icelandic. The Stone of Helnaes was found on the islet of that name in 1860, and is now at Copenhagen. The other most famous runic monuments are those of Flemisø, Örja, Nörrenærå, Glarendrup, Fryggevælde and Rønning. Of all of which Wimmer has published full analytical descriptions.

These inscriptions are of remarkable value as historical documents, from a period of which no other definite records remain in existence. From a literary point of view, they represent what Germanic language was up to the point at which Ulfilas created a new alphabet for his version of the Bible; by adapting to the runic alphabets a number of Greek letters. It was an error, now exploded, to suppose that the *notae impressae*, which Tacitus describes in his *Germania*, were written runes; these were simply signs, or mystic marks, which had no linguistic significance. These are described in the staves of the *Edda* as having been revealed to mankind by the god Od-

and they were of a hieratic character. The suggestion is that the written runes were introduced from the south of Europe by a Phoenician agency, and that they were copied from Greek or Roman coins which had found their way to Scandinavia. In several of the sagas it is recorded that runes were inscribed on round pieces of wood, called *keffi*, or runic sticks. It has been suggested that the Eddaic poems were preserved in this way, but the only authority for this is that the *Sonatorrek* is said to have been taken down on a *keffi*. In Christian times runes came to be regarded as an archaic curiosity, and were engraved on sticks, chairs and spoons; a loto stick with runes on it is preserved in the Bodleian library. In the *Fornsögur* runes are mentioned as carved on the blade of an oar. Even cases occur in which the normal Latin alphabet was called *rúnamal* or a language of Runes. A runic letter was called a *rúnastafr* in Icelandic.

**AUTHORITIES.**—Ludwig F. A. Wimmer, *Runeskriiften oprindelse og udvikling i Norden* (Copenhagen, 1874); L. F. A. Wimmer, *Die Runenschrift* (Berlin, 1887); J. Taylor, *Greeks and Goths: a Study on the Runes* (London, 1879); G. Stephens, *The Old-Northern Runic Monuments of Scandinavia and England* (Copenhagen, 1879); Bugge, *Tolkning af runeskriften på Rökstenen i Östergötland* (Stockholm, 1878); Cleaby and Vigfusson, *Icelandic-English Dictionary* (Oxford, 1874); Wilhelm Grimm, *Ueber deutsche Runen* (Göttingen, 1821); Olsen, *Runerne's den oldislandske Litteratur* (Christiania, 1891).

**RUNG**, a short round bar or stick used as a cross-bar or rail in a chair, and particularly as one of the steps or rounds of a ladder. In Scottish the word retains the original meaning of a staff or stick, especially a short thick cudgel. The O.E. *hrung* is used only of a bar or rail in a wagon; the word also occurs in O.Du. *ronge*, beam of a plough, Ger. *Runge*, pin, bolt.

**RUNNIMEDE**, or **RUNNYMEDE**, a meadow on the S. bank of the river Thames, England, in the county of Surrey and the parish of Egham. It is celebrated in connexion with the signature of Magna Carta (*q.v.*) by King John on the 15th of June 1215. It has been disputed whether the ceremony took place actually in the meadow or on Magna Carta or Charter Island lying off it. The charter itself indicates Runnimeede by name, but this may have included the island, which is the traditional site and was in 1217 the meeting-place of Henry III. and Louis (afterwards Louis VIII.) of France.

**RUNNING**, the most primitive form of athletic exercise considered as a sport. Athletic apparatus of every kind has been improved in modern times, but the spiked running-shoe may be said to represent the sole advantage enjoyed by the modern runner over his Olympic prototype. As an athletic sport running has been in vogue from the earliest times, and the simple foot-race (*δρόμος*), run straight away from starting-point to goal, or once over the course of the stadion (a little over 200 yds.), formed an event in the Greek *pentathlon*, or quintuple games (see *GAMES, CLASSICAL*). It was diversified with the race once over the course and return, and the *βάδισος*, a long run many times (often as many as twelve, *i.e.* about 2½ m.) up and down the stadion. There was also the *δρόμος ἀπλῆτος*, a short race for warriors, who wore full armour and carried sword and shield, which has been imitated by the modern military race in full marching order. Except in the warriors' race the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times made by the runners in the Greek races have been handed down. It may be inferred that the contests were very severe, since the ancient Olympic chronicles preserve the memory of several runners, of whom Ladas was the most conspicuous, who fell dead at the completion of the long course, and were buried in state with their brows encircled by the victor's chaplet. In ancient Italy running was practised in circus exhibitions, as described by Virgil (*Aen. v. 286 seq.*).

In the middle ages the best runners were oftenest found among the couriers maintained by potentates and municipalities, those of Tartary, England, Scotland, Italy and the Basque country having enjoyed the greatest reputation, while the Peichs, or Persian couriers of the Turkish sultans, often

ran from Constantinople to Adrianople and back, a distance of about 220 m., in two days and nights. Many couriers carried silver beads in their mouths to obviate thirst. Couriers (*syce*) who run before the carriages of their masters are still in use in the East. In the districts of India not traversed by railways, dak runners are still employed to carry the mails from village to village, many wearing bells about their necks to frighten away the tigers. The runners of the American Indians were famous, and extraordinary tales are told of their swiftness and endurance.

In all parts of Great Britain, running at short distances, as well as steeplechases and cross-country runs, has been popular for many centuries, each district and period having its champions, some of whom achieved national reputation. During the Puritan rule and that of Charles II. athletic sports all but died out in England, only to be revived with renewed vigour in the early part of the 19th century, when the public schools and universities began to pay more attention to them. A significant event in the history of running was the institution of the famous "Crick Run" (cross-country) at Rugby in 1837. The establishment of the Cambridge University sports (1857), the Oxford sports (1860), and the British championship meetings (1866) placed athletics upon a formal and recognized basis. Records made thereafter received the stamp of authenticity, those made in former years being doubtful on account of lax measurements and timing. In the United States and Canada authentic records date from the institution of the American Championships in 1876. The National Association of Amateur Athletes of America was formed in 1880.

Running at the present day is divided into sprinting (distances up to one-quarter of a mile), middle-distance running (from one-quarter of a mile to 1000 yds.) and long-distance running (over 1000 yds.).

*Sprinting* consists of running over short distances with a full and continuous burst of speed, the chief distances being 100 yds., 220 yds. and quarter-mile. Distances up to and including 220 yds. are in America called *dashes*. The course for sprinting races, when run in the open air, is marked off in lanes for the individual runners by means of cords stretched upon short iron rods. Starting in sprints has now become very expert. The old method of dropping a handkerchief was the worst possible way to give the starting signal, since the muscles react most slowly to impressions of sight, less so to those of touch, and most quickly to those of sound, a difference of  $\frac{1}{100}$  of a second in reaction amounting to over one foot in a run of 100 yds. All modern foot-races are therefore started by the pistol; the runners wait for the signal in a crouching attitude, with the fingers of both hands resting on the ground on each side of the body, from which position they spring upwards and forwards at the sound of the pistol. The crouching start was found to be much quicker in getting off the mark than the upright attitude formerly adopted, and by 1892 had been adopted by all first-class sprinters in America, and a year or two later in Great Britain. Another advantage is that the runner is steadier on the mark, and since its adoption the prescribed penalty of being placed one yard behind the mark for starting before the pistol-shot has been very seldom enforced, and the risky experiment of "beating the pistol," *i.e.* letting the body fall forward in the hope that the shot would come before the feet had to be moved, has practically disappeared.

The improvement in training and the adoption of the crouching start have resulted in the continued reduction of sprinting records. "Even time," or 10 secs., is still considered a fine performance for the hundred yards, but has been repeatedly beaten both in England and America. A. F. Duffey, who, like C. A. Bradley and J. W. Morton, won the English championship in four successive years, shares with D. J. Kelly the record, 9½ secs., for 100 yds.; and J. W. Morton, a Scot, as well as J. H. Hempton and W. T. Macpherson of New Zealand, are credited with 9½ secs. The excellence of American runners in the sprints is probably accounted for partly by temperament influenced by climate; but the American practice of running

short races of from 50 to 75 yds. during the numerous indoor meetings held in winter-time offers excellent training in starting and getting rapidly into full stride.

The best time for the eighth mile (220 yds.), a distance often run in America, is 21½ secs., made in 1896 on a straightaway track by B. J. Wefers.

The quarter-mile (440 yds.) is almost always run on a curved track, and hence a quick start is important, for should the runner who has the advantage of the inside position allow himself to be outrun in the distance to the first turn, one of his opponents is likely to cut in and deprive him of it, while on the other hand a runner on the outside must actually outrun the inside man in order to be on even terms after the turn. The element of strategy, unknown in straight sprints, thus enters into the quarter. Speed is, of course, the chief requisite for a quarter-miler, but a certain amount of staying power is also necessary. The standard time for the quarter is 50 secs., which means an average speed of 11.3 secs. for each 100 yds. round the course. That of M.W. Long of Columbia University, who made the record, 47 secs., in 1900, was on that occasion 20.68 secs. for each hundred yards.

The system of "relay races," usually run by four men each going a quarter of the distance, is a popular variety. The favourite distance is a mile, each man running a quarter at top speed. This method of racing was introduced in the United States about the year 1890 on the model of the Massachusetts firemen's "bean-pot" races, and has since become very popular there. The old method was for the men running the second quarter of the course to wait on the mark for the first relay men to arrive, and then, snatching small flags from their hands, to continue the race, handing over the flags to the third relay upon completing their quarter. The flags, being cumbersome, were afterwards abandoned, and the new runners are now required only to touch the persons of the preceding contestants. The 1 m. record, 3 min. 21½ secs., was made in 1898 by B. J. Wefers, M. W. Long, T. E. Burke and H. S. Lyons of the New York Athletic Club.

**Middle-Distance Running.**—The chief middle distances are 600 yds., 660 yds., 880 yds. (half-mile) and 1000 yds., but of these the half-mile is the only one commonly recognized in championship sports. Endurance is more important at these distances, though speed is essential, and the element of strategy increases. An element unknown to sprinting enters into middle- and long-distance runs, namely that of pace-making; even when the real race is between two individuals at least one other runner on each side takes part in the contest, in order to "make the pace" for his principal. Emilio Lunghi (U.S.A.) holds the half-mile world's record of 1 min. 52½ secs., made in 1909. J. F. K. Cross of Oxford University ran the half-mile at Oxford in 1888 in 1 min. 54½ secs. The record for 1000 yds., 2 min. 13 secs., was made by L. E. Myers (U.S.A.). The distance of three-quarters of a mile is seldom run now at large meetings.

**Long-Distance Running.**—This includes all flat races of 1 m. or more, as well as steeplechasing, hare-and-hounds, and other forms of cross-country running. Great Britain has always been the home of long-distance running, different forms of cross-country racing having been popular all over the kingdom for centuries. In England at the championship meeting the distance events on the flat are the 1 m., 4 m. and 10 m. races, and in the inter-university sports the 1 m. and 3 m.; in America the distances are 1 m., 3 m. and 5 m.; but any and all of these distances are often included in important British and American programmes. Hard daily training is necessary for a distance runner. Good pace-making and strategy in general are of great importance. The runner must learn to "run to the watch," i.e. to cover the different portions of the distance in a certain time, in order to be placed most advantageously for the finish. The mile race requires speed as well as stamina. Most champion milers are capable of doing the half under 2 min. The record for the mile, made in 1886 at Lillie Bridge by W. G. George, as a professional, is 4 min., 12½ secs.; the amateur record is 4 min.

15½ secs., made by T. P. Conneff in America, J. Binks, holding the British amateur record with 4 min. 16½ secs., made at Stamford Bridge in 1902. The longer-distance races require more stamina than speed, and a careful husbanding of strength.

The following table gives the records (up to 1908) for the distance runs on the flat, longer than 1 m.:—

Distance.	Name.	Time.	Date.	Place.
		h. m. s.		
2 miles	A. Shrubbs	9 9½	1904	Glasgow

In addition to the records for the above-mentioned distances, Shrubbs held in 1908 the records for 6, 7, 8, 9 and 11 m., and also for the greatest distance covered in 1 h., namely, 11 m. 1316 yds. He won the 4 m. and the 10 m. British championship 1901-4 inclusive, and the 1 m. championship 1903 and 1904; also the French 1 m. and 3 m. championship 1902-4 inclusive. Shrubbs was moreover a first-rate cross-country runner also; he won the British 10 m. cross-country championship 1901-4 inclusive, and the international 8 m. cross-country championship 1902-4. In 1863 a full-blooded Seneca Indian, L. Bennet, known as "Deerfoot," ran 12 m. in 1 h. 2 m. 2½ secs.

**Real cross-country running** is a fast jog over hill and dale. It may take the form of a race from the gymnasium or clubhouse across the fields to a given spot and back again, passing certain objects or buildings; of a practice run behind the coach preparatory to a long-distance race on the track; or of a paper-chase, or hare-and-hounds, the "hares," two or three in number, starting a few minutes before the "hounds," and leaving a trail of scraps of paper dropped from bags, which must be followed by the "hounds." In Great Britain the standard distance is 10 m., but in America it is somewhat less, the distance for the intercollegiate championship race being 6½ m.

**Steeplechasing** was originally only a cross-country run over a course plentifully provided with natural obstacles, such as brooks, ditches, fences and hedges; but at the present day the steeplechase takes place in the inner enclosure of an athletic field and the obstacles are artificial. They are placed about 70 or 80 yds. apart, and consist of hurdles, a stone wall about 3 ft. high and 2 or 3 ft. broad, and a water-jump, a ditch about 6 ft. broad filled with water and guarded by a wall or fence covered with thick furze or other thick shrubbery. Steeplechase courses differ widely, but the usual distance both in Great Britain and America is 2 m. The time necessary to cover this distance varies according to the difficulties of the course, but a few seconds under 22 min. is considered very fast time.

**Team-racing** is a favourite form of distance running, each team consisting of 10 men and the distance usually 4 m., the standard of the modern Olympic Games. Different systems of scoring are in vogue, but the usual one allows the winner ten points, the second to arrive nine, and so on, the tenth arrival scoring one. The team aggregating the highest number of points wins.

Among modern distance events the **Marathon Race** of about 40 kilometres (24 m. 1500 yds.) is the most important. It was introduced in the first revived Olympic Games at Athens in 1896 (see ATHLETIC SPORTS) in memory of the famous Greek runner who was said to have brought the news of the battle of Marathon to Athens, dropping dead when his task was finished.

**RUODLIEB**, a romance in Latin verse by an unknown German poet who flourished about 1030; he was almost certainly a monk of the Bavarian abbey of Tegernsee. The poem is one of the earliest German romances of knightly adventure, and its vivid picture of feudal manners gives it a certain value as historical document. The poet was probably an eye-witness of the episode (ll. 4231-5221) which represents the meeting of the emperor Henry II. with Robert of France on the bank

of the Maas in 1023. *Ruedlieb* was left unfinished, and furthermore the MS. was cut up and used for binding books, so that the fragments were only gradually discovered (from 1807 onwards) and pieced together. The framework of the story is borrowed from a popular *märchen* of the youth who takes service away from home, and is paid in wise saws instead of current coin. He receives at the same time a loaf, with instructions not to cut it until he is once more at home. This contains the coins. The proverbs, usually three in number, were increased in *Ruedlieb* to twelve, each of which was the starting-point of an episode by which the hero was made to appreciate its value.

For examples of the three-proverb tale see W. Bottrell, *Traditions and Heartside Stories* (Penzance, 2nd series, 1873); Cuthbert Bede, *The White Wife*... (London, 1868); K. V. K. Illinger, *Erz* (Stuttgart and Tübingen, 1849), and others in the French romance of the *Saint Graal*, in the *Gesta Romanorum* (the three proverbs taught by Dominian) and the old French *Di des liors de Sommes*. The best edition of *Ruedlieb* is by F. Seiler (Halle, 1882). There is a modern version by M. Heine (Leipzig, 1877), and a full analysis of the contents is given by R. Koepel, *Gesta d. deutschen Lit. bis zum Ausgange des Mittelalters* (Strasbourg, 1894-97, ii. pp. 342-412).

**RUPAR**, a town of British India, in Umballa district of the Punjab, on the left bank of the river Sutlej, 43 m. N. of Umballa, 1120 ft. above sea-level. Pop. (1901) 8888. It was the scene of Ranjit Singh's visit to Lord William Bentinck when governor-general in 1831. Here are the head works of the Sirhind canal. Rugar has manufactures of cotton twill and hardware. Hindu and Mahomedan fairs are held.

**RUPPEE** (Hindustani *rupiya*, from Sanskrit *rupya*), the standard coin of the monetary system in India. A silver coin of 175 grains Troy, called *tanika*, approximating to the rupee, was struck by the Mahomedan rulers of Delhi in the 13th century; but the rupee itself, of 179 grains, was introduced by Sher Shah in 1542. The English at first followed various indigenous standards; but since 1835 the rupee has uniformly weighed 180 grains, containing 165 grains of pure silver. The weight of the rupee (one *tola*) is also the unit upon which the Indian standard of weights is based. Down to about 1873 the gold value of the rupee was 2s., and ten rupees were thus equal to £1; but after 1873, owing to the depreciation of silver, the rupee at one time sank as low in value as 1s. In order to provide a remedy the government of India decided in 1893 to close the mints, and in 1899 to make the rupee legal tender at fifteen to £1. This policy proved successful, and since 1899 the exchange value of the rupee has practically remained at 1s. 4d. Therefore a lakh of rupees, which before 1873 was worth £10,000, is now only worth £6666, and a crore of rupees, which was formerly a million sterling, now only amounts to £666,666. The rupee is divided into sixteen annas, now worth 1d. each, and the anna is subdivided into 12 pies. (See INDIA, and MONEY.)

**RUPERT** (HROBERT), ST., according to the *Gesta Sancti Hrodberti*, which dates from the 9th century, was a kinsman of the Merovingian house, and bishop of Worms under Childbert III. (695-711). At the invitation of the duke of Bavaria, Theodo II., Rupert went to Regensburg (Ratisbon), where he began his apostolate. He founded the church of St Peter near the Wallersee, and subsequently, at Salzburg, the church of St Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women "in superiori castro Iuvavensium." He died and was buried at Salzburg. He is regarded as the apostle of the Bavarians, not that the land was up to that time altogether heathen, but because of his services in the promotion and consolidation of its Christianity.

See *Bibliotheca hagiographica Latina* (Brussels, 1899), n. 7390-7403; W. Levison, "Die älteste Lebensbeschreibung Ruperts von Salzburg," in *Neues Archiv für ältere deutsche Geschichtskunde*, xxviii. 283 seq.; Hauck, *Kirchengeschichte Deutschlands* (3rd ed.), i. 372 seq. (H. DE.)

**RUPERT, PRINCE, COUNT PALATINE OF THE RHINE AND DUKE OF BAVARIA** (1619-1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V., and of Elizabeth,

daughter of James I. of England, was born at Prague on the 17th of December 1619. A year later his father was defeated at the battle of the Weisser-Berg, near Prague, and driven from Bohemia. After many wanderings the family took refuge in Holland, where Rupert's boyhood was spent. In 1633 the boy was present at the siege of Rheinberg in the suite of the Prince of Orange, and in 1635 he served in this prince's bodyguard. In 1636 he paid his first visit to England, was entered as an undergraduate, though only nominally, at St John's College, Oxford, and was named as the governor of a proposed English colony in Madagascar. But this scheme did not mature, and Charles sent his nephew back to Holland, having, however, formed a high opinion of his energy, talent and resolution. In 1637 he was again serving in the wars, and in 1638, after displaying conspicuous bravery, he was taken prisoner by the imperialists at the action of Vlotho (17th October) and held in a not very strict captivity for three years. In 1641 he was released, and, rejoining his mother in Holland, was summoned to England to the assistance of his uncle, for the Great Rebellion was about to break out.

In July 1642 he landed at Tynemouth. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert is the dominant figure of the war. His battles and campaigns are described in the article GREAT REBELLION. He was distinctively a cavalry leader, and it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy was bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed, and in the two far-ranging expeditions which he carried out for the relief of Newark and of York. In November 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army. But this appointment, though welcome to the army, was obnoxious to the king's counsellors, who resented the prince's independence of their control, to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose indiscipline and rapacity were likely to be repressed with a heavy hand. These dissensions culminated, after the prince's surrender of Bristol to Fairfax, in a complete break with Charles, who dismissed him from all his offices and bade Rupert and his younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. By 1645, although the parliamentary party accused him not merely of barbarity but of ingratitude for the kindnesses which his family had received from English people in the days of the Palatinate War, Rupert had in fact become a good Englishman. He was convinced, after Marston Moor, that the king's cause was lost, in a military sense, and moreover that the king's cause was bad. When he surrendered Bristol without fighting to the uttermost, it was because Fairfax placed the political issue in the foreground, and after the capitulation the prince rode to Oxford with his enemies, frankly discussing the prospect of peace. Already he had deliberately advised Charles to make peace, and had come to be suspected, in consequence, by Charles's optimistic adviser Digby. But to Charles himself the news of the fall of Bristol was a thunderbolt. "It is the greatest trial to my constancy that has yet befallen me," he wrote to the prince, "that one that is so near to me in blood and friendship submits himself to so mean an action." Rupert was deeply wounded by the implied stain on his honour; he forced his way to the king and demanded a court-martial. The verdict of this court smoothed over matters for a time, but Rupert was now too far estranged from the prevailing party at court to be of any assistance, and after further misfortunes and quarrels they separated, Charles to take refuge in the camp of the Scots, Rupert to stay, as a spectator without command, with the Oxford garrison. He received at the capitulation a pass from the parliament to leave England, as did also his faithful comrade Maurice.

For some time after this Rupert commanded the troops

formed of English exiles in the French army, and received a wound at the siege of La Bassée in 1647. Charles in misfortune had understood something of his nephew's devotion, and wrote to him in the friendliest terms, and though the prince had by no means forgiven Digby, Colepeper and others of the council, he obtained command of a Royalist fleet. The king's enemies were now no longer the Presbyterians and the majority of the English people but the stern Independent community, with whose aims and aspirations he could not have any sympathy whatever. A long and unprofitable naval campaign followed, which extended from Kinsale to Lisbon and from Toulon to Cape Verde. But the prince again quarrelled with the council, and spent six years (1654-60) in Germany, during which period nothing is known of him, except that he vainly attempted (as also before and afterwards) to obtain the apanage to which as a younger son he was entitled from his brother the elector palatine. At the Restoration he settled in England again, receiving from Charles II. an annuity and becoming a member of the privy council. He never again fought on land, but, turning admiral like Blake and Monk, he bore a brilliant part in the Dutch Wars. He died at his house in Spring Gardens, Westminster, on the 29th of November 1682.

Apart from his military renown, Prince Rupert is a distinguished figure in the history of art as one of the earliest mezzotinters. It has often been said that he was the inventor of mezzotint engraving, but this is erroneous, as he obtained the secret from a German officer, Ludwig von Siegen. One of the most beautiful and valuable of early mezzotints is his "Head of St John the Baptist." He was also interested in science, experimented with the manufacture of gunpowder, the boring of guns and the casting of shot, and invented a modified brass called "prince's metal."

Prince Rupert was duke of Cumberland and earl of Holderness in the English peerage. He was unmarried, but left two natural children; one a daughter who married General Emmanuel Scrope Howe and died in 1740, and the other a son, whose mother (who claimed that she was married to the prince) was Frances, daughter of Sir Henry Bard, Viscount Bellamont. The son was killed in 1686 at the siege of Buda.

See E. Warburton's *Life of Pr. Rupert* (London, 1849) and additional authorities quoted in the memoir by C. H. Firth in the *Dict. Nat. Biog.*

**RUPERT** (1352-1410), German king, and, as Rupert III., elector palatine of the Rhine, was a son of the elector Rupert II. and Beatrice, daughter of Peter II., king of Sicily. He was born at Amberg on the 5th of May 1352, and from his early years took part in the government of the Palatinate to which he succeeded on his father's death in 1398. He was one of the four electors who met at Oberlahnstein in August 1400 and declared King Wenceslaus deposed. This was followed by the election of Rupert as German king at Rense on the 21st of that month, and by his coronation at Cologne on the 6th of the following January. Winning some recognition in S. Germany, he made an expedition to Italy, where he hoped to receive the imperial crown, and to crush Gian Galeazzo Visconti, duke of Milan. In the autumn of 1401 he crossed the Alps, but his troops, checked before Brescia, melted away, and in 1402 Rupert, too poor to continue the campaign, returned to Germany. The news of this failure increased the disorder in Germany, but the king met with some success in his efforts to restore peace, and in October 1403 he was recognized by Pope Boniface IX. It was only the indolence of Wenceslaus that prevented his overthrow, and in 1406 he was compelled to make certain concessions. The quarrel was complicated by the papal schism, but the king was just beginning to make some headway when he died at his castle of Landskron near Oppenheim on the 18th of May 1410 and was buried at Heidelberg. He married Elizabeth, daughter of Frederick IV. of Hohenzollern, burgrave of Nuremberg, and left three sons and four daughters. Rupert, who earned the surname of *clemens*, was brave and generous, but his resources were totally inadequate to bear the strain of the German kingship.

**BIBLIOGRAPHY.**—J. Chmel, *Regesta chronologica-diplomatica Ruperti regis Romanorum* (Frankfort, 1834); C. Hofer, *Ruprecht von der Pfalz genannt Clem römischer König* (Freiberg, 1861); L. Häusser, *Geschichte der Rheinischen Pfalz* (Heidelberg, 1845); Th. Lindner, *Geschichte des Deutschen Reiches vom Ende des 14 Jahrhunderts bis zur Reformation* (Brunswick, 1875-80), part i.; A. Winkelmann, *Der Romzug Ruprechts von der Pfalz* (Innsbruck, 1892); and J. Weizsäcker, *Die Urkunden der Approbation König Ruprechts* (Berlin, 1899).

**RUPERT'S LAND**, a former district of Canada. The generous charter of Charles II. given in 1670 to the Hudson's Bay Company gave rights of possession, trade and administration of justice "of all those seas, streights and bays, rivers, lakes, creeks and sounds, in whatsoever latitude they shall be, that lie within the entrance of the streights commonly called Hudson's streights, together with all the lands, countries and territories upon the coasts and confines of the seas, streights, bays, lakes, rivers, creeks and sounds aforesaid, which are not now actually possessed by any of our subjects, or by the subjects of any other Christian prince or state."

The general interpretation given to this was that it included all the country drained into Hudson Bay. As Prince Rupert was first governor of the Hudson's Bay Company his name was given to the concession under the name "Rupert's Land." It will be observed that Athabasca, New Caledonia and British Columbia were not included in this grant. They were held under the title Indian Territories by the Hudson's Bay Company by licence terminable every twenty-one years, the last term closing with 1850. Rupert's Land was transferred to Canada by the imperial government in 1870, and ceased to exist as a political name. It is still used as the title of the episcopal diocese, which is in the main coincident with the province of Manitoba.

**RUPILIUS, PUBLIUS**, Roman statesman, consul in 132 B.C. During the inquiry that followed the death of Tiberius Gracchus conducted by himself and his colleague Popilius Laenas, he proceeded with the utmost severity against the supporters of Gracchus. In the same year he was despatched to Sicily, where he suppressed the revolt of the slaves under Eunus. During 131 he remained as proconsul of the island, and, with the assistance of ten commissioners appointed by the senate, drew up regulations for the organization of Sicily as a province. These regulations were known by the title of *leges Rupiliae*, though they were not laws in the strict sense. Rupilius was subsequently brought to trial (123 B.C.) and condemned to his treatment of the friends of Gracchus. The disgrace of his condemnation, added to disappointment at the failure of his brother to obtain the consulship in spite of the efforts of Scipio, caused his death shortly afterwards.

See Cicero, *De Am. 19*, *Tusc. disp. iv. 17*, in *Verr. ii. 13, 15* Diod. Sic. xxiv. 1, 20; Vell. Pat. ii. 7.

**RUPPIN**, or Neurruppin, a town of Germany, in the Prussian province of Brandenburg, lies on the W. bank of a small lake the Ruppiner See, 37 m. N.W. of Berlin by rail. Pop. (100: 18,555. The town, which was rebuilt in fine, regular fashion after a destructive fire in 1787, contains three Protestant churches, a Roman Catholic church and various educational and benevolent institutions. Its inhabitants are employed in the manufacture of cloth, starch and machinery, in ice founding and lithography. Important cattle and horse fairs are held here. Ruppiner received municipal rights in 1256.

The small town of Altruppiner, lying at the north end of the lake, has a 15th-century church and some small manufactures. Pop. (1905) 1813.

See Heydemann, *Neuere Geschichte der Stadt Neurruppin* (Neurruppin, 1863), and G. Bittkau, *Ältere Geschichte der Stadt Neurruppin* (Neurruppin, 1887).

**RUSSELLAE**, an ancient town of Etruria, Italy, about 10-15 S.E. of Vetulonia and 5 m. N.E. of Grosseto, situated on a hill with two summits, the higher 636 ft. above sea-level. It was one of the twelve cities of the Etruscan confederation, and was taken in 204 B.C. by the Romans. In 205 B.C. it contributed grain and timber for the needs of Scipio's fleet. A colony was founded here either by the Triumviri or by Augustus. The place was deserted in 1138, and the episcopal see was transferred

to Grosseto. The ruins are now thickly overgrown with brushwood; but the walls, nearly 2 m. in circumference, are in places well preserved. They consist of large unworked blocks of a travertine which naturally splits into roughly rectangular blocks; these are quite irregular, and often as much as 9 ft. long by 4 ft. wide: in the interstices smaller pieces are inserted. The walls are embanking walls, with a low breastwork in places. Within the circuit which they enclose, now under cultivation, are two summits, one occupied by a Roman amphitheatre [the other by a tower (?) of uncertain date]: a Roman cistern also is visible. Some 2 m. S.S.W. are modern baths, fed by hot springs, which were in use in Roman times also, as the discovery of remains of Roman buildings shows.

See G. Dennis, *Cities and Cemeteries of Etruria* (London, 1883), ii. 222. (T. As.)

**RUSH, BENJAMIN** (1745-1813), American physician, was born in Byberry township, near Philadelphia, on a homestead founded by his grandfather, a Quaker gunsmith, who had followed Penn from England in 1683. In 1760 he graduated at Princeton. After serving an apprenticeship of six years with a doctor in Philadelphia, he went for two years to Edinburgh, where he attached himself chiefly to William Cullen. He took his M.D. degree there in 1768, spent a year more in the hospitals of London and Paris, and began practice in Philadelphia at the age of twenty-four, undertaking at the same time the chemistry class at the Philadelphia medical college. He was a friend of Franklin, a member of Congress for the state of Pennsylvania in 1776, and one of those who signed the Declaration of Independence the same year. He had already written on the Test Laws, "Sermons to the Rich," and on negro slavery; and in 1774 he started along with James Pemberton the first anti-slavery society in America, and was its secretary for many years. In 1787 he was a member of the Pennsylvania convention which adopted the Federal constitution, and thereafter he retired from public life, and gave himself up wholly to medical practice. In 1789 he exchanged his chemistry lectureship for that of the theory and practice of physic; and when the medical college, which he had helped to found, was absorbed by the university of Pennsylvania in 1791 he became professor of the institutes of medicine and of clinical practice, succeeding in 1796 to the chair of the theory and practice of medicine. He gained great credit when the yellow fever devastated Philadelphia, in 1793, by his assiduity in visiting the sick, and by his bold and apparently successful treatment of the disease by bloodletting. He died in Philadelphia on the 19th of April 1813, after a five days' illness from typhus fever. His son Richard is separately noticed. Another son, James (1786-1869), was a physician, and author of various books, such as *Philosophy of the Human Voice* (1827) and *Analysis of the Human Intellect* (1865).

Benjamin Rush's writings covered an immense range of subjects, including language, the study of Latin and Greek, the moral faculty, capital punishment, medicine among the American Indians, maple sugar, the blackness of the negro, the cause of animal life, tobacco smoking, spirit drinking, as well as many more strictly professional topics. His last work was an elaborate treatise on the *Diseases of the Mind* (1812). He is best known by the five volumes of *Medical Inquiries and Observations*, which he brought out at intervals from 1789 to 1798 (two later editions revised by the author). See eulogy by his friend Dr David Hosack (*Essays*, i. New York, 1824), with biographical details taken from a letter of Rush to President John Adams; also references in the works of Thacker, Gross and Bowditch on the history of medicine in America. His part in the yellow fever controversies is indicated by La Roche (*Yellow Fever in Philadelphia from 1699 to 1854*, 2 vols., Philadelphia, 1855) and by Bancroft (*Essay on the Yellow Fever*, London, 1811). His services as an abolitionist pioneer are recorded in Clarkson's *History of the Abolition of the African Slave Trade*.

**RUSH, RICHARD** (1780-1859), American statesman and diplomatist, son of Dr Benjamin Rush, was born in Philadelphia, Pennsylvania, on the 29th of August 1780. He graduated at Princeton in 1797, and was admitted to the bar in 1800. He was attorney-general of Pennsylvania in 1811, comptroller of the treasury of the United States in 1811-14, attorney-general in the cabinet of President James Madison in 1814-17,

acting secretary of state from March to September 1817, minister to Great Britain in 1817-25, secretary of the treasury in the cabinet of President J. Q. Adams in 1825-29, and candidate for vice-president on the Adams ticket in 1828. In 1818, while minister to Great Britain, he, in association with Albert Gallatin, concluded with British plenipotentiaries the important treaty which determined the boundary line between the United States and Canada from the Lake of the Woods to the Rocky Mountains and provided for the joint occupation of Oregon for ten years. He also conducted the negotiations with Canning in 1823 relating to the S. American policy of the Holy Alliance. He followed the Adams-Clay faction of the Democratic-Republican party in the split of 1825-28, but returned to the Democratic party about 1834 on the bank issue. In 1835 he and Benjamin C. Howard, of Baltimore, Maryland, were sent by President Jackson to prevent an outbreak of hostilities in the Ohio-Michigan boundary dispute. In 1836-38 Rush was commissioner to receive the Smithsonian legacy (see **SMITHSONIAN INSTITUTION**), and in 1847-49 he was minister to France. He died at Philadelphia on the 30th of July 1859.

He published *A Narrative of a Residence at the Court of London from 1817 to 1825* (2 vols., 1833-45; all editions after the first edition of the 1st volume are entitled *Memoranda of a Residence, &c.*); *Washington in Domestic Life* (1837), compiled from letters written by Washington to his private secretary in 1790-98; and *Occasional Productions, Political, Diplomatic and Miscellaneous* (1860); and while attorney-general he suggested the plan for the compilation, *Laws of the Nation* (5 vols., 1815), edited by John B. Colvin.

**RUSH**. Under the name of rush or rushes, the stalks or hollow stem-like leaves of several plants have minor industrial applications. The common rushes (species of *Juncus*; see **JUNCACEAE**) are used in many parts of the world for chair-bottoms, mats and basket-work, and the pith serves as wicks in open oil-lamps and for tallow candles—whence rushlight. The fibrous stems and leaves of the bulrush or reed-mace, *Typha angustifolia*, are used in N. India for ropes, mats and baskets. *Scirpus* and other Cyperaceae are used for chair-bottoms, mats and thatch; the rush mats of Madras are made from a species of *Cyperus*. The sweet-rush, yielding essential oil, is a grass, *Andropogon Schoenanthus*, known also as lemon grass. Large quantities of the "horse-tail," *Equisetum hiemale*, are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces on account of the large proportion of silica the plant contains. Flowering rush is *Bulotus umbellatus* (see **ALISMACEAE**); wood-rush is the common name for *Luzula* (see **JUNCACEAE**). *Acorns Calamus*, sweet-flag, is also known as sweet-rush.

**RUSHDEN**, an urban district in the E. parliamentary division of Northamptonshire, England, 66 m. N.N.W. from London by the Midland railway. Pop. (1901) 12,453. The church of St Mary is a fine cruciform building with western tower and spire. It is mainly decorated, with perpendicular additions, but retains some Early English details. The growth of Rushden as a town is modern. The industrial population is employed in boot and shoe making, the local staple.

**RUSHWORTH, JOHN** (c. 1612-1690), the compiler of the *Historical Collections* commonly described by his name, was the son of Lawrence Rushworth of Acklington Park, Warkworth, Northumberland. When he was given the degree of M.A. at Oxford in 1649, he was said to belong to Queen's College, but there are no traces of his presence at the university. He was bred to the law, and in 1638 was appointed solicitor to the town of Berwick. He was enrolled in Lincoln's Inn in 1641, and was called to the bar in 1647. He made a point of attending on all public occasions of a political and judicial character, such as proceedings before the Star Chamber or the Council, and of making shorthand notes of them. On the 25th of April 1649 he was appointed an assistant clerk to the House of Commons. He was on duty when King Charles I. came down to arrest the five members on the 4th of January 1642, and made notes of his speech. The king insisted on taking the notes, and ordered them to be published. Rushworth

attended the trial of the earl of Strafford, and took shorthand notes of the proceedings. He was much employed as a messenger between the king and the parliament, and from the 11th of April 1644 till the 9th of March 1647 was licenser of pamphlets. When the new model army was formed he was appointed secretary to the parliamentary general, Sir Thomas Fairfax. He was present at the battle of Naseby, of which he wrote an account. When Fairfax, who was offended by the execution of the king, resigned his command, Rushworth was for a short time secretary to Cromwell. He was afterwards employed by the council of state and during the protectorate, and sat in Cromwell's parliament for Berwick. When Richard Cromwell resigned the protectorate, Rushworth was employed by the Rump after it had been re-established by Monk. He made his peace with the government of Charles II., and though he was threatened with trial as a regicide he was not seriously molested. During the reign of Charles II. he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts, but the colony complained that it received no advantage from his services. During the last years of his life he fell into poverty, and from 1684 till his death on the 12th of May 1690 he was a resident in the King's Bench prison. At this time he had destroyed his memory by over-indulgence in drink. The collection of papers which he made was published in eight volumes folio between 1699 and 1701. The volumes from the fourth onwards appeared after his death. The first, which appeared with a dedication to Richard Cromwell, was recalled and the dedication was suppressed.

**RUSKIN, JOHN** (1819-1900), English writer and critic, was born in London, at Hunter Street, Brunswick Square, on the 8th of February 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732-1780). In *Præterita* the author professes small knowledge of his ancestry. But the memoirs published on the authority of the family trace their descent to the Adairs and Agnews of Galloway. In this family tree are men famous in arms and in the public service: Sir Andrew Agnew of Lochnaw, Admiral Sir John Ross, Field-Marshal Sir Hew Dalrymple Ross, Dr John Adair, in whose arms Wolfe died at Quebec, and the Rev. W. Tweeddale of Glenluce, to whom the original covenant, now in the Glasgow Museum, had been confided. The name Ruskin is said to be a variant of Erskine, or Roskeen, or Rogerkin, and even Roughskin. It is more probably Rusking, an Anglian family, which passed northwards and became Ruskyn, Rusken and Ruskin.

John Ruskin, the author's grandfather, a handsome lad of twenty, ran away with Catherine Tweeddale, daughter of the Covenanted minister and of Catherine Adair, then a beautiful girl of sixteen. He settled in Edinburgh and engaged in the wine trade, lived liberally in the cultivated society of the city, lost his health and his fortune, and ended his days in debt. His son, John James Ruskin (1785-1864), father of the author, was sent to the High School at Edinburgh under Dr A. Adam, received a sound classical education, and was well advised by his friend Dr Thomas Brown, the eminent metaphysician. When of age, John James was sent to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford & Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. John James Ruskin, a typical Scot, of remarkable energy, probity and foresight, built up a great business, paid off his father's debts, formed near London a most hospitable and cultured home, where he maintained his taste for literature and art, and lived and died, as his son proudly wrote upon his tomb, "an entirely honest merchant." He was also a man of strong brain, generous nature and fine taste. After a delay of nine years, having at last obtained an adequate income, he married his cousin, Margaret Cox, who had already lived for eighteen years with his mother, the widow of John

Ruskin of Edinburgh. When this marriage of the two cousins, who had known much of each other all their lives, took place in 1818, neither of them was young. John James was thirty-three and Margaret was thirty-seven. In the following year (8th February 1819) their only child, John, was born in Hunter Street, London.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. She was the daughter of Captain Cox, of Yarmouth, master mariner in the herring fishery, who died young; whereupon his widow maintained herself as landlady of the King's Head Inn at Croydon. Her younger daughter married Mr Richardson, a baker, of Croydon; the elder, Margaret, married John James Ruskin. Jessie, a sister of John James, married Peter Richardson, a tanner, of Perth, so that the author had cousins of two Richardson families, unconnected with each other. In his own memoirs he speaks much more of these than of any Ruskins, Tweeddals, Adairs or Agnews. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At five the child was taken to Keswick; at six to Paris, Brussels and Waterloo; at seven to Perthshire. At fourteen he was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye.

His first letter is dated 1823, when he was only four. In it he corrects his aunt, who had put up the wooden pillars of his Waterloo bridge "upside down." At five he was a book-worm. At seven he began a work in four volumes, with "copper-plates printed and composed by a little boy, and also drawn." His first poem, correct in rhyme and form, was written before he was seven. At nine he began "Eudasia, a poem of the Universe." From that year until his Newdigate Prize, at the age of twenty, he wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley. What remain of these effusions have no special quality except good sense, refined feeling, accuracy of phrase, and a curious correctness of accent and rhythm. Of true poetry in the higher sense there is hardly a single line.

His schooling was irregular and not successful. At the age of eleven he was taught Latin and Greek by Dr Andrews, a scholar of Glasgow University. About the same time he had lessons in drawing and in oil painting from Runciman. French and Euclid were taught by Rowbotham. At fifteen he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at seventeen he attended some courses in

literature at King's College, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naïf and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius. As a child he had been "a savant in petticoats"; as a boy he was a poet in breeches. At the age of seventeen he saw Adèle, the French daughter of Monsieur Domecq, Mr Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious youth was not a possible *parti*. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the dangerous illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and was one day to be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Though he never became either a scholar or a mathematician, he did enough accurate work to be placed in the honorary fourth class both in classics and in mathematics. By the young bloods of the "House" he was treated pleasantly as a raw outsider of genius. By some of the students and tutors, by Liddell, Newton, Acland and others, he was regarded as a youth of rare promise, and he made some lifelong friendships with men of mark and of power. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephants," which he recited in the Sheldonian Theatre (June 1830). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his twenty-fourth year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art and of literature. Long before Ruskin published books he had appeared in print. In March 1834, when he was but fifteen, Loudon's *Magazine of Natural History* published an essay of his on the strata of mountains and an inquiry as to the colour of the Rhine. He then wrote for Loudon's *Magazine of Architecture*, and verses of his were inserted in Messrs Smith & Elder's *Friendship's Offering*, by the editor, T. Pringle, who took the lad to see the poet Rogers. At seventeen he wrote for *Blackwood* a defence of Turner, which the painter, to whom it was first submitted, did not take the trouble to forward to the magazine. At eighteen he wrote a series of papers, signed Kata Phusin, i.e. "after Nature," for Loudon's *Magazine*, on "The Poetry of Architecture." In 1838 (he was then nineteen) Mr Loudon wrote to the father, "Your son is the greatest natural genius that ever it has been my fortune to become acquainted with."

Having recovered his health and spirits by care and foreign travel, and having taken his degree and left Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of

Turner, which was to become his first work. *Modern Painters*, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It produced a great and immediate sensation. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his *Modern Painters*, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the *Quarterly Review* and other periodicals, and in 1849 (*act.* 30) he published *The Seven Lamps of Architecture*, with his own etchings, which greatly increased the reputation acquired by his *Modern Painters*.

On the 10th of April 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which *The Seven Lamps* was the first fruit, turned him from Turner and *Modern Painters*. He planned a book about Venice in 1845, and *The Stones of Venice* was announced in 1840 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of *The Stones of Venice* appeared (*act.* 32). It was by no means a mere antiquarian and artistic study. It was a concrete expansion of the ideas of *The Seven Lamps*—that the buildings and art of a people are the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a sermon in stones," "a singular sign of the times," "a new Renaissance." It appeared in the same year with the *Construction of Sheepfolds*—a plea for the reunion of Christian churches—in the same year with the essay on *Pre-Raphaelitism*, the year of Turner's death (19th December). *The Stones of Venice* was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of *Modern Painters* by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modern preference for the mechanical and unnatural *chiaroscuro* of photogravure—the successor and destroyer of the graver's art. Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds mountains, landscapes, towers.

churches, trees, flowers and herbs were drawn with wonderful precision, minuteness of detail and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 *The Stones of Venice* was completed at Herne Hill, and he began a series of *Letters and Notes* on pictures and architecture. In this year (æd. 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner, and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in *A Joy for Ever*. Some other lectures are reprinted in *On the Old Road and The Two Paths* (1859). These lectures did not prevent the issue of various *Notes* on the Royal Academy pictures and the Turner collections; works on the *Harbours of England* (1856); on the *Elements of Drawing* (1857); the *Elements of Perspective* (1859); and at last, after prolonged labour, the fifth and final volume of *Modern Painters* was published in 1860 (æd. 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called; indeed, this was the last of his regular works in substantial form. The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life. And his teaching was embodied in an enormous series of *Lectures, Letters, Articles, Selections* and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined Mr F. D. Maurice, Mr T. Hughes, and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the *Cornhill Magazine* until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as *Unto this Last*. In the same year he wrote four papers in the same sense in *Fraser's Magazine*, then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title *Munera Pulveris*. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia: they contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and failing in sight, to whom came as a companion their cousin, Joanna Ruskin Agnew, afterwards Mrs Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of *Sesame and Lilies* (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with *Fors*, the most complete sketch of his conception of the place of woman in modern society. In the very characteristic preface to the new edition of 1871 he

proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of *Ethics of the Dust*; and this was followed by a more important and popular work, *The Crown of Wild Olive*. This in its ultimate form contained lectures on "Work," "Traffic," "War," and the "Future of England." It was one of his most trenchant utterances, full of fancy, wit, eloquence and elevated thought. But a more serious volume was *Time and Tide* (1867), a series of twenty-five letters to a workman of Sunderland, upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued the *Queen of the Air*, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the university of Oxford. He now entered on his professional career, which continued with some intervals down to 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Mr Arthur Severn. In that year he bought from Mr Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of the most eventful years of his life, he began *Fors Clavigera*, a small serial addressed to the working men of England, and published only by Mr George Allen, engraver, at Keston, in Kent, at 7d., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral and religious reflections interspersed with casual thoughts about persons, events and art. *Fors* means alternatively Fate, Force or Chance, bearing the *Clavis*, Club, Key or Nail, i.e. power, patience and law. It was a desultory exposition of the Ruskinian ideal of life, manners and society, full of wit, play, invective and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St George's Guild," himself contributing £7000, the object of which was to form a model industrial and social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connexion with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in Mr E. T. Cook's *Studies in Ruskin* (1890), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town. In *Fors*, which was continued month by month for seven years, Ruskin poured out his thoughts, proposals and rebukes on

society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1878 (*æt.* 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*, the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures; but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aratra Pentelici*, *The Eagle's Nest*, *Lose's Meine*, *Ariadne Florentina*, *Val d'Arno*, *Proserpina*, *Deucalion*, *The Laws of Fesolè*, *The Bible of Amiens*, *The Art of England and The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Præterita*, a desultory autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4000 a year, and at times on the sale of his pictures and realizable property. In 1874 a correspondent had remonstrated with him in vain as to taking "usury," i.e. interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*. Until 1880 he continued to write chapters of *Præterita*, which was designed to record memories of his life down to the year 1875 (*æt.* 56). It was, in fact, only completed in regular series down to 1858 (*æt.* 30), with a separate chapter as to Mrs Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifty years. But he has left nothing more graceful, naive and pathetic than his early memories in *Præterita*—a book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and preface words to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible. And now the whole of his writings are under the control of Mr George Allen, in several forms and prices, including a cheap series at 5s. per volume.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership of numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation

in Great Britain and the United States. Many volumes about his career and opinions were issued in his lifetime both at home and abroad. His 80th birthday, 8th February 1899, was celebrated by a burst of congratulations and addresses, both public and private. His strength failed gradually; his mind remained feeble but unclouded, and his spirit serene. An attack of influenza struck him down, and carried him off suddenly after only two days' illness, 20th January 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Ruskin's literary life may be arranged in three divisions. From 1837 to 1860 (*æt.* 18 to 41) he was occupied mainly with the arts. From 1860 to 1871 (*æt.* 41 to 52) he was principally occupied with social problems. From 1871 to 1885 (*æt.* 52 to 66) he was again drawn back largely to art by his lectures as professor, whilst prosecuting his social Utopia by speech, pen, example and purse. But the essential break in his life was in 1860, which marks the close of his main works on art and the opening of his attempt to found a new social gospel. With regard to his views of art, he himself modified and revised them from time to time; and it is admitted that some of his judgments are founded on imperfect study and personal bias. But the essence of his teaching has triumphed in effect, and has profoundly modified the views of artists, critics and the public, although it is but rarely accepted as complete or final. The moral of his teaching—that all living art requires *truth, nature, purity, earnestness*—has now become the axiom of all æsthetic work or judgment. John Ruskin founded the Reformation in Art.

With regard to his economic and social ideas there is far less general concurrence, though the years that have passed since *Unto this Last* appeared have seen the practical overthrow of the rigid plutonomy which he denounced. So, too, the vague and sentimental socialism which pervades *Munera Pulveris*, *Time and Tide* and *Fors* is now very much in the air, and represents the aspirations of many energetic reformers. But the negative part of Ruskin's teaching on economics, social and political problems, has been much more effective than the positive part of his teaching. It must be admitted that nearly the whole of his practical experiments to realize his dreams have come to nothing, which is not unnatural, seeing his defiance of the ordinary habits and standards of the world. A more serious defect was his practice of violently assailing philosophers, economists and men of science, of whom he knew almost nothing, and whom he perversely misunderstood: men such as Adam Smith, Comte, Mill, Spencer, Darwin and all who followed them. In art, Ruskin had enjoyed an unexampled training, which made him a consummate expert. In philosophy and science he was an amateur, seeking to found a new sociology and a Utopian polity out of his own inner consciousness and study of nature, of poetry and the Bible. It is not wonderful if, in doing this, he poured forth a quantity of crude conceits and some glaring blunders. But in the most Quixotic of his schemes, and the most Laputan of his theories, his pure and chivalrous nature, his marvellous insight into the heart of things and men, and his genius to seize on all that is true, real and noble in life, made his most startling proposals pregnant with meaning, and even his casual play full of fascination and moral suggestion.

In mastery of prose language he has never been surpassed, when he chose to curb his florid imagination and his discursive eagerness of soul. The beauty and gorgeous imagery of his art works bore away the public from the first, in spite of their heretical dogmatism and their too frequent extravagance of rhetoric. But his later economic and social pieces, such as *Unto this Last*, *Time and Tide*, *Sesame and Lilies*, are composed in the purest and most lucid of English styles. And many of his simply technical and explanatory notes have the same quality. Towards the close of his life, in *Fors* and in *Præterita*, will be found passages of tenderness, charm and subtlety which have never been surpassed in our language.

Ruskin's life and writings have been the subject of many works composed by friends, disciples and admirers. The principal is the *Life* by W. C. Cullingwood, his friend, neighbour and secretary (1900). His pupil, Mr E. T. Cook, published his *Studies in Ruskin* in 1890, with full details of his career as professor. Mr J. A. Hobson, in *John Ruskin, Social Reformer* (2nd ed., 1899), has elaborately discussed his social and economic teaching, and claims him as "the greatest social teacher of his age." An analysis of his works has been written by Mrs Meynell (1900). His art theories have been discussed by Professor Charlès Waldstein of Cambridge in *The Work of John Ruskin* (1894), by Robert de la Sizeranne in *Ruskin et la religion de la beauté* (1897), and by Professor H. J. Brumhes of Fribourg in *Ruskin et la Bible* (1901). The monumental "library edition" of Ruskin's works (begun in 1903), prepared by Mr E. T. Cook, with Mr A. Wedderburn, is the greatest of all the tributes of literary admiration. (F. HA.)

**RUSSELL (FAMILY).** The great English Whig house of the Russells, earls and dukes of Bedford, rose under the favour of Henry VIII. Obscure genealogists have traced their

lineage from "Hugh de Rozel," *alias* "Hugh Bertrand, lord of le Rozel," a companion of the Conqueror, padding their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undoubted ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as burgess to the parliament of 1395, and one William Russell was returned for King's Melcombe in 1340. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry Russell was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as *alias* Henry Gascoign, gentleman, and it is therefore probable that the ducal house of Bedford springs from a family of Gascon wine-merchants settled in a port of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with Elizabeth Hering, one of the two daughters and co-heirs of John Hering of Chaldon Hering, a Dorsetshire squire of old family, heir of the Winterbournes of Winterbourne Clenston and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1450, had his seat at Berwick in Swyre, he and his son and heir, James Russell, being buried in the parish church of Swyre.

Thus John Russell, son and heir of James, was born in a family of squire's rank, whose younger branches went on for many generations as merchants and shipowners at Weymouth. A happy accident is said to have brought him to court. The archduke Philip, son of the emperor Maximilian, was driven by heavy weather into Weymouth, whence Sir Thomas Trenchard had him escorted to the king at Windsor. According to tradition, John Russell, Trenchard's young kinsman, was lately home from his travels with a knowledge of foreign tongues, those travels being probably made in the mercantile interests of his family. As travelling companion, or as a spy upon the strange guests, young Russell was sent with the archduke, who is said to have commended him to King Henry. Certain it is that on the accession of Henry VIII. John Russell advanced rapidly, serving the crown as soldier and as diplomatic agent. He fought well at Théroutanne, saw the Field of Cloth-of-Gold and the French disaster at Pavia, lost an eye by an arrow at Morlaix. In 1523 he was knight-marshal of the king's household. In 1526 he married a rich widow, Anne, daughter and co-heir of Sir Guy Sapcotes by the co-heir of Sir Guy Wolston, a match which brought to the Russells the Buckinghamshire estate of Chenies, in whose chapel many generations of them lie buried. His peerage as Lord Russell of Chenies dated from 1539, and in the same year he had the Garter. Having held many high offices—lord high admiral, lord president of Devon, Cornwall, Dorset and Somerset, and lord privy seal—he was named by Henry VIII. as one of his executors. At the crowning of Edward VI. he was lord high steward, and after his defeat of the western rebels was raised, in 1550, to the earldom of Bedford. Queen Mary, like her brother, made him lord privy seal, although he is said to have favoured that Reformation which enriched him. He died in London in 1555, leaving to his son a vast estate of church lands and lands forfeited by less successful navigators of the troubled sea of Tudor politics. In the west he had the abbey lands of Tavistock, which give a marquess's title to his descendants. In Cambridgeshire he had the abbatial estate of Thorney, in Bedfordshire the Cistercian house of Woburn, now the chief seat of the Russells. In London he had Covent Garden with the "Long Acre." Thus the future wealth of his house was secured by those "immoderate grants" which made

a text for Edmund Burke's furious attack upon a duke of Bedford.

He left an only son, Francis, second earl of Bedford, K.G. (c. 1527-1585), who, being concerned in Wyatt's plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in 1557, and was employed by Queen Mary before her death. Under Queen Elizabeth he governed Berwick, and was lord-lieutenant of the northern counties. Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in 1627. The fourth son, William, created Lord Russell of Thornhaugh in 1603, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing, and was from 1594 to 1597 lord-deputy of Ireland. He died in 1613, leaving an only son, Francis, who in 1627 succeeded his cousin as fourth earl of Bedford. This earl built the square of Covent Garden, and headed the "undertakers" who began the scheme for draining the great Fen Level. He opposed the king in the House of Lords, but might have played a part as mediator between the sovereign and the popular party who accepted his leadership had he not died suddenly of the smallpox in 1641 on the day of the king's assent to the bill for Strafford's attainder. William, the eldest surviving son, succeeded as fifth earl, Edward, the youngest son, being father of Edward Russell (1653-1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in 1697 earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St Edward's staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in 1683. In 1694 he was created duke of Bedford and marquess of Tavistock, titles to which his grandson, Wrothesley Russell, succeeded in 1700. The "patriot" Lord Russell had added to the family estates by his marriage with Rachel, daughter and co-heir of Thomas Wrothesley, the fourth earl of Southampton, from whom she finally inherited the earl's property in Bloomsbury, with Southampton House, afterwards called Bedford House. Her son, the second duke of Bedford, married the daughter of a rich citizen, John Howland of Streatham, a match strangely commemorated by the barony of Howland of Streatham, created for the bridegroom's grandfather, the first duke, in 1695. The third duke, another Wrothesley Russell (1708-1732), died without issue, his brother John (1710-1771) succeeding him. This fourth duke, opposing Sir Robert Walpole, became, by reason of his rank and territorial importance, a recognized leader of the Whigs. In the duke of Devonshire's administration he was lord-lieutenant of Ireland, and he served as lord high constable at the coronation in 1760. His son Francis, styled marquess of Tavistock, was killed in 1767 by a fall in the hunting field, and Lord Tavistock's son Francis (1765-1802) became the fifth duke. This was the peer whom Burke, smarting from a criticism of his own pension, assailed as "the Leviathan of the creatures of the crown," enriched by grants that "outraged economy and even staggered credibility." He pulled down Bedford House, built by Inigo Jones, Russell Square and Tavistock Square rising on the site of its gardens and courts. Dying unmarried, he was succeeded by his brother John, the sixth duke (1766-1839), whose third son was the statesman created in 1861, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of "Lord John," and ambassador at Berlin from 1871 to his death in 1884, was created Lord Amphil in 1881. Herbrand Arthur Russell (b. 1858), the eleventh duke and fifteenth earl, succeeded an elder brother in 1893. (O. B.A.)

RUSSELL, ISRAEL COOK (1852- ), American geologist, was born at Garrattsville, New York, on the 10th of December 1852. He graduated at New York University in 1872, and later studied at the School of Mines, Columbia, where he was assistant professor of geology from 1875-77. He was assistant

Geologist on the United States Geographical and Geological Surveys in 1878, and in 1880 became attached to the Geological Survey of the United States. In 1892 he was appointed professor of geology in the university of Michigan.

His publications include *Sketch of the Geological History of Lake Lakemans* (1885); *The Newark System* (Bulletin No. 85 U.S. Geol. Survey, 1892); *Present and Extinct Lakes of Nevada* (1896); *Glaciers of North America* (1897); *Volcanoes of North America* (1897); *Glaciers of Mount Rainier* (Ann. Rep. U.S. Geol. Survey, 1898); and *North America* (1900).

**RUSSELL, JOHN** (1745-1806), British portrait painter in pastel, was born at Guildford, Surrey. At an early age he entered the studio of Francis Cotes, R.A., from whom he derived his artistic education, and set up his own studio in 1767. Russell was a man of remarkable religious character, a devout follower of Whitefield. He began an elaborate introspective diary in Byrom's shorthand in 1766 and continued it to the time of his death. In it he records his own mental condition and religious exercises, entering with a certain morbid ingenuity into long disquisitions, and only occasionally recording information concerning his sitters. His religious life is the key to his complex character, as it actuated his whole career. He obtained the gold medal at the Royal Academy for figure drawing in 1770 and exhibited from the beginning of the Academy down to 1805. He was the finest painter in crayons England ever produced, and although he painted in oil, in water-colours and in miniature, it was by his works in crayon that his reputation was made. He wrote the *Elements of Painting in Crayons*, and described in it his method. He made his own crayons, blending them on his pictures by a peculiar method termed "sweetening." This he carried out with his fingers, rubbing in the colours and softening them in outline, uniting colour to colour so accurately that they melt into one another with a characteristic cadence. His pastel work is to oil painting "what the vaudeville is to the tragedy or the sonnet to the epic." His colours were pure and his blending so perfect that no change is to be seen in his works since they were executed. Sir Joseph Banks, writing in 1789 respecting his portraits of the president, of Lady, Mrs and Miss Banks, stated that "the oil pictures of the present time fade quicker than the persons they are intended to present, but the colours made use of by Russell will stand for ever," and in that prophecy is so far justified.

An important picture by him hangs in the Louvre ("Child with Cherries"), and two, including "The Old Bathing Man at Brighton," are owned by the crown. At the Royal Academy, of which he was a member, he exhibited three hundred and thirty works, and his portraits were engraved by Collyer, Turner, Heath, Dean, Bartolozzi, Trotter and other prominent engravers. Russell received warrants of appointment to the king, queen, prince of Wales and the duke of York. He was interested in astronomy, a friend of Sir W. Herschell, and no mean mathematician. He drew an exceedingly accurate map of the moon, and invented a piece of complicated mechanism for exhibiting its phenomena, publishing a pamphlet, illustrated by his own drawings, describing the apparatus.

Two of his sons inherited their father's talent, and one of them, William (1780-1870), exhibited five fine portraits in the Royal Academy.

See George C. Williamson, *John Russell* (London, 1894).

(G. C. W.)

**RUSSELL, JOHN** (d. 1494), English bishop and chancellor, was admitted to Winchester College in 1443, and in 1449 went to Oxford as fellow of New College. He resigned his fellowship in 1462, and appears to have entered the royal service. In April 1467 and January 1468 he was employed on missions to Charles the Bold at Bruges. He was there again in February 1470 as one of the envoys to invest Charles with the Garter: the Latin speech which Russell delivered on this last occasion was one of Caxton's earliest publications, probably printed for him at Bruges by Colard Mansion (see Blades, *Life of Caxton*, i. p. vii, li. 29-31). In May 1474 he was promoted to be keeper of the privy seal, and retained his office even after his

consecration as bishop of Rochester on the 22nd of September 1476, and translation to Lincoln on the 9th of September 1480. As a trusted minister of Edward IV., he was one of the executors of the king's will; but on the 13th of May 1483 he accepted the office of chancellor in the interest of Richard of Gloucester, apparently with great reluctance. He retained the great seal till the 29th of July 1485. Russell was above all things an official, and was sometimes employed by Henry VII. in public affairs. But his last years were occupied chiefly with the business of his diocese, and of the university of Oxford, of which he had been elected chancellor in 1483. He died at Nettleham on the 30th of December 1494, and was buried at Lincoln Cathedral.

Sir Thomas More calls Russell "a wise manne and a good, and of much experience, and one of the best-learned men, undoubtedly, that England had in hys time." Two English speeches composed by Russell, for the intended parliament of Edward V., and the first parliament of Richard III., are printed in Nichols's *Grants of Edward V.* (Camden Soc.). Some other writings of less interest remain in manuscript.

For contemporary notices see especially More's *Life of Richard III.*, the *Continuation of the Croyland Chronicle*, ap. Freeman *Scriptores*, and Bentley's *Excerpta Historica*, pp. 16-17. See also Wood's *History and Antiquities of the University of Oxford*, and T. Kirby, *Winchester Scholars*, and *Annals of Winchester College*. There are modern biographies in Campbell's *Lives of the Chancellors*, and Foss's *Judges of England*. (C. L. K.)

**RUSSELL, JOHN RUSSELL, 1ST EARL** (1792-1878), British statesman, third son of the 6th duke of Bedford, by Georgiana Elizabeth Byng, second daughter of the 4th Viscount Torrington, was born in London on the 18th of August 1792. He was sent to a private school at Sunbury in 1800, and from 1803 to 1804 he was at Westminster School, but was then withdrawn on account of his delicate health. From 1805 to 1808 he was with a private tutor at Woodnesborough, near Sandwich. After travelling in Scotland and in Spain, he studied from the autumn of 1809 to 1812 at the university of Edinburgh, then the academic centre of Liberalism, and dwelt in the house of Professor John Playfair. On leaving the university, he travelled in Portugal and Spain, but on the 4th of May 1813 he was returned for the ducal borough of Tavistock and thereupon came back to England.

In foreign politics Lord John Russell's oratorical talents were especially shown in his struggles to prevent the union of Norway and Sweden. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the causes of the discontent at home should be removed by remedial legislation. When failure attended all his efforts he resigned his seat for Tavistock in March 1817, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends, and especially by a poetic appeal from his friend Tom Moore. In the parliament of 1818-20 he again represented the family borough in Devon, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820-26) of George IV. he sat for the county of Huntingdon, and secured in 1821 the disfranchisement of Grampound, but the seats were not transferred to the constituency which he desired. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire into their operations, and after this decisive victory they were repealed (9th of May 1828). He warmly supported the Wellington ministry when it realized that the king's government could only be carried on by the passing of a Catholic Relief Act (April 1829). For the greater part of the short-lived parliament of 1830-31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and when Lord Grey's

Reform ministry was formed, in November 1830, Lord John Russell accepted the office of paymaster-general without a seat in the cabinet. This exclusion was the more remarkable in that he was chosen (1st of March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given its formal sanction. The Whig ministry was soon defeated, but an appeal to the country increased the number of their adherents, and Lord John Russell was returned by the freeholders of Devon. After many a period of doubt and defeat, "the bill, the whole bill, and nothing but the bill" passed into law (7th of June 1832), and Lord John stood forth in the mind of the people as its champion. After the passing of the Reform Bill he sat for the S. division of Devon, and continued to retain the place of paymaster-general in the ministries of Lord Grey and Lord Melbourne. The former of these cabinets was broken up by the withdrawal of Mr Stanley, afterwards Lord Derby.

Lord John Russell had visited Ireland in the autumn of 1833 and had come back with a keen conviction of the necessity for readjusting the revenues of the Irish church. To these views he gave expression in a debate on the Irish Tithe Bill (May 1834), whereupon Stanley, with the remark that "Johnny has upset the coach," resigned his place. The latter was abruptly, if not rudely, dismissed by William IV. when the death of Lord Spencer promoted the leader of the House of Commons, Lord Althorp, to the peerage, and Lord John Russell was proposed as the spokesman of the ministry in the Commons (Nov. 1834). At the general election which ensued the Tories received a considerable accession of strength, but not sufficient to ensure their continuance in office, and the adoption by the House of Commons of the proposition, that the surplus funds of the Irish church should be applied to general education, necessitated the resignation of Sir Robert Peel's ministry (April 1835). In Lord Melbourne's new administration Lord John Russell became home secretary and leader of the House of Commons, but on his seeking a renewal of confidence from the electors of South Devon, he was defeated and driven to Stroud. The Whig ministry succeeded in passing a Municipal Reform Bill (7th of Sept. 1835), and a settlement of the tithe question in England and Ireland (1836). In May 1839, on an adverse motion concerning the administration of Jamaica, the ministry was left with a majority of five only, and promptly resigned. Sir Robert Peel's attempt to form a ministry was, however, frustrated by the refusal of the queen to dismiss the ladies of the bedchamber, and the Whigs resumed their places with Lord John Russell as secretary of state for the colonies. Their prospects brightened when Sir John Yarde Buller's motion of "no confidence" at the opening of the session of 1840 was defeated by twenty-one, but a similar vote was some months later carried by a majority of one, whereupon the Whig leader announced a dissolution of parliament (June 1841). At the polling-booth his friends sustained a crushing defeat; the return of Lord John Russell for the City of London was almost their solitary triumph.

On Sir Robert Peel's resignation (1846) the task of forming an administration was entrusted to Lord John Russell, and he remained at the head of affairs from July 1846 to Feb. 1852, but his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter (4th of Nov. 1850) on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops weakened the attachment of the "Peelites" and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Mr Locke King's County Franchise Bill in February 1851, it could not divest itself of office. Lord Palmerston's unauthorized recognition of the French *coup d'état* was followed by his dismissal from the post of foreign secretary (Dec. 1851), but he had his revenge in the ejection of his old colleagues in February 1852. During Lord Aberdeen's administration Lord John Russell led the Lower House, at first as foreign secretary (to the 21st of February 1853), then without portfolio, and lastly as president of the council (June

1854). In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop. His popularity was diminished by this failure, and although he resigned in January 1855, on Mr Roebuck's motion for an inquiry into the conduct of the war in the Crimea, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England's representative, and immediately on his return he became secretary of the colonies (May 1855), but the errors in his negotiations at the Austrian capital followed him and forced him to retire in July of the same year.

For some years after this he was the "stormy petrel" of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Lord John Russell consented to become foreign secretary in Lord Palmerston's ministry (1860) and to accept an earldom (July 1861). During the American War Earl Russell's sympathies with the North restrained his country from taking sides in the contest, and he warmly sympathized with the efforts for the unification of Italy, but he was not equally successful in preventing the spoliation of Denmark. On Lord Palmerston's death (October 1865) Earl Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent after this event in the preparation of numberless letters and speeches, and in the composition of his *Recollections and Suggestions* (1873), but everything he wrote was marked by the belief that all philosophy, political or social, was summed up in the Whig creed of fifty years previously. Earl Russell died at Pembroke Lodge, Richmond Park, 28th May 1878.

Earl Russell was twice married—first in 1835, to Adelaide, daughter of Mr Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ana Maria, daughter of Gilbert, second earl of Minto. By the former he had two daughters, by the latter three sons and one daughter. His eldest son, Lord Amberley, who married a daughter of the second Baron Stanley of Alderley, predeceased him on the 9th of January 1876, and their eldest son (b. 1865) succeeded as second Earl Russell.

Lord Russell played some part as an author. His tales, tragedies and essays (including *The Ven. of Arrosa*, 1822, and *Essays and Sketches by a Gentleman who has left his Lodgings*, 1820) are forgotten, but his historical works, *Life of William Lord Russell* (1810), *Memoirs of the Affairs of Europe* (1824-29, 2 vols.), *Correspondence of John, 4th Duke of Bedford* (1842-46, 3 vols.), *Memorials and Correspondence of C. J. Fox* (1853-57, 4 vols.) and *Life and Times of C. J. Fox* (1859-66, 3 vols.) are among the chief authorities on Whig politics. He also edited the *Memoirs, Journal and Correspondence of Thomas Moore* (1853-56, 8 vols.).

The chief biography is that by Sir Spencer Walpole (1891, 2 vols.). The volume by Stuart J. Reid (1895, "Prime Ministers of Queen Victoria" Series) should also be consulted. (W. F. C.)

**RUSSELL, JOHN SCOTT** (1808-1882), British engineer, was born in 1808 near Glasgow, a "son of the manse," and was at first destined for the ministry. But this intention on his father's part was changed in consequence of the boy's early leanings towards practical science. He attended in succession the universities of St Andrews, Edinburgh and Glasgow,—taking his degree in the last-named at the age of sixteen. After spending a couple of years in workshops, he settled in Edinburgh as a lecturer on science, and soon attracted large classes. In 1832-33 he was engaged to give the natural philosophy course at the university, the chair having become vacant by the death of Sir John Leslie. In the following year he began his remarkable series of observations on waves. Having been consulted as to the possibility of utilizing steam-navigation on the Edinburgh & Glasgow canal, he replied that the question could not be answered without experiments, which he was willing to undertake if a portion of the canal were placed at his disposal. The results of this inquiry are to be found in the *Trans. Roy. Soc. Ed.* (vol. xiv.), and in the *British*

*Association Reports* (seventh meeting). The existence of the long wave, or wave of translation, with many of its most important features, was here first recognized, and it was clearly pointed out why there is a special rate, depending on the depth of the water, at which a canal-boat can be towed at the least expenditure of effort by the horse. The elementary mathematical theory of the long wave was soon supplied by commentators on Scott Russell's work, and a more complete investigation was subsequently given by Sir G. G. Stokes. Russell indulged in many extraordinary and groundless speculations, some of which were published in a posthumous volume, *The Wave of Translation* (1885). His observations led him to propose and experiment on a new system of shaping vessels, known as the wave system, which culminated in the building of the "Great Eastern." His activity and ingenuity were also displayed in many other fields,—steam-coaches for roads, improvements in boilers and in marine engines, the immense iron dome of the Vienna Exhibition, cellular double bottoms for iron ships, &c. With Mr Stafford Northcote (afterwards Lord Iddesleigh) he was joint-secretary of the Great Exhibition of 1851; and he was one of the chief founders of the Institution of Naval Architects. He died at Ventnor on the 8th of June 1882.

**RUSSELL, THOMAS** (1762–1788), English poet, was born at Beaminster, early in 1762. He was the son of John Russell, an attorney at Bridport, in Dorsetshire, and his mother was Miss Virtue Brickle, of Shaftesbury. He was educated at the grammar school of Bridport, and in 1777 proceeded to Winchester, where he stayed three years, under Dr Joseph Warton, and Thomas Warton, the professor of poetry. In 1780 Russell became a member of New College, Oxford. He graduated B.A. in 1784 and was ordained priest in 1786. During his residence at the university he devoted himself to French, Italian, Spanish, Portuguese, Provençal and even German literature. His health, however, broke down, and he retired to Bristol hot wells to drink the waters; but in vain, for he died there on the 31st of July 1788. He was buried in Powerstock churchyard, Dorset. In 1789 was published a thin volume, containing his *Sonnets and Miscellaneous Poems*, now a very rare book. It contained twenty-three sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and it is by right of these that Russell takes his place as one of the most interesting precursors of the romantic school. "War, Love, the Wizard, and the Fay he sung"—in other words, he rejected entirely the narrow circle of subjects laid down for 18th-century poets. In this he was certainly influenced both by Chatterton and by Collins. But he was still more clearly the disciple of Petrarch, of Boccaccio and of Camoens, each of whom he had carefully and enthusiastically studied. His sonnet, "Suppos'd to be written at Lemnos," is his masterpiece, and is unquestionably the greatest English sonnet of the 18th century.

The anonymous editor of Russell's solitary volume is said to have been William Howley (1766–1848), long afterwards archbishop of Canterbury, who was a youthful bachelor of New College when Russell, who had been his tutor, died. His memoir of the poet is very perfunctory, and the fullest account of Russell is that published in 1897 by T. Secombe.

**RUSSELL, WILLIAM CLARK** (1844– ), British author, was born at the Carlton House Hotel, New York, on the 24th of February 1844, the son of Henry Russell, author of "Cheer, Boys, Cheer," and other popular songs. He went to school at Winchester, and then at Boulogne, joining the merchant service at thirteen, and serving for eight years. This apprenticeship to a seafaring life was turned to account in a series of stories which have fascinated two generations of boy readers. *John Holdsworth, Chief Mate* (1874), immediately made his reputation. Other successful stories were: *The Wreck of the Grosvenor* (1875), in which he pleaded for better food for English seamen; *The Frozen Pirate* (1877), *An Ocean Tragedy* (1881), *The Emigrant Ship* (1894), *The Ship, Her Story* (1894), *The Convict Ship* (1895), *What Cheer!* (1895), *The Two Captains* (1897), *The Romance of a Midshipman* (1898), *The Ship's*

*Adventure* (1899), *Overdue* (1903), *Abandoned* (1904), *His Island Princess* (1905). He joined the staff of the *Newcastle Daily Chronicle*, and afterwards became a leader writer on the *Daily Telegraph*, but the double labour of journalism and novel-writing threatened his health, and he resigned in 1887. Many of the papers which he contributed to the *Daily Telegraph* were collected in volume form in *Round the Galley Fire* and other volumes. He also wrote a *Life of Lord Collingwood* (1891), and, with W. H. Jacques, *Nelson and the Naval Supremacy of England* (New York, 1890).

**RUSSELL, SIR WILLIAM HOWARD** (1821–1907), English war correspondent, was born at Lilyvale, near Tallaght, in the county of Dublin, on the 28th of March 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity College in 1838. Three years later he was thrown very much on his own resources, but a relative, Mr R. W. Russell, who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. In the following year he was sent by *The Times* to Ireland to report the O'Connell meetings. In 1845 he was appointed to superintend the reports on the Irish railways, and was shortly afterwards sent by *The Times* to inspect the O'Connell property in S.W. Ireland, when his plain speaking drew forth a characteristic tirade from the "Liberator." For a short period in 1847 his services were temporarily transferred to the *Morning Chronicle*, but with that exception he remained permanently connected with *The Times*. He was sent as special correspondent to Denmark in the war of 1849–50. He did not, however, at once relinquish a legal career, and was called to the bar at the Middle Temple in 1851. On the outbreak of the Crimean War in 1853 he went out as special correspondent, and, accompanying the light division to Gallipoli, proceeded with the first detachment to Varna. On the embarkation for the Crimea he was attached to the second division, and landed with it on the 14th of September. He was present at the battle of the Alma on the 20th of September, at the investment of Sevastopol, at Balaklava on the 25th of October and Inkerman on the 5th of November.

Towards the end of May 1855 he accompanied the expedition to Kertch, and did not return to the Crimea until the following August. In September and October he described the attacks on the Malakoff and Redan, the occupation of Sevastopol and the capture of Fort Kinburn. The popularity of *The Times* Crimea correspondence led to its republication in two volumes under the title of *The War, 1855–56*. Russell's letters to *The Times* were mainly responsible for the enlightenment of the public at home as to the conduct of affairs at the scene of action, and his exposure of the mismanagement during the winter of 1854 did more than anything else to cause the downfall of Lord Aberdeen's ministry. In 1856 Russell was sent to Moscow to describe the coronation of the tsar, and in the following year was attached to the headquarters of Lord Clyde in India. He was present at the siege and capture of Lucknow in 1858, the operations in Oude, the battle of Bareilly and the actions in Rohilkhand, and he received the Indian war medal with the Lucknow clasp. The events of those stirring times are vividly recorded in *My Diary in India in 1858–59*. Next year he was sent to Italy, but arrived on the eve of the armistice at Villafranca. On the 7th of January 1860 appeared the first number of the *Army and Navy Gazette*, which he founded, and of which he was editor and principal proprietor. In 1861 Russell proceeded to Washington, and reached M'Dowell's headquarters just before the first battle of Bull Run, and his account of the Federal retreat drew much hostile criticism. He published a full account of the war, in so far as he had witnessed it, in *My Diary, North and South, during the Civil War in America*, 1862. Returning to England in 1863, he remained at home until 1866, when he proceeded to the headquarters of General Benedek and witnessed the battle of Königgrätz, 3rd of July.

During the interval of peace that followed he accompanied the prince of Wales to the Nile, Constantinople, the Crimea and Greece in 1868, and published an account of the tour in the following year, when he also contested the borough of Chelsea unsuccessfully in the Conservative interest. On the outbreak of the Franco-Prussian War in 1870, Russell was with the crown prince from the battle of Wörth, 6th of August, and Sedan, 12th of September, till the capitulation of Paris. His account appeared in 1874 under the title of *My Diary during the Last Great War*. His description of the burning of Paris by the Communards was not the least of his journalistic triumphs. In 1875-76 he was honorary private secretary to the prince of Wales during his tour through India, of which he published an account in 1877. When Lord Wolsey was sent to quell the Zulu rebellion in 1879, Russell was attached to his staff as correspondent. In 1881 he went with the duke of Sutherland's party for a tour in the United States and Canada, described in *Hesperothen*, and in 1882 he was again with Lord Wolsey in the Egyptian campaign. In 1895 he published a personal retrospect entitled *The Great War with Russia*. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He married twice, first in 1846 Miss Burrowes, who died not long afterwards, and secondly in 1884 the Countess A. Malvezzi. He died on the 11th of February 1907.

**RUSSELL, LORD WILLIAM** (1639-1683), English politician, was the third son of the 1st duke of Bedford and was born on the 20th of September 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1678 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons and Geneva, and residing for some while at Augsburg. William's account of his impressions is spirited and interesting. He was at Paris in 1658, but had returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. For a long time he appears to have taken no part in public affairs, but rather to have indulged in the follies of court life and intrigue; for both in 1663 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married Rachel (1636-1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton's niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1773.

It was not until the formation of the "country party," in opposition to the policy of the Cabal and Charles's French-Catholic plots, that Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. His first speech appears to have been on the 22nd of January 1673, in which he inveighed against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and "the ill ministers about the king." He also supported the proceedings against the duke of Buckingham. In 1675 he moved an address to the king for the removal of Danby (see LEEDS, DUKE OF) from the royal councils, and for his impeachment. On the 15th of February 1677, in the debate on the fifteen months' prorogation, he moved the dissolution of parliament; and in March 1678 he seconded the address praying the king to declare war against France. The enmity of the country party against Danby and James, and their desire for a dissolution and the disbanding of the army, were greater than their enmity to Louis. The French king therefore found it easy to form a temporary alliance with Russell, Hollis and the opposition leaders, by which they engaged to cripple the king's power of hurting France and to compel him to seek Louis's friendship,—that friendship, however, to be given only on the condition that they in their turn

should have Louis's support for their cherished objects. Russell in particular entered into close communication with the marquis de Ruvigny (Lady Russell's maternal uncle), who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell himself utterly refused to take any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell appears to have been affected more completely than his otherwise sober character would have led people to expect. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On the 4th of November 1678 he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On the 16th of June he accompanied Shaftesbury, when the latter indicted James at Westminster as a popish recusant; and on the 26th of October he took the extreme step of moving "how to suppress popery and prevent a popish successor"; while on the 2nd of November, now at the height of his influence, he went still further by seconding the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. The statement, made by Echard alone (*Hist. of England*, ii.), that he joined in opposing the indulgence shown to Lord Strafford by Charles in dispensing with the more horrible parts of the sentence of death—an indulgence afterwards shown to Russell himself—is entirely unworthy of credence. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's-breadth.

On the 26th of March 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. It was, however, no doubt at his wish that his chaplain wrote the *Life of Julian the Apostate*, in reply to Dr Hicken's sermons, in which the lawfulness of resistance in extreme cases was defended. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on the 26th of June 1683 to the Tower, and, looking upon himself as a dying man, betook himself wholly to preparation for death. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of

the council Russell, on the 28th of June, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard. The suicide of Essex, the news of which was brought into court during the trial, was quoted as additional evidence against him, as pointing to the certainty of Essex's guilt. On July 19 he was tried at the Old Bailey, his wife assisting him in his defence. Evidence was given by an informer that, while at Shaftesbury's hiding-place in Wapping, Russell had joined in the proposal to seize the king's guard, a charge indignantly denied by him in his farewell paper, and that he was one of a committee of six appointed to prepare the scheme for an insurrection. Howard, too, expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as those of the murder of the king and of rebellion. It will be observed that the legality of the trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, spending his last day on earth as he had intended to spend the following Sunday if he had reached it. He received the sacrament from Tillotson, and Burnet twice preached to him. Having supped with his wife, the parting from whom was his only great trial, he slept peacefully, and spent the last morning in devotion with Burnet. He went to the place of execution in Lincoln's Inn Fields with perfect calmness, which was preserved to the last. He died on the 21st of July 1683, in the forty-fourth year of his age. His attainder was reversed in 1689, and his son Wriothesley (1680-1711) succeeded his grandfather as 2nd duke of Bedford in 1700.

A true and moderate summing-up of his character will be found in his *Life*, by Lord John Russell (1820). (O. A.)

**RUSSELL OF KILLOWEN, CHARLES RUSSELL, BARON** (1832-1900), lord chief-justice of England, was born at Newry, county Down, on the 10th of November 1832. He was the elder son of Arthur Russell, a Roman Catholic gentleman, who was engaged in commerce and brewing in Newry. Educated first at Belfast, afterwards in Newry, and finally at St Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. Disturbances between Roman Catholics and Orangemen were at that time prevalent in this part of Ireland, and in the legal proceedings which ensued at quarter and petty sessions young Russell distinguished himself as a bold and skilful advocate in the cause of his co-religionists. The political zeal which always formed an important element in Russell's character happily harmonized with these professional duties. After practising, however, for two years, he determined to seek a wider field for his abilities,

and to become a barrister in England. It was a wise ambition, early conceived by young Russell, stimulated by his present success, and encouraged by the counsel of at least one competent adviser, Judge Jones, who was much impressed by Russell's ability in the conduct of a case at the Newry quarter sessions. He believed, moreover, that to succeed at the Irish bar he would have (to use his own phrase) to "swallow his convictions." With this end in view Russell, whilst still practising and residing in Belfast, became a student of Trinity College, Dublin. He matriculated there in 1855, and passed examinations from time to time, but did not wait to become a graduate. In 1856 he went to London and became a student of Lincoln's Inn. In 1858 he married, in Belfast, Ellen, the eldest daughter of Dr Mulholland, a physician of distinction in that city. In 1859 he was called to the bar, after gaining by examination a first-class honour certificate, and joined the Northern Circuit. Except some valuable introductions to friends in London and Liverpool, which his uncle, the president of Maynooth, had given to him, Russell brought to the work of his profession no external aids. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a voice which, though not musical, was rich, and responded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornateness or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. His successful advocacy in the Colin Campbell divorce case in 1886, and his famous cross-examination of hostile witnesses and still more famous speech before the Parnell Commission in 1888, afforded perhaps the best examples of Russell's characteristic powers. He was not a learned lawyer in the sense in which Willes, or Mellish, or Blackburn were learned lawyers; he did not possess the fine legal acumen of his great contemporary, Herschell; but he had a sufficient apprehension of legal principles. He handled a point of law with telling directness and force. His argument as the leading counsel for Great Britain in the Bering Sea Arbitration in 1893, and his address at Saratoga Springs on International Law and International Arbitration in August 1896, were expositions of law in its practical application to matters of state which the most learned jurist must admire for their thoroughness and perspicuity.

Russell's success, after he joined the Northern Circuit, did not, of course, come to him at once. For some time his work in court was principally in the Court of Passage at Liverpool, which he regularly attended from London. He wrote a book on its procedure, which was published in 1862. This ancient local court, possessing both common law and Admiralty jurisdiction, had as its presiding judge—then styled "assessor"—an eminent leader of the Northern Circuit, Mr Edward James. Substantial commercial cases were tried there, and of these Russell soon had a goodly portion. Steadily, and, for a barrister, speedily, Russell's fortune grew. His biographer, Mr Barry O'Brien, has given, in *The Life of Lord Russell of Killowen* (1901), an account of Russell's fees, which shows that they were, in round figures: in 1859, £117; in 1862, £1016; in 1866, £2367; and in 1870, £4230. At the beginning of this period Russell wrote occasionally for the newspapers, and especially for the Irish press. From early boyhood onwards he maintained a keen interest in politics, and pre-eminently in the public affairs of Ireland. In 1859 he published a pamphlet entitled *The Catholic in the Workhouse*, and an article from his pen is to be found in *The Dublin Review*, vol. xviii. p. 407. His legal work was not wholly confined to the north of England. He was employed at the Guildhall and elsewhere by solicitors of position in the City of London. He was one of the counsel engaged in

the Windham lunacy case in 1861, and in the action of *Saurin v. Starr* in 1869. In 1865 he argued in *ex parte* Chavasse before Lord Westbury, L.C., and soon afterwards was honoured by him with the offer of a county court judgeship.

In 1872 Russell took "silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. In 1874 Holker became solicitor-general in the Conservative administration. In 1880 Herschell accepted the same office in a Liberal ministry, and about the same time Pope practically left the circuit, to become in a short time one of the most successful advocates at the parliamentary bar. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time will not easily forget the case of *Dixon v. Plimsoll*—a libel action brought by a Liverpool shipowner against Mr S. Plimsoll—tried before Baron Amphlett and a Liverpool special jury, in which Holker won a notable victory for the defendant; or *Nuttall v. Wilde*, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit. At the same time, with all his fighting power, Russell was eminently a sagacious adviser. No barrister knew better how and when to settle a case, where the client's true interest called for a settlement.

In 1880 a new phase of Russell's arduous life began. He was returned to parliament as an independent Liberal member for Dundalk, a constituency which he had twice before unsuccessfully contested. From that time forward until his appointment to a lordship of appeal in succession to Lord Bowen in 1894, he sat in the House of Commons: for Dundalk until 1885, and afterwards for South Hackney, where he was returned as the Liberal member on four successive occasions—once in 1885, twice in 1886, and again in 1892. The entrance into parliament laid upon Russell's time and labour a heavy additional tax. His was a nature which could not, in work or even in pleasure, be content to do anything lightly or by halves. He was essentially a man of action; intensity—at times almost fierce intensity—both of purpose and of devotion to its fulfilment characterized everything he did. Upon such a man parliamentary life between 1880 and 1894 necessarily entailed a severe strain. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Mr Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. He never spared himself. After a long day in the turmoil of the courts, he cheerfully gave a long evening to a distant and often, from the standpoint of personal notoriety, an obscure, platform. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. He wrote to the *Daily Telegraph* a series of letters on the Irish land question, which were afterwards published (1886) in a collected form. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. He was proud of the kingdom in whose might and glory Ireland could claim so large a part; and when, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of that kingdom. "I am absolutely opposed," he said (*The Life*

of Lord Russell of Killowen, p. 194) to the South Hackney voters, "to separation; but, reserving imperial control on all imperial questions, I think Irishmen on Irish soil should have the power of dealing in the way which seems best to them with all questions that concern them." It is impossible to say that Russell's success in the House of Commons, considerable as it was, was comparable to his success as an advocate in the courts of justice. He was listened to, always with respect and often with admiration, but he was not made for a debater; and the position of a law officer has generally not proved favourable to the attainment of parliamentary eminence. In great public affairs the law officer advises and supports, but not for him is the glory of initiating public policy.

Russell's parliamentary duties, fully as he discharged them, first as a private member and afterwards as attorney-general, were not allowed by him to obstruct his professional career. He rapidly became in London what he was already in Lancashire, the favourite leader in *nisi prius* actions. The list of causes *celebres* in the period 1880-94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions from the latter category was the libel action *Bell v. Laves* in 1882, which, after a trial before Baron Huddleston and a special jury lasting more than forty days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. His fees in 1885, the year before he became attorney-general, amounted to nearly £17,000. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888-90, in which Sir Charles Russell appeared as leading counsel for Mr Parnell. The commission held its first sitting on the 22nd of October 1888, and presented its report in February 1890. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Mr Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on the 12th of April. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey of the Irish question during the last century, from the point of view of an Irish Liberal. It was in the same year published after careful revision by its author (1889). The second public transaction was the Bering Sea Arbitration, held in Paris in 1893. Sir Charles Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell, in the course of his very powerful argument before the tribunal, maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain. In recognition of their distinguished services, the queen bestowed upon both the leading representatives of Great Britain the honour of the grand cross of St Michael and St George.

In 1894 Russell's career as an advocate ended. A judgeship, if he had wished it, had been within his reach twelve years before. In 1894, on the death of Lord Bowen, he accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge, to whose memory he devoted in the following September a paper in the *North American Review*. To the discharge of his functions as a judge Russell brought with him all the qualities of intellect and character which had made him so eminent as an advocate, and their greatness was not less conspicuous in his

new position. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompousness, quick without being irritable, and masterful without tyranny. He was scrupulously punctual. Suitors and bearers could not but be impressed by the manifest determination of the lord chief justice to get at the truth, and to do so without waste of time. If this was a fault, it was that of excessive zeal for despatch. When, occasionally, there were flashes of impatience, they were elicited by the exhibition, as he deemed it, of want of preparation, or slovenliness, or verbosity on the part of the advocate before him. Even the youngest and most obscure practitioner could always count upon the assiduous attention of the lord chief justice to a pertinent and thoughtful argument. In 1806 Lord Russell (Pollock B. and Hawkins J. being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. It was a state trial of grave importance. Russell's conduct of it, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1890. Lord Herschell, who had been nominated to act with Lord Justice Collins (afterwards Master of the Rolls), as a British representative on the Commission of Arbitration, of which the distinguished Russian jurist M. Martens was president, died somewhat suddenly in America before the beginning of the proceedings. The lord chief justice accepted the invitation to take the vacant place, and performed his very onerous duty with conspicuous ability.

Nor was it only on the bench or as an international judge that Lord Russell of Killowen sought, during the last years of his busy life, to do service to his country. He signalized his zeal as a law reformer by the public advocacy of radical changes in the system of legal education in the Inns of Court, and by the promotion of measures to put down the vice of secret and illicit commissions in commercial and business life. On the former subject he delivered in 1895 an address in Lincoln's Inn Hall, under the auspices of the Council of Legal Education, which was afterwards printed and published. In 1899, dealing with the latter question, he introduced in the House of Lords a bill, which had its first reading. He again introduced a bill in the session of 1900, which was read a second time, but did not become law. On the 10th of August 1900 the great advocate and great judge passed quietly away at his London residence, after a short illness due to an internal malady.

In private as in public life Russell was always strenuous, and most attracted by things that called for the exercise of activity, whether bodily or intellectual. Inaction he disliked both for himself and in others. Though not an athlete, he took an interest in manly pastimes: he was fond of riding and of breeding horses; he liked being on the racecourse; and he enjoyed games, both of skill and of chance. A student of books he was not; he could lay no claim to wide learning or elegant scholarship; but he could appreciate a good book; he was versed in Shakespeare; and he knew and loved the poetry and the songs of his native land. When he wrote, his style, inornate, clear and forcible, reflected the character of his thought. He was a staunch and sympathetic friend, ever ready, in an unostentatious way, to help, where help was really needed. While he undoubtedly exhibited at times, chiefly during the earlier part of his career, a certain brusqueness and impetuosity of speech and demeanour, those who came into contact with him recognized that such occasional outbursts never sprang from any desire to hurt, or from any unkindness of disposition. In his contests at the bar he never made an enemy. He was a strong man, and he liked to have his way; but he was also large-hearted and without a tinge of rancour in his disposition. He was never offended by opposition. Whilst he did not himself shine as a wit or a humorist in conversation or in after-dinner oratory, he heartily enjoyed fun and humour in others; and, wherever he was, the

force and distinctness of his personality never failed to impress his company. Probably no English lawyer ever excited abroad the admiration which was accorded to Lord Russell of Killowen, alike on the continent of Europe and in America. To the United States he paid two visits, the first in 1883 and the second in 1896. On both occasions he won golden opinions, which were manifested in widespread and warm expressions of sympathy and regret when the news of the death of Lord Russell of Killowen passed across the Atlantic. Between 1894 and 1897 Lord Russell of Killowen received the degree of Doctor of Laws *honoris causa* from the universities of Dublin, Edinburgh and Cambridge, and from the Laval university, Quebec. In 1892 he was treasurer of Lincoln's Inn. He left surviving him, besides his widow, five sons and four daughters. His sister Katherine (in religion, Sister Mary Baptist Joseph), pioneer sister of mercy in California, had died two years before at San Francisco. (W. R. K.)

**RUSSELL OF THORNHAUGH, WILLIAM, 1ST BARON** (c. 1558-1613), English soldier, was a younger son of Francis Russell, 2nd earl of Bedford, and was educated at Magdalen College, Oxford. After spending a few years abroad, he went to Ireland in 1580, and having seen some service in that country he was knighted in September 1581. In 1585 he joined the English forces in the Netherlands, being made lieutenant-general of cavalry; in September 1586 he so distinguished himself at Zutphen that the Spaniards pronounced him "a devil and not a man"; and in 1587 he became governor of Flushing in succession to his late friend, Sir Philip Sidney. He differed with the estates of Holland and with his superior, Lord Willoughby de Eresby; consequently, on his own initiative, he was recalled to England in July 1588. In May 1594 Russell was made lord deputy of Ireland in place of Sir William Fitzwilliam. He relieved Enniskillen, but his attempts to capture the insurgent leaders, Hugh O'Neill, earl of Tyrone, and Fiagh MacHugh O'Byrne, came to nothing. In May 1595 Sir John Norris landed in Ireland, his orders being to help the lord deputy in his difficult task. Russell was somewhat chagrined at the choice, as he and Norris were not very good friends, but for a short time they acted together against the rebels in the N. of Ireland. Russell then led an expedition into Connaught, but soon he and Norris were at variance. Having captured O'Byrne in May 1597, Russell laid down his office and left Ireland later in the month. In 1603 he was created Baron Russell of Thornhaugh, and he died on the 9th of August 1613. In 1627 his only son Francis succeeded his cousin Edward as 4th earl of Bedford.

Russell's *Journal* of his doings in Ireland is in the Carew MSS., and many of his letters are in the British Museum. See J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833), and R. Bagwell, *Ireland under the Tudors*, vol. iii. (1890).

**RUSSIA** (*Rossiya*), the general name for the European and Asiatic dominions of the "Tsar of All the Russias." Although the name is thus correctly applied, both in English and Russian, to the whole area of the Russian empire, its application is often limited, no less correctly, to European Russia, or even to European Russia exclusive of Finland and Poland. The use of the name in its most comprehensive sense dates only from the expansion of the empire in the 19th century; to the historian who writes of the earlier growth of the empire, Russia means, at most, Russia in Europe, or Muscovy, as it was usually called until the 18th century, from Moscow, its ancient capital. The origin of the term "Russia" has been much disputed. It is certainly derived, through *Rossiya*, from Slavonic *Rus* or *Ros* (Byzantine Ρῶς or Ρῶσος), a name first given to the Scandinavians who founded a principality on the Dnieper in the 9th century; and afterwards extended to the collection of Russian states of which this principality formed the nucleus. The word *Rus*, in former times wrongly connected with the tribal name Rhololani, is more probably derived from *Ruotsi*, a Finnish name for the Swedes, which seems to be a corruption of the Swedish *rothsmenn*, "rowers" or "seafarers."

## I. THE RUSSIAN EMPIRE

The Russian empire stretches over a vast territory in E. Europe and N. Asia, with an area exceeding 8,660,000 sq. m., or one-sixth of the land surface of the globe (one twenty-third of its whole superficies). It is, however, but thinly peopled on the average, including only one-twelfth of the inhabitants of the earth. It is almost entirely confined to the cold and temperate zones. In Novaya Zemlya and the Taimyr peninsula, it projects within the Arctic Circle as far as 77° 6' and 77° 40' N. respectively; while its S. extremities reach 38° 50' in Armenia, 35° on the Afghan frontier, and 42° 30' on the coasts of the Pacific. To the W. it advances as far as 20° 40' E. in Lapland, 17° in Poland, and 29° 42' on the Black Sea; and its E. limit—East Cape on the Bering Strait—is in 191° E.

The White, Barents and Kara Seas of the Arctic bound it on the N., and the northern Pacific—that is, the Seas of Bering, Okhotsk and Japan—bounds it on the E. **Boundaries.** The Baltic, with the Gulfs of Bothnia and Finland, limits it on the N.W.; and two sinuous lines of land frontier separate it respectively from Sweden and Norway on the N.W. and from Prussia, Austria and Rumania on the W. On the S. and E. the frontier has changed frequently according to the expansion and contraction of the empire under the pressure of political exigency and expedience. The Black Sea is the principal demarcating feature on the S. of European Russia. On the W. side of that sea the S. frontier touches the Danube for some 120 m.; on the E. side of the same sea it zigzags from the Black Sea to the Caspian, utilizing the river Aras (Araxes) for part of the distance. As the Caspian is virtually a Russian sea, Persia may be said to form the next link in the S. boundary of the Russian empire, followed by Afghanistan. On the Pamirs Russia has since 1885 been contentious with British India (Kashmir); but the boundary then swings away N. round Chinese Turkestan and the N. side of Mongolia, and, since 1904-5, it has skirted the N. of Manchuria, being separated from it by the river Amur. As thus traced, the boundary in Central Asia includes the two khanates of Bokhara and Khiva, which, though nominally protected states, are to all intents and purposes integral parts of the Russian empire. But it excludes Manchuria, with the Liao-tung peninsula and Port Arthur, upon which Russia only placed her grasp in 1898-99, a grasp which she was compelled by Japan to release after the war of 1904-5. The total length of the frontier line of the Russian empire by land is 2800 m. in Europe, and nearly 10,000 m. in Asia, and by sea over 11,000 m. in Europe and between 19,000 and 20,000 m. in Asia.

Russia has no oceanic possessions; her islands are all appendages of the mainland to which they belong. Such are Karlo, East Kvarken, the Åland archipelago, **Islands.** Dagö, and Ösel or Oesel in the Baltic Sea; Novaya Zemlya, with Kolguev and Vaigach, in the Barents Sea; the Solovetski Islands in the White Sea; the New Siberian archipelago, Wrangel Land and Bear Islands, off the Siberian coast; the Commander Islands off Kamchatka; the Shantar Islands and the N. of Sakhalin in the Sea of Okhotsk. The Aleutian archipelago was sold to the United States in 1867, together with Alaska, and in 1875 the Kurile Islands were ceded to Japan.

If the border regions, that is, two narrow belts, on the N. and S., be left out of account, a striking uniformity of physical **Leading physical features.** feature prevails throughout the whole vast extent of the Russian empire. High plateaus like that of Pamir (the "Roof of the World") and Armenia, and lofty mountain chains like the snow-clad Caucasus, the Alai, the Tian-shan, the Sayan Mountains, exist only on the outskirts of the empire.

Viewed broadly, the Russian empire may be said to occupy the territories to the N.W. of the great plateau formation of the old continent—the backbone of Asia—which stretches with decreasing altitude and width from the high tableland of Tibet and Pamir to the lower plateaus of Mongolia, and thence N.E. through the Vitim

region to the farthest extremity of Asia. Thus it consists of the immense plains and flat lands which extend between the plateau formation and the Arctic Ocean, including the series of parallel chains and hilly spurs which skirt the former region on the N.W. And it is only to the E. of Lake Baikal that it climbs up on to the plateau, from which it descends again before it reaches the Pacific.

This plateau formation—the oldest geological continent of Asia—being unfit for agriculture and for the most part unsuited for permanent settlement, while its oceanic slopes have from the dawn of history been occupied by a relatively dense population, long prevented Slav colonization from reaching the Pacific. The Russians chanced to cross it in the 17th century at its narrowest and most N. part, and thus struck the Pacific on the foggy and frozen shores of the Sea of Okhotsk; but two centuries elapsed ere, after colonizing the depressions around Lake Baikal, they crossed over the plateau in a more genial zone and descended to the Pacific by the Amur. After that they spread rapidly S., up to the nearly uninhabited valley of the Uuri, to what is now the Gulf of Peter the Great. In the S.W. higher portions of the plateau formation the empire has only comparatively recently planted its foot on the Pamir, and it was only a few years earlier that it established itself firmly on the highlands of Armenia.

A broad belt of hilly tracts—in every respect alpine in character, and displaying the same variety of climate and organic life as alpine tracts usually do—skirts the plateau formation throughout its entire length on the N. and N.W., forming an intermediate region between the plateau and the plains. **The alpine belt.** The Caucasus, the Elburz, the Kopet-dagh and Paropamisus, the intricate and imperfectly known network of mountains W. of the Pamir, the Tian-shan and the Ala-tau mountain regions, and farther N.E. the Altai, the still unnamed complex of the Miansinsk Mountains, the intricate mountain-chains of Sayan, with those of the Olekma, Vitim and Aldan all arranged *en échelon*—the former from N.W. to S.E., and the others from S.W. to N.E.—all these belong to the same alpine belt that borders the plateau from end to end of the series.

The flat lands which extend from the base of the Alpine foothills to the shores of the Arctic Ocean, assume the character either of dry deserts, as in the Aral-Caspian depression, or of low tablelands, as in central Russia and E. Siberia, **The flat lands.** of lacustrine regions in N.W. Russia and Finland, or of marshy prairies in W. Siberia, and of *savanas* in the far N. Throughout the whole of this vast area, their monotonous surfaces are diversified by only a few, and, for the most part, low, hilly tracts. Recently emerged from the Post-Pliocene sea, or freed from their mantle of ice, they persistently maintain the self-same features over immense areas; and the few portions that rise above the general elevation have more the character of broad and gentle swellings than of mountain-chains. Of this class are the swampy plateaus of the Kola peninsula, sloping gently S. to the lacustrine region of Finland and N.W. Russia; the Valdai tablelands, where all the great rivers of Russia take their rise; the broad and gently sloping meridional belt of the Ural Mountains; and lastly the Taimyr, Tunguzka and Verkhoyansk ranges in Siberia, which, notwithstanding their sub-Arctic position, do not reach the snow-line. The picturesque Bureya Mountains above the Amur, the forest-clad Sikhota-ain on the Pacific, and the volcanic chains of Kamchatka belong, however, to quite another orographical construction, being the border-ridges of the terraces by which the great plateau formation descends to the depths of the Pacific Ocean.

It is owing to these leading orographical features—divided by Carl Ritter, but only recently ascertained and established as facts by geographical research—that so many of the great **European rivers of the old continent are comprised within the limits of the Russian empire.** Taking their rise on the plateau formation, or in its outskirts, they flow first along lofty longitudinal valleys formerly filled with great lakes, next they cleave their way through the rocky barriers, and finally they enter the lowlands, where they become navigable, and, describing wide curves to avoid here and there the minor plateaus and hilly tracts, they bring into water-communication with one another places thousands of miles apart. The double river-systems of the Volga and Kama, the Ob and Irtysh, the Angara and Yenisei, the Lena and Vitim on the Arctic slope; and the Amur and Sungari on the Pacific slope, are instances. These were the obvious channels of Russian colonization.

A broad depression—the Aral-Caspian desert—has arisen where the plateau formation reaches its greatest altitude, and at the same time suddenly changes its direction from N.W. to N.E. This desert is now filled to only a small extent by the salt waters of the Caspian, Aral and Balkash inland seas; but it bears unmistakable traces of having been during Post-Pliocene times an immense inland basin. There the Volga, the Ural, the Syr-darya and the Amu-darya discharge their waters without reaching the ocean, but they bring life to the rapidly desiccating Transcaspien steppes, and link together the most remote parts of Russia.

**Geology.**—The most striking feature in the geology of Russia is its

level of the Miocene sea, which was very shallow to the N. of this last ridge, while farther S. it was connected both with the Vienna basin and with the Aral-Caspian. The Pliocene appears only in the coast region of the Black and Azov Seas, but it is widely developed in the Aral-Caspian region, where, however, the Ust-Urt and the Obshchiy Syrt rose above the sea.

The thick Quaternary, or Post-Pliocene, deposits which cover nearly all Russia were for a long time a puzzle to geologists. They consist of a boulder clay in the N. and of loess in the S. The former presents an intimate mixture of boulders brought from Finland and Olonets (with an addition of local boulders) with small gravel, coarse sand and the finest glacial mud,—the whole bearing no trace of ever having been washed up and sorted by water in motion, except in subordinate layers of glacial sand and gravel; the size of the boulders decreases on the whole from N. to S., and the boulder clay, especially in N. and central Russia, often takes the shape of ridges parallel to the direction of the motion of the boulders. Its S. limits, roughly corresponding with those established by Murchison, but not yet settled in the S.E. and E., are, according to N. Nikitin, the following:—from the S. frontier of Poland to Ovrutsh, Umañ, Kremenchug, Pottava and Razdornaya (50° N. latitude), with a curve N. to Kozelsk (?); thence due N. to Vetluga (58° N. latitude), E. to Glazova in Vyatka, and from this place towards the N. and W. along the watershed of the Volga and Pechora (?). S. of the 50th parallel appears the loess, with all its usual characters (land fossils, want of stratification, &c.), showing a remarkable uniformity of composition over very large surfaces; it covers both watersheds and valleys, but chiefly the former. Such being the characters of the Quaternary deposits in Russia, the majority of Russian geologists now adopt the opinion that Russia was covered, as far as the above limits, with an immense ice-sheet which crept over central Russia and central Germany from Scandinavia and N. Russia. Another ice-covering was probably advancing at the same time from the N.E., that is, from the N. of the Urals, but the question as to the glaciation of the Urals still remains open. As to the loess, the usual view is that it was a steppe-deposit due to the drifting of fine sand and dust during a dry episode in the Pleistocene period.

The deposits of the Post-Glacial period are represented throughout Russia, Poland and Finland, as also throughout Siberia and Central Asia, by very thick lacustrine deposits, which show that, after the melting of the ice-sheet, the country was covered with immense lakes, connected by broad channels (the *fjärden* of the Swedes), which later on gave rise to the actual rivers. On the outskirts of the lacustrine region, traces of marine deposits, not higher than 200 or perhaps even 150 ft. above present sea-level, are found alike on the Arctic Sea and on the Baltic and Black Sea coasts. A deep gulf of the Arctic Sea advanced up the valley of the Dvina; and the Caspian, connected by the Manych with the Black Sea, and by the Uzböy valley with Lake Aral, penetrated N. up the Volga valley, as far as its Samara bend. Unmistakable traces show that, while during the Glacial period Russia had an arctic flora and fauna, the climate of the Lacustrine period was more genial than it is now, and a dense human population at that time peopled the shores of the numberless lakes.

The Lacustrine period has not yet reached its close in Russia. Finland and the N.W. hilly plateaus are still in the same geological phase, and are dotted with numberless lakes and ponds, while the rivers continue to dig out their yet undetermined channels. But the great lakes which covered the country during the Lacustrine period have disappeared, leaving behind them immense marshes like those of the Pripet and in the N.E. The disappearance of what still remains of them is accelerated not only by the general decrease of moisture, but also perhaps by the gradual upheaval of N. Russia, which is going on from Esthonia and Finland to the Kola peninsula and Novaya Zemlya, at an average rate of about two feet per century. This upheaval—the consequences of which have been felt even within the historic period, by the drainage of the formerly impracticable marshes of Novgorod and at the head of the Gulf of Finland—together with the destruction of forests (which must be considered, however, as a quite subordinate cause), contributes towards a decrease of precipitation over Russia and towards increased shallowness of her rivers. At the same time, as the gradients are gradually increasing on account of the upheaval of the continent, the rivers dig their channels deeper and deeper. Consequently central and especially S. Russia witness the formation of numerous miniature canons, or *oroghs* (deep ravines), the summits of which rapidly advance and ramify in the loose surface deposits. As for the S. steppes, their desiccation, the consequence of the above causes, is in rapid progress.<sup>1</sup>

**Population.**—The population of the empire, which was estimated at 74,000,000 in 1859, was found to be over 129,200,000 at the census of 1897, taken over all the empire except Finland. In 1904 it was estimated to be 143,000,000, and in 1906, according to a detailed estimate of the Central Statistical Committee, it was 149,299,300. Thus from 1860 to 1897 the population increased 74½%, and from 1897 to 1904 26·3, an average annual increase of about 3½% as compared with an average annual increase of 2½% during the period 1860-97. The increase took place chiefly in the large cities, in Siberia, Poland, Lithuania, S. Russia and Caucasasia. The official divisions of the empire are given here, and details are given in separate articles.

It has been found, from a comparison of the densities of population of the various provinces in 1859 with the distribution in 1897, that the centre of density has distinctly moved S., towards the shores of the Black Sea, and W., the greatest increase having taken place in the E. Polish and in the Lithuanian provinces, along the S.W. border, in the prairie belt beside the Black Sea, and in Orenburg, N. Caucasasia and S.W. Siberia likewise show a considerable increase. The census of 1897 revealed in several provinces a remarkably low proportion of men to women. This was owing to the fact that large numbers of the men engaged in agricultural pursuits during the summer temporarily move every year into the large industrial centres for the winter. Consequently there were only 87·4 and 89·8 women to every 100 men in the governments of St Petersburg and Taurida respectively, but as many as 133·8 in Yaroslavl, 119 in Tver and 117 in Kostroma. The average number of women to every 100 men in the Russian governments proper was 102·9; in Poland, 98·6; in Finland, 102·2; in Caucasasia, 88·9; in Siberia, 93·7; and in Turkestan and Transcaspia, 83·0.

The effects of emigration and immigration cannot be estimated with accuracy, because only those who cross the frontier with passports are taken account of. The statistics of these show that there was during the thirty-two years, 1856-88, an excess of emigration over immigration of 1,146,052 in the case of Russians, and a surplus of immigration of 2,304,717 foreigners. On the other hand, in the six years, 1892-97, the excess of Russian emigration over immigration was 207,353, as compared with an excess of foreign immigration over emigration of only 136,740. During the years 1900-4 inclusive the total emigrants from Russia numbered 2,358,539, of whom 1,144,246 were Russians; while the immigrants numbered 2,333,053, of whom 1,432,057 were foreigners. It is also known that the number of Russian immigrants into the United States in 1891-1902 was 742,869, as compared with 213,469 in 1873-90, or a grand total since 1873 of 1,056,338. By far the greater part of these were Jews. The emigration to Siberia varies much from year to year. It was 26,129 in 1888, and 60,000 in 1898. During the two following years it amounted to an average of over 160,000, but in the years 1901-3 to an average of 84,638 per annum. Altogether some 800,000 peasants are estimated to have settled in Siberia during the period 1886-96, but during the years 1893-1905 no less than four millions in all. There is also some emigration from central Russia to the S. Urals, as well as to some of the steppe governments.

Within the empire a very great diversity of nationalities is comprised, due to the amalgamation or absorption by the Slav race of a variety of Ural-Altaic stocks, of Turko-Tatars, Turko-Mongols and various Caucasian races. In some cases their ethnical relations have not yet been completely determined. According to the results obtained by the census committee of 1897, working on a linguistic basis, the distribution of races was as given in the table opposite:—

Taken as a whole, only 13% of the population of Russia lived in towns in 1897, but in the years 1857-60 less than 10% was urban.

**Cities.** In Russia proper less than 2% emigrated from the villages to the towns during the forty years ending 1897. The following table shows the urban population in the various divisions of the empire in 1897:—

	Urban Population.	Percentage of Total.
European Russia . . . . .	12,027,038	12.8
Poland . . . . .	2,055,892	21.7
Finland . . . . .	281,216	11.0
Caucasia . . . . .	1,010,615	10.9
Siberia . . . . .	473,799	9.3
Central Asia . . . . .	936,655	12.0
Russian Empire . . . . .	16,785,212	13.0

There were in European Russia and Poland only twelve cities with more than 100,000 inhabitants in 1884; in 1900 there were sixteen, namely, St Petersburg, Moscow, Warsaw, Odessa, Łódz, Riga, Kiev, Kharkov, Vilna, Saratov, Kazan, Ekaterinoslav, Rostov-on-Don, Astrakhan, Tula and Kishinev. In other parts of the empire there were four cities each having over 100,000 inhabitants in that year, namely, Baku, Tiflis, Tashkent and Helmsingora. While only three of these are in middle Russia (Moscow, Tula and Kazan), eight are in S. Russia. There are thirty-four cities in European Russia and Poland, and forty in the entire empire, with from 50,000 to 100,000 inhabitants each. The rural population live for the most part in villages, not as a rule scattered about the country. In the inclement regions of the N. and in the N. parts of the forest zone the villages are very small. They are larger, but still small, in White Russia, Lithuania and the region of the lakes; but in the steppe governments they are very appreciably bigger, some of the Cossack *stanitsas* or settlements exceeding 20,000, and many of them numbering more than 10,000 inhabitants each. The houses are generally built of wood and wear a poverty-stricken aspect. Owing to the great risks from fire the villages usually cover a large area of ground, and the houses are scattered and straggling. The mortality in most towns is so great that during the last ten years of the 19th century, in a very great number of cities, the deaths exceeded the births by 1 to 4 in the thousand. (P. A. K.; J. T. Br.)

**Government and Administration.**—Russia was described in the *Almanach de Gotha* for 1910 as "a constitutional monarchy under an autocratic tsar." This obvious contradiction in terms well illustrates the difficulty of defining in a single formula the system, essentially transitional and meanwhile *sui generis*, established in the Russian empire since October 1905. Before this date the fundamental laws of Russia described the power of the emperor as "autocratic and unlimited." The imperial style is still "Emperor and Autocrat of All the Russias"; but in the fundamental laws as remodelled between the imperial manifesto of 17/30 October and the opening of the first *Duma*

<sup>1</sup> See A. Atoff, *Peuples et langages de la Russie* (Paris, 1906), based on the report of the Russian Census Committee of 1897.

on the 27th of April 1906, while the name and principle of autocracy was jealously preserved, the word "unlimited" vanished. Not that the régime in Russia had become in any true sense constitutional, far less parliamentary; but the "unlimited autocracy" had given place to a "self-limited autocracy," whether permanently so limited, or only at the discretion of the autocrat, remaining a subject of heated controversy between conflicting parties in the state.<sup>2</sup> Provisionally, then, the Russian governmental system may perhaps be best defined—as M. Chasles suggests<sup>3</sup>—as "a limited monarchy under an autocratic emperor."

At the head of the government is the emperor,<sup>4</sup> whose power is limited only by the provisions of the fundamental laws of the empire. Of these some are ancient and undisputed: the empire may not be partitioned, but descends entire in order of primogeniture, and by preference to the male heir; the emperor and his consort must belong to the Eastern Orthodox Church; the emperor can wear no crown that entails residence abroad. By the manifesto of the 17/30th of October 1905 the emperor voluntarily limited his legislative power by decreeing that no measure was to become law without the consent of the Imperial Duma, a freely elected national assembly. By the law of the 20th of February 1906 the Council of the Empire was associated with the Duma as a legislative Upper House; and from this time the legislative power has been exercised normally by the emperor only in concert with the two chambers.

The Council of the Empire, or Imperial Council (*Gosudarstvennyy Sovet*), as reconstituted for this purpose, consists of 196 members, of whom 98 are nominated by the emperor, while 98 are elective. The ministers, also nominated, are *ex officio* members. Of the elected members 3 are returned by the "black" clergy (the monks), 3 by the "white" clergy (seculars),<sup>5</sup> 18 by the corporations of nobles, 6 by the academy of sciences and the universities, 6 by the chambers of commerce, 6 by the industrial councils, 34 by the governments having *zemstvos*, 16 by those having no *zemstvos*, and 6 by Poland. As a legislative body the powers of the Council are co-ordinate with those of the Duma; in practice, however, it has seldom if ever initiated legislation.<sup>6</sup>

The Duma of the Empire or Imperial Duma (*Gosudarstvennaya Duma*), which forms the Lower House of the Russian parliament, consists (since the *ukaz* of the 2nd of June 1907) of 442 members, elected by an exceedingly complicated process, so manipulated as to secure an overwhelming preponderance for the wealthy, and especially the landed classes, and also for the representatives of the Russian as opposed to the subject peoples. Each province of the empire, except the now disfranchised steppes of Central Asia,<sup>7</sup> returns a certain proportion of members (fixed in each case by law in such a way as to give a preponderance to the Russian element), in addition to those returned by certain of

<sup>2</sup> M. Stolypin defended the *ukaz* of the 2nd of June 1907, which in flat contradiction of the provisions of the fundamental laws altered the electoral law without the consent of the legislature, on the ground that what the autocrat had granted the autocrat could take away. The members of the Opposition, on the other hand, quoting Art. 84 of the fundamental laws ("The empire is governed on the immutable basis of laws issued according to the established order"), argued that the emperor himself could only act within the limits of the order established by those laws. It is noteworthy that even the third Duma in its address to the throne, if it avoided the tabooed word "Constitution," avoided also all mention of autocracy.

<sup>3</sup> *Le Parlement russe*, p. 151.  
<sup>4</sup> *Imperator* is the official style. The Russian translation is *Gosudar*. Popularly, however, the emperor is known by his old Russian title of *tsar* (q.v.).

<sup>5</sup> This is the first time since Peter the Great that the clergy have been given a voice in secular affairs in Russia.

<sup>6</sup> The number of the council was formerly not fixed, and there are still honorary councillors who have no right to sit. Thus in 1910 the honorary president of the council was the grand-duke Michael Nicolaiévich, the actual president M. G. Akimov. The judicial and administrative work of the old council was in 1906 assigned to separate committees.

<sup>7</sup> These returned 23 members in the first and second Dumas.

TABLE SHOWING DISTRIBUTION OF RACES

<sup>1</sup> These totals include in some cases small linguistic groups not mentioned in the table.

<sup>2</sup> About 77% Bulgarians, the rest mostly Bohemians (Czechs).

<sup>3</sup> Inclusive of 448,022 Zhuzds.

<sup>4</sup> Principally Frenchmen, with Englishmen, Italians, Norwegians, Danes, Dutchmen and Spaniards.

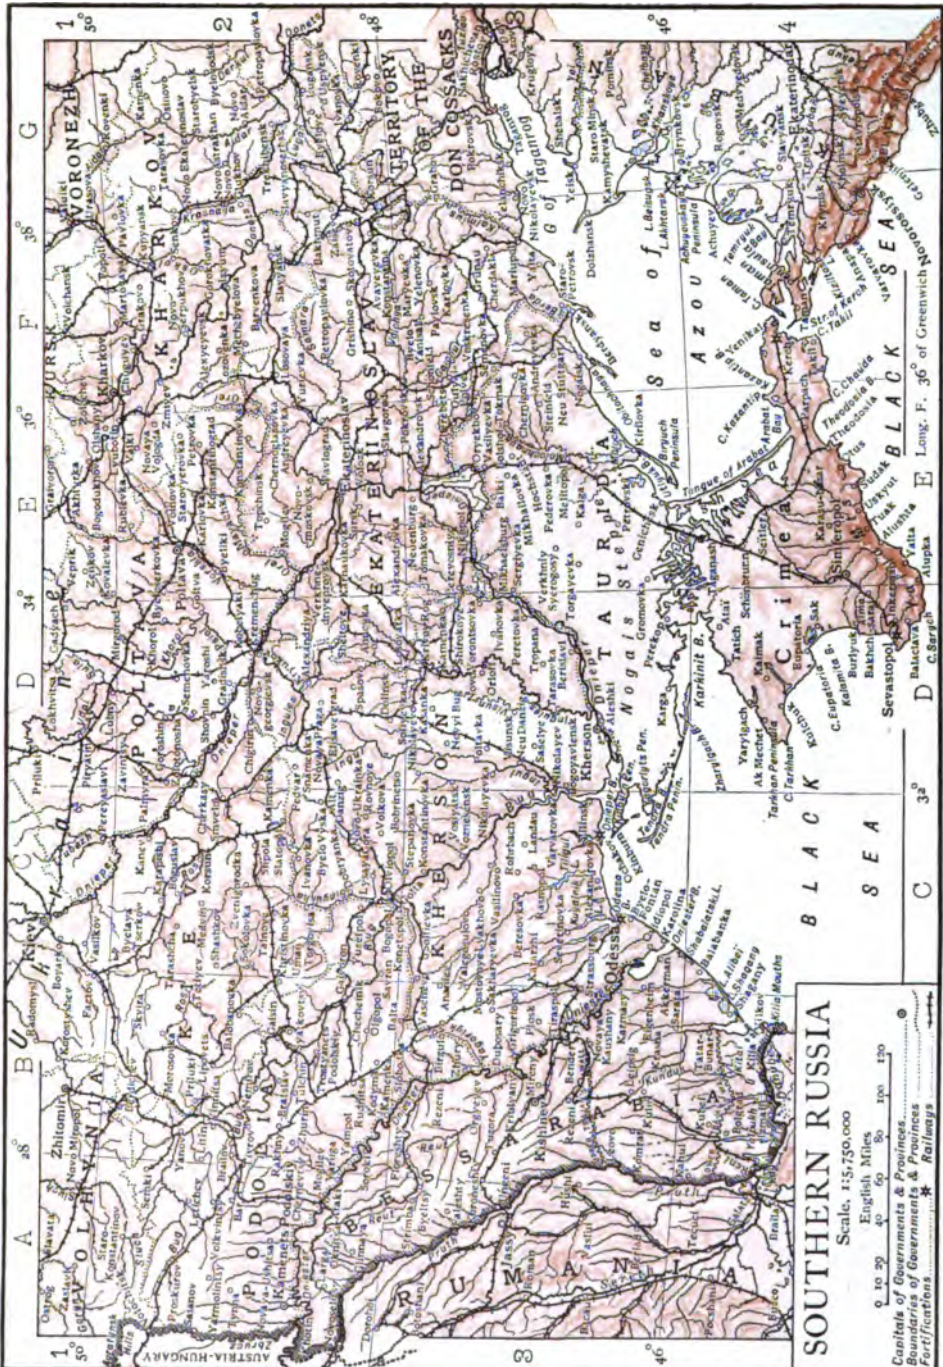

<sup>5</sup> Ethnologically the Bulgarians ought perhaps to come here; but, as a large admixture of Slav blood flows in their veins and they speak a distinctly Slav language, they have in this table been grouped with the Slavs.

<sup>6</sup> Includes Georgians, Mingrelians, Imeritians, Lazes and Svanetians.

<sup>7</sup> For details, see table under the heading CAUCASIA. Of the total given here, 20% are Circassians.

the great cities. The members of the Duma are elected by electoral colleges in each government, and these in their turn are elected, like the *zemstvos* (see below), by electoral assemblies chosen by the three classes of landed proprietors, citizens and peasants. In these assemblies the large proprietors sit in person, being thus electors in the second degree; the lesser proprietors are represented by delegates, and therefore elect in the third degree. The urban population, divided into two categories according to their taxable wealth, elects delegates

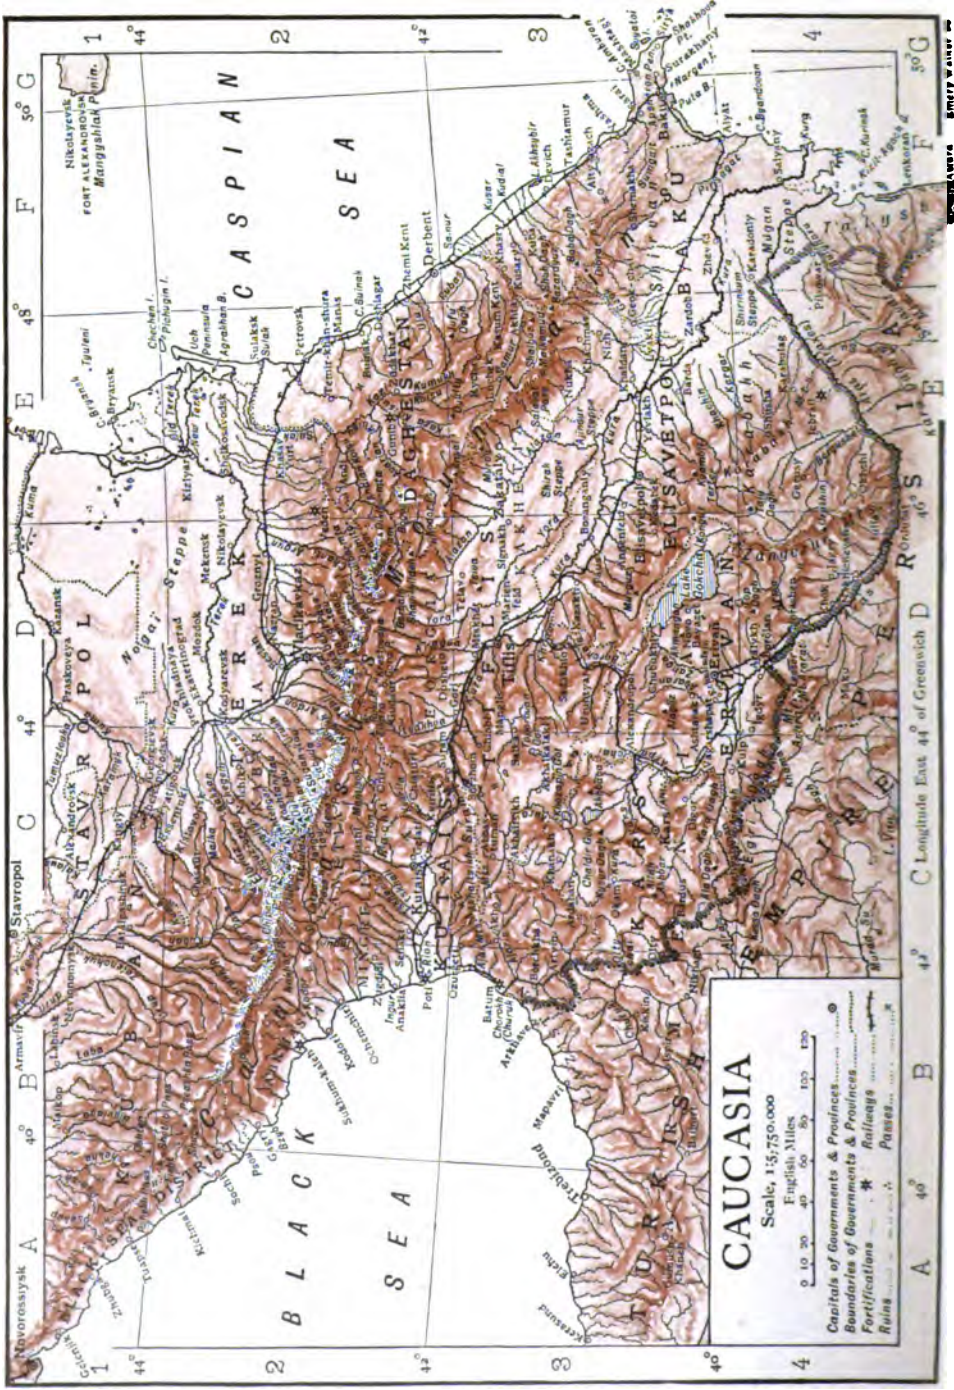

direct to the college of the government (*Guberniya*), and is thus represented in the second degree; but the system of division into categories, according not to the number of taxpayers but to the amount they pay, gives a great preponderance to the richer classes. The peasants are represented only in the fourth degree, since the delegates to the electoral college are elected by the *volosts* (see below). The workmen, finally, are specially treated. Every industrial concern employing fifty hands or over elects one or more delegates to the electoral

college of the government, in which, like the others, they form a separate *curia*.

In the college itself the voting—secret and by ballot throughout—is by majority; and since this majority consists, under the actual system, of very conservative elements (the landowners and urban delegates having 4ths of the votes), the progressive elements—however much they might preponderate in the country—would have no chance of representation at all save for the curious provision that one member at least in each government must be chosen from each of the five classes represented in the college. For example, were there no reactionary peasant among the delegates, a reactionary majority might be forced to return a Social Democrat to the Duma. As it is, though a fixed *minimum* of peasant delegates *must* be returned, they by no means probably represent the opinion of the peasantry. That in the Duma any Radical elements survive at all is mainly due to the peculiar franchise enjoyed by the seven largest towns—St Petersburg, Moscow, Kiev, Odessa, Riga and the Polish cities of Warsaw and Lodz. These elect their delegates to the Duma direct, and though their votes are divided into two *curias* (on the basis of taxable property) in such a way as to give the advantage to wealth, each returning the same number of delegates, the democratic colleges can at least return members of their own complexion.<sup>1</sup>

The competence of the Russian parliament<sup>2</sup> thus constituted is strictly limited. It shares with the emperor the legislative power, including the discussion and sanctioning of the budget. But, so far as the parliament is concerned, this power is subject to numerous and important exceptions. All measures, *e.g.* dealing with the organization of the army and navy are outside its competence; these are no longer called "laws" but "ordinary administrative rules." Moreover, the procedure of the Houses practically places the control of legislation in the hands of ministers. Any member may bring in a "project of law," but it has to be submitted to the minister of the department concerned, who is allowed a month to consider it, and himself prepares the final draft laid on the table of the House. Amendments, however, may be and have been carried against the government. Ministers are responsible, moreover, not to parliament but to the emperor. They may be interpellated, but only on the legality, not the policy, of their acts. In the words of M. Stolypin, there is no intention of converting the ministerial bench into a prisoners' dock. If by a two-thirds majority the action of a minister be arraigned, the president of the Imperial Council lays the case before the emperor, who decides. The powers of the parliament over the budget are even more limited, though not altogether illusory. No legislation by means of the budget is allowed, *i.e.* no alteration may be made in credits necessary for carrying out a law. This deprives parliament of control over the administrative departments, all the ministries being thus "armour-plated"—to use the cant phrase current in Russia—except that of ways and communications (railways). The sum of 700,000,000 roubles per annum is thus excepted from the control of the chambers. Other exceptions are the "Institutions of the Empress Marie," which absorb, *inter alia*, the duties on playing-cards and the taxes on places of public entertainment; the imperial civil list, so far as this does not exceed the sum fixed in 1906 (16,359,595 roubles!); the expenses of the two imperial chanceries, 10,000,000 roubles per annum, which constitute in effect a secret service fund. Altogether, half the annual expenditure of the country is outside the control of parliament. Nor is this all. If the budget be not sanctioned by the emperor, that of the previous year remains in force, and the government has power, *motu proprio*, to impose the extra taxes necessary to carry out new laws. In certain circumstances, too, the emperor reserves the right to raise fresh loans.

<sup>1</sup> Thus M. Guchkov, leader of the Octobrists, and M. Milinkov, leader of the cadets, were both returned by the second *curia* of St Petersburg to the third Duma.

<sup>2</sup> Strictly speaking, the title is inapplicable, there being no collective official name for the two chambers. The word parliament may, however, be used as a convenient term, failing a better.

Further, the emperor has the power to issue ordinances having the force of law, *i.e.* under extraordinary circumstances when the Duma is not sitting. These ordinances must, however, be of a temporary nature, must not infringe the fundamental laws or statutes passed by the two chambers, or change the electoral system, and must be laid upon the table of the Duma at the first opportunity. Since, however, the emperor has the power of proroguing or dissolving the Duma as often as he pleases, it is clear that these temporary ordinances might in effect be made permanent. Finally, the emperor has the right to proclaim anywhere and at any time a state of siege. In this way the fundamental laws were suspended not only in Poland but in St Petersburg and other parts of the empire during the greater part of the four years succeeding the grant of the constitution.

It should be noted, none the less, that the third Duma succeeded in establishing its position, and that in view of its useful activities even the extreme Right came to realize that there could be no return to the old undisguised absolutist régime (see *History*, below, *ad fin.*).

By the law of the 18th of October (November 2) 1905, to assist the emperor in the supreme administration a Council of Ministers (*Sovyet Ministrov*) was created, under a minister president, the first appearance of a prime minister in Russia. This council consists of all the ministers and of the heads of the principal administrations. The ministries are as follows: (1) of the Imperial Court, to which the administration of the appanages, the chapter of the imperial orders, the imperial palaces and theatres, and the Academy of Fine Arts are subordinated; (2) Foreign Affairs; (3) War and Marine; (4) Finance; (5) Commerce and Industry (created in 1905); (6) Interior (including police, health, censorship and press, posts and telegraphs, foreign religions, statistics); (7) Agriculture; (8) Ways and Communications; (9) Justice; (10) Public Instruction. Dependent on the Council of Ministers are two other councils: the Holy Synod and the Senate.

The Holy Synod (established in 1721) is the supreme organ of government of the Orthodox Church in Russia. It is presided over by a lay procurator, representing the emperor, and consists, for the rest, of the three metropolitans of Moscow, St Petersburg and Kiev, the archbishop of Georgia, and a number of bishops sitting in rotation.

The Senate (*Pravitelstvennyy Soud*, *i.e.* directing or governing senate), originally established by Peter the Great, consists of members nominated by the emperor. Its functions, which are exceedingly various, are carried out by the different departments into which it is divided. It is the supreme court of cassation (see *Judicial System*, below); an audit office, a high court of justice for all political offences; one of its departments fulfils the functions of a heralds' college. It also has supreme jurisdiction in all disputes arising out of the administration of the empire, notably differences between the representatives of the central power and the elected organs of local self-government. Lastly, it examines into registers and promulgates new laws, a function which, in theory, gives it a power, akin to that of the Supreme Court of the United States, of rejecting measures not in accordance with the fundamental laws.

For purposes of provincial administration Russia is divided into 78 governments (*guberniya*), 18 provinces (*oblast*) and 1 district (*obkrug*). Of these 11 governments, 17 provinces and 1 district (Sakhalin) belong to Asiatic Russia. Of the rest 8 governments are in Finland, 10 in Poland. European Russia thus embraces 59 governments and 1 province (that of the Don). The Don province is under the direct jurisdiction of the ministry of war; the rest have each a governor and deputy-governor, the latter presiding over the administrative council. In addition there are governors-general, generally placed over several governments and armed with more extensive powers,

Council of Ministers.

Holy Synod.

The Senate.

Provincial administration.

usually including the command of the troops within the limits of their jurisdiction. In 1906 there were governors-general in Finland, Warsaw, Vilna, Kiev, Moscow and Riga. The larger cities (St Petersburg, Moscow, Odessa, Sevastopol, Kerch-Yenikala, Nikolayev, Rostov) have an administrative system of their own, independent of the governments; in these the chief of police acts as governor. As organs of the

**Police.** central government there are further, the *isppravniki*, chiefs of police in the districts into which the governments are divided. These are nominated by the governors,<sup>1</sup> and have under their orders in the principal localities commissaries (*stanovoi pristav*). *Isppravniki* and *stanovoi* alike are armed with large and ill-defined powers; and, since they are for the most part illiterate and wholly ignorant of the law, they have proved exasperating engines of oppression. Towards the end of the reign of Alexander II., the government, in order to preserve order in the country districts, also created a special class of mounted rural policemen (*vryadniki*, from *vriad*, order), who, armed with power to arrest all suspects on the spot, rapidly became the terror of the countryside.<sup>2</sup> Finally, in the towns every house is provided with a detective policeman in the person of the porter (*dvornik*), who is charged with the duty of reporting to the police the presence of any suspicious characters or anything else that may interest them.<sup>3</sup>

In addition to the above there is also a police organization, in direct subordination to the ministry of the interior, of which the principal function is the discovery, prevention and extirpation of political sedition. A secret police, armed with inquisitorial and arbitrary powers, has always existed in autocratic Russia. Its most famous development was the so-called "Third Section" (of the imperial chancery) instituted by the emperor Nicholas I. in 1826. This was entirely independent of the ordinary police, but was associated with the previously existing corps of gendarmes (*Korpus Zhandarmov*), whose chief was placed at its head. Its object had originally been to keep the emperor in close touch with all the branches of the administration and to bring to his notice any abuses and irregularities (see NICHOLAS I.), and for this purpose its chief was in constant personal intercourse with the sovereign. Actually, however, its activity, directed mainly to the discovery of political offences, degenerated into a hideous reign of terror. Its organization was spread all over Russia; its procedure was secret and summary (transportation by administrative order); and, its instruments being for the most part ignorant and largely corrupt, its victims were counted by thousands.

The "Third Section" was suppressed by Alexander II. in 1880, but only in name. In fact it was transformed into a separate department of the ministry of the interior, and, provided with an enormous secret service fund, soon dominated the whole ministry. The corps of gendarmes was also incorporated in this department, the under-secretary of the interior being placed at its head and at that of the police generally, with practically unlimited jurisdiction in all cases which, in the judgment of the minister of the interior, required to be dealt with by processes outside the ordinary law. In 1896 the powers of the minister were extended at the expense of those of the under-secretary, who remained only at the head of the corps of gendarmes; but by a law of the 24th of September 1904 this was again reversed, and the under-secretary was again placed at the head of all the police with the title of under-secretary for the administration of the police.

**Local Elected Administrative Bodies.**—Alongside the local organs of the central government in Russia there are three classes of local elected bodies charged with administrative functions: (1) the peasant assemblies in the *mir* and the *volost*,

<sup>1</sup> From Catherine II.'s time to that of Alexander II. they were elected by the nobles. This was changed in consequence of the emancipation of the serfs.

<sup>2</sup> They were soon nicknamed *Kuryadniki*, chicken-stealers (from *Kura*, hen). See Leroy-Beaulieu, *L'Empire des tsars*, II. 134.

<sup>3</sup> The *dvornik* is on duty for sixteen hours at a stretch, during which he is not allowed to sleep or even to alight in the porch.

(2) the *zemstvos* in the 34 governments of Russia proper, (3) the municipal *dumas*. Of these the peasant assemblies are the most interesting and in some respects the most important, since the peasants (*i.e.* three-quarters of the population of Russia) form a class apart,<sup>4</sup> largely excepted from the incidence of the ordinary law, and governed in accordance with their local customs. The *mir* itself, with its customs, is of immemorial antiquity (see VILLAGE COMMUNITIES); it was not, however, till the emancipation of the serfs in 1861 that the village community was withdrawn from the patrimonial jurisdiction of the landowning nobility and endowed with self-government. The assembly of the *mir* consists of all the peasant householders of the village.<sup>5</sup> These elect a head-man (*starosta*) and a collector of taxes, who was responsible, at least until the *skas* of October 1906, which abolished communal responsibility for the payment of taxes, for the repartition among individuals of the taxes imposed on the commune. A number of *mir*s are united into a *volost*, and, hitherto, a court of justice (*volostnoye sud*). See *Judicial System*, below. The self-government of the *mir*s and *volosts* is, however, tempered by the authority of the police commissaries (*stanovoi*) and by the power of general oversight given to the nominated "district committees for the affairs of the peasants."

The system of local self-government is continued, so far as the 34 governments of old Russia are concerned,<sup>6</sup> in the elective district and provincial assemblies (*zemstvos*).

These bodies, one for each district and another for each province or government, were created by Alexander II. in 1864. They consist of a representative council (*zemskoye sobraneye*) and of an executive board (*zemskoye upravye*) nominated by the former. The board consists of five classes of members: (1) large landed proprietors (nobles owning 500 acres and over), who sit in person; (2) delegates of the small landowners, including the clergy in their capacity of landed proprietors; (3) delegates of the wealthier townsmen; (4) delegates of the less wealthy urban classes; (5) delegates of the peasants, elected by the *volosts*.<sup>7</sup> The rules governing elections to the *zemstvos* were taken as a model for the electoral law of 1906 and are sufficiently indicated by the account of this given below. The *zemstvos* were originally given large powers in relation to the incidence of taxation, and such questions as education, public health, roads and the like. These powers were, however, severely restricted by the emperor Alexander III. (law of 12/25 June 1890), the *zemstvos* being absolutely subordinated to the governors, whose consent was necessary to the validity of all their decisions, and who received drastic powers of discipline over the members.<sup>8</sup> It was not till 1905 that the *zemstvos* regained, at least *de facto*, some of their independent initiative. The part played by the congress of *zemstvos* in the earlier stages of the Russian revolution is outlined below (see *History*: § 2. *Development of the Russian Constitution*).

<sup>4</sup> Until the *skas* of October 18, 1906, the peasant class was stereotyped under the electoral law. No peasant, however rich, could qualify for a vote in any but the peasants' electoral colleges. The *skas* allowed peasants with the requisite qualifications to vote as landowners. At the same time the Senate interpreted the law so as to exclude all but heads of families actually engaged in farming from the vote for the *Duma*.

<sup>5</sup> None but peasants—not even the noble-landowner—has a voice in the assembly of the *mir*.

<sup>6</sup> Sixteen provinces have no *zemstvos*, *i.e.* the three Baltic provinces, the nine western governments annexed from Poland by Catherine II., and the Coesack provinces of the Don, Astrakhan, Orenburg and Stavropol.

<sup>7</sup> By the law of the 12th (25th) of June 1890 the peasant members of the *zemstvos* were to be nominated by the governor of the government or province from a list elected by the *volosts*.

<sup>8</sup> In spite of these restrictions and of an electoral system which tended to make these assemblies as strait-laced and reactionary as any government bureau, the *zemstvos* did good work, notably educational, in those provinces where the proprietors were inspired with a more liberal spirit. Many *zemstvos* also made extensive and valuable inquiries into the condition of agriculture, industry and the like.

Since 1870 the municipalities in European Russia have had institutions like those of the *zemstvos*. All owners of houses, and tax-paying merchants, artisans and workmen are enrolled on lists in a descending order according to their assessed wealth. The total valuation is then divided into three equal parts, representing three groups of electors very unequal in number, each of which elects an equal number of delegates to the municipal *duma*. The executive is in the hands of an elective mayor and an *uprava*, which consists of several members elected by the *duma*. Under Alexander III., however, by laws promulgated in 1892 and 1894, the municipal *dumas* were subordinated to the governors in the same way as the *zemstvos*. In 1894 municipal institutions, with still more restricted powers, were granted to several towns in Siberia, and in 1895 to some in Caucasia.

In the Baltic provinces (Courland, Livonia and Esthonia) the landowning classes formerly enjoyed considerable powers of self-government and numerous privileges in matters affecting education, police and the administration of local justice. But by laws promulgated in 1888 and 1889 the rights of police and manorial justice were transferred from the landlords to officials of the central government. Since about the same time a process of rigorous Russification has been carried through in the same provinces, in all departments of administration, in the higher schools and in the university of Dorpat, the name of which was altered to Yuriev. In 1893 district committees for the management of the peasants' affairs, similar to those in the purely Russian governments, were introduced into this part of the empire.

**Judicial System.**—Not the least valuable of the gifts of the "tsar emancipator," Alexander II., to Russia was the judicial system established by the statute (*Sudebni Ustos*) of the 20th of November 1864. The system which this superseded was not indigenous to Russia, but had been set up by Peter the Great, who had taken as his model the inquisitorial procedure at that time in vogue on the continent of western Europe. Both civil and criminal procedure were secret. All the proceedings were conducted in writing, and the judges were not confronted with either the parties or the witnesses until they emerged to deliver judgment. This secrecy, combined with the fact that the judges were very ill paid, led to universal bribery and corruption. To check this courts were multiplied (there were five, six or more instances), which only multiplied the evil. Documents accumulated from court to court, till none but the clerks who had written them could tell their gist; costs were piled up; and all this, combined with the confusion caused by the chaotic mass of imperial ukazes, ordinances and ancient laws—often inconsistent or flatly contradictory—made the administration of justice, if possible, more dilatory and capricious than in the old, unreformed English court of chancery. Above all, there was no dividing line between the judiciary and the administrative functions. The judges were not so by profession; they were merely members of the official class (*chinovniks*), the prejudices and vices of which they shared.

Of this system—except so far as the confusion of the laws is concerned—the reform of 1864 made a clean sweep. The new system established—based partly on English, partly on French models—was built up on certain broad principles: the separation of the judicial and administrative functions, the independence of the judges and courts, the publicity of trials and oral procedure, the equality of all classes before the law. Moreover, a democratic element was introduced by the adoption of the jury system and—so far as one order of tribunal was concerned—the election of judges. The establishment of a judicial system on these principles constituted, as M. Leroy-Beaulieu justly observes, a fundamental change in the conception of the Russian state, which, by placing the administration of justice outside the sphere of the executive power, ceased to be a despotism. This fact made the new system especially obnoxious to the bureaucracy, and during the latter years of Alexander II. and the reign of

Alexander III. there was a piecemeal taking back of what had been given. It was reserved for the third Duma, after the revolution, to begin the reversal of this process.<sup>1</sup>

The system established by the law of 1864 is remarkable in that it set up two wholly separate orders of tribunals, each having their own courts of appeal and coming in contact only in the senate, as the supreme court of cassation. The first of these, based on the English model, are the courts of the elected justices of the peace, with jurisdiction over petty causes, whether civil or criminal; the second, based on the French model, are the ordinary tribunals of nominated judges, sitting with or without a jury to hear important cases.

The justices of the peace, who must be landowners<sup>2</sup> or (in towns) persons of moderate property, are elected by the municipal *dumas* in the towns, and by the *zemstvos* in the country districts, for a term of three years. They are of two classes: (1) acting justices (*uchastnye mirovoye sudi*); (2) honorary justices (*pochetnye mirovoye sudi*). The acting justice sits normally alone to hear cases in his canton of the peace (*uchastok*), but, at the request of both parties to a suit, he may call in an honorary justice as assessor or substitute.<sup>3</sup> In all civil cases involving less than 30 roubles, and in criminal cases punishable by no more than three days' arrest, his judgment is final. In other cases appeal can be made to the "assize of the peace" (*miroye syezd*), consisting of three or more justices of the peace meeting monthly (cf. the English quarter sessions), which acts both as a court of appeal and of cassation. From this again appeal can be made on points of law or disputed procedure to the senate, which may send the case back for retrial by an assize of the peace in another district.

The ordinary tribunals, in their organization, personnel and procedure, are modelled very closely on those of France (see FRANCE, *Law and Institutions*). From the town judge (*ispravnik*), who, in spite of the principle laid down in 1864, combines judicial and administrative functions, an appeal lies (as in the case of the justices of the peace) to an assembly of such judges; from these again there is an appeal to the district court (*okrugniya sud*), consisting of three judges;<sup>4</sup> from this to the court of appeal (*sudebniya palata*); while over this again is the senate, which, as the supreme court of cassation, can send a case for retrial for reason shown. The district court, sitting with a jury, can try criminal cases without appeal, but only by special leave in each case of the court of appeal. The senate, as supreme court of cassation, has two departments, one for civil and one for criminal cases. As a court of justice its main drawback is that it is wholly unable to cope with the vast mass of documents representing appeals from all parts of the empire.

Two important classes in Russia stood more or less outside the competence of the above systems: the clergy and the peasants. The ecclesiastical courts still retain a jurisdiction over the clergy which they have lost elsewhere in Europe; and in them the old secret written procedure survives. Their interest for the laity lies

<sup>1</sup> An ukaz of 1879 gave the governors the right to report secretly on the qualifications of candidates for the office of justice of the peace. In 1889 Alexander III. abolished the election of justices of the peace, except in certain large towns and some outlying parts of the empire, and greatly restricted the right of trial by jury. The confusion of the judicial and administrative functions was introduced again by the appointment of officials as judges. In 1909 the third Duma restored the election of justices of the peace.

<sup>2</sup> The justices, though noble-landowners, are almost exclusively of very moderate means, and, though elected by the land-owning class, they are according to M. Leroy-Beaulieu—prejudiced in favour of the poor *mirnik* rather than of the wealthy landlord.

<sup>3</sup> These honorary justices are mainly recruited from the ranks of the higher bureaucracy and the army.

<sup>4</sup> This corresponds to the French *cour d'arrondissement*, but its jurisdiction is, territorially, much wider, often covering several districts or even a whole government.

mainly in the fact that marriage and divorce fall within their competence; and their reform has been postponed largely because the wealthy and corrupt society of the Russian capital preferred a system which makes divorce easily purchasable and avoids at the same time the scandal of publicity. The case of the peasants is more interesting, and deserves a somewhat more detailed notice.

The peasants, as already stated, form a class apart, untouched by the influence of Western civilization, the principles of which they are quite incapable of understanding or appreciating. This fact was recognized by the legislators of 1864, and beneath the statutory tribunals created in that year the special courts of the peasants were suffered to survive. These were indeed but a few years older. Up to 1861, the date of the emancipation, the peasant serfs had been under the patrimonial jurisdiction of their lords. The edict of emancipation abolished this jurisdiction, and set up instead in each *volost* a court particular to the peasants (*volostnyye sud*), of which the judges and jury, themselves peasants, were elected by the assembly of the *volost* (*volostnyye skhod*) each year. In these courts the ordinary written law had little to say; the decisions of the *volost* courts were based on the local customary law, which alone the peasants, and the peasants alone, understand. The justice administered in them was patriarchal and rough, but not ineffective. All civil cases involving less than 100 roubles value were within their competence, and more important cases by consent of the parties. They acted also as police courts in the case of petty thefts, breaches of the peace and the like. They were also charged with the maintenance of order in the *mir* and the family, punishing infractions of the religious law, husbands who beat their wives, and parents who ill-treated their children. The penalty of flogging, preferred by the peasants to fine or imprisonment, was not unknown. The judges were, of course, wholly illiterate, and this tended to throw the ultimate power into the hands of the clerk (*pisar*) of the court, who was rarely above corruption.

In 1880, according to the observations of M. Leroy-Beaulieu,<sup>1</sup> the fines inflicted by the court were commonly paid in *volika*, which was consumed on the premises by the judges and the parties to the suit; there is no reason to suppose that this amiable custom has been abandoned.

The peasants are not compelled to go to the *volost* court. They can apply to the police commissaries (*stanovoi*) or to the justices of the peace; but the great distances to be traversed in a country so sparsely populated makes this course highly inconvenient.<sup>2</sup> On the other hand, from the *volost* court there is no appeal, unless it has acted *ultra vires* or illegally. In the latter case a court of cassation is provided in the district committee for the affairs of the peasants (*Uyedenoe po krestianskim dolam prisustvo*), which has superseded the assembly of arbiters of the peace (*mirnyye posredniki*) established in 1866.<sup>3</sup> (W. A. P.)

Previous to the revolution of 1905 but little progress had been made in Russia as regards education.<sup>4</sup> Distrust of the natural sciences, even in their technical applications, and of Western ideas of free government; desire to make university education, and even secondary education, a privilege of the wealthier classes; neglect of primary education, coupled with suppression by the ministry of public instruction of all initiative, private and public, in the matter of disseminating education among the illiterate classes—these were the distinctive features of the educational policy of the last twenty years of the 19th century.

<sup>1</sup> *L'Empire des tsars*, II, p. 310.

<sup>2</sup> In the ordinary tribunals weight is given to the "customs" of the peasants, even when these conflict with the written law.

<sup>3</sup> The abolition of the special courts of the peasants was announced in the same imperial ukas (18th of October 1906) which promised the relief of the peasants from the arbitrary control of the communes, and permission for them to migrate elsewhere without losing their communal rights. This was made part of the general reform of Russian local government, which in the autumn of 1910 was still under the consideration of the Duma.

<sup>4</sup> Of the effects of the political changes in Russia on the educational system of the country it was, even in the autumn of 1910, too early to say anything save that an undoubted impetus had

been given to the effort for improvement, and that the question had been seriously taken in hand by the imperial administration and the Duma. What form it would ultimately take depended still on the balance between the forces of conservatism and change, the suspicious temper of the autocracy being revealed, during the years of unstable equilibrium, by the alternate concession and withdrawal of privileges, e.g. in the matter of the independence of the universities. Any account of the educational system cannot, therefore, be otherwise than historical and provisional [E.D.].

It was only towards its close that a change took place in the attitude of the government towards technical education, and a few high and middle technical schools were opened. It was only then, too, that a reform was started in secondary education, with the object of revising the so-called "classical" system favoured in the lycæums since the 'seventies, the complete failure of which has been demonstrated after nearly thirty years of experiment. Apart from the schools under the ministry of war (Cossack *voivods* and schools at the barracks), the great bulk of the primary schools are either under the ministry of public instruction or of the Holy Synod. Those under the latter body are of recent growth, the policy of the last twenty years of the 19th century having been to hand over the budget allowances for primary instruction to the Holy Synod, which opened parish schools under the local priests. The schools under the Synod are themselves divided into two categories: parish schools and reading schools of an inferior grade. No teaching certificate is required by the teachers in either class of school, the permission of the bishop (like the French *lettre d'obédience* of 1849) being sufficient. The consequence is, that the village priests, being too much occupied with their parochial duties, cannot give more than casual or perfunctory attention to the schools, and the numerous pupils either exist on paper only, or are handed over to half-educated cantors, deacons or hired teachers. One good feature of the Russian primary school system, however, is that in many villages there are school gardens or fields; in nearly 1000 schools, bee-keeping, and in 300 silkworm culture is taught; while in some 900 schools the children receive instruction in various trades; and in 300 schools in *shikh* (a system of manual training originated in Finland). Girls are taught handwork in many schools. Nearly 50% of the teachers are women. The total expenditure on primary schools in 1905 was £5,300,000 (about the average in recent years), of which 20% was supplied by the state, 23% by the *zemstvos*, 35% by the village communities and the municipalities and 11% by private persons. The middle schools are maintained by the state, which contributes 25% of the expenditure of the classical and technical schools, by the fees of the pupils (30%), and by donations from the *zemstvos* and municipalities. The total grants from the state exchequer for education of all grades in all parts of the empire amounted in 1906 to £8,107,000. The progress of primary education is illustrated by the fact that, while in 1885 there was one school for every 2665 inhabitants and one pupil for every 48 inhabitants, in 1898 the figures were 1643 and 31 inhabitants respectively. According to the census of 1897 the number of illiterates varied from 89.2 to 44.9% of the population in the rural districts, and from 63.6 to 37.2% in the urban.

For higher education there were in 1904 only 9 universities (Yuriev or Dorpat, Kazan, Kharkov, Kiev, Moscow, Odessa, St. Petersburg, Warsaw and Tomsk), with 19,400 students, 6 medical academies (one for women), 6 theological academies, 6 military academies, 5 philological institutes, 3 Eastern languages institutes, 3 law schools, 4 veterinary institutes, 4 agricultural colleges, 2 mining institutes, 4 engineering institutes, 2 universities for women (930 students at St. Petersburg), 3 technical pedagogic schools, 10 technical institutes, 1 forestry and 1 topographical school. There has, however, been much activity since 1905 in the establishment of new educational institutions, notably technical and commercial schools, which are placed under the new minister of commerce and industry. Finland has a university of its own at Helsinki.

The standard of teaching in the universities is on the whole very high, and may be compared to that of the German universities. The students are hard working, and generally very intelligent. Mostly sons of poor parents, they live in extreme poverty, supporting themselves chiefly by translating and by tutorial work.

The state of secondary education still leaves much to be desired. The steady tendency of Russian society towards increasing the number of secondary schools, where instruction would be based on the study of the natural sciences, is checked by the government in favour of the classical gymnasiums.<sup>5</sup> Sunday schools and public lectures are virtually prohibited.

A characteristic feature of the intellectual movement in Russia is its tendency to extend to women the means of higher instruction. The gymnasiums for girls are both numerous and good. In addition to these, notwithstanding government opposition, a series

been given to the effort for improvement, and that the question had been seriously taken in hand by the imperial administration and the Duma. What form it would ultimately take depended still on the balance between the forces of conservatism and change, the suspicious temper of the autocracy being revealed, during the years of unstable equilibrium, by the alternate concession and withdrawal of privileges, e.g. in the matter of the independence of the universities. Any account of the educational system cannot, therefore, be otherwise than historical and provisional [E.D.].

<sup>5</sup> An imperial rescript of 10th of June 1902 foreshadowed a reorganization of secondary education, and an imperial ukas of 15th of March 1903 laid down the lines on which this was to proceed. The old curriculum of the *Real* schools is now superseded.

of higher schools, in which careful instruction is given in natural and social sciences, have been opened in the chief cities under the name of "pedagogical courses." At St Petersburg a women's medical academy, the examinations of which were even more searching than those of the ordinary academy (especially as regards diseases of women and children), was opened, but after about one hundred women had received the degree of M.D. it was suppressed by government. In several university towns there are free teaching establishments for women, supported by subscription, with programmes and examinations equal to those of the universities.

The natural sciences are much cultivated in Russia. Besides the Academy of Science, the Moscow Society of Naturalists, the Mineralogical Society, the Geographical Society, with its *Scientific societies.* Caucasian and Siberian branches, the archaeological societies and the scientific societies of the Baltic provinces, all of which are of old and recognized standing, there have lately sprung up a series of new societies in connexion with each university, and their serials are yearly growing in importance, as, too, are those of the Moscow Society of Friends of Natural Science, the Chemo-Physical Society, and various medical, educational and other associations. The work achieved by Russian savants, especially in biology, physiology and chemistry, and in the sciences descriptive of the vast territory of Russia, is well known to Europe.

The ordinary revenue of the empire is in excess of the ordinary expenditure, but the extraordinary expenditure not only swallows up this surplus, but necessitates the raising of fresh loans every year. On the other hand, there is a good deal to show for this extraordinary expenditure. A considerable number of new railways, including the Siberian, have been built with money obtained from that source. But since 1894 all extraordinary items of expenditure, with the exception of those for the construction of new lines of railway, have been defrayed out of ordinary revenue. The only sources of extraordinary revenue still remaining under that head are the money derived from loans and the perpetual deposits in the Imperial Bank. The ordinary revenue, obtained principally from the sale of spirits (28%), which is a state monopoly, from state railways (23%) and customs (10%), steadily rose from a total of £132,750,000 in 1895 to a total of £214,360,000 in 1905. Other noteworthy sources of revenue are trade licences, direct taxes on lands and forests, stamp duties, posts and telegraphs, indirect taxes on tobacco; sugar and other commodities, the crown forests, and land redemption payable annually by the peasants since 1861. At the same time the total ordinary expenditure has increased at a similarly steady rate, namely, from £119,391,000 in 1895 to £202,544,000 in 1905. In 1904, 81½% of the extraordinary expenditure, namely, £71,550,000, was incurred in consequence of the war with Japan, and to this must be added in 1906 a further expenditure of £42,085,000. The total national debt of Russia nearly trebled between 1852 (£57,038,600) and 1862 (£145,500,000), and again between 1872 (£242,277,000) and 1892 (£526,109,000) it more than doubled, while by 1906 it amounted altogether to £812,040,000. Of the total, 77% stands at 4% and 17 at less than 4%.

The system of obligatory military service for all, introduced in 1874, has been maintained, but the six years' term of service has been reduced to five, while the privileges granted to young men who have received various degrees of education have been slightly extended. During the reign of Alexander III. efforts were mainly directed towards—(1) reducing the time required for the mobilization of the army; (2) increasing the immediate readiness of cavalry for war and its fitness for serving as mounted infantry (dragoon regiments taking the place of husars and lancers); (3) strengthening the W. frontier by fortresses and railways; and (4) increasing the artillery, siege and train reserves. Further, the age releasing from service was raised from 40 to 43 years and the militia (*landsturm*) was reorganized. The measures taken during the reign of Nicholas II. have been chiefly directed towards increasing the fighting capacity and readiness for immediate service of the troops in Asia, and towards the better reorganization of the local irregular militia forces. Broadly speaking, the army is divided into regulars, Cossacks and militia. The peace strength of the army is estimated at 42,000 officers and 1,100,000 men (about 950,000 combatants), while the war strength is approximately 75,000 officers and 4,500,000 men. However, this latter figure is merely nominal, the available artillery and train service being much below the strength which would be required for such an army; estimates which put the military forces of Russia in time of war at 2,750,000—irrespective of the armies which may be levied during the war itself—seem to approach more nearly the strength of the forces which could actually be mustered. The infantry and rifles are armed with small-bore magazine rifles, and the active artillery have steel breech-loaders with extreme ranges of 4150 to 4700 yds.

Before the Japanese war Russia maintained four separate squadrons: the Baltic, the Black Sea, the Pacific and the Caspian. But in the operations before Port Arthur and in the disastrous battle of Tushima the Russian fleets were almost completely annihilated. The bulk of the Black Sea fleet and a few other battleships were, however, still left, and since 1904

steps have been taken to build new ships, both battleships and powerful cruisers. Kronstadt is the naval headquarters in the Baltic, Sevastopol in the Black Sea and Vladivostok on the Pacific.

*Fortresses.*—The chief first-class fortresses of Russia are Warsaw and Novogorogievsk in Poland, and Brest-Litovsk and Kovno in Lithuania. The second-class fortresses are Kronstadt and Sveaborg in the Gulf of Finland, Ingavord in Poland, Libau on the Baltic Sea, Kerch on the Black Sea and Vladivostok on the Pacific. In the third class are Viborg in Finland, Ossovets and Ust Dvinsk (or Dünamünde) in Lithuania, Sevastopol and Ochakov on the Black Sea, and Kars and Batum in Caucasia. There are, moreover, 46 forts and fortresses unclassified, of which 6 are in Poland, 8 in W. and S.W. Russia, and the remainder (mere fortified posts) in the Asiatic dominions.

## II. EUROPEAN RUSSIA

*Geography.*—The administrative boundaries of European Russia, apart from Finland, coincide broadly with the natural limits of the East-European plains. In the N. it is bounded by the Arctic Ocean; the islands of Novaya-Zemlya, Kolguev and Vaigach also belong to it, but the Kara Sea is reckoned to Siberia. To the E. it has the Asiatic dominions of the empire, Siberia and the Kirghis steppes, from both of which it is separated by the Ural Mountains, the Ural river and the Caspian—the administrative boundary, however, partly extending into Asia on the Siberian slope of the Urals. To the S. it has the Black Sea and Caucasia, being separated from the latter by the Manyk depression, which in Post-Pliocene times connected the Sea of Azov with the Caspian. The W. boundary is purely conventional: it crosses the peninsula of Kola from the Varanger Fjord to the Gulf of Bothnia; thence it runs to the Kurisches Haff in the southern Baltic, and thence to the mouth of the Danube, taking a great circular sweep to the W. to embrace Poland, and separating Russia from Prussia, Austrian Galicia and Rumania.

It is a special feature of Russia that she has no free outlet to the open sea except on the ice-bound shores of the Arctic Ocean. Even the White Sea is merely a gulf of that ocean. The deep indentations of the gulfs of Bothnia and Finland are surrounded by what is ethnologically Finnish territory, and it is only at the very head of the latter gulf that the Russians have taken firm foothold by erecting their capital at the mouth of the Neva. The Gulf of Riga and the Baltic belong also to territory which is not inhabited by Slavs, but by Finnish races and by Germans. It is only within the last hundred and thirty years that the Russians have definitely taken possession of the N. shores of the Black Sea and the Sea of Azov. The E. coast of the Black Sea belongs properly to Transcaucasia, a great chain of mountains separating it from Russia. But even this sheet of water is an inland sea, the only outlet of which, the Bosphorus, is in foreign hands, while the Caspian, an immense shallow lake, mostly bordered by deserts, possesses more importance as a link between Russia and her Asiatic settlements than as a channel for intercourse with other countries.

The great territory occupied by European Russia—1600 m. in length from N. to S., and nearly as much from E. to W.—is on the whole a broad elevated plain, ranging between 500 and 900 ft. above sea-level, deeply cut into by river-valleys, and bounded on all sides by broad swellings or low mountain-ranges: the lake plateaus of Finland and the Maanselkä heights in the N.W.; the Baltic coast-ridge and spurs of the Carpathians in the W., with a broad depression between the two, occupied by Poland; the Crimean and Caucasian mountains in the S.; and the broad but moderately high swelling of the Ural Mountains in the E.

From a central plateau, which comprises the governments of Tver, Moscow, Smolensk and Kursk, and projects E. towards Samara, attaining an average elevation of 800 to 900 ft. above the sea, the surface slopes gently in all directions to a level of 300 to 500 ft. Then it again rises gradually as it approaches the hilly tracts which enclose the great plain. This central swelling may be considered a continuation towards the E.N.E. of the great line of upheavals of N.W. Europe; the elevated grounds of Finland would then represent a continuation of the Scanian plateaus of S. Sweden, and the northern mountains of Finland a continuation of Kjölen (the Keel) which separate Sweden from Norway, while the other great line of

upheaval of the old continent, which runs N.W. to S.E., would be represented in Russia by the Caucasus in the S. and by the Timan ridge of the Pechora basin in the N.

The hilly aspect of several parts of the central plateau is not due to foldings of the strata, which for the most part appear to be horizontal, but chiefly to the excavating action of the rivers, whose valleys are deeply eroded in the plateau, especially on its borders. The round flattened summits of the Valdai plateau do not rise above 1100 ft., and they present the appearance of mountains only in consequence of the depths of the valleys—the rivers which flow towards the depression of Lake Peipus being only 200 to 250 ft. above the sea. The same is true of the plateaus of Livonia, "Wendish Switzerland," and the government of Kovno, which do not exceed 1000 ft. at their highest points; and again of the E. spurs of the Baltic coast-ridge between the governments of Grodno and Minsk. The same elevation is reached by a very few flat summits of the plateau about Kurak, and farther E. on the Volga about Kamyshin, where the valleys are excavated to a depth of 800 or 900 ft., giving quite a hilly aspect to the country. It is only in the S.W. where spurs of the Carpathians enter the governments of Volhynia, Podolia and Bessarabia, that ridges reaching 1100 ft. are met with, these again intersected by deep ravines.

The depressions which gap the borders of the central plateau thus acquire a greater importance than the small differences in its vertical elevation. Such is the broad depression of the middle Volga and lower Kama, bounded on the N. by the faint swelling of the Uvaly, the watershed between the Arctic Ocean and the Volga basin. Another broad depression, 250 to 500 ft. above the sea, still filled by Lakes Peipus, Ladoga, Onega, Byelo-ozero, Lacha, Vozhe, and many thousands of smaller lakes, skirts the central plateau on the N., and follows the same E.N.E. direction. Only a few low swellings penetrate into it from the N.W., about Lake Onega, and reach 900 ft., while in the N.E. it is enclosed by the Timan ridge (1000 ft.). A third depression, traversed by the Pripiet and the middle Dnieper, extends to the W. and penetrates into Poland. This immense lacustrine basin is now broken up into numberless ponds, lakes and marshes (see MINSK). It is bounded on the S. by the broad plateaus which spread out E. of the Carpathians. S. of 60° N. the central plateau slopes gently towards the S., and we find there a fourth depression stretching W. and E. through Poktava and Kharkov, but still reaching in its higher parts 500 to 700 ft. It is separated from the Black Sea by a gentle swelling which may be traced from Kremenez in Volhynia to the lower Don, and perhaps farther S.E. This swelling includes the Donets coal-measures and the middle granitic ridges which give rise to the rapids of the Dnieper. Finally a fifth depression, which descends below the level of the ocean, extends for more than 200 m. to the N. of the Caspian, comprising the lower Volga and the Ural and Emba rivers, and establishing a link between Russia and the Aral-Caspian region. It is continued farther N. by plains below 300 ft., which join the depression of the middle Volga, and extend as far as the mouth of the Oka.

The Ural Mountains present the aspect of a broad swelling whose strata no longer exhibit the horizontality which is characteristic of central Russia, and moreover are deeply cut into by rivers. They are connected in the W. with broad plateaus which join those of central Russia, but their orographical relations to other upheavals must be more closely studied before they can be definitely pronounced on.

The rhomboidal peninsula of the Crimea, connected by only a narrow isthmus with the continent, is occupied by an arid plateau sloping gently N. and E., and bordered on the S.E. by the Yaila Mountains, the summits of which range between 4000 and 5000 ft.

Owing to the orographical structure of the East-European plains, the river systems have become more than usually prominent and important features of the configuration. Taking their origin from a series of lacustrine basins scattered over the plateaus and differing slightly in elevation, the Russian rivers describe immense curves before reaching the sea, and flow with a very gentle gradient, while numerous large tributaries collect their waters from over vast areas. Thus the Volga, the Dnieper and the Don attain respectively lengths of 2325, 1410 and 1325 m., and their basins run to 563,300, 202,140 and 166,000 sq. m. respectively. Moreover, the chief rivers, the Volga, the W. Dvina, the Dnieper, and even the Lovat and the Oka, take their rise (in the N.W. of the central plateau) so close to one another that they may be said to radiate from the same centre. The sources of the Don interlace with the tributaries of the Oka, while the upper tributaries of the Kama join those of the N. Dvina and Pechora. In consequence of this, the rivers of Russia have been from remote antiquity the principal channels of trade and migration, and have contributed much more to the elaboration of national unity than any political institutions. Boats could be conveyed over flat and easy portages from one river-basin to another, and these portages were subsequently transformed with a relatively small amount of labour into navigable canals, and even at the present day the canals have more importance for the traffic of the country than have most of the railways. By their means the plains of the central plateau—the very heart of Russia, whose natural outlet was the Caspian—were brought into water-communication with the Baltic, and the Volga

basin was connected with the Gulf of Finland. The White Sea has also been brought into connexion with the central Volga basin while the sister-river of the Volga—the Kama—became the main artery of communication with Siberia.

But although the rivers of Russia rank before the rivers of W. Europe in respect of length, they are far behind them as regards the volumes of water which they discharge. They freeze in winter and dry up in summer, and most of them are navigable only during the spring floods; even the Volga becomes so shallow during the hot season that none but boats of light draught can pass over its shoals.

**Arctic Ocean Basin.**—The Pechora rises in the N. Ural, and enters the ocean by a large estuary at the Gulf of Pechora. Its basin, thinly populated and available only for cattle-breeding and for hunting, is quite isolated from Russia by the Timan ridge. The river is navigable for 770 m.; grain and a variety of goods conveyed from the upper Kama are floated down, while furs, fish and other products of the sea are shipped up the river to be transported to Cherdyn on the Kama. The Mezei enters the Bay of Mezei; it is navigable for 450 m., and is the channel of a considerable export of timber. The N. Dvina is formed by the union of the Yug and the Sukhona. The latter, although it flows over a great number of rapids, is navigable throughout its length (330 m.); it is connected by canal with the Caspian and the Baltic. The Vychegda, which flows W.S.W. to join the Sukhona, through a woody region, thinly peopled, is navigable for 500 m. and in its upper portion is connected by a canal with the upper Kama. The N. Dvina flows with a very slight gradient through a broad valley, and reaches the White Sea at Archangel. Notwithstanding serious obstacles offered by shallows, corn, fish, salt and timber are largely shipped to and from Archangel. The Onega, which flows into Onega Bay, has rapids; but timber is floated down in spring, and fishing and some navigation are carried on in the lower portion.

**Baltic Basin.**—The Neva (40 m.) flows from Lake Ladoga into the Gulf of Finland. The Volkhov, discharging into Lake Ladoga, and forming part of the Vyshny-Volochok system of canals, is an important channel for navigation; it flows from Lake Ilmen, which receives the Msta, connected with the Volga, and the Lovat. The Svir, also discharging into Lake Ladoga, flows from Lake Onega, and, being part of the Mariinsk canal system, is of great importance for navigation. The Narova flows out of Lake Peipus into the Gulf of Finland at Narva; it has remarkable rapids, which are used to generate power for cotton-mills; in spite of this, the river is navigated. Lake Peipus, or Chudskoye, receives the Velikaya, a channel of traffic with S. Russia from remote antiquity, but now navigable only in its lower portion, and the Embach, navigated by steamers to Dorpat (Yurjev). The S. Dvina, which falls into the sea below Riga, is shallow above the rapids of Jacobstadt, but navigation is carried on as far as Vitebsk—corn, timber, potash, flax, &c., being the principal shipments of its navigable tributaries (the Oboka, Ulla and Kasplya). The Ulla is connected by the Berezina canals with the Dnieper. The Memel (Niemen), with a course of 470 m. in Russia, rises in the N. of Minsk, leaves Russia at Yurburg, and enters the Kurisches Haf; rafts are floated upon it almost from its source, and steamers ply as far as Kovno; it is connected by the Oginsky canal with the Dnieper. For the Vistula, with the Bug and Narwe, see POLAND.

**Black Sea Basin.**—The Pruth rises in Austrian Bukovina, and separates Russia from Rumania; it enters the Danube, which flows along the Russian frontier for 100 m. below Reni, touching it with its Kilia branch. The Dniester (530 m. in Russia) rises in Galicia. Light boats and rafts are floated at all points, and steamers ply on its lower portion; its estuary has important fisheries. The Dnieper, with a basin of 202,140 sq. m., drains 13 governments, the aggregate population of which numbers over 28,000,000. It also originates in the N.W. parts of the central plateau, in the same marshy lakes which give rise to the Volga and the W. Dvina, and enters the Black Sea. In the middle navigable part of its course, from Dorogobuzh to Ekaterinoslav, it is an active channel for traffic. It receives several large tributaries:—on the right, the Berezina, connected with the W. Dvina, and the Pripiet, both very important for navigation—as well as several smaller tributaries on which rafts are floated; on the left the Sozh, the Desna, one of the most important rivers of Russia, navigated by steamers as far as Bryansk, the Sula, the Psiol and the Vorskla. Below Ekaterinoslav the Dnieper flows for 46 m. over a series of rapids. At Kherson it enters its long (40 m.) but shallow estuary, which receives the S. Bug and the Ingul. The Don, with a basin of 166,000 sq. m., and navigable for 880 m., rises in the government of Tula and enters the Sea of Azov at Rostov, after describing a great curve to the E. at Tsaritsyn, approaching the Volga, with which it is connected by a railway (45 m.). Its navigation is of great importance, especially for goods brought from the Volga, and its fisheries are extensive. The chief tributaries are the Sosna and North Donets on the right, and the Voronezh, Khoper, Medveditsa and Manych on the left. The Tyva, the Kuban and the Rion belong to Caucasia.

**The Caspian Basin.**—The Volga, the chief river of Russia, has a length of 2325 m., and its basin, about 563,300 sq. m. in area, contains a population of nearly 40,000,000. It is connected with the Baltic by three systems of canals (see VOLGA). The Ural, in its lower

part, constitutes the frontier between European Russia and the Kirghiz steppe; it receives the Sakmara on the right and the Ilek on the left. The Kuma, the Terek and the Kura, with the Aras, which receives the waters of Lake Gok-cha, belong to Caucasia.<sup>1</sup>

The soil of Russia depends chiefly on the distribution of the boulder-clay and loess, on the degree to which the rivers have severally excavated their valleys, and on the moistness of the climate. Vast areas in Russia are quite unfit for cultivation, 10% of the aggregate surface of European Russia (apart from Poland and Finland) being occupied by lakes, marshes, sand, &c., 30% by forests, 16% by prairies, and only 26% being under cultivation. The distribution of all these is, however, very unequal, and the five following subdivisions may be established—

(1) the tundra; (2) the forest region; (3) the middle region, comprising the surface available for agriculture and partly covered with forests; (4) the black-earth (*chernozem*) region; and (5) the steppes. Of these the black-earth region—about 150,000,000 acres—which reaches from the Carpathians to the Urals, from the Pinsk marshes in the S.W. to the upper Oka in the N.E., is the most important. It is covered with a thick sheet of black earth, a kind of loess, mixed with 5 to 15% of humus, due to the decomposition of an herbaceous vegetation, which developed luxuriantly during the Lacustrine period on a continent relatively dry even at that epoch. On the three-fields system corn has been grown upon it for fifty to seventy consecutive years without manure. Isolated black-earth islands, though less fertile, occur also in Courland and Kovno, in the Oka-Volga-Kama depression, on the slopes of the Urals, and in a few patches in the N. Towards the Black Sea coast its thickness diminishes, and it disappears in the valleys. In the extensive region covered with boulder-clay the black earth appears only in isolated places, and the soil consists for the most part of a sandy clay, containing a much smaller admixture of humus. There cultivation is possible only with the aid of a considerable quantity of manure. Drainage finding no outlet through the thick clay, the soil of the forest region is often hidden beneath extensive marshes, and the forests themselves are often mere thickets choking marshy ground; large tracts of sand appear in the W., and the admixture of boulders with the clay in the N.W. renders agriculture difficult. On the Arctic coast the forests disappear, giving place to the tundras. Finally, in the S.E., towards the Caspian, on the slopes of the southern Urals and the plateau of Obchichy Syrt, as also in the interior of the Crimea, and in several parts of Bessarabia, there are large tracts of real desert, buried under coarse sand and devoid of vegetation.

Notwithstanding the fact that Russia extends from N. to S. through 30° of latitude, the climate of its different portions, apart from the Crimea and Caucasia, presents a striking uniformity. The aerial currents—cyclones, anti-cyclones and dry S.E. winds—prevail over extensive areas, and sweep across the flat plains without hindrance. Everywhere the winter is cold and the summer hot, both varying in their duration, but differing relatively little in the extremes of temperature recorded. There is no place in Russia, Archangel and Astrakhan included, where the thermometer does not rise in summer nearly to 86° Fahr. and descend in winter to -13° and -22°. It is only on the Black Sea coast that the absolute range of temperature does not exceed 108°, while in the remainder of Russia it reaches 126° to 144°, the oscillations being between -22° and -31°, occasionally going down as low as -54°, and rising as high as 86° to 104°, or even 109°. Everywhere the rainfall is small; if Finland and Poland on the one hand and Caucasia with the Caspian depression on the other be excluded, the average yearly rainfall varies between 16 and 28 in. Nowhere does the maximum rainfall take place in winter (as in W. Europe), but it occurs in summer, and everywhere the months of advanced spring are warmer than the corresponding months of autumn.

Though thus exhibiting the distinctive features of a continental climate, Russia does not lie altogether outside the reach of the moderating influence of the ocean. The Atlantic cyclones penetrate to the Russian plains, mitigating to some extent the cold of winter, and in summer bringing with them their moist winds and thunderstorms. Their influence is chiefly felt in W. Russia, though it does reach as far as the Urals and beyond. They thus check the extension and limit the duration of the cold anticyclones.

<sup>1</sup>Bibliography of Geography: see Tillo, in *Ismestia* of Russian Geogr. Soc. (1883); P. P. Semenov, *Geogr. and Statist. Dictionary of the Russian Empire* (in Russian, 5 vols., St Petersburg, 1863-84), the most trustworthy source for the geography of Russia; the official *Spod Materialov*, with regard to Russian rivers (1876); Statistical *Sbornik* of the Ministry of Communications, vol. x. (freezing of Russian rivers, and navigation). A great variety of monographs dealing with separate rivers and basins are available; e.g. S. Martynov, *Das Felschoragebiet* (St Petersburg, 1905); G. von Helmersen, *Das Olenische Berggebiet* (St Petersburg, 1860); Turbin, *The Dnieper*; Prasolenko, *The Dniester* in *Engin. Jour.* (1881); Danilevsky, "Kuban," in *Mem. Geogr. Soc.* 1; K. E. von Baer, *Russische Studien* (St Petersburg, 1857-59); V. Ragozin, *Volga* (St Petersburg, 1890); Peretyatkovich, *Volga*; and Mikhailov, *Kama*. An orohydrographical map of Russia in four sheets was published in 1878.

Throughout Russia the winter is of long duration. The last days of frost are experienced for the most part in April, but as late as May to the N. of 55° N. The spring is exceptionally beautiful in central Russia; late as it usually is, it sets in with vigour, and vegetation develops with a rapidity which gives to this season in Russia a special charm, unknown in warmer climates. The rapid melting of the snow at the same time causes the rivers to swell, and renders a great many minor streams navigable for a few weeks. But a return of cold weather, injurious to vegetation, is very frequently observed in central and E. Russia between May the 18th and the 24th, so that it is only in June that warm weather sets in definitely, and it reaches its maximum in the first half of July (or of August on the Black Sea coast). In S.E. Russia the summer is much warmer than in the corresponding latitudes of France, and really hot weather is experienced everywhere. It does not, however, prevail for long, and in the first half of September frosts begin on the middle Urals. They descend upon W. and S. Russia in the beginning of October, and are felt on the Caucasus about the middle of November. The temperature drops so rapidly that a month later, about October the 10th on the middle Urals and November the 15th throughout Russia, the thermometer ceases to rise above the freezing-point. The rivers freeze rapidly; towards November 20th all the streams of the White Sea basin are ice-bound, and so remain for an average of 167 days; those of the Baltic, Black Sea and Caspian basins freeze later, but about December the 20th nearly all the rivers of the country are highways for sledges. The Volga remains frozen for a period varying between 150 days in the N. and 90 days at Astrakhan, the Don for 100 to 110 days, and the Dniester for 83 to 122 days. On the W. Dvina ice prevents navigation for 125 days, and even the Vistula at Warsaw remains frozen for 77 days. The lowest temperatures are experienced in January, the average being as low as 20° to 5° Fahr. throughout Russia; in the west only does it rise above 22°. On the whole, February and March continue to be cold, and their average temperatures rise above zero nowhere except on the Black Sea coast. Even at Kiev and Lugansk the average of March is below 40°, while in central Russia it is 25° to 22°, and as low as 20° and 16° at Samara and Orenburg.

All Russia is comprised between the isotherms of 32° and 54°. On the whole, they are more remote from one another than even on the plains of N. America, those of 46° to 32° being distributed over twenty degrees of latitude. They are, on the whole, inclined towards the S. in E. Russia; thus the isotherm of 39° runs from St Petersburg to Orenburg, and that of 35° from Tornéa in Finland to Uralsk. The inflexion is still greater for the winter isotherms. Closely following one another, they run almost N. and S.; thus Odessa and Königsberg are situated on the same winter isotherm of 28°; St Petersburg, Orel and the mouth of the Ural river on about 20°; and Mezen and Ufa on 0°. The summer isotherms cross the winter isotherms nearly at right angles, so that Kiev and Ufa, Warsaw and Tobolsk, Riga and the upper Kama have the same average summer temperatures of 64°, 62½° and 61° respectively.

The laws and relations of the cyclones and anti-cyclones in Russia are not yet thoroughly understood. It appears, however, that in January the cyclones mostly travel across N.W. Russia (N. of 55° and W. of 40° E.), following directions which vary between N.E. and S.E. In July they are pushed farther towards the N., and cross the Gulf of Bothnia, while another series of cyclones sweep across middle Russia, between 50° and 55° N. Nor are the laws of the anti-cyclones established. The winds closely depend on the routes followed by both. Generally, however, it may be said that alike in January and in July W. and S.W. winds prevail in W. Russia, while E. winds are most common in S.E. Russia. N. winds are predominant on the Black Sea coast. The strength of the wind is greater, on the whole, than in the continental parts of W. Europe, and it attains its maximum velocity in winter. Terrible tempests blow from October to March, especially on the S. steppes and on the tundras. Hurricanes accompanied with snow (*burans*, *myatels*), and lasting from two to three days, or N. blizzards without snow, are especially dangerous to man and beast. The average relative moisture reaches 80 to 85% in the N., and only 70 to 81% in S. and E. Russia. In the steppes it is only 60% during summer, and still less (57) at Astrakhan. The average amount of cloud is 73 to 75% on the White Sea and in Lithuania, 68 to 64 in central Russia, and only 59 to 53 in the S. and S.E. The amount of rainfall is shown in the Table on next page.<sup>2</sup>

The flora of Russia, which represents an intermediate link between the flora of Germany and the flora of Siberia, is strikingly uniform over a very large area. Though not poor at any given place, it appears so if the space occupied by Russia be taken into account, only 3300 species of phanerogams and ferns

<sup>2</sup>Bibliography of Meteorology: *Memoirs of the Central Physical Observatory*; *Repertorium für Meteorologie und Meteorologische Sbornik*, published by the same body; Veselovsky, *Climate of Russia* (Russian); H. Wild, *Temperatur-Verhältnisse des Russ. Reiches* (1881); Voveikov, *The Climates of the Globe* (Russ., 1884), containing the best general information about the climate of Russia.

being known. Four regions may be distinguished: the Arctic, the Forest, the Steppe and the Circum-Mediterranean.

The Arctic Region comprises the tundras of the Arctic littoral beyond the N. limit of the forests, which closely follows the coast-line, with deviations towards the N. in the river valleys (70° N. in Finland and on the Arctic Circle about Archangel, 68° N. on the Ural, 71° in W. Siberia). The shortness of the summer, the deficiency of drainage and the depth to which the soil freezes in winter, are the circumstances which determine the characteristic features of the vegetation of the tundras. Their flora is far closer akin to the floras of N. Siberia and N. America than to that of central Europe. Mosses and lichens are distinctive, as also are the birch, the dwarf willow and several shrubs; but where the soil is drier, and humus has been able to accumulate, a variety of herbaceous flowering plants, some of them familiar in W. Europe, make their appearance. Only 275 to 280 phanerogams are found within this region.

The Forest Region of the Russian botanists includes the greater part of the country, from the Arctic tundras to the steppes, and over this immense expanse it maintains a remarkable uniformity of character. Beketov subdivides it into two portions—the forest region proper and the "Ante-Steppe" (*predstepie*). The N. limit of the ante-steppe is represented by a line drawn from the Pruth through Zhitomir, Kursk, Tambov and Stavropol-on-Volga to the sources of the Ural river. But the forest region proper presents a different aspect in the N. from that in the S., and must in turn be subdivided into two parts—the coniferous region and the region of the oak forests—these being separated by a line drawn through Pskov, Koestroma, Kazani and Ufa. Of course the oak occurs farther N. than this, and coniferous forests extend farther S., advancing even to the border-region of the steppes. To the N. of this line the forests are of great extent and densely grown, more frequently diversified by marshes than by meadows or cultivated fields. Vast and impenetrable forests, impassable marches and thickets, numerous lakes, swampy meadows, with cleared and dry spaces here and there occupied by villages, are the leading features of this region. Fishing and hunting are the most important sources of livelihood. The characteristics of the oak region, which comprises all central Russia, are totally different. The surface is undulatory; marshy meadow lands no longer exist on the flat watersheds, and only a few in the deeper and broader river valleys. Forests are still numerous where they have not been destroyed by the hand of man, but their character has changed. Conifers are rare, and the Scotch pine, which is abundant on the sandy plains, takes the place of the *Abies*. The forests are composed of the birch, oak and other deciduous trees, the soil is dry, and the woodlands are divided by green prairies. Viewed from rising ground, the landscape presents a pleasing variety of cornfield and forest, while the horizon is broken by the bell-towers of the numerous villages strung along the banks of the streams.

Viewed as a whole, the flora of the forest region is to be regarded as European-Siberian; and, though certain species disappear towards the E., while new ones make their appearance, it maintains, on the whole, the same features throughout from Poland to Kamchatka. Thus the beech (*Fagus sylvatica*) is unable to survive the continental climate of Russia, and does not penetrate beyond Poland and the S.W. provinces, reappearing again in the Crimea. The silver fir does not extend over Russia, and the oak does not

cross the Ural. On the other hand, several Asiatic species (Siberian pine, larch, cedar) grow freely in the N.E., while numerous shrubs and herbaceous plants, originally from the Asiatic steppes, have found their way into the S.E. But all these do not greatly alter the general character of the vegetation. The coniferous forests of the north contain, besides conifers, the birch (*Betula alba*, *B. pubescens*, *B. fruticosa* and *B. serracosa*), which extends from the Pechora to the Caucasus, the aspen, two species of alder, the mountain-ash (*Sorbus aucuparia*), the wild cherry and three species of willow. S. of 62°-64° N. appears the lime tree, which multiplies rapidly and, notwithstanding the rapidity with which it is being exterminated, constitutes entire forests in the east (central Volga, Ufa). Farther S. the ash (*Fraxinus excelsior*) and the oak make their appearance, the latter (*Quercus pedunculata*) reaching in isolated groups and single trees as far N. as St Petersburg and South Finland (*Q. Robur* appears only in the S.W.). The hornbeam is prevalent in the Ukraine, and the maple begins to appear in the S. of the coniferous region. In the forest region no fewer than 772 flowering species are found, of which 568 dicotyledons occur in the Archangel government (only 436 to the E. of the White Sea, which is a botanical limit for many species). In central Russia the species become still more numerous, and, though the local floras are not yet complete, they number 850 to 1050 species in the separate governments, and about 1600 in the best explored parts of the S.W. Corn is cultivated throughout this region. Its N. limits advance almost to the Arctic coast at Varsage, Fird, farther E. they hardly reach N. of Archangel, and the limit is still lower towards the Ural. The N. boundary of rye closely corresponds to that of barley. Wheat is cultivated in S. Finland, but in W. Russia it hardly gets N. of 58° N. Its true domains are the oak region and the steppes. Fruit trees are cultivated as far as 62° N. in Finland, and as far as 58° in the E. Apricots and walnuts flourish at Warsaw, but in Russia they do not thrive beyond 50°. Apples, pears and cherries are grown throughout the oak region.

The Region of the Steppes, which is coincident with the whole of S. Russia, may be subdivided into two zones—an intermediate zone and that of the steppes proper. The ante-steppe of the preceding region and the intermediate zone of the steppes include those tracts in which the W. European climate contends against the Asiatic, and where a struggle is carried on between the forest and the steppe. It is comprised between the summer isotherms of 59° and 63°, being bounded on the S. by a line which runs through Ekaterinoslav and Lugansk. S. of this line begin the steppes proper, which extend to the sea and penetrate to the foot of the Caucasus.

The steppes proper are very fertile, elevated plains, slightly undulating, and intersected by numerous ravines, which are dry in summer. The undulations are scarcely apparent. Not a tree is to be seen, the few woods and thickets being hidden in the depressions and deep valleys of the rivers. On the thick layer of black earth by which the steppe is covered a luxuriant vegetation develops in spring; after the old grass has been burned a bright green prevails over immense stretches, but this rapidly disappears under the burning rays of the sun and the hot E. winds. The colouring of the steppe changes as if by magic, and only the silvery plumes of the steppe-grass (*Stipa pennata*) wave in the wind, tinting the steppe a bright yellow. For days together the traveller sees no other vegetation; even this, however, disappears as he approaches the regions recently left dry by the Caspian, where saline clays, bearing a few Salsolaceae, or mere sand, take the place of the black earth. Here begins the Aral-Caspian desert. The steppe, however, is not so devoid of trees as at first sight appears. Innumerable clusters of wild cherries (*Prunus Chamaecerasus*), wild apricots (*Amygdalus nana*), the Siberian pea-tree (*Caragana frutescens*), and other deep-rooted shrubs grow at the bottoms of the depressions and on the slopes of the ravines, imparting to the steppe that charm which manifests itself in the popular poetry. Unfortunately the spread of cultivation is fatal to these oases (they are often called "islands" by the inhabitants); the axe and the plough ruthlessly destroy them.

The vegetation in the marshy bottoms of the ravines and in the valleys of the streams and rivers is totally different. The moist soil encourages luxuriant thickets of willows (*Salicaceae*), surrounded by dense *Chenopod-de-frise* of wormwood and thorn-bearing Compositae, and interspersed with rich but not extensive prairies, harbouring a great variety of herbaceous plants; while in the deltas of the Black Sea rivers impenetrable beds of reeds (*Arundo phragmites*) shelter a forest fauna. But cultivation rapidly changes the physiognomy of the steppe. The prairies are superseded by wheat-fields, and flocks of sheep destroy the true steppe-grass (*Stipa pennata*).

A great many species unknown in the forest region make their appearance in the steppes. The Scotch pine still grows on all sandy spaces, and the maple (*Acer tatarica* and *A. campestre*), the hornbeam and the black and white poplar are very common. The number of species of herbaceous plants rapidly increases, while beyond the Volga a variety of Asiatic species are added to the W. European flora.

The Circum-Mediterranean Region is represented by a narrow

strip on the S. coast of the Crimea, where a climate similar to that of the Mediterranean coast has permitted the development of a flora closely resembling that of the valley of the Arno in Italy. Human cultivation has destroyed the abundant forests which sixty years ago made deer-hunting possible at Kherones. The olive and the chestnut are rare; but the beech reappears, and the *Pinus pinaster* recalls the Italian pines. At a few points, such as Nikita near Livadia and Alupka, where plants have been acclimatized by human agency, the Californian *Wellingtonia*, the Lebanon cedar, many evergreen trees, the laurel, the cypress, and even the Anatolian palm (*Chamaerops excelsa*) flourish. The grass vegetation is very rich, and, according to lists still incomplete, no fewer than 1654 flowering plants are known. But on the whole, the Crimean flora has little in common with that of the Caucasus.<sup>1</sup>

Russia belongs to the same zoo-geographical region as central Europe and N. Asia, the same fauna extending in Siberia as far as the Yenisei and the Lena. In the forests not many animals which have disappeared from W. Europe have held their ground; while in the Urals only a few—now Siberian, but formerly also European—are met with.

In S.E. Russia, however, towards the Caspian, there is a notable admixture of Asiatic species. Three separate sub-regions may, however, be distinguished on the E. European plains—the tundra, including the Arctic islands, the forest region, especially the coniferous part of it, and the ante-steppe and steppes of the black earth region. The Ural Mountains might be distinguished as a fourth sub-region, while the S. coast of the Crimea and Caucasia, as well as the Caspian deserts, have each their own individuality.

The fauna of the Arctic Ocean off the Norwegian coast corresponds, in its W. parts at least, to that of the N. Atlantic Gulf Stream. The White Sea and the Arctic Ocean to the E. of Svyatoi Nos on the Kola peninsula belong to a separate zoological region, connected with, and hardly separable from, that part of the Arctic Ocean which washes the Siberian coast as far as the mouth of the Lena. The Black Sea, the fauna of which appears to be very rich, belongs to the Mediterranean region, slightly modified, while the Caspian partakes of the characteristic fauna inhabiting the lakes and seas of the Aral-Caspian depression.

In the region of the tundras life has to contend with such unfavourable conditions that it cannot be abundant. Still, the reindeer frequents it for its lichens, and on the drier slopes of the moraine deposits there occur four species of lemming, hunted by the Arctic fox (*Vulpes lagopus*). The willow-grouse (*Lagopus albus*), the ptarmigan (*L. alpinus* or *mutus*), the lark, the snow-bunting (*Plectrophenax nivalis*), two or three species of *Sylvia*, one *Phylloscopus* and a *Motacilla* must be added. Numberless aquatic birds visit it for breeding purposes. Ducks, divers, geese, gulls, all the Russian species of snipes and sandpipers (*Limicolae*, *Tringae*), &c., swarm on the marshes of the tundras and on the crags of the Lapland coast.

The forest region, and especially its coniferous portion, though it has lost some of its representatives within historic times, still possesses an abundant fauna. The reindeer, rapidly disappearing, is now met with only in the governments of Olonets and Vologda; *Cervus pygargus* is found everywhere, and reaches Novgorod. The weasel, the fox and the hare are exceedingly common, as also are the wolf and the bear in the N., but the glutton (*Gulo borealis*), the lynx and the elk (*C. alces*) are rapidly disappearing. The wild boar is confined to the basin of the W. Dvina, and the *Bison europæa* to the Byelovezh forest in Grodno. The sable has quite disappeared, being found only on the Urals; the beaver may be trapped at a few places in Minsk, and the otter is very rare. On the other hand, the hare, grey partridge (*Perdix cinerea*), hedgehog, quail, lark, rook and stork find their way into the coniferous region as the forests are cleared. The avifauna of this region is very rich; it includes all the forest and garden birds known in W. Europe, as well as a very great variety of aquatic birds. A list, still incomplete, of the birds of St. Petersburg runs to 251 species. Hunting and shooting give occupation to a great number of persons. The reptiles are few. As for fishes, all those of W. Europe, except the carp, are met with in the lakes and rivers in immense quantities, the characteristic feature of the region being its wealth in *Coregoni* and in Salmonidae generally.

In the ante-steppe the forest species proper, such as *Pteromys solanus* and *Tamias striatus*, disappear, but common squirrel (*Sciurus vulgaris*), weasel and bear are still met with in the forests. The hare is increasing rapidly, as well as the fox. The avifauna, of course, becomes poorer; nevertheless, the woods of the steppe, and still more the forests of the ante-steppe, give refuge to many

birds, even to hazel-ben (*Troglodytes*), capercaillie (*T. tetrix*) and woodcock (*T. urogallus*). The fauna of the scrub in the river valleys is decidedly rich, and includes aquatic birds. The destruction of the forests and the advance of wheat into the prairies are rapidly thinning the steppe fauna. The various species of rapacious animals are disappearing, together with the colonies of marmots; the insectivores are also becoming scarce in consequence of the destruction of insects; while vermin, such as the musk, or pouched marmot (*Spermophilus*), and the destructive insects which are a scourge to agriculture, become a real plague. The absence of *Coregoni* is a characteristic feature of the fish-fauna of the steppes; the carp, on the contrary, reappears, and the rivers abound in sturgeon (Acipenseridae). In the Volga below Nižnii-Novgorod the sturgeon (*Acipenser ruthenus*), and others of the same family, as well as a very great variety of ganoids and *Teleostei*, appear in such quantities that they give occupation to nearly 100,000 people. The mouths of the Caspian rivers are especially celebrated for their wealth of fish.<sup>2</sup>

**Ethnography.**—Remains of Palaeolithic man, contemporary with the large Quaternary mammals, are few in Russia; they have been discovered only in Poland, Poltava and Voronezh, and perhaps also on the Oka. Those of the later Lacustrine period, on the contrary, are so numerous that there is scarcely one lacustrine basin in the regions of the Oka, the Kama, the Dnieper, not to speak of the lake-region itself, and even the White Sea coasts, where remains of Neolithic man have not been discovered. The Russian plains have been, however, the scene of so many migrations of successive races, that at many places a series of deposits belonging to widely distant epochs are found one upon another. Settlements belonging to the Stone age, and manufactories of stone implements, burial-grounds of the Bronze epoch, earthen forts and burial-mounds (*kurgans*)—of this last four different types are known, the earliest belonging to the Bronze period—are superposed, rendering the task of unravelling their several relations one of great difficulty.

Two different races—a brachycephalic and a dolichocephalic—can be distinguished among the remains of the earlier Stone period (Lacustrine period) as having inhabited the plains of E. Europe. But they are separated by so many generations from the earliest historic times that sure conclusions regarding them are impossible; at all events, as yet Russian archaeologists are not agreed as to whether the ancestors of the Slavs were Sarmatians only or Scythians also, whose skulls have nothing in common with those of the Mongol race. The earliest data which may be regarded as established belong to the 1st century, when the Finns migrated from the N. Dvina region towards the W., and the Sarmatians were compelled to abandon the region of the Don, and cross the Russian steppes from E. to W., under the pressure of the Aorzes (the Mordvinian Erzya and Siraks, who in their turn were soon followed by the Huns and Uigur-Turkish Avars.

In the 7th century S. Russia was the seat of the empire of the Khazars, who drove the Bulgarians, descendants of the Huns, from the Don, one section of them migrating up the Volga to found there the Bulgarian empire, and the remainder travelling towards the Danube. This migration compelled the N. Finns to advance farther W., and a body of intermingled Tavans and Karelians penetrated to the S. of the Gulf of Finland.

<sup>1</sup> Bibliography of Flora: see Pallas, *Zoographia Rosso-Asiatica*; Sjevvertsov for the birds of south-eastern Russia; M. A. Bogdanov, *Birds and Mammals of the Black-Earth Region of the Volga Basin* (in Russian, Kazan, 1871); Karelin for the southern Urals; Kessler for fishes; Strauch, *Die Schlangen des Russ. Reiches*, for reptiles generally; Rodoszkowski and the publications of the Entomological Society generally for insects; Czerniavsky for the marine fauna of the Black Sea; Kessler for that of Lakes Onega and Ladoga; Grimm for the Caspian. The fauna of the Baltic provinces is described in full in the *Memoirs of the scientific bodies of these provinces*. A. T. von Middendorff's *Sibirische Reise*, vol. iv., *Zoology* (St. Petersburg, 1875), though dealing more especially with Siberia, is an invaluable source of information for the Russian fauna generally. A. E. Nordenkiöld's *Vega-expeditionens Vetenskapliga Iakttagelser* (5 vols., Stockholm, 1872-87) may be consulted for the mammals of the tundra region and marine fauna. For more detailed bibliographical information see *Aperçu des travaux zoo-geographiques*, published at St. Petersburg in connexion with the Exhibition of 1878; and the index *Uzasateli Russkoi Literatury* for natural science, mathematics and medicine, published since 1872 by the Society of the Kiev University.

R. von Trautvetter, *Russische Asiatische Pflanzen* (1880), and *Flora Rossica Fennica* (St. Petersburg, 1880). For flora of the tundras, Beketov's "Flora of Archangel, in *Mém. Soc. Natur.* of St. Petersburg University, xv. (1864); Regel, *Flora Rossica* (1884); Brown, *Forestry in the Mining Districts of the Urals* (1885); Reports by Commissioners of Woods and Forests in Russia (1884).

As early as the 8th century, and probably still earlier, a stream of Slav colonization, advancing E. from the Danube, poured over the plains of S.W. Russia. It is also most probable that another similar stream—the N., coming from the Elbe, through the basin of the Vistula—ought to be distinguished. In the 9th century the Slavs occupied the upper Vistula, the S. of the Russian lacustrine region, and the W. of the central plateau. They had Lithuanians to the W.; various Finnish tribes, intermingled towards the S.E. with Turkish (the present Bashkirs); the Bulgars, whose origin still remains doubtful, on the middle Volga and Kama; and to the S.E. the Turkish-Mongol races of the Pechenegs, Polovits, Uzes, &c., while in the S., along the Black Sea, was the empire of the Khazars, who had under their rule several Slav tribes, and perhaps also some of Finnish origin. In the 9th century also the Ugrians are supposed to have left their Ural abodes and to have traversed S.E. and S. Russia on their way to the basin of the Danube. If the Slavs be subdivided into three branches—the W. (Poles, Czechs and Wends), the S. (Servians, Bulgarians, Croats, &c.), and the E. (Great, Little and White Russians), it will be seen that, with the exception of some 3,000,000 Little Russians, now settled in East Galicia and in Poland, and of a few on the southern slope of the Carpathians, the whole of the E. Slavs occupy, as a compact body, W., central and S. Russia.

Like other races of mankind, the Russian race is not pure. The Russians have absorbed and assimilated in the course of their history a variety of Finnish and Turko-Finnish elements. Still, craniological researches show that, notwithstanding this fact, the Slav type has been maintained with remarkable persistency: Slav skulls ten and thirteen centuries old exhibit the same anthropological features as those which characterize the Slavs of our own day. This may be explained by a variety of causes, of which the chief is the maintenance by the Slavs down to a very late period of gentile or tribal organization and gentile marriages, a fact vouched for, not only in the pages of the Russian chronicler Nestor, but still more by visible social evidences, the *gens* later developing into the village community, and the colonization being carried on by large co-ordinated bodies of people. The Russians do not emigrate as isolated individuals; they migrate in whole villages. The overwhelming numerical superiority of the Slavs, and the very great differences in ethnical type, belief and mythology between the Indo-European and the Ural-Altaic races, may have contributed to the same end. Moreover, while a Russian man, far away from home among Siberians, readily marries a native, the Russian woman seldom does the like. All these causes, and especially the first-mentioned, have enabled the Slavs to maintain their ethnical purity in a relatively high degree, whereby they have been enabled to assimilate foreign elements and make them intensify or improve the ethnical type, without giving rise to half-breed races. The very same N. Russian type has thus been maintained from Novgorod to the Pacific, with but minor differentiations on the outskirts—and this notwithstanding the great variety of races with which the Russians have come into contact. But a closer observation of what is going on in the recently colonized confines of the empire—where whole villages live without mixing with the natives, but slowly bringing them over to the Russian manner of life, and then slowly taking in a few female elements from them—gives the key to this feature of Russian life.

Not so with the national customs. There are features—the wooden house, the oven, the bath—which the Russian never abandons, even when swamped in an alien population. But when settled among these the Russian—the N. Russian—readily adapts himself to many other differences. He speaks Finnish with Finns, Mongolian with Buriats, Ostiak with Ostiaks; he shows remarkable facility in adapting his agricultural practices to new conditions, without, however, abandoning the village community; he becomes hunter, cattle-breeder or fisherman, and carries on these occupations according to local usage; he modifies his dress and adapts his religious beliefs to the locality he inhabits. In consequence of all this,

the Russian peasant (not, be it noted, the trader) proves himself to be an excellent colonist.

Three different branches can be distinguished among the Russians from the dawn of their history—the Great Russians, the Little Russians (Malorusses or Ukrainians), and the White Russians (the Byelorusses). These correspond to the two currents of immigration mentioned above—the N. and S., with perhaps an intermediate stream, the proper place of the White Russians not having been as yet exactly determined. The primary distinctions between these branches have been increased during the last nine centuries by their contact with different nationalities—the Great Russians absorbing Finnish elements, the Little Russians undergoing an admixture of Turkish blood, and the White Russians submitting to Lithuanian influence. Moreover, notwithstanding the unity of language, it is easy to detect among the Great Russians themselves two separate branches, differing from one another by slight divergences of language and type and deep diversities of national character—the Central Russians and the Novgorodians. The latter extend throughout N. Russia into Siberia. Many minor anthropological differentiae can be distinguished among both the Great and the Little Russians, depending probably on the assimilation of various minor subdivisions of the Ural-Altaic.

The Great Russians occupy in one compact mass the space enclosed by a line drawn from the White Sea to Lake Pskov, the upper courses of the W. Dvina and the Donets, and thence, through the mouth of the Sura, by the Veluga, to the Mезь. To the E. of this boundary they are intermingled with Turko-Finns, but in the Ural mountains they reappear in a second compact body, and thence extend through S. Siberia and along the courses of the Lena and the Amur. Great Russian Nonconformists are disseminated among Little Russians in the governments of Chernigov and Mogilev, and they reappear in greater masses in Novorossia (*i.e.* S. Russia), as also in N. Caucasia.

The Little Russians occupy the steppes of S. Russia, the S.W. slopes of the central plateau and those of the Carpathian and Lublin mountains, and the Carpathian plateau, that is, the governments of Podolia, Volhynia, Poltava, and Kiev. The Zaporozhian Cossacks colonized the steppes farther E., towards the Don, where they met with a large population of Great Russian runaways, constituting the present Don Cossacks. The Zaporozhian Cossacks, sent by Catherine II. to colonize the E. coast of the Sea of Azov, constituted there the Black Sea and later the Kuban Cossacks (part of whom, the Nekrasovtsy, migrated to Turkey). They have also peopled large parts of the government of Stavropol and of N. Caucasia.

The White Russians, intermingled to some extent with Great and Little Russians, Poles and Lithuanians, occupy the upper parts of the W. slope of the central plateau.

The Finnish races, which in prehistoric times extended from the Ob all over N. Russia, even then were subdivided into Ugrians, Permyks, Bulgarians and Finns proper, who drove back the previous Lapp population from what is now Finland, and about the 7th century penetrated to the S. of the Gulf of Finland, in the region of the Livs and Kurs, where they fused to some extent with the Lithuanians and the Letts. At present the races of Finnish origin are represented in Russia by the following: (a) the W. Finns; the Tavasts, in central Finland; the Kvaens, in N.W. Finland; the Karelians, in the E., who also occupy the lake regions of Olonets and Archangel, and have settlements in Novgorod and Tver; the Izhores, on the Neva and the S.E. coast of the Gulf of Finland; the Esths, in Esthonia and the N. of Livonia; the Livs, on the Gulf of Riga; and the Kurs, intermingled with the Letts; (b) the N. Finns, or Lapps, in N. Finland and on the Kola peninsula, and the Samoyedes in Archangel and W. Siberia; (c) the Volga Finns, or rather the old Bulgarian branch, to which belong the Mordvians, and the Cheremisses in Kazan, Kostroma and Vyatka, though they are classified by some authors with the following: (d) the Permyks, or Cis-Uralian Finns, including the Votjaks on the E. of Vyatka, the Permyaks in Perm, the Syryemians or Zyryans in Volodga, Archangel, Vyatka and Perm; (e) the Ugrians, or Trans-Uralian Finns, including the Voguls on both slopes of the Ural, the Ostiaks in Tobolsk and partly in Tomsk, and the Magyars, or Ugrians.

The following are the chief subdivisions of the Turko-Tatars in European Russia:—(1) The Tatars, of whom three different branches must be distinguished: (a) the Kazan Tatars on both banks of the Volga, below the mouth of the Oka, and on the lower Kama, but penetrating farther S. in Ryazan, Tambov, Samara, Simbirsk and Penza; (b) the Tatars of Astrakhan at the mouth of the Volga; and (c) those of the Crimea, a great many of whom emigrated to Turkey after the Crimean War (1854-56). There are, besides, a certain number of Tatars in the S.E. in Minak, Grodno and Vilna. (2) The Bashkirs, who inhabit the slopes of the S. Ural, that is, the steppes of Ufa and Orenburg, extend also into Perm and Samara. (3) The Chuvashes, on the right bank of the Volga, in Kazan and Simbirsk. (4) The Meshcheryaks, a tribe of Finnish origin who formerly inhabited the basin of the Oka, and, driven thence during the 15th century by the Russian colonists, immigrated into Ufa and Penza, where they now live among the Bashkirs, having adopted their religion and customs. (5) The Teptyars, also of Finnish origin.

settled among the Tatars and Bashkirs in Samara and Vyatka. The Bashkirs, Meshcheryaks and Teptyars rendered able service to the Russian government against the Khirgiz, and until 1863 they constituted a separate Cossack army. (6) The Khirgiz, whose true abodes were in Asia, in the Ishim and Khirgiz steppe. One section of them crossed the Urals and occupied the steppes between the Urals and the Volga; the remainder belong to Turkestan and Siberia.

The Mongol race is represented in Russia by the Kalmucks, who inhabit the steppes of Astrakhan between the Volga, the Don and the Kuma. They are Lamaists by religion and immigrated to the mouth of the Volga from Dzungaria, in the 17th century, driving out the Tatars and Nogais, and after many wars with the Don Cossacks, one part of them was taken in by the Don Cossacks, so that even now there are among these Cossacks several Kalmuck sotnias or squadrons. They live for the most part in tents, and support themselves by breeding live stock, and partly by agriculture.

The Semitic race is represented by upwards of 5,000,000 Jews. They first entered Poland from Germany during the era of the crusades, and soon spread through Lithuania, Courland, the Ukraine, and, in the 18th century, Bessarabia. The rapidity with which they peopled certain towns (e.g. Odessa) and the whole provinces was really prodigious. The law of Russia prohibits them from entering Great Russia, only the wealthiest and best educated enjoying this privilege; nevertheless they are met with everywhere, even on the Ussals. Their chief abodes, however, continue to be Poland, the W. provinces of Lithuania, White and Little Russia, and Bessarabia. In Russian Poland they constitute 13½% of the total population. In Kovno, Vilna, Mogilev, Grodno, Volhynia, Podolia, Minsk, Vitebak, Kiev, Bessarabia and Kherson, they constitute, on the average, 12 to 17½% of the population, while in the cities and towns of these governments they reach 30 to 50% of the population. Organized as they are into a kind of community for mutual protection and mutual help, they soon become masters of the trade wherever they penetrate. In the villages they are mostly innkeepers, intermediaries in trade and pawbrokers. In many towns most of the skilled labourers and a great many of the unskilled (for instance, the grain-porters at Odessa and elsewhere) are Jews.

The Jews of the Karaité sect differ entirely from the orthodox Jews both in worship and in mode of life. They, too, are inclined to trade, but they also enter on agriculture successfully. Those inhabiting the Crimea speak Tatar, and the few who are settled in W. Russia speak Polish. They are on good terms with the Russians.

Of W. Europeans, the Germans only attain considerable numbers in European Russia. In the Baltic provinces they constitute the ennobled landlord class, and are the tradesmen and artisans in the towns. Considerable numbers of Germans, tradesmen and artisans, settled at the invitation of the Russian government in many of the larger towns as early as the 16th century, and to a much greater extent in the 18th century. Numbers were invited in 1762 to settle in S. Russia, as separate agricultural colonies, and these have since then gradually extended into the Don region and N. Caucasia. Protected as they were by the right of self-government, exempted from military service, and endowed with considerable allotments of good land, these colonies are much wealthier than the neighbouring Russian peasants, from whom they have adopted the slowly modified village community. They are chiefly Lutherans, but many of them belong to other religious sects—Anabaptists, Moravians, Mennonites. During the closing years of the 19th century great numbers of Germans flocked into the industrial governments of Poland, namely, Piotrkow, Warsaw and Kalisz.

The Rumanians (Moldavians) inhabit the governments of Bessarabia, Podolia, Khetsovolnia, Ekaterinoslav. In Bessarabia they constitute from one-fourth to three-fourths of the population of certain districts, and nearly 50% of the entire population of the government. On the whole the Novorossian governments (Bessarabia, Kherson, Ekaterinoslav and Taurida) exhibit the greatest variety of population. Little and Great Russians, Rumanians, Bulgarians, Germans, Greeks, Frenchmen, Poles, Tatars and Jews are mingled together and scattered about in small colonies, especially in Bessarabia. The Greeks inhabit chiefly the towns, where they are traders, as also do the Armenians, scattered through the towns of S. Russia, and appearing in larger numbers only in the district of Rostov.

The Lithuanians prevail in Kovno, Vilna and Suwalki; and the Letts, who are, however, more scattered, are chiefly concentrated in Vitebak, Courland and Livonia.

In the Baltic provinces (Esthonia, Livonia and Courland) the prevailing population is Esthonian, Kuronian or Lettish, the Germans being respectively only 3.8, 7.6 and 8.2% of the population. The relations of the Esths and Letts with their landlords are anything but friendly.

The governments of St Petersburg (apart from the capital), Olonets and Archangel contain an admixture of Karelians, Samoeyedes and Syryenians, the remainder being Great Russians. In the E. and S.E. provinces of the Volga (Nishny-Novgorod, Simbirsk, Samara, Penza and Saratov) the Great Russians prevail, the remainder being chiefly Mordvians, Tatars, Chuvashes and

Bashkirs, Germans in Samara and Saratov, and Little Russians in the last named. In the Ural governments of Perm and Vyatka Great Russians are in the majority, the remainder being a variety of Finno-Tatars. In the S. Ural governments (Uralisk, Orenburg, Ufa) the admixture of Turko-Tatars—of Kirgiz in Uralisk, Bashkirs in Orenburg and Ufa, and less important races—becomes considerable.

The state religion is that of the Orthodox Greek Church (Orthodox Catholic or Orthodox Eastern Church). Its head is the tsar; but although he makes and annuls all appointments, he does not determine questions of dogmatic theology. The principal ecclesiastical authority is the Holy Synod, the head of which, the Procurator, is one of the council of ministers and exercises very wide powers in ecclesiastical matters. In theory all religions may be freely professed, except that certain restrictions, such as domicile,<sup>1</sup> are laid upon the Jews; but in actual fact the dissenting sects are more or less severely treated. According to returns published in 1903 the adherents of the different religious communities in the whole of the Russian empire numbered approximately as follows, though the heading Orthodox Greek includes a very great many *Raskolniki* or Dissenters. Indeed it is estimated that there are more than 12,000,000 Dissenters in Great Russia alone.

Orthodox Greek . . . . .	87,123,600
Dissenters . . . . .	2,204,600
Armenian Gregorians . . . . .	1,179,240
Armenian Catholics . . . . .	38,840
Roman Catholics . . . . .	11,468,000
Lutherans . . . . .	3,572,650
Reformed . . . . .	85,400
Baptists . . . . .	38,140
Mennonites . . . . .	66,560
Anglicans . . . . .	4,180
Other Christians . . . . .	3,950
Karaité Jews . . . . .	12,900
Jews . . . . .	5,215,800
Mahomedans . . . . .	13,907,000
Buddhists . . . . .	423,860
Other non-Christians . . . . .	285,300

Total . . . . . 125,640,020

The ecclesiastical heads of the national Orthodox Greek Church consist of three metropolitans (St Petersburg, Moscow, Kiev), fourteen archbishops and fifty bishops, all drawn from the ranks of the monastic (celibate) clergy. The parochial clergy are celibate in so far as they must be married when appointed, but if left widowers may not marry again.

All Russians, with the exception of a number of White Russians who belong to the United Greek Church (see ROMAN CATHOLIC CHURCH), profess the Orthodox Greek faith or belong to one or other of the numberless dissident sects. The Poles and most of the Lithuanians are Roman Catholics. The Esths and all other Western Finns, the Germans and the Swedes are Protestant. The Tatars, Bashkirs and Kirgizis are Mahomedans; but the last-named have to a great extent maintained along with Mahomedanism their old Shamanism. The same holds good of the Meshcheryaks, both Moslem and Christian. The Mordvians are nearly all Orthodox Greek, as also are the Votyaks, Voguls, Cheremisses and Chuvashes, but their religions are, in reality, modifications of Shamanism under the influence of some Christian and Moslem beliefs. The Moguls, though baptized, are in fact believers in fetishism as much as the unconverted Samoeyedes. Finally, the Kalmucks are Lamaite Buddhists.

In his relations with Moslems, Buddhists and even fetishists the Russian peasant looks rather to conduct than to creed, the latter being in his view simply a matter of nationality. Indeed, towards paganism, at least, he is perhaps even more than tolerant, preferring on the whole to keep on good terms with pagan divinities. The numerous outbreaks against the Jews are directed, not against their creed, but against them as keen business men and extortionate money-lenders. Any idea of proselytism is quite foreign to the ordinary Russian mind, and the outbursts of proselytizing zeal occasionally manifested by the clergy are really due to the desire for "Russification," and traceable to the influence of the higher clergy and of the government.

<sup>1</sup> The restrictions on domicile were to some extent relaxed in the beginning of 1907.

It is this political rather than religious spirit which also underlies the repressive attitude of the government, and of the Orthodox Church as the organ of the government, towards the various dissident sects (*Raskolniki*, from *raskol*, schism), which for more than two centuries past have played an important part in the popular life of Russia, and, since the political developments of the end of the 19th and early years of the 20th century, have tended to do so more and more. To understand the problem of the *Raskolniki* it is necessary to bear two things in mind: the fundamental principle of Eastern Orthodoxy as distinct from Western Catholicism, and the practical identification in Russia of the National Church with the National State. The very basis of Orthodoxy is that the Church is by Christ's ordinance unalterable, that its traditional forms, every one of which is a vehicle of saving grace, were established in the beginning by Christ and his apostles, and that consequently nothing may be added or altered. The trouble began early in the 17th century with the attempt, made in connexion with the printing of the liturgical books, to amend certain ritual details in which there was proved to have been a departure from primitive usage; it came to a head under the patriarch Nikon (q.v.). Under his influence a synod endorsed the changes in 1654; one bishop alone, Paul of Colomna, dissented, and he was deposed, knouted and kept in prison till he died mad. In 1656 the synod anathematized the adherents of the old forms, and the anathema was confirmed by those of 1666 and 1667. To the conservatives, known subsequently as Old Ritualists or Old Believers, this marked the beginning of the reign of Antichrist (was not 666 the number of the Beast?); but they continued the struggle, conservative opposition to the Westernizing policy of the tsars, which was held responsible for the introduction of Polish luxury and Latin heresy, giving it a political as well as a religious character. The rising of the Strelitsi in 1682 all but gave them the victory; the crushing of the rising relegated them definitely to the status of schismatics. They were placed in still completer antagonism to the established Orthodox Church by the innovations of Peter the Great. The Muscovite tsars had pursued them with fire and sword. The Russian emperors, having established themselves as heads of the Church and the Holy Synod as a state department, were not likely willingly to tolerate their existence.

The *Raskol* was threatened with extinction by the gradual dying out of its priests, which led to a further schism within itself, into the *Popovschchina* (with priests) and the *Beapopovschchina* (without priests). The *Popovitsi*, who were served by priests converted from the Orthodox Church, made their headquarters in the island of Werka, in a tributary of the Dnieper, in Poland (1695), and after its destruction by the government in 1735 and again in 1764, at Starodubye in the government of Chernigov, whence their doctrine spread in the country of the Don. In 1771 their headquarters were fixed at Moscow, in the Rogoshkiy cemetery assigned to them during the plague; here they had a monastery, seminary and consistory, until they were ejected by the emperor Nicholas I. In 1832 priests were forbidden to join them, and they had to apply to a deposed Bosnian metropolitan, who became their chief bishop, establishing his see in the monastery of Belokrinitsa in Bukovina. In 1862 the synod of the *Popovschchina* passed a circular letter making advances to the government with a view to a compromise, which was arranged on the basis of the Old Believers consenting to accept the ministrations of Orthodox priests on condition that they should use the unrevised books. This led to a further schism into three sections: those who recognize the metropolitan and the compromise (*Edinoveritsi*), those who recognize the metropolitan but repudiate the compromise, those who repudiate both (*Bioglopopovitsi*). There had already been other schisms on such questions as the right way to swing a censer and the legality of self-immolation for the Lord's sake.

The *Beapopovitsi*, known also as *Pomoranye*, because they are

mainly found in the sparsely populated country near the White Sea, are in some ways more remarkable. They reject the ministrations of priests altogether, since in the time of Antichrist (i.e. the heretic tsar) the only sacrament that remains is baptism. They therefore elect elders, who expound the Scriptures, baptize and hear confessions. They are, however, in no sense evangelicals in the Western sense; for they observe rigorous fasts, reverence icons, and believe implicitly in the efficacy of the multiplication of crossings, bowings and prostrations. They have, moreover, thrown off from time to time a number of extravagant offshoots. Such are the *Philippovitsi*, founded by one Philip (who burned himself alive for Christ's sake in 1743), who have exalted self-immolation into a principle; the *Stranniki* (pilgrims) and *Byeguni* (runners), who interpret Matt. x. 37 ff. literally, and reject legal marriage; the *Nyetovitsi* (denyers), who deny the necessity for common worship, since there are no priests; the *Molchalyniki* (mutes), whom no torture can persuade to utter a word.

Closely akin to these, though not derived from the Old Believers, are certain mystic sects which deny the efficacy of the sacraments altogether. Of these the most remarkable are the so-called *Khlysti* ("flagellants," from *hlysat*, "to strike, lash," but possibly a corruption of *Khristi*, "Christus"). They originated in 1645, when, according to their belief, God the Father descended in a chariot of fire on Mount Gorodim, in the province of Vladimir, and took up his abode in a peasant named Daniel Philippov, who chose another peasant, named Ivan Suslov, for his son, the Christ. Suslov selected a "mother of God" and twelve apostles. Though twice crucified and once flayed by order of the tsar, he always rose again, and did not die till 1716. Suslov chose a successor in one Prokopyi Lupkin, and since then—in the belief of the sect—every generation, even every community, has had its Christ and its "mother of God," who are worshipped by reason of the Divine Spirit dwelling in them. It is the duty of all believers to strive to become one or other of these by subduing the flesh, which is the product of Evil, and all motions of the will. Each community is presided over by an "angel," or prophet, and a prophetess, whose word is law. All alike are subject to the twelve commandments issued by the "Sabaoth," that is to say Daniel Philippov. These include the prohibition of alcoholic drink, of fleshly sins and of marriage, and the inculcation of faith in the Holy Ghost and complete surrender to his influence. At their prayer-meetings the *Khlysti* dance to the accompaniment of hymns, the dance gradually developing into a wild dervish-like spinning which is kept up till they drop, foaming at the mouth and prophesying. Perhaps the most remarkable fact about this sect is that it is secret, and that its members ostensibly belong to the Orthodox Church.

An offshoot of the *Khlysti* is the more celebrated secret sect of the *Skopetsi* (*skopets*, a eunuch), which represents an extreme ascetic reaction from the promiscuous immorality of some (by no means all) of the *Khlysti*. Their idea of attaining salvation is self-mutilation according to the counsel of perfection implied in Matt. xix. 12 and xviii. 8, 9. The "royal seal" is complete self-castration; partial mutilation is known as the "second purity." In the case of women the mutilation usually takes the form of amputation of the breasts. This horrible sect, which was founded by one Selivanov in the last quarter of the 18th century, seems to have a morbid attraction for people of all classes in Russia, and all the efforts of the government have not succeeded in stamping it out (see SKOPETS).

Closer akin to certain Western forms of dissidence from traditional Catholicism, though of native growth, are the *Molokani*, so called popularly because they continue to drink milk (*moloko*) during fasts. Their origin is unknown, but they are officially mentioned as early as 1765. They style themselves "truly spiritual Christians," and in their rejection of the sacraments, their indifference to outward forms, and their insistence on the spiritual interpretation of the Bible ("the letter killeth"), they are closely akin to the Quakers, whom they resemble also in their inoffensive mode of life and the practice of mutual help.

<sup>1</sup>The most important alterations were the repetition twice, instead of three times, of the "Alleluiah" at the Eucharist, and the making the sign of the cross with two fingers instead of three.

From the Molokani the *Dukhoborts*, in England better known as Doukhobors (*q.v.*), are distinguished by their subordination of the Scriptures to the authority of the "inner light." They are dualists, like the Bogomils (*q.v.*), ascribing the body to a fall from a state when the soul was on the same plane as God. The Incarnation was no isolated historical occurrence, but it is repeated over and over again in the faithful, each one of whom is in a certain sense God, by virtue of the indwelling Spirit. Both the Molokani and the Dukhoborts deny the authority of the civil government as such, and object on principle to military service. The former, however, give little trouble; on the other hand, the government has from time to time proceeded with extreme severity against the Dukhoborts, whose refusal to serve in the army, if allowed to go unpunished, would have set a contagious example.

Disidence of all kinds has made a considerable advance since the emancipation of the serfs in 1861, the increase—as might be expected in a wholly illiterate population—being greatest in the more extravagant sects. On the other hand, Western Protestantism has also made great headway, notably the Stundists, whose rationalistic-Protestant teaching has gained a firm foothold especially in Little Russia, where the *Raskol* never penetrated. The Baptists have also made considerable progress, notably among the Molokani.<sup>1</sup>

**Social Conditions.**—The old subdivisions of the population into orders possessed of unequal rights is still maintained. The great mass of the people, 81·6%, belong to the peasant order, the others being: nobility, 1·3%; clergy, 0·9; the burghers and merchants, 9·3; and military, 6·1. Thus more than 88 millions of the Russians are peasants. Half of them were formerly serfs (10,447,149 males in 1858)—the remainder being "state peasants" (9,194,891 males in 1858, exclusive of the Archangel government) and "domain peasants" (842,740 males the same year).

The serfdom which had sprung up in Russia in the 16th century, and became consecrated by law in 1609, taking, however, nearly one hundred and fifty years to attain its full growth, was abolished in 1861. This act liberated the serfs from a yoke which was really terrible, even under the best landlords, and from this point of view it was obviously an immense benefit.<sup>2</sup> But it was far from securing corresponding economic results.

The household servants or dependents attached to the personal service of their masters were merely set free; and they entirely went to reinforce the town proletariat. The peasants proper received their houses and orchards, and allotments of arable land. These allotments were given over to the rural commune (*mir*), which was made responsible, as a whole, for the payment of taxes for the allotments. For these allotments the peasants had to pay, as before, either by personal labour or by a fixed rent. The allotments could be redeemed by them with the help of the crown, and then they were freed from all obligations to the landlord. The crown paid the landlord in obligations representing the capitalized rent, and the peasants had to pay the crown, for forty-nine years, 6% interest on this capital. The redemption was not calculated on the value of the allotments of land, but was considered as a compensation for the loss of the compulsory labour of the serfs; so that throughout Russia, with the exception of a few provinces in the S.E., it was—and still remains, notwithstanding a very great increase in the value of land—much higher than the market value of the allotment. Moreover, many proprietors contrived to curtail seriously the allotments which the peasants had possessed under serfdom, and frequently they deprived them of precisely the parts which they were most in need of, namely, pasture lands around their houses, and forests. The effect of this, craftily calculated beforehand, was to compel the peasants to rent pasture lands from the landlord at any price.

<sup>1</sup> See N. Tsakni, *Russie sectaire* (1888); A. Leroy-Beaulieu, *L'Empire des Tsars*, tome iii. (1889; trans. 1896); C. K. Grass, *Russische Sektien* (1907 sqq.). Further useful references are given in Bonwetsch's article, "Raskolniken," in Herzog-Hauck, *Real-encyklop.* (3rd ed., 1905), vol. xvi. p. 436.

<sup>2</sup> It was only as late as 1904, however, that the landed proprietors were forbidden by law to inflict corporal punishment upon the peasants.

The present condition of the peasants—according to official documents—appears to be as follows. In the twelve central governments they grow, on the average, sufficient rye-bread for only 200 days in the year—often for only 180 and 100 days. One quarter of them have received allotments of only 2·9 acres per male, and one-half less than 8·5 to 11·4 acres—the normal size of the allotment necessary to the subsistence of a family under the three-fields system being estimated at 28 to 42 acres. Land must thus of necessity be rented from the landlords at fabulous prices. The aggregate value of the redemption and land taxes often reaches 185 to 275% of the normal rental value of the allotments, not to speak of taxes for recruiting purposes, the church, roads, local administration and so on, chiefly levied from the peasants. The arrears increase every year; one-fifth of the inhabitants have left their houses; cattle are disappearing. Every year more than half the adult males (in some districts three-fourths of the men and one-third of the women) quit their homes and wander throughout Russia in search of labour. In the governments of the black-earth region the state of matters is hardly better. Many peasants took the "gratuitous allotments," whose amount was about one-eighth of the normal allotments.

The average allotment in Kherson is only 0·90 acre, and for allotments from 2·9 to 5·8 acres the peasants pay 5 to 10 roubles of redemption tax. The state peasants are better off, but still they are emigrating in masses. It is only in the steppe governments that the situation is more hopeful. In Little Russia, where the allotments were personal (the *mir* existing only among state peasants), the state of affairs does not differ for the better, on account of the high redemption taxes. In the W. provinces, where the land was valued cheaper and the allotments somewhat increased after the Polish insurrection, the general situation might be better were it not for the former misery of the peasants. Finally, in the Baltic provinces nearly all the land belongs to the German landlords, who either farm the land themselves, with hired labourers, or let it in small farms. Only one-fourth of the peasants are farmers, the remainder being mere labourers, who are emigrating in great numbers.

The situation of the former serf-proprietors is also unsatisfactory. Accustomed to the use of compulsory labour, they have failed to accommodate themselves to the new conditions. The millions of roubles of redemption money received from the crown have been spent without any real or lasting agricultural improvements having been effected. The forests have been sold, and only those landlords are prospering who exact rack-rents for the land without which the peasants could not live upon their allotments. During the years 1861 to 1894 the land owned by the nobles decreased 30%, or from 210,000,000 to 150,000,000 acres; during the following four years an additional 2,119,500 acres were sold; and since then the sales have gone on at an accelerated rate, until in 1903 alone close upon 2,000,000 acres passed out of their hands. On the other hand, since 1861, and more especially since 1882, when the Peasant Land Bank was founded for making advances to peasants who were desirous of purchasing land, the former serfs, or rather their descendants, have between 1883 and 1904 bought about 19,500,000 acres from their former masters. There has been an increase of wealth among the few, but along with this a general impoverishment of the mass of the people, and the peculiar institution of the *mir*, framed on the principle of community of ownership and occupation of the land, was not conducive to the growth of individual effort. In November 1906, however, the emperor Nicholas II. promulgated a provisional *ukaz* permitting the peasants to become freeholders of allotments made at the time of emancipation, all redemption dues being remitted. This measure, which was endorsed by the third Duma in an act passed on the 21st of December 1908, is calculated to have far-reaching and profound effects upon the rural economy of Russia. Thirteen years previously the government had endeavoured to secure greater fixity and permanence of tenure by providing that at least twelve years must elapse between every two redistributions of the land belonging to, or to be shared by, those entitled to share in it. The *ukaz* of November 1906 had provided that the various strips of land held by each peasant should be merged into a single holding; the Duma, however, on the advice of the government, left this to the future, as an ideal that could only gradually be realized.

The co-operative spirit of the Great Russians shows itself in another sphere in the *artel*, which has been a prominent feature of Russian life since the dawn of history. The *artel* "Artek" very much resembles the co-operative society of W. "Artek" Europe, with this difference that it makes its appearance without

<sup>3</sup> See *Collection of Materials on the Village Community*, vol. i.; *Collection of Materials on Landholding, and Statistical Descriptions of Separate Governments*, published by several zemstvos (Moscow, Tver, Nizhny-Novgorod, Tula, Ryazan, Tambov, Potava, Saratov, &c.); Kawelin, *The Peasant Question*; Vasilchikov, *Land Property and Agriculture* (2 vols.); and *Village Life and Agriculture*; Ivanukov, *The Fall of Serfdom in Russia*; Shashkov, "Peasantry in the Baltic Provinces," in *Russische Myt.* (1893), iii. and iv.; V. V., *Agric. Sketches of Russia*; Golovachov, *Capital and Peasant Farming*; Engelhardt's *Letters from the Country*.

any impulse from theory, simply as a spontaneous outgrowth of popular life. When workmen from any province come, for instance, to St Petersburg to engage in the textile industries, or to work as carpenters, masons, &c., they immediately unite in groups of ten to fifty persons, settle in a house together, keep a common table and pay each his part of the expense to the elected elder of the artel. All over Russia there is a network of such artels—in the cities, in the forests, on the banks of the rivers, on journeys and even in the prisons.

The industrial artel is almost as frequent as the preceding, in all those trades which admit of it. Artels of one or two hundred carpenters, bricklayers, &c., are common wherever new buildings have to be erected, or railways or bridges constructed; the contractors always prefer to deal with an artel, rather than with separate workmen. It is needless to add that the wages divided by the artels are higher than those earned by isolated workmen.

Finally, a great number of artels on the stock exchange, in the seaports, in the great cities, during the great fairs and on railways have grown up, and have acquired the confidence of tradespeople to such an extent that considerable sums of money and complicated banking operations are frequently handed over to an artelshik (member of an artel) without any receipt, his number or his name being accepted as sufficient guarantee. The artels are recruited only on personal acquaintance with the candidates for membership. Co-operative societies have also been organized by several artels. They have achieved good results, but do not exhibit, on the whole, the same unity of organization as those which have arisen in a natural way among the peasants and artisans.

The chief occupation of approximately seven-eighths of the population of European Russia is agriculture, but its character varies considerably according to the soil, the climate and the geographical position of the different regions. A

*Agri-culture.* A sinuous line drawn from Zhitomir via Kiev, Tula and Kazan to Ufa—that is, from W.S.W. to E.N.E.—separates the "northern soils" from the "southern soils." To the S. of this line, as far as the sandy deserts of Astrakhan and the steppes of N. Caucasia, lies the "black earth" region. Broadly speaking, the forests here yield to steppes, and the soil is very fertile; but the whole region suffers periodically from drought. The "northern soils," which are glacial deposits more or less redistributed by water, are much less fertile as a rule, and consist of all possible varieties from a tough boulder clay to loose sand. Both N. and S. of this line it is customary to distinguish several zones, lying, generally, parallel to it, and differentiated chiefly by climatic differences. In the tundras of the extreme N. agriculture does not exist; the reindeer constitutes the principal wealth of the nomad Samoyedes and Lapps. In the forest region S. of the tundras, which extends over an area of more than 500,000 sq. m., agriculture is carried on with great difficulty, not only because of the infertility of the soil, but also because of the severity of the climate and the fact that there are only three to four months in the year during which agriculture can be carried on. Apart from hunting and fishing, the exploitation of the forests provides the principal occupation of the inhabitants. Crops, chiefly barley, rye, oats, turnips and green crops, are, however, grown on clearings in the forest, though the yield is poor. S. of 60° N. agriculture becomes the predominant industry, while the exploitation of the forests plays only a secondary part. In this zone, which extends over an area of nearly 600,000 sq. m., and on the S. touches the agrarian line already mentioned, the principal crops are rye and oats, with barley and wheat coming next, though flax and green crops are also grown. Cattle have to be housed for the winter. In the W. of this zone, that is in the Baltic provinces, the climate is less severe as well as moister. Agriculture is carried on in a more intelligent manner, and the yield is higher. Flax is almost of as much importance as wheat, and the potato is more cultivated than in any other part of Russia. Hardy fruit thrives, and live-stock breeding prospers. In the W. governments of Kovno, Vitebsk, Vilna, Mogilev, Minsk and Grodno the climate is more temperate, but agriculture is more backward than in the Baltic provinces. The three-field system of cropping a patch of land until its fertility is exhausted, and then allowing it to revert to the primeval condition, is still pursued, and both landowners and peasantry suffer from want of capital and lack of agricultural training. Flax is one of the principal exports of this region, timber being another.

In middle Russia the winters are both longer and harder, and agriculture is consequently carried on under greater difficulties. One of the most serious of these is caused not by the unfavourable character of the climate but by the shortness of labour. Since their emancipation in 1861, the peasants of the central governments of Russia have in large numbers drifted away into the black earth zone, or have gone to the factories. The methods of agriculture are still unscientific and unprogressive. Rye is the staple crop, though buckwheat, flax, green crops and the potato are cultivated in considerable quantities.

Agriculture is most advanced in the W. of the black earth zone, that is in the governments of Kiev, Podolia, Poltava and in part of Kharkov. The winters are less severe, and modern agricultural machinery is generally employed, at all events on the larger estates.

In consequence of these more favourable conditions there is greater variety in the cropping; a good deal of wheat is grown, as well as beetroot for sugar, fibre plants and oleaginous plants, fruit, and even (W. of the Dnieper) the vine. Live-stock breeding is likewise in a more prosperous condition. The rest of the black earth zone, which stretches from these governments N.E. to the Volga, is less favoured by nature; the winters are longer and more inclement, and droughts are not uncommon. When this happens there is great suffering from famine, for wheat is the crop upon which the people principally depend, though rye, buckwheat and oats are also cultivated. But a long course of continuous cropping with these grain crops, without affording compensation to the soil in the form of manure or deep cultivation, has so exhausted it that its productiveness has sadly deteriorated. The consequence is that the peasantry are constantly in a state bordering on destitution, and exposed to the horrors of famine, like those which visited them in 1890 and 1898, and threatened in 1907.

S. of the above zone come the S. steppes. In the W., in Bessarabia, the three chief products are maize, wine and hardy fruit, especially plums. Here the climate is temperate and fairly moist, but farther E. it is distinctly more arid. Wheat is the principal crop, with barley second. Water-melons, sun-flowers and flax, both the last two for oil, are usual crops. But the breeding of horses and sheep is of equal importance with agriculture. Here again both capital and labour are short, and the cultivation of the soil suffers from the fact that, owing to the absence of timber, dung is used for fuel instead of being employed as manure. The steppe conditions extend over the greater part of the Crimea and up to the foothills of the Caucasus. The actual distribution of arable land, forests and meadows, in European Russia and Poland is shown in the following table:—

	European Russia.		Poland.	
	Acres.	Per-centage.	Acres.	Per-centage.
Arable land	301,435,000	26	16,900,000	53
Meadows and pasturages	185,498,000	16	6,059,000	19
Forests	452,152,000	39	7,334,000	23
Uncultivated	220,279,000	19	1,594,000	5
Total	1,159,364,000	100	31,887,000	100

The land in European Russia and Poland (Caucasia being excluded) is divided amongst the different classes of owners as follows:—

	European Russia.		Poland.	
	Acres.	Per-centage.	Acres.	Per-centage.
State and imperial family	400,816,000	35	1,808,000	5½
Peasants	446,657,000	38½	13,584,000	42½
Private owners, towns, &c.	245,835,000	21	15,106,000	47½
Unit for cultivation	66,056,000	5½	1,389,000	4½
Total	1,159,364,000	100	31,887,000	100

Down to January 1st 1903, the peasants had actually redeemed out of the land allotted to them in 1861 a total of 280,530,516 acres. In Poland the peasants as a body have, in addition to the land thus assigned to them by the government, bought some 2½ million acres since 1863, and of this quantity they purchased no less than 1,600,000 acres, or 64% of the whole, between 1893 and 1905.

Taking the whole of European Russia and Poland, almost exactly two-thirds of the total area is sown every year with cereals. But generally in from 18 to 33 out of the 72 governments in European Russia (including Caucasia) and Poland the yield of cereals is not sufficient for the wants of the people. In 30 to 40 governments, however, there is in most years a surplus available for export. Out of the total acreage under cereals 34% is generally sown with rye, 26% with wheat, 20% with oats and 10% with barley. Beetroot (6-8 million tons annually) for sugar is especially cultivated in Poland, the governments of Kiev, Podolia, Volhynia, Kharkov, Bessarabia and Kherson. About 100,000 tons of tobacco are grown annually in the S. Flax and hemp occupy considerable acreages in central and N.W. Russia. The vine is cultivated as far N. as 49° N. (in Bessarabia, Crimea, Don Cossack territory and Caucasia), the annual production of wine amounting to 35-50 million gallons, three-fifths in Caucasia. Market-gardening and fruit-growing are profitable occupations in certain parts of S. and central Russia, and have led recently to the establishment

of factories for canning fruit and for making jam and pickles. Transcaucasia supplies, chiefly from the government of Erivan, some 12,000 tons of raw cotton annually. The tea plant thrives and is being planted fairly rapidly on the Black Sea littoral in Transcaucasia.

Live-stock are diminishing in numbers all round: in the case of horses, from 21 per 100 inhabitants in 1882 to 11 per 100 inhabitants in 1904; of cattle, from 31 in 1881 to 23 in 1882 and 27 in 1904; sheep, from 96 to 46 and 41 in the years named respectively; and pigs, from 13 to 9 and 10 respectively. Recent investigations in the government of Moscow have revealed that 40% of the peasant households possessed no horses, and similar inquiries in 41 governments elicited the fact that 28% of the peasant households were without horses, although of the total number of horses in the country 82% belong to the peasantry. The animal commonly met with is small and possessed of very little strength; the best are those of Poland, the W. governments and the S. steppe country. Both the horses of the Cossacks and the *biyag* race of S. Russia are fine animals, and those of the Kirghis, though not big, are famous for their endurance. Finland ponies are exported in large numbers. The best bred races of cattle are those of Poland, the W. provinces, Little Russia and the far N. (Kholmogory). Of the 55 million sheep kept in Russia only about 15 millions belong to the fine merino breed, and these are pastured chiefly on the Black Sea steppes. Modern dairy-farming is only just beginning in Russia, but butter is being exported in increasing quantities to W. Europe, including Great Britain. Poultry-farming is being more extensively engaged in, and vast numbers of eggs are exported.

Agriculture stands at a low level in Russia. The landowners are often poor, and suffer from want of capital and lack of enterprise. The peasantry are impoverished, and in many parts live on the verge of starvation for the greater part of the year. While the methods of agriculture have generally shown little, if any, advance, the population is increasing rapidly; and although since the emancipation of the peasants the average annual export of cereals has increased from less than 1½ million tons in 1860 to over 6 million tons in 1900, this result has been attained largely by the repeated cropping to exhaustion of the soil. Thus the cultivators, whether noble or peasant, have not profited much from the change in their economic circumstances brought about by the social emancipation of 1861. Agriculture suffers from the widespread poverty of the agricultural classes, from the taxation which weighs unjustly upon the peasantry, from their lack of education, their technical ignorance and national indolence, and from the absence of those progressive institutions (e.g. co-operative buying) by means of which the peasantry of Denmark have so wonderfully improved their position. As illustrating the general impoverishment of the Russian peasantry, it may be stated that the arrears of taxation owed by them have increased enormously since 1882, when they amounted to £2,854,000, until in 1900 the total amount was put at \$15,222,000. And, strange to say, the heaviest arrears are due from the fertile black earth region of S. Russia, namely, 80% of their total indebtedness. Within recent years, however, some efforts have been made both by the Ministry of Agriculture and by the more enlightened of the *zemstvos* to improve the education of the peasantry, but the progress achieved has been small. The methods adopted by the *zemstvos* for improving the condition of agriculture have included the formation of agricultural councils, the appointment of inspectors, and the founding of museums, meteorological stations and depots for the sale of agricultural machinery. Measures are being taken by the *zemstvos* to increase the very low productivity of the forests. These cover a considerable area, as may be seen by the following table for 1904:—

Region.	Square Miles.	Percentage of Total Area.
European Russia	706,500	39
Poland	11,500	23
Finland	79,800	53
Caucasia	29,200	16
Total	826,200	39

The distribution of forests is very unequal, the area covered by them in the various governments varying from 70% of the total area in the Ural governments of Perm and Ufa, and 68% in Olonets and Archangel, down to 2% in the S.E. The state is the chief owner of forests (almost exclusive owner in Archangel), and owns no less than 289,226,000 acres in European Russia and Poland (235,000,000 acres of good forests), while private persons own 171,800,000 acres, the peasant communities 67,250,000 and the imperial family 22,400,000 acres.

Sericulture, which was in a flourishing condition in the 'sixties both in Caucasia and in S. Russia, was reduced to a very low ebb, in consequence of the silkworm disease, and was only renewed with any vigour towards the end of the 'eighties. At the beginning of

the 20th century it was most developed in Transcaucasia (Kutais, Eliasvetpol), and extended into N. Caucasia. Sericulture is taught in a number of special schools and in a great number of village schools. Attempts are being made to re-establish the silk-worm industry in S. Russia and in Poland. Altogether raw silk and silk yarn to an annual value exceeding 1½ millions sterling are exported from Russia.

Notwithstanding the wealth of the country in minerals and metals of all kinds, and the endeavours made by government to encourage mining, including the imposition of protective tariffs even against Finland (in 1885), this and the related industries are still at a low stage of development. The remoteness of the mining from the industrial centres, the want of technical instruction and of capital, and the existence of vexatious regulations, aggravated by the disturbed condition of the country, which hinder credit, confidence and enterprise, are amongst the chief reasons for this. The imports of foreign metals in the rough and of coal are steadily increasing, while the exports, never otherwise than insignificant, show no advance. As a producer of iron Russia nevertheless runs France neck and neck for the fourth place amongst the iron-producing countries of the world, her annual output having increased from 1,004,800 metric tons in 1891 to 2,808,000 in 1901 and to 2,900,000 in 1904. The two principal mining centres of European Russia are the Urals, Ekaterinoslav, Kharikov and the Don Cossacks territory. The Ural industry is the older, and is still conducted on primitive methods; wood being largely used for fuel, and the ore and metals being transported by water down the Kama and other rivers. The minerals chiefly produced in the Urals are iron, coal, gold, platinum, copper, salt and precious stones. The production of pig-iron nearly doubled between 1890 and 1900, increasing from 446,800 tons in the former year to 801,600 in the latter; but since 1900 the output has declined, the total for 1904 (inclusive of Siberia) being 644,000 tons. The amount of iron and steel produced in the Urals is not quite 20% of the total in all European Russia and Poland. The output of coal in the Urals is, altogether, less than 3% of the total for all the empire and 4% of the output of European Russia (exclusive of Poland) alone. The annual increase is but small, 261,300 tons having been the total in 1891, and 517,000 tons the total in 1904. Gold has been mined in the Urals since 1820; but since 1892 the output has fallen off very considerably. Whereas in the latter year the yield amounted to 897,300 oz., in 1900 it was only 291,250 oz. No less than 96% of the world's supply of platinum comes from the Urals; but the total output only ranges between 10,000 and 16,000 lb annually. The copper industry has greatly declined since the 18th century; whereas then it kept 20 smelting works employed, now one-tenth of that number can hardly be kept going. The output for the year is less than 4000 tons. At one time all Russia was supplied with salt from the Urals, but at the present time the output is extremely small, less than 350 tons annually. Salt has been mined there since the 16th century.

The mining region of S. Russia is much more important. It is of comparatively recent foundation (1860), and is carried on largely with French and Belgian capital, with modern appliances and with modern scientific knowledge. Out of an average of some 2,700,000 tons of pig-iron produced annually in the whole of the Russian empire, 61.5% is produced in the basin of the Donets, and out of an average of 2,160,500 tons of worked iron and steel 48.7% are prepared in the same region. The principal consumer of this iron and steel is the government, for its railways, locomotives, wagons, arsenals, artillery, &c. The output of coal in the Russian empire has increased from a total of less than 300,000 tons in 1860 to 2,280,000 in 1880, 15,878,200 in 1900, and 18,620,000 tons in 1904. Of these totals something like 70% is produced in the S. coal-field. Coal takes, however, an altogether secondary place as a fuel in Russia; wood is much more extensively used, not only for domestic, but also for industrial purposes. It is estimated that for domestic purposes nearly 150,000,000 tons of wood are consumed every year, while the steamships, railways and factories consume another 20 or 25 million tons. At the same time large quantities of petroleum refuse are used as fuel in the railways of S.E. Russia and Caucasia, and on the steamboats of the Volga system. For the petroleum industry and the mining of the Caucasia region, see CAUCASIA. Mining in Poland and Siberia are more fully discussed under those headings.<sup>1</sup>

Since the time of Peter the Great, the Russian government has been unceasing in its efforts for the creation and development of home manufactures. Important monopolies in the 18th century, and prohibitive import duties, as well as large money bounties, in the 19th, contributed towards the accumulation of immense private fortunes, but manufactures have on the whole developed but slowly. A great upward movement has, however, been observable since 1863. About that time a thorough reform of the machinery in use was effected whereby the number of hands employed was reduced, but the yearly production doubled or trebled. Manufacturing industry in the modern sense can hardly be said to have existed in Russia

<sup>1</sup> See *Russian Journal of Financial Statistics*, in English (2 vols., St Petersburg, 1901).

before the 19th century, that is to say, industries carried on with capital and machinery in large factories. Industry of this character was first established in Poland in 1820, and it has grown there rapidly, though never so rapidly as during the last few years of the 19th century. The principal centre is Lodz in the government of Piotrkow, the staple industry being cottons. A good many factories have sprung up also in Warsaw and at Sconawice and Bendzin in the extreme S.W. corner of Poland. Besides cottons the products include woollens and cloth, silks, chemicals, machinery, ironware, beer and flour. At Lodz alone the workmen, in great part Germans and Jews, number between 50,000 and 60,000, and the total output of the factories is estimated at £9,000,000 to £10,500,000 annually. Similar industries, carried on by similar methods, exist at St. Petersburg, Riga, Narva and Odessa. In S. Russia, more particularly at Ekaterinodav, a very vigorous metallurgical industry has grown up since 1860 in conjunction with the iron and coal mining.

The peculiar feature of Russian industry is the development out of the domestic petty handicrafts of central Russia of a semi-factory on a large scale. Owing to the forced abstention from agricultural labour in the winter months the peasants of central Russia, more especially those of the governments of Moscow, Vladimir, Yaroslavl, Kostroma, Tver, Smolensk and Ryazan have for centuries carried on a variety of domestic handicrafts during the period of compulsory leisure. The usual practice was for the whole of the people in one village to devote themselves to one special occupation. Thus, while one village would produce nothing but felt shoes, another would carve sacred images (*ikons*), and a third spin flax only, a fourth make wooden spoons, a fifth nails, a sixth iron chains, and so on. In the same way certain governments become famous for certain commodities, as Moscow for oser baskets, Novgorod for wicker furniture and lace; Kostroma for lace, wooden utensils, toys, wooden spoons, cups and bowls, bast sacks and mats, bast boots and garden products; Yaroslavl for furniture, brass sawyers, saucers, spurs, rings, &c.; Vladimir for furniture, oser baskets and flower-stands and sickles; Nizhny-Novgorod for bast mats and sacks, knives, forks and scissors; Tver for lace, nails, sieves, anchors, fish-hooks, locks, coarse clay pottery, saddlery and harness, boots and shoes, and so on. Out of these have grown large factories, employing as many as 10,000 to 12,000 men each; but when harvest comes round, these men leave the factories and repair to their fields, and meantime the factories stand still for two or three months. Nor do the people work on the holidays of the church, the number of days they lose in this way amounting to nearly one-third of the whole year. Hence, although wages are painfully low, the cost of production to the manufacturer is relatively high; and it is still further increased by the cost of the raw materials, by the heavy rates of transport owing to the distance from the sea, by the dearth of capital and by the scarcity of fuel. As a consequence this central Russian industry, even when supported by very high protective duties, is only able to produce for the home market and the markets of the adjacent territories in Asia which are under Russian political control. Here again cotton is the principal product; and the remarkable growth of the industry is illustrated by the fact that, whereas in 1843 there were only 330,000 spindles at work, fifty years later there were 4,322,000 so employed, and in 1900, 6,554, 600. The number of looms increased from 87,190 in 1860 to 154,500 in 1900. Next after cottons come woollens, silk, cloth, chemicals, machinery, paper, furniture, hats, cement, leather, glass and china and other products. From the governments of Vyatka and Vladimir large numbers of bricklayers, carpenters and other handicraftsmen migrate temporarily to the S. governments every year, and similarly plasterers and painters from the government of Moscow.

The growth of Russian industry is set forth in the following table, which compares the number of workers for 1887, 1897 and 1902, of all factories throughout the empire of which the annual production was valued at more than £210—

Branch of Industry.	Number of Workers.		
	1887.	1897.	1902.
Textiles . . . . .	399,178	642,520	708,186
Food products . . . . .	205,223	235,357	303,213
Animal products . . . . .	38,876	64,418	79,664
Wood . . . . .	36,703	86,273	78,395
Paper . . . . .	19,401	46,190	78,395
Chemical products . . . . .	21,134	35,320	60,108
Ceramics . . . . .	67,346	143,291	150,809
Mining and metals . . . . .	390,915	544,333	549,000
Metal goods . . . . .	103,300	214,311	252,215
Various . . . . .	41,882	66,249	78,183
<b>Total</b> . . . . .	<b>1,318,048</b>	<b>2,098,262</b>	<b>2,259,773</b>

With regard to Russian industry generally, the extravagant prices which have to be paid for iron and all iron goods, owing to the prohibitive tariffs, combined with the obstacles put in the way of education, hamper the development of all industries. The cotton factories excel chiefly in the production of red and printed

cottons. In the flax-mills the tendency is to produce the finest tissues as well as the coarser. The silk-mills employ silk obtained from the Caucasus, Italy and France. The growth of the sugar industry is shown by the fact that in 1888-93 the average annual production of sugar was 444,520 tons, in 1900-3 it was 1,180,293 tons. Since 1894 the government has had a monopoly in retailing spirituous liquors, but not wine or beer; but distilling, a very widespread industry, is left in private hands. Beer is chiefly brewed in Poland and the Baltic provinces. Tanneries exist in nearly every government, but it is especially at Warsaw and St. Petersburg, and after these at Moscow, that the largest and best modern tanneries and shoe and glove factories are established. The governments of Orel (shoe factories), Klenov, Vyatka, Nizhny-Novgorod, Perm, Kiev and Kazan rank next in this respect. Fur-trade factories are developing greatly, as is the paper industry. Flour-mills play an important part in the general industry of Russia, and there are several tobacco and hemp factories.

Far from being destroyed by the competition of the "modern" factories, domestic industries have well maintained their ground, new branches of petty trade having sprung up in some districts, among them the manufacture of agricultural machinery (threshing machines in Ryazan, Vyatka and Perm; ploughs in Smolensk, &c.) deserves notice.

The wealth of Russia consisting mainly of raw produce, the trade of the country turns chiefly on the purchase of this for export, and on the sale of manufactured and imported goods in exchange. This traffic is in the hands of a great number of middlemen,—in the W. Jews, and elsewhere Russians,—to whom the peasants are for the most part in debt, as they purchase in advance on security of subsequent payments in corn, tar, wooden wares, &c. A good deal of the internal trade is carried on by travelling merchants.

The fairs are very numerous. Those of Nizhny-Novgorod, with a return of 20 millions sterling, of Irbit and Khar'kov, of Menzelinsk, in Ufa, and Omak and Iahim in Siberia, have considerable importance both for trade and for home manufactures. Altogether, no fewer than 16,600 fairs are held in Russia, 85% of them in European Russia. Of these, 30 show returns of goods imported to the value of over £100,000 each, 41 from £50,000 to £100,000, and 437 from £10,000 to £50,000 each.

The external trade of the Russian empire (bullion and the external trade of Finland not included) since the year 1886 is shown in the following table:—

Years (average).	Exports.	Imports.
1886-1891 . . . . .	£72,200,000	£43,250,000
1892-1896 . . . . .	60,350,000	46,100,000
1897-1901 . . . . .	68,500,000	55,180,000
1902-1905 . . . . .	103,448,000	66,533,000

The exports rank in the following order:—cereals (wheat, barley, rye, oats, maize, buckwheat) and flour, 49.2%; timber and wooden wares, 7.2; petroleum, 5.8; eggs, 5.4; flax, 5; butter, 3; sugar, 2.4; cottons and oilcake, 2 each; oleaginous seeds, &c., 1.5; with hemp, spirits, poultry, game, bristles, hair, furs, leather, manganese ore, wool, caviare, live-stock, gutta-percha, vegetables and fruit, and tobacco. The two best customers of Russia are Germany, which takes 23.3% of her total exports, and the United Kingdom, which takes 22.9%. Then follow the Netherlands (9.8%), France, Italy, Finland, Belgium, Austria-Hungary, Denmark, Turkey and Sweden. The commodities which the United Kingdom principally takes are wheat, wool, barley, eggs, oats and flax. With regard to the imports into Russia,—they consist mainly of raw materials and machinery for the manufactures, and of provisions, the principal items being raw cotton, 17% of the aggregate; machinery and metal goods, 13%; tea, 5%; mineral ores, 5%; gums and resins, 4%; wool and woollen yarns, 3.1%; textiles, 3%; fish, 3%; with leather and hides, chemicals, silks, wine and spirits, colours, fruits, coffee, tobacco and rice. The countries from which Russia buys most extensively are Germany (34%), the United Kingdom (15%) and the United States (9%). Machinery, coal, iron, woollens, ships, lead and copper are the commodities supplied by the United Kingdom.

The total mercantile marine of Russia does not aggregate 700,000 tons; and it is distributed in the following proportions: 35.4% in the Caspian Sea, 34.7% in the Black Sea and the Sea of Azov, 24.7% in the Baltic Sea and 5.2% in the White Sea. And these proportions represent fairly well the tonnages entering and clearing at the ports of these respective seas. But of the vessels that visit the Russian ports in the way of trade every year only 8.3% are Russian, the rest being of course foreign. Russian craft play, however, a much more important part on the internal waterways, the traffic on which increases rapidly, e.g. whilst in 1894 it amounted to an aggregate of 23,293,000 tons, in 1904 it reached a total of 38,720,240 or an increase of over 66% in the ten years. During the same period the tonnage of the craft themselves more than doubled, while the

crews increased 19½ %, the number of men employed in the latter year being approximately 150,000.

In 1860 Russia possessed less than 1000 m. of railways; by 1885 this had increased to 16,155 m., and by the middle of 1905 there were open for traffic over 40,500 m. of railway, of which 34,150 m. or 84.3 % were in European Russia and nearly 6400 m. (15.7 %) in Asiatic Russia. Between 1895 and 1905 the building of railways proceeded at a rapid rate, the total length nearly doubling within the ten years, namely, from 27,600 to 40,500 m. The European railways cost on an average £10,465 per mile to construct, and the Asiatic railways £5092 per mile.

A considerable number of new railways, some of great strategic as well as commercial importance, were built during the last twenty years of the 19th century. At the same time the chief lines of railway which had been built by public companies with a state guarantee, and which represented a loss to the empire of £3,171,250 per annum, as well as a growing indebtedness, were bought by the state. On the whole, the state derives profit from its railways, although several of the later lines, while imperative for state purposes, must necessarily yield but a very small revenue, or be worked at a loss. The most important of the new railways is the Siberian, of which the first section, Chelyabinsk to Omsk, was opened in December 1895, and which, except for a short section round Lake Baikal, in 1901 was completed right through to Stryetensk, on the Shilka, the head of navigation on the Shilka and the Amur, 2710 m. from Chelyabinsk and 4076 miles from Moscow, via Samara and Chelyabinsk. The section round the S. end of Lake Baikal was completed in 1905. At the Pacific end of the Siberian railway a line connecting Vladivostok with Khabarovsk (479 m.) at the junction of the Amur and the Usuri, was first of all built, following the valley of the Usuri. But it was soon found that the cost of the section required to complete the railway between Stryetensk and Khabarovsk, along the Shilka (246 m.) and the Amur (1160 m.), would be enormous, while neither the wild mountainous tracts of the lower Shilka and upper Amur, nor the marshy, often inundated region between Khabarovsk and the Little Khingan mountains, could ever be the seat of a numerous population. Consequently a company was formed by the Russian government in 1896 to construct, with the consent of the Chinese government, a railway from Vladivostok across Manchuria to Karymskaya near Chita in Transbaikalia. This runs for 222 m. on Russian territory and for 1080 m. on Manchurian territory, and from Kharbin sends off a branch to Dalny near Port Arthur on the Liaotung peninsula. The first portion of the Manchurian railway, built by Russian engineers, with Chinese labour, was finished in 1902. At the same time several secondary lines were built in connexion with the Siberian line. Chelyabinsk was linked by a transverse line with the middle Urals railway, which connects Perm, the head of navigation in the Volga basin, with Tyumen, the head of navigation on the Ob and Irtysh, passing through Ekaterinburg and other mining centres of the middle Urals. Tomsk is now connected with the main line by a short side branch. A railway has also been built to connect Perm with Kotlas, near the confluence of the Sukhona with the Yug, at the head of the N. Dvina. This N. portion of the Russian railway system was further completed by the opening in 1906 of a line from St Petersburg via Volodga to Vyatka, intersecting the Moscow-Archangel line at Volodga.

Another line of great strategic importance was built across the Transcaspien territory to Ferghana. Starting from Krasnovodsk, it runs S.E. to Merv (560 m.), with a branch line (104 m.) to Kushk, near Herat, then N.E. across the desert to Charjui, on the Amur river, Bokhara and the Russian fort Katta-kurgan, and then to Samarkand, Kokand and Andijan in Ferghana, 710 m. from Merv, with a branch to Tashkent (220 m.). This railway has become important for the export of raw cotton from Central Asia to Russia. In 1905 a second totally independent line was opened from Tashkent down the Syr-darya to Kazanlik, and thence to Orsk.

A third line of great importance is the junction line between the Transcaspien railways which runs from Batum and Poti to Baku, via Tiflis, with a branch line to Karakum—and the railway system of Russia proper. This junction has been effected not across the main Caucasus range, but at its E. extremity, that is, via the Caspian ports of Baku and Petrovsk, which are connected with Vladikavkaz (Beslan junction). The Black Sea port of Novorossiysk, in W. Caucasia, having been connected with the Rostov-Vladikavkaz line, has consequently also been brought into touch with the Russian railways. The Volga is reached from central Russia by seven lines of railways, including one to Kazan, and three main lines radiate from the Volga E. (one to Siberia and two to the Ural river), while the upper Volga (Yaroslavl) is connected with Archangel by a line 523 m. long. A zone tariff was introduced on the Russian railways in 1894, and the cost of long journeys was considerably reduced; a journey of 623 m. can be made third class at a cost of only about 17 shillings, while for less than twice as much 1990 m. can be covered.

Fish form an important article of national food. The numerous fasts of the national church prescribe a fish diet on many days in the year, and the continuous frost of winter is favourable to the transportation of fish for great distances. Along the Murman coast of the Arctic Ocean and in the White Sea, where many

millions of herrings are caught annually by some 3000 persons, the yearly produce is estimated at the value of £140,000. In the Baltic Sea, as well as in the lakes of its basin (Ladoga, Onega, IImen, &c.), the yearly value is estimated at £200,000. Of anchovies alone, 10,000,000 jars are prepared annually, while salted fish is, next after bread, the staple food of large masses of the population. The Black Sea fisheries, in which about 4000 men are engaged, yield fish valued at £300,000 per annum. The value of the fish has much increased owing to the introduction of cold storage; as a result of the employment of this method of packing, fish is now exported in a fresh state from the Black Sea to all parts of S.W. Russia, and even to Moscow. The annual yield of the Azov Sea fisheries, occupying 15,000 men, is valued at £600,000. In the Volga section of the Caspian Sea fish are caught to the value of about £1,000,000 annually; in the Ural section over 40,000 tons of fish and nearly 1500 tons of caviare are obtained. The total value of the Caspian fisheries is estimated at £3,000,000 per annum. Taking the Lake Aral and Siberian river fisheries into account, it is estimated that altogether the fishing industries yield a revenue to the state of £530,000 annually.<sup>1</sup> In addition from 13,000 to 60,000 seals and about 200 whales are killed annually off the Murman coast. Hunting is an occupation of considerable importance in N. and N.E. Russia, and along the shores of the Arctic Ocean.

**AUTHORITIES.**—The *Russkii Encyclopedicheskiy Slovar*, edited by Brockhaus and Efron, was begun in 1890, with the idea of giving a Russian version of Brockhaus's *Conversations Lexikon*, but from the very first volumes it became a monumental encyclopaedia, and is, indeed, an inexhaustible source of information on everything Russian. A general popular description of Russia entitled *Rosstiya*, containing excellent geographical, geological and other descriptions of separate regions, and very well-chosen illustrations, was begun in 1899 under the editorship of V. P. Semenov. *La Russie à la fin du XIX<sup>e</sup> siècle*, under the editorship of W. W. Kovalevsky, is especially worthy of notice. See also H. Norman, *All the Russias* (London, 1902); Sir D. Mackenzie Wallace, *Russia* (3 vols., new ed., 1905, London); A. Leroy-Beaulieu, *L'Empire des tsars* (3 vols., 1882-88; Eng. trans., London, 1893-96); A. ## HISTORY

The history of Russia may be conveniently divided into four consecutive periods: (1) the period of Independent Principalities; (2) the Mongol Domination; (3) the Tsardom of Muscovy; and (4) the Modern Empire.

1. *A Conglomeration of Independent Principalities.*—The first period, like the early history of many other countries, begins with a legend. Nestor, an old monkish chronicler *Origin of the Russians*, relates that in the middle of the 9th century the Slav and Finnish tribes inhabiting the forest region around Lake IImen, between Lake Ladoga and the upper waters of the Dnieper, paid tribute to military adventurers from the land of Rûs, which is commonly supposed to have been a part of Sweden. In the year 859 these tribes expelled the Northmen, but finding that they quarrelled among themselves, they invited them, three years later, to return. Our land, said the deputation sent to Rûs for this purpose, is great and fertile, but there is no order in it; come and reign and rule over us. Three brothers, princes of Rûs, called respectively Rurik, Sineus and Truvor, accepted the invitation and founded a dynasty, from which many of the Russian princes of the present day claim descent.

Who were those warlike men of Rûs who are universally recognized as the founders of the Russian Empire? This question has given rise to an enormous amount of discussion among learned men, and some of the disputants have not yet laid down their arms; but for impartial outsiders who have carefully studied the evidence there can be little doubt that

<sup>1</sup> See *Researches into the State of Fisheries in Russia* (9 vols.), edited by Minister of Finance (1896, Russian); Kuanetzov's *Fischerei und Thiererzeugung in den Gewässern Russlands* (1898).

the men of Rûs, or Variags, as they were sometimes called, were simply the hardy Norsemen or Normans who at that time, in various countries of Europe, appeared first as armed marauders and then lived in the invaded territory as a dominant military caste until they were gradually absorbed by the native population. Lake Ilmen and the river Volkhov, on which stands Novgorod, Rurik's capital, formed part of the great waterway from the Baltic to the Black Sea, and we know that by this route travelled from Scandinavia to Constantinople the tall fair-haired Northmen who composed the famous Varangian bodyguard of the Byzantine emperors.

The new rulers did not long confine their attention to the tribes who had invited them. They at once began to conquer the surrounding country in all directions, and before two centuries had passed they had established themselves firmly at Kiev on the Dnieper, invaded Byzantine territory, threatened Constantinople with a fleet of small craft, obtained as consort for one of their princes, Vladimir I, (*g.s.*), a sister of the

*Early  
medieval  
dynasties.  
The  
grand-  
princes.*

Byzantine emperor on condition of the prince becoming a Christian, adopted Christianity for themselves and their subjects, learned to hold in check the nomadic hordes of the steppe, and formed matrimonial alliances with the reigning families of Poland, Hungary, Norway and France. In short, they became a considerable power in eastern Europe, and might be regarded as one of the claimants for the inheritance of the decrepit East Roman Empire. Unfortunately for the political future of this new state, its internal consolidation did not keep pace with its territorial expansion. In theory the whole Russian land was a gigantic family estate belonging to the Rurik dynasty, and each member of that great family considered himself entitled to a share of it. It had to be divided, therefore, into a number of independent principalities, but it continued to be loosely held together by the dynastic sentiment of the descendants of Rurik and by the patriarchal authority—a sort of *patria potestas*—of the senior member of the family, called the grand-prince, who ruled in Kiev, “the mother of Russian cities.” His administrative authority was confined to his own principality, but when territorial disputes arose between two or more of his relations, his paternal influence was exercised in the interests of peace and justice. What added to the practical difficulties of this arrangement was that the post of grand-prince was not an hereditary dignity in the sense of descending from father to son, but was always to be held by the senior member of the dynasty; and in the subordinate principalities the same principle of succession was applied, so that reigning princes had to be frequently shifted about from one district to another, according as they could establish the strongest claim to vacant principalities. What constituted in this primitive system of inheritance the strength of a claim was often not easily determined, and even when the legal question was clear enough the law was not always respected by the contending parties. Hence family quarrels became very frequent. These princes were, in fact, men of like passions with ourselves, and acted as powerful men generally do in a rude state of society. Instead of conforming to abstract principles of public law and hereditary succession, they strove to enlarge their territories at the expense of their rivals, and to leave them at their death to their sons rather than to their brothers, nephews and more distant relations. In these circumstances, the traditional authority of the grand-prince, never very great, rapidly declined, and the complicated law of succession, never scrupulously respected, was gradually replaced by “the good old rule, the simple plan, that he should take who has the power, and he should keep who can.” Yaroslav, surnamed the Great, a man of commanding personality, was the last grand-prince who upheld vigorously the old system. After his death in 1054 the process of disintegration went on apace and the family feuds multiplied at an alarming rate. During the next 170 years (1054–1224) no less than 64 principalities had a more or less ephemeral existence, 293 princes put forward succession-claims, and their disputes led to 83 civil wars.

During these interminable struggles of rival princes, Kiev, which had been so long the residence of the grand-prince and of the metropolitan, was repeatedly taken by storm and ruthlessly pillaged, and finally the whole valley of the Dnieper fell a prey to the marauding tribes of the steppe. Thereupon Russian colonization and political influence retreated northwards, and from that time the continuous stream of Russian history is to be sought in the land where the Vikings first settled and in the adjoining basin of the upper Volga. Here new principalities were founded and new agglomerations of principalities came into existence, some of them having a grand-prince who no longer professed allegiance to Kiev. Thus appeared the grand-prince of Suzdal or Vladimir, of Tver, of Ryazan and of Moscow—all irreconcilable rivals with little or no feeling of blood-relationship. The more ambitious and powerful among them aspired not to succeed but to subdue the others and to take possession of their territory, and the armed retainers, who were wont formerly to wander about as free lances, gave up their roving mode of life, settled down permanently in one principality, became landed proprietors, and sought to share as boyars the princes' authority.

Among the principalities of that northern region the first place was long held by Novgorod. Since the days when Rurik had first chosen it as his headquarters, the little town <sup>Republic of Novgorod.</sup> on the Volkhov had grown into a great commercial city and a member of the Hanseatic league, and it had brought under subjection a vast expanse of territory, stretching from the shores of the Baltic to the Ural Mountains, and containing several subordinate towns, of which the principal were Pskov, Nizhny-Novgorod and Vyatka. Unlike the ordinary Russian principalities, it had a republican rather than a monarchical form of government. Indeed, it was not so much a principality as a municipal republic of the Venetian type. It always had a prince, no doubt, but he was engaged by formal contract without much attention being paid to hereditary rights, and he was merely leader of the troops, while all the political power remained in the hands of the civil officials and the *Veche*, a popular assembly which was called together in the market-place, as occasion required, by the tolling of the great bell. Descendants of Rurik, impregnated with the pride of a dominant military caste, did not much like serving those truculent, willful burghers, and some of them, after a time, voluntarily laid down their office and retired to more congenial surroundings. Those of them who tried to have their own way and came into conflict with the authorities had always to yield in the long run, and they were liable to be treated very unceremoniously, so that the vulgar adage, “If the prince is bad, into the mud with him!” became a maxim of state policy.

There was here in the Russian land the germ of republicanism or constitutional monarchy, but it was not destined to be developed. The principality which was to become the nucleus of the future Russian empire was not Novgorod with its democratic institutions, but its eastern neighbour Moscow, in which the popular assembly played a very insignificant part, and the supreme law was the will of the prince. The opposition which he encountered came not from the burghers but from the boyars and the nobles.

II. *The Mongol or Tatar Domination, 1238–1462.*—Between Moscow and Novgorod there was a long and bitter rivalry, breaking out occasionally into armed conflicts, and among the princes of the other principalities the old struggle for precedence and territory went on unceasingly until it was suddenly interrupted, in the first half of the thirteenth century, by the unexpected irruption of an irresistible foreign foe coming from the mysterious regions of the Far East. “For our sins,” says the Russian chronicler of the time, “unknown nations arrived. No one knew their origin or whence they came, or what religion they practised. That is known only to God, and perhaps to wise men learned in books.” The Russian princes first heard of them from the wild nomadic Polovtsi, who usually pillaged the Russian settlers on the frontier but who now preferred

*Mongol  
and  
Tatar  
invaders.*

friendship and said: "These terrible strangers have taken our country, and to-morrow they will take yours if you do not come and help us." In response to this call some Russian princes formed a league and went out eastward to meet the foe, but they were utterly defeated in a great battle on the banks of the Kalka (1224), which has remained to this day in the memory of the Russian common people. Now the country was at the mercy of the invaders, but, instead of advancing, they suddenly retreated and did not reappear for thirteen years, during which the princes went on quarrelling and fighting as before, till they were startled by a new invasion much more formidable than its predecessor. This time the invaders came to stay, and they built for themselves a capital, called Sarai, on the lower Volga. Here the commander of "the Golden Horde," as the western section of the Mongol empire was called, fixed his headquarters and represented the majesty of his sovereign the grand khan who lived with the Great Horde in the valley of the Amur. About the origin and character of these terrible invaders we are much better informed than the early Russian chroniclers. The nucleus of the invading horde was a small pastoral tribe in Mongolia, the chief of which, known subsequently to Europe as Jenghiz Khan (q.v.), became a mighty conqueror and created a vast empire stretching from China, across northern and central Asia, to the shores of the Baltic and the valley of the Danube—a heterogeneous state containing many nationalities held together by purely administrative ties and by an enormous military force. For forty years after the death of its founder it remained united under the authority of a series of grand khans chosen from among his descendants, and then it began to fall to pieces till the various fractions of it became independent khanates.

The khanate closely connected with the history of Russia was that of Kipchak or the Golden Horde, the khans of which settled, as we have seen, on the lower Volga and built for themselves a capital called Sarai. Here they had their headquarters and held Russia in subjection for nearly three centuries.

The term by which this subjection is commonly designated, the Mongol or Tatar yoke, suggests ideas of terrible oppression, but in reality these barbarous invaders from the Far East were not such cruel, oppressive taskmasters as is generally supposed. In the first place, they never settled in the country, and they had not much direct dealings with the inhabitants. In accordance with the admonitions of Jenghiz to his children and grandchildren, they retained their pastoral mode of life, so that the subject races, agriculturists and dwellers in towns, were not disturbed in their ordinary avocations. In religious matters they were extremely tolerant. When they first appeared in Europe they were idolaters or Shamanists, and as such they had naturally no religious fanaticism; but even when they adopted Islam they remained as tolerant as before, and the khan of the Golden Horde (Berktai) who first became a Mussulman allowed the Russians to found a Christian bishopric in his capital. One of his successors, half a century later, married a daughter of the Byzantine emperor, and gave his own daughter in marriage to a Russian prince. These represent the bright side of Tatar rule. It had its dark side also. So long as a great horde of nomads was encamped on the frontier the country was liable to be invaded by an overwhelming force of ruthless marauders. These invasions were fortunately not frequent, but when they occurred they caused an incalculable amount of devastation and suffering. In the intervals the people had to pay a fixed tribute. At first it was collected in a rough-and-ready fashion by a swarm of Tatar tax-gatherers, but about 1250 it was regulated by a census of the population, and, finally, the collection of it was entrusted to the native princes, so that the people were no longer brought into direct contact with the Tatar officials.

By the princes the "yoke" was felt more keenly, and it was very galling. In order to reply to accusations brought against them, or in order to be confirmed in their functions, they had to travel to the Golden Horde on the Volga or even to the camp of the grand khan in some distant part of Siberia,

and the journey was considered so perilous that many of them, before setting out, made their last will and testament and wrote a parental admonition for the guidance of their children. Nor were these precautions by any means superfluous, for not a few princes died on the journey or were condemned to death and executed for real or imaginary offences. Even when the visit to the Horde did not end so tragically, it involved a great deal of anxiety and expense, for the Mongol dignitaries had to be conciliated very liberally, and it was commonly believed that the judges were more influenced by the amount of the bribes than by the force of the arguments. The grand khan was the lord paramount or suzerain of the Russian princes, and he had the force required for making his authority respected. Ambitious members of the Rurik dynasty, instead of seeking to acquire territory by conquest in the field, now sought to attain their ends by intrigue and bribery at the Mongol court.

Of all the princes who sought to advance their fortunes in this way the most dexterous and successful were those of Moscow. They made themselves responsible for the tribute of other principalities as well as of their own, and gradually they became lieutenants-general of their Mongol suzerain. So long as the Mongol empire remained united and strong, they were most submissive and obsequious, but as soon as it was weakened by internal dissensions and began to fall to pieces, they assumed airs of independence, intrigued with the insubordinate Tatar generals, retained for their own use the tribute collected for the grand khan, and finally put themselves at the head of the patriotic movement which aimed at throwing off completely the hated Mongol yoke. For this purpose Dimitri Donskoi formed in 1380 a coalition of Russian princes, and gained a great victory over Khan Mamai of the Golden Horde on the famous battlefield of Kulikovo, the memory of which still lives in the popular legends. For some time longer the Tatars remained troublesome neighbours, capable of invading and devastating large tracts of Russian territory and of threatening even the city of Moscow, but the Horde was now broken up into independent and mutually hostile khanates, and the Moscow diplomatists could generally play off one khanate against the other, so that there was no danger of the old political domination being re-established.

Having thus freed themselves from Tatar control, the Moscow princes continued to carry out energetically their traditional policy of extending and consolidating their dominions at the expense of their less powerful relations. Already Dimitri of the Don was called the grand-prince of all Russia, but the assumption of such an ambitious title was hardly justified by facts, because there were still in his time principalities with grand-princes who claimed to be independent. The complete suppression of these small moribund states and the creation of the autocratic tsardom of Muscovy were the work of Ivan III., surnamed the Great, his son Basil and his grandson Ivan IV., commonly known as Ivan the Terrible, whose united reigns cover a period of 122 years (1462-1584).

III. *The Tsardom of Muscovy.*—What may be called the home policy of these three remarkable rulers consisted in absorbing the few principalities which still remained independent, and in creating for themselves an uncontrolled monarchical authority. In the pursuit of both of these objects they were completely successful. When Ivan III. came to the throne the remaining independent principalities were Great Novgorod, Pskov, Tver, Ryazan and Novgorod-Seversk. He first directed his attention to Novgorod, and by gradually undermining and then destroying the ancient republican liberties he reduced the haughty city, which had long styled itself Lord Novgorod the Great, to the rank of a provincial town. Then he annexed its colonies and thereby extended his dominions to the Polar Ocean and the Ural Mountains. At the same time he took possession of Tver, on the ground that the prince had allied himself with Lithuania. His successor Basil followed in his footsteps, and dealt with the municipal republic of Pskov as Ivan had dealt with Novgorod. Finding the inhabitants too much attached to

*The princes of Moscow. Dimitri Donskoi, 1380-1389.*

*Ivan III. 1462-1480.*

*Basil III. 1505-1533.*

their ancient liberties, he abolished the popular assembly, removed the great bell to Novgorod, installed his own boyars in the administration, transported 300 of the leading families to other localities, replaced them by 300 families from Moscow, and left in the town a strong garrison of his own troops. Ryazan shared the same fate. In 1521 the prince, being suspected of forming an alliance with the Crimean Tatars, was summoned to Moscow and arrested. Two years later the prince of Novgorod-Seversk was accused of intriguing with the Poles and imprisoned for the rest of his life. Thus all the principalities were brought under the power of Moscow, and in that respect there remained nothing for Ivan the Terrible to do. He took precautions, however, against any of the dead or moribund principalities being resuscitated, and punished with merciless severity any attempt to resist or undermine his authority.

With the suppression and absorption of the independent principalities the problem was only half solved. The tsars of Muscovy meant to be autocratic rulers alike in their old and in their new territories. Their forefathers had been trained in the Tatar school of politics and administration, and in their ideas of government they had come to resemble Tatar khans much more than grand-princes of the old patriarchal type. Their autocratic tendencies were fostered also by the Church. As Christianity was brought into Russia from Constantinople it was only natural that the ecclesiastics, many of whom were Greeks, should admire Byzantine ideals and recommend them as models to be imitated. For the ambitious Moscow princes many of the Byzantine ideas were very acceptable. They liked to consider themselves as the Lord's anointed, placed high above all ordinary mortals even of the most exalted rank; and when Constantinople fell into the hands of the infidel they began to imagine that, as the most powerful potentates of the Eastern Orthodox world they were the protectors of the Orthodox faith and the political heirs of the East Roman emperors. With a view to strengthen this claim Ivan III. married a niece of the emperor Constantine Palaeologus, who had fallen fighting when his capital was taken by the Turks (1453). From that moment Ivan's subjects noticed a change in his attitude towards them, and attributed it to the evil influence of the Greek princess. In the old times the grand-prince was simply *primus inter pares* among the minor princes, and these lived with their boyars almost on a footing of equality. Now the tsar of Muscovy and of all Russia adopted the airs and methods of a Tatar khan and surrounded himself with the pomp and splendours of a Byzantine emperor. Ivan III., notwithstanding the influence of his Greek consort, showed some respect for the ancient traditions and the susceptibilities of those around him, but his successor Basil did not follow his father's example. All through his reign he preferred to employ as officials men of humble origin, and habitually treated the boyars and great nobles very unceremoniously. For disobedience to his orders he imprisoned a boyar who was his own brother-in-law, and he caused another to be beheaded for complaining that the boyar-council was not consulted in important affairs of state. A boyar of Nizhny-Novgorod who allowed himself to criticize the new order of things, and attributed the change to the influence of the Greek princess, had his tongue cut out. From the ecclesiastics Basil likewise insisted on unquestioning obedience, and he did not hesitate to depose by his own authority a metropolitan who was at that time the highest dignity of the Russian Church. According to Siegmund von Herberstein (1486-1566), an Austrian envoy who visited Moscow at that period, no sovereign in Europe was obeyed like the grand-prince of Muscovy, and his court was remarkable for barbaric luxury. In his palace were numerous equerries, chamberlains and other court dignitaries, and when he went out he was attended by a guard of young nobles dressed in gaudy costumes and armed with silver halberds.<sup>1</sup>

Such radical changes naturally produced a great deal of

<sup>1</sup> See Friedrich Adlung, *Siegmund Freiherr von Herberstein, mit besonderer Rücksicht auf seine Reisen in Russland geschildert.* (St Petersburg, 1818); autobiography of Herberstein in *Familie rerum Austriacorum*, part i. vol. i. pp. 67-396.

dissatisfaction among men of Slavonic temperament, whose grandfathers had been independent princes, boyars or free lances, and the malcontents could not adopt the old practice of emigrating to some other principality. There was no longer within the Russian land any independent principality in which an asylum could be found, and emigration to a principality beyond the frontier, such as Lithuania, was regarded as treason, for which the property of the fugitive would be confiscated and his family might be punished. In these circumstances the only outlet for discontent was sedition, and the malcontents awaited impatiently a favourable opportunity for an attempt to curb or overthrow the autocratic power. That opportunity came when Basil died in 1533, leaving as successor a child only three years old, and the chances seemed all on the side of the nobles; but the result belied the current expectations, for the child came to be known in history as Ivan the Terrible, and died half a century later in the full enjoyment of unlimited autocratic power. The fierce struggle between autocratic tyranny and oligarchic disorder, which went on in intermittent fashion during the whole of his reign, cannot be here described in detail, but the chief incidents may be mentioned.

During Ivan's minority the country was governed, or rather misgoverned, first by his mother, and then by rival factions led by great nobles such as the princes Shuiski and Bélski. Only once during this period did the young <sup>Ivan the Terrible, 1533-84.</sup> tsar come forward and assert his authority. Having convoked his boyars he reproached them collectively with robbing the treasury and committing acts of injustice, and he caused one of them, a Prince Shuiski who happened to be in power at the moment, to be seized by his huntsmen and torn in pieces by a pack of hounds, as a warning to others. Thus apparently he asserted his authority, but in reality, being only thirteen years old, he was a mere puppet in the hands of one of the opposition factions, who wished to oust their rivals, and for the next four years the misgovernment of the nobles went on as before. It was not till he was about seventeen that he took an active part in the administration, and one of his first acts foreshadowed his future policy: he insisted on the metropolitan crowning him, not as grand-prince of Muscovy, but as tsar of all Russia (1547). From the earliest times the term tsar—a contraction of the word Caesar—had been applied to the kings in Biblical history and the Byzantine emperors, and Ivan III. had already been described in the Church service as "the ruler and autocrat of all Russia, the new Tsar Constantine in the new city of Constantine Moscow," but on no previous occasion had a grand-prince been crowned under that title. A few months later occurred in Moscow a great fire, which destroyed nearly the whole of the city, and a serious popular tumult, in which the tsar's uncle was murdered by the populace. Ivan regarded these events as a punishment from Heaven for the neglect of his duties, and he began to attend to public affairs under the influence of an enlightened priest called Sylvester and an official of humble origin called Adashev. With the assistance of these two counsellors he held in check the lawless, turbulent nobles, and ruled justly, to the satisfaction of the people, for fourteen years. Then suddenly, for reasons which cannot easily be explained, he inaugurated a reign of terror which lasted for twenty-four years and earned for him the epithet of "the Terrible." Though there had been no open insurrection, he caused many boyars and humbler persons to be executed, and when some of the great nobles, fearing a similar fate, fled across the frontier and tendered their allegiance to the prince of Lithuania, his suspicion and indignation increased and he determined to adopt still more drastic measures. For this purpose he organized, outside the regular administration, a large corps of civil officials and armed retainers, whose duty it was to obey him implicitly in all things; and with this force, which rose rapidly from 1000 to 6000 men, he acted like a savage invader in a conquered country. Accompanied by these so-called *Oprichniki*, who have been compared to the Turkish Janissaries of the worst period, he ruthlessly devastated large districts—with no other object

apparently than that of terrorizing the population and rewarding his myrmidons—and during a residence of six weeks in Novgorod, lest the old turbulent spirit of the municipal republic should revive, he massacred, it is said, no less than 60,000 of the inhabitants, including many women and children. It is quite possible, as some apologists suggest, that the number of his victims may have been exaggerated, but that they are to be counted by thousands there can be no doubt. In the monastery of St Cyril has been preserved a list of those for whom he requested the prayers of the Church, the total being 3470. The only reference to Novgorod in this curious document is: "Remember, O Lord, the souls of thy Novgorodian servants to the number of 1505 persons." According to the Novgorodian annalists as many as 1500 persons were sometimes put to death in a single day. Perhaps the discrepancy is to be explained by supposing that the pious tsar did not consider all his victims as servants of the Lord, whose souls deserved the prayers of the faithful.

While thus uniting under their vigorous autocratic rule the small rival principalities, the Moscow princes had to keep a watchful eye on their eastern neighbours. The Golden Horde, long weakened by internal dissensions, had now fallen into several khanates, the chief of which were Kazan, Astrakhan and the Crimea. As these independent Tatar states were always jealous of each other, and their jealousy often broke out in open hostility, it was easy to prevent any combined action on their part; and as in each khanate there were always several pretenders and contending factions, Muscovite diplomacy had little difficulty in weakening them individually and preparing for their annexation. In the case of Kazan and Astrakhan the annexation was effected without any great effort in 1552-54, and two years later the Bashkins, who had likewise formed part of the great Mongol empire, consented to pay tribute. On the other hand, the khans of the Crimea were able, partly from their geographical position and partly from having placed themselves under the protection of the sultans of Turkey, to resist annexation for more than two centuries and to give the Muscovites a great deal of trouble, not only by frequent raids and occasional invasions, but also by allying themselves with the Western enemies of the tsars. As late as 1571 Moscow was pillaged by a Tatar horde; but there was no longer any question of permanent political subjection to the Asiatics, and the Russian frontier was being gradually pushed forward at the expense of the nomads of the steppe by the constant advance of the agricultural population in quest of virgin soil. These latter, like the colonists in the American Far West, had to be constantly on the alert against the attacks of their troublesome neighbours, and they accordingly organized themselves in semi-military fashion. Those of them who lived on the outskirts of the pacified territory adopted a mode of life similar to that of their hereditary opponents, and constituted a peculiar class known as Cossacks, living more by flocks and herds and by marauding expeditions than by agriculture.

#### The Cossacks.

In the basins of the southern rivers they formed semi-independent military communities. Those of the Volga and the Don professed allegiance to the tsar of Muscovy, whilst those of the Dnieper recognized at first as their suzerain the king of Poland. In neither case did the allegiance involve strict obedience to orders from the superior, and their loyalty was always in danger of being troubled by their love of independence and equality and their desire for loot. More than once they raided and pillaged in wholesale fashion the territory they were supposed to protect. On the whole, however, at that period as in more recent times, they contributed largely to the process of territorial expansion. (See also POLAND: *History*.)

Before the Eastern menace had been entirely removed the ambitious Moscow princes had begun to look with envious eyes beyond their western frontier. Here lay the principality of Lithuania and beyond it the kingdom of Poland, two loosely conglomeraled states which had been created by the Piast and Gedymin dynasties in pretty much the same way as the tsardom of Muscovy had been created by the descendants of Rurik. When

the two became united under one ruler towards the end of the 14th century they formed a broad strip of territory stretching from the Baltic to the Black Sea and separating Russia from central Europe. For Russian ambition the barrier was a formidable one, but it did not entirely preclude possibilities of expansion in a more or less remote future. When examined closely it was found to contain many internal flaws. In no sense could it be considered a homogeneous political unit, for in Lithuania the majority of the population were Russian in nationality, language and religion, whereas in Poland the great majority of the inhabitants were Polish and Roman Catholic. Gradually, it is true, the Lithuanian nobles, who possessed all the land and held the peasantry in a state of serfage, adopted Polish nationality and culture, but this change did not secure homogeneity, because the masses clung obstinately to their old nationality and religion, and all the efforts of the Church of Rome to bring them under papal authority proved fruitless. A further source of weakness was the political organization. Nominally it was an hereditary monarchy, but the warlike, turbulent nobles systematically encroached on the sovereign power till they reduced it to a mere shadow and made it elective, with the result that the kingdom of Poland, including the principality of Lithuania, was at last, politically speaking, the most anarchical country in Europe.

As the Muscovite and the Lithuano-Polish princes were equally ambitious and equally anxious to widen their borders, they naturally came into conflict. At first the Muscovite was decidedly the aggressor. On the death of Casimir, king of Poland and grand-prince of Lithuania, in 1492, the kingdom and the principality ceased to be united and Ivan III. considered he had a good opportunity for attacking the latter. After a short campaign a peace was concluded and Ivan's daughter was given in marriage to the Lithuanian grand-prince, but the matrimonial alliance did not improve the relations between the two countries. On the contrary it served as a pretext for Ivan to interfere in Lithuanian affairs. He not only insisted that his daughter's religion should be duly respected, but he constituted himself the protector of the Orthodox population and this led to a new war in 1499, which went on till 1503, when it was concluded by the cession to Russia of Chernigov, Starodub and 17 other towns. His successor, Basil, tried to get himself elected grand-prince of Lithuania when the throne became vacant by the death of his brother-in-law in 1506, but the choice fell on the late prince's brother Sigismund, who was likewise elected king of Poland. The two countries were thus once more united and better able to resist aggression, but some of the great nobles were discontented and Basil hoped with their assistance to attain his ends. He began war therefore in 1514 and at once captured Smolensk, but in the following year he was defeated, and the war dragged on during more than seven years, with varying successes and without any important result. In the negotiations for peace the inordinate pretensions of the Muscovite prince were put forward boldly: he not only refused to restore Smolensk, but claimed Kiev and a number of other towns on the ground that in the old time of the independent principalities they had belonged to descendants of Rurik.

The policy of expansion westwards, inaugurated by Ivan III., was modified and enlarged by Ivan the Terrible. The former had aimed simply at making annexations in Lithuania; the latter aspired to obtaining a firm footing on the Baltic coast and establishing direct relations, diplomatic and commercial, with the Western Powers. In this respect he was a precursor of Peter the Great, but he greatly underestimated the difficulties of the task. To reach the Baltic he had to overcome the resistance, not only of the Lithuanians and the Poles, but also of the Teutonic and Livonian military orders, the Swedes and the Danes, who all had possessions in the intervening territory and who all objected to the barbarous Muscovites, already sufficiently formidable, strengthening themselves by direct foreign trade with western Europe and especially by the importation of arms and cunning

*Relations with Poland and Lithuania.*

*Ivan IV. and western Europe.*

foreign artificers. Like the European settlers on the coast of Africa in more recent times, they wished the barbarians of the interior to be restricted to the use of their primitive weapons. One of the Polish kings, for example, threatened with death the English sailors who should attempt to carry on the illicit trade in arms, on the ground that "the Muscovite, who is not only our opponent to-day but the eternal enemy of all free nations, should not be allowed to supply himself with cannons, bullets and munitions or with artisans who manufacture arms hitherto unknown to those barbarians." This was precisely the reason why Ivan IV. was so anxious to force his way to the coast. His grandfather had obtained from Venice an "artist" who undertook "to build churches and palaces, to cast big bells and cannons, to fire off the said cannons and to make every sort of castings very cunningly"; and with the aid of that clever Venetian he had become the proud possessor of a "cannon-house," subsequently dignified with the name of "arsenal." In imitation of the grandfather the grandson gave a commission to a Saxon, in whom he had confidence, to collect artists and artisans in Germany and bring them to Moscow, but he was prevented from carrying out his scheme by the Livonian Order (1547). A few years later (1553) he found unexpectedly a different route for communication with the West. A ship of an English squadron which was trying

*First relations with England.*

to reach China by the North-East passage, entered the northern Dvina, and her captain, Richard Chancellor, journeyed to Moscow in quest of opportunities for trade. He met with such a favourable reception from the tsar that on his return to England a special envoy was sent to Moscow by Queen Mary, and he succeeded in obtaining for his countrymen the privilege of trading freely in Russian towns. In return the Russians were allowed to trade freely in England. This afforded great satisfaction to Ivan, but it did not entirely satisfy his requirements, because the new route by the White Sea and North Cape was long and uncertain and for a great part of the year communications were stopped by the ice. He continued, therefore, his efforts to reach the Baltic coast, and he soon came into collision with the Swedes. After a dilatory war of three years he concluded a peace on the ground of free commercial relations, and then he attacked the Livonian Order, on the pretext that the Livonian town of Dorpat had not paid tribute according to ancient treaties. Finding himself unable to resist the Muscovites, the grand master of the Order put himself under Polish protection, and this led to a seven years' war (1563-70) with Poland, during which the Swedes and Danes intervened on their own account. Ivan did not display much military talent, but he showed a remarkable amount of tenacity. No sooner had he made peace with the Poles and failed to get himself elected as their king, than he began a war with the Swedes which dragged on for more than a decade (1572-1583), and before it was ended he was again at war with Poland (1579-81). Though severely tried by disappointments and defeats he never lost hope, and when he died in 1584 he was preparing to renew the struggle and endeavouring to form for that purpose an alliance with England; his great idea, however, was not to be realized till more than a century later, and meanwhile the tsardom of Muscovy had to pass through a severe internal crisis in which its existence was seriously endangered.

Ivan the Terrible had succeeded in stamping out ruthlessly all open resistance to his will, and had created an autocratic government of the Oriental type; but the elements of disorder were still lying beneath the surface, and as soon as the cunning, energetic despot died they reappeared. His son and successor, Theodore (Feodor), was a weak man of saintly character, very ill fitted to consolidate his father's work and maintain order among the ambitious, turbulent nobles; but he had the good fortune to have an energetic brother-in-law, with no pretensions to sanctity, called Boris Godunov, who was able, with the tsar's moral support, to keep his fellow-boycars in order. This he did during fourteen years, and his administration was signalized by two important innovations—the attaching of the peasants

to the land (*adscriptio glebæ*) and the creation of the patriarchate—both of which deserve a passing notice.

Boris has often been called the creator of serfage in Russia, but in reality he merely accelerated a process which was the natural result of economic conditions. In a primitive, thinly populated, agricultural country, in which the demand for agricultural labour greatly exceeds the supply, the value of land is in proportion to the number of permanent labourers settled on it, and the landed proprietors naturally try to attract to their estates as many peasants as possible; and in this competition the large proprietors have evidently an advantage over their humbler and weaker rivals. Such had been for a considerable time the condition of Russia, and the small proprietors were now becoming so impoverished that they could no longer fulfil their duties to the state. The remedy they proposed was that the labourers should be prohibited from migrating from one estate to another, and an order to that effect was issued, with the result that the peasants, being no longer able to change their domicile and seek new employers, fell practically under the unlimited power of the proprietors on whose land they resided. This change was, of course, popular among the lower and middle ranks of the landlord class, but was very displeasing to the great nobles.

The second of the two innovations above mentioned was popular among all classes. Hitherto the highest authority in the Russian Church was the metropolitan, who was nominally under the jurisdiction of the patriarch of Constantinople, and as soon as Constantinople fell into the hands of the infidel, and the tsars of Muscovy claimed to be the successors of the Byzantine emperors, it seemed right and proper that the Russian Church should become autocephalous and be governed by an independent Russian patriarch. The change was very dexterously effected by Godunov, with the formal assent of the Eastern Orthodox Church as a whole, and one of his adherents was placed on the patriarchal throne.

Having thus gained the support of a large majority of the landed proprietors and the ecclesiastics, Boris Godunov increased his influence to such an extent that on the death of Tsar Feodor without male issue in 1598 he was elected his successor by a Great National Assembly.

His short reign was not so successful as his administration under the weak Feodor. The oligarchical party considered it a disgrace to obey a simple boyar; conspiracies were frequent, the rural districts were desolated by famine and plague, great bands of armed brigands roamed about the country committing all manner of atrocities, the Cossacks on the frontier were restless, and the government showed itself incapable of maintaining order. Under the influence of the great nobles who had unsuccessfully opposed the election of Godunov, the general discontent took the form of hostility to him as a usurper, and rumours were heard that the late tsar's younger brother Dimitri (Demetrius), supposed to be dead, was still alive and in hiding. In 1603 a man calling himself Dimitri, and professing to be the rightful heir to the throne, appeared in Poland, and a few months later he crossed the frontier with a large force of Poles, Russian exiles, German mercenaries and Cossacks from the Dnieper and the Don. In reality the younger son of Ivan the Terrible had been strangled before his brother's death—by orders, it was said, of Godunov—and the mysterious individual who was impersonating him was an impostor; but he was regarded as the rightful heir by a large section of the population, and immediately after Boris's death in 1605 he made his triumphal entry into Moscow. Thus began a period of Russian history commonly called "the Troublesome Times," which lasted until 1613. (See DEMETRIUS, PSEUDO-.)

The reign of Dimitri was short and uneventful. Before a year had passed a conspiracy was formed against him by an ambitious noble called Basil (Vassili) Shuiski, and he was assassinated in the Kremlin. The chief conspirator, Shuiski, seized the power and was elected tsar by an Assembly composed of his faction, but neither

the ambitious boyars, nor the pillaging Cossacks, nor the German mercenaries were satisfied with the change, and soon a new impostor, likewise calling himself Dimitri, son of Tsar Ivan, came forward as the rightful heir. Like his predecessor, he enjoyed the protection and support of the Polish king, Sigismund III., and was strong enough to compel Shuiski to abdicate; but as soon as the throne was vacant Sigismund put forward as a candidate his own son, Wladislaus. To this latter the people of Moscow swore allegiance on condition of his maintaining Orthodoxy and granting certain rights, and on this understanding the Polish troops were allowed to occupy the city and the Kremlin. Then Sigismund unveiled his real plan, which was to obtain the throne not for his son but for himself. This scheme did not please any of the contending factions and it roused the anti-Catholic fanaticism of the masses. At the same time it was displeasing to the Swedes, who had become rivals of the Poles on the Baltic coast, and they started a false Dimitri of their own in Novgorod.

Russia was thus in a very critical condition. The throne was vacant, the great nobles quarrelling among themselves, the Catholic Poles in the Kremlin of Moscow, the Protestant Swedes in Novgorod, and enormous bands of brigands everywhere. The severity of the crisis produced a remedy, in the form of a patriotic rising of the masses under the leadership of a butcher called Minin and a Prince Pozharski. In a short time the invaders were expelled, and a Grand National Assembly elected as tsar Michael Románov, the young son of the metropolitan Philaret, who was connected by marriage with the late dynasty.

During the reign of Michael (1613-45) the new dynasty came to be accepted by all classes, and the country recovered to some extent from the disorders and exhaustion from which it had suffered so severely; but it was not strong enough to pursue at once an aggressive foreign policy, and the tsar prudently determined to make peace with Sweden and conclude an armistice of fourteen years with Poland. At the conclusion of the armistice in 1632, during a short interregnum in Poland, he attempted to avenge past injuries and recover lost territory; but the campaign was not successful, and in 1634 he signed a definitive treaty by no means favourable to Russia. That lesson was laid to heart, and he subsequently maintained a purely defensive attitude. As a precaution against Tatar invasions he founded fortified towns on his southern frontiers—Tambov, Kozlov, Penza and Simbirsk; but when the Don Cossacks offered him Azov, which they had captured from the Turks, and a National Assembly, convoked for the purpose of considering the question, were in favour of accepting it as a means of increasing Russian influence on the Black Sea, he decided that the town should be restored to the sultan, much to the disappointment of its captors.

In the reign of Michael's successor, Alexius (1645-76), the country recovered its strength so rapidly that the tsar was tempted to revive the energetic aggressive policy and put forward claims to Livonia, Lithuania and Little Russia, but he was obliged to moderate his pretensions. Livonia continued to be under Swedish rule, and Lithuania remained united with Poland. Some advantages, however, were obtained. Smolensk and Chernigov were definitely incorporated in the tsardom of Muscovy, and great progress was made towards the absorption of Little Russia.

Roughly speaking, Little Russia, otherwise called the Ukraine, may be described as the basin of the Dnieper southward of the 51st parallel of latitude. In the 16th century it was a thinly populated region inhabited chiefly by Cossacks, speaking the so-called Little Russian dialect, and until 1569 it formed nominally part of Lithuania, but was practically independent. In that year, when Lithuania and Poland were permanently united, it fell under Polish rule, and the Polish government considered it necessary to tame the wild inhabitants and bring them under regular administration. For this decision there were good

reasons, for those turbulent sons of the steppe paid no taxes and were much given to brigandage, and their raiding propensities occasionally created international difficulties with the khan of the Crimea and the sultan of Turkey. It was proposed, therefore, in 1576, that 6000 families should be registered as a militia under a Polish Hetman for the protection of the country against Tatar raids, and that the remainder of the inhabitants should be assimilated to the ordinary peasants of Poland. This arrangement was very distasteful to all classes. The registered Cossacks objected to being placed under a Hetman not freely chosen by themselves, and those who were not included in the militia objected still more strongly to the prospect of being reduced to the miserable condition of Polish serfs. To escape this danger many of them moved down the river and settled on the waste lands beyond the rapids. Here, about 1590, was founded an independent military colony called the *Setch*, the members of which, recognizing no authority but that of their own elected officers, lived by fishing, hunting and making raids on the Tatars, and were always ready to assist their less fortunate countrymen in resisting Polish aggression. For half a century the struggle between the two races went on with varying success, but on the whole the Polish government proved stronger than its insubordinate subjects, and about 1638 it seemed to have attained its object. Polish proprietors settled in large numbers on the Cossack territory, and great efforts were made, with the assistance of the Jesuits, to bring the Orthodox population under papal authority. But for both proprietors and Jesuits a surprise was in store. Threatened seriously in their liberty and their faith, the people rose with greater enthusiasm than before, and a general insurrection, in which the peasants joined, spread over the whole country under the leadership of Bogdan Chmielnicki or Khmelnitiski (*q.v.*), whose name is still remembered in the Ukraine. As in all previous insurrections the Poles proved stronger in the field, and Khmelnitiski in desperation sought foreign assistance, first in Constantinople and then in Moscow. For some time Tsar Alexius hesitated, because he knew that intervention could entail a war with Poland, but after consulting a National Assembly on the subject, he decided to take Little Russia under his protection, and in January 1654 a great Cossack assembly ratified the arrangement, on the understanding that a large part of the old local autonomy should be preserved. In the expected war with Poland, which followed quickly, the Russians were so successful that the arrangement was upheld; but it was soon found that the Cossacks, though they professed unbounded devotion to the Orthodox tsar, disliked Muscovite, quite as much as Polish, interference in their internal affairs, and some of their leaders were in favour of substituting federation with Poland for annexation by Russia. In these circumstances the tsar was induced to accept a compromise, and signed in 1667 the treaty of Andrussovo, by which the territory in dispute was partitioned and the middle course of the Dnieper became the frontier between Russia and Poland.

In the reign of Alexius a conflict took place between the tsar and the patriarch, which is often described as a conflict between Church and State, and which illustrates the relations between the temporal and the spiritual power in Russian state-organization. Until the beginning of the 17th century the Byzantine tradition that in all matters outside the sphere of dogma the ecclesiastical is subordinate to the civil power had been observed in Russia; but the traditional conceptions had been to some extent undermined during the reign of Michael, when the metropolitan Philaret, who was the tsar's father (*vide supra*), became patriarch and was associated with his son in the government on a footing of equality. Like the tsar, he had the official title of "Great Lord" (*veliki gosudár*), and he had his palace, his court-dignitaries, his retinue, his boyars and his officials all organized on the model of those of the sovereign. Without his assent and blessing no important decisions were taken, all state documents emanating from the highest authority bore his signature, and he was regarded, both in the official world and by the

public generally, as the tsar's equal in rank and dignity. His immediate successors, being men of humble origin and submissive character, made no pretensions to such an exalted position, but when the haughty, ambitious and energetic Nikon, who enjoyed in large measure the affection and favour of the devout Tsar Alexius, became patriarch, he took Philaret as his model, and propounded, like the popes in western Europe, the doctrine that the spiritual is higher than the temporal power, the former corresponding to the sun and the latter to the moon in the firmament. In accordance with this view he declared that the patriarch was the image of Christ, the head of the Church, and was therefore subject to no earthly authority, and he complained of the tsar's interference in ecclesiastical affairs. His pretensions and his haughty dictatorial manner at last exhausted the tsar's patience, and he was formally deposed and exiled to a monastery. As no voice was raised in his defence and the decision of the ecclesiastical council which condemned him was universally accepted without protest, we must conclude that the conflict was not really between Church and State but simply between the haughty, ambitious Patriarch Nikon and the devout, long-suffering Tsar Alexius. The incident afforded a new proof, where no proof was required, that the autocratic power in Russia was supreme. In order to prevent such incidents in future, Peter the Great abolished the patriarchate altogether, and entrusted the administration of the Church to a synod entirely dependent on the government.

Much more important in its consequences was Nikon's activity as an ecclesiastical reformer. During the Russian Dark Ages certain clerical errors had crept into the liturgical books

#### Reforms of Nikon.

and certain peculiarities had been adopted in the ritual. These had been detected and pointed out by learned ecclesiastics of Kiev, where some of the ancient learning of Byzantium had been preserved, and Nikon determined to make the necessary corrections. He determined also to introduce into the Church many desirable reforms. His project was approved by an ecclesiastical council and was supported by the tsar, but it met with violent opposition from a large section of the clergy, and it alarmed the ignorant masses, who regarded any alterations in the ritual, however insignificant they might be, as heretical and very dangerous to salvation. When put into execution the project produced in the Russian Church a great schism and numerous fantastic sects. The cruel persecutions instituted by the authorities with a view to securing conformity increased the number and fanaticism of the schismatics and heretics, and created among them a widespread belief that the reign of Antichrist, foretold in the Apocalypse, was at hand. In support of this idea, independently of the ecclesiastical innovations, many significant facts could be adduced. Numerous foreigners had been allowed to settle in Moscow and to build for themselves a heretical church, and their strange unholy customs had been adopted by not a few courtiers and great dignitaries. Matveyev, the most influential of the boyars, had married a foreigner who conversed freely with her husband's male friends, contrary to the Muscovite notions of respectability and decorum, and his house, in which the tsar was a frequent visitor, was furnished and decorated in foreign fashion. Books on mundane subjects, not at all conducive to the spiritual edification of the faithful, were read by the tsar's counsellors, and a theatre had been erected, in which the tsar often witnessed very unedifying dramas and ballets. Worst of all, the Orthodox tsar occasionally abandoned the decorous flowing robes of his venerated ancestors, and appeared publicly in the unseemly costume of heretical foreigners, whilst his consort, when carried through the streets in a litter, did not conceal her face from the public gaze. Such innovations troubled deeply the pious souls of the conservative Muscovites, and confirmed them in their repugnance to accept the ecclesiastical reforms. Though this original fanaticism gradually cooled and the rigorists had to make many concessions to the exigencies of practical life, a large section of the Russian people remained outside the official fold, so that at the present day, if we may credit the most competent authorities, the schismatics and heretics number more than twelve millions.

While the Muscovites of the upper classes were thus beginning to abandon their old oriental habits, their government was preparing to make a political evolution of a similar kind.

Notwithstanding the efforts of the Poles and the Military Orders to exclude Russia from the shores of the Baltic and keep her in a state of isolation, she was coming slowly into closer relations with central and western Europe. The emperor, the governments of England, Holland, France and Sweden, and even the Grand Turk made advances to the tsar. Some of them wished to gain him as an ally against their rivals, whilst others hoped to obtain from him commercial privileges and permission to trade directly with Persia. The political and the commercial proposals were alike received with coldness, because the native diplomatists had aims which could not be reconciled completely with the policy of any other country, and the native merchants were afraid of foreign competition. The negotiations gave, therefore, little tangible result, but they helped to prepare the way for the new order of things which was soon to be introduced by Alexius's son, Peter the Great.

Before reaching the new order of things, the country had to pass through an internal crisis similar to that which followed the death of Ivan the Terrible, but not nearly so severe. Alexius had been twice married and had left several children by each of his wives, and, as generally happened in such cases, a struggle for power ensued between the two rival families. The late tsar's eldest son, Theodore, was weak in health and died without male issue after an uneventful reign of six years (1676-82). As the second son, Ivan, next in the order of succession, was almost an imbecile, the third son, Peter, born of the second marriage, was proclaimed tsar, and his maternal relations became the dominant faction, but their triumph was of very short duration. An ambitious, energetic sister of Ivan, well known in Russian history as Sophia Alexeyevna, instigated the *stryelitsi* (*strélitsa*), as the troops of the unreformed standing army were called, to upset the arrangement. After making a tumult in the Kremlin and assassinating several of the men in power, they insisted that Ivan should be proclaimed tsar conjointly with Peter, and that Sophia should act as regent during the minority of the two young sovereigns. She accepted unhesitatingly the difficult and dangerous post, and ruled autocratically for seven years (1682-89), but this did not satisfy her ambition. Having discovered that Peter, who had reached the age of seventeen, was thinking of taking the administration into his own hands, she conspired against him with the commander of the *stryelitsi* and some of his maternal relations; but she was circumvented by the rival faction and interned in a convent, and Peter's mother was put in her place. The importance of these incidents, which are very characteristic of political life in the tsardom of Muscovy, will appear in the sequel.

If Peter really thought of taking the administration into his own hands, he very soon abandoned the idea and returned to the irregular suburban life he had led during his half-sister's regency—associating with foreigners who could teach him the mechanical arts of the West, drilling troops, building and sailing boats, forming projects for the creation of a great navy, indulging publicly in Bacchanalian revels and boisterous amusements not at all to the taste of his pious countrymen, and appearing in Moscow as Orthodox tsar only on great ceremonial occasions. Already the desire to make his country a great naval power was becoming his ruling passion, and when he found by experience that the White Sea, Russia's sole maritime outlet, had great practical inconveniences as a naval base, he revived the project of getting a firm footing on the shores of the Black Sea or the Baltic. At first he gave the preference to the former, and with the aid of a flotilla of small craft, constructed on a tributary of the Don, he succeeded in capturing Azov from the Turks. Greatly elated by this success, he recommended to the council of boyars the construction of a powerful fleet for carrying on war with the infidel, and he himself went abroad to learn more about shipbuilding and useful foreign inventions, and to prepar-

diplomatically the projected crusade. His foreign tour, during which he visited Germany, Holland, England, France and Austria, lasted nearly a year and a half, and was suddenly interrupted, when on his way from Vienna to Venice to study the construction of war-galleys, by the alarming news that the turbulent *strzyelski* of Moscow had mutinied anew with the intention of placing Sophia on the throne. On arriving in Moscow he found that the mutiny had been suppressed and the ringleaders punished, but he considered it necessary to reopen the investigation and act with exemplary severity. Of the surviving mutineers over twelve hundred were executed, some of them by his own hand, and the entire corps was disbanded.

From this moment may be dated the personal reign of Peter, for he now began to direct personally all branches of the administration, and governed with indefatigable vigour for twenty-seven years, during which he greatly increased the area and profoundly modified the internal condition of his country. At first he concentrated his attention on foreign affairs. During his foreign tour he had discovered that the idea of a grand crusade against the infidel was irrealizable, for France was, according to her traditional policy, the ally of the sultan, Austria wished to avoid trouble on her eastern frontier in order to devote her energies to the question of the Spanish succession, and all the other countries which he wished to draw into the coalition had good reasons of their own for desiring the maintenance of peace in eastern Europe. For his Baltic schemes, on the contrary, he had found the ground well prepared. During a halt of a few days in Poland on his way back from Vienna, King Augustus had explained to him a project for partitioning the trans-Baltic provinces of Sweden, by which Poland should recover Livonia and annex Esthonia, Russia should obtain Ingria and Karelia, and Denmark should take possession of Holstein. As Sweden was known to be exhausted by the long wars of Gustavus Adolphus and his successors, and weakened by internal dissensions, the dismemberment seemed an easy matter, and Peter embarked on the scheme with a light heart; but his illusions were quickly dispelled by the eccentric young Swedish king, Charles XII., who arrived suddenly in Esthonia and completely routed the Russian army before Narva. Thus began the so-called Northern War, which lasted intermittently for more than twenty years, and was terminated by the treaty of Nystad (Sept. 10, 1721). By that treaty Peter acquired not only Ingria and Karelia, as originally contemplated, but also Livonia, Esthonia and part of Finland. The problem of obtaining a firm footing on the Baltic coast, on which Ivan the Terrible had squandered his resources to no purpose, was now solved satisfactorily.

Peter's other favourite scheme, that of acquiring the command of the Black Sea, was as far from realization as ever. In the midst of the Northern War, shortly after the great Russian victory of Poltava (1709), the sultan, at the instigation of Swedish and French agents, determined to recover Azov, and made great military preparations for that purpose. Having annihilated at Poltava the army of Charles XII., Peter was not at all indisposed to renew the struggle with Turkey, and began the campaign in the confident hope of making extensive conquests; but he had only got as far as the Pruth when he found himself surrounded by a great Turkish army, and, in order to extricate himself from his critical position, he had to sign a humiliating treaty by which Azov and other conquests were restored to the sultan. His dreams of freeing the Christians from the yoke of the infidel had to be abandoned, and the conquest of the northern shores of the Black Sea was postponed till the reign of Catherine II.

Those tedious and exhausting wars did not prevent Peter from attending to internal affairs, and he displayed as a reformer even more vigour and tenacity than as a general in the field. His first reforms were connected with the army. Several of his immediate predecessors had come to recognize that Russia, with her antiquated military organization, was unable to cope with her Western neighbours, and

had begun to organize, with the help of foreigners, a military force more in accordance with modern requirements; but the progress made in that direction had been slow and unsatisfactory. Unlike his predecessors, Peter was in a hurry to realize his plans, and he set to work at once. In less than two years from the time of disbanding the *strzyelski* he contrived to create an army of 40,000 men. This army, it is true, was so inefficient that it was completely routed by the Swedish king with a most inferior force, but it was improved gradually until it learned to conquer its Swedish opponents. To accomplish such a feat it was necessary, of course, to expend large sums of money; and as the country could ill bear an increase of taxation, the whole financial system had to be improved and the natural resources of the country had to be developed. At the same time the military and financial requirements dislocated the local and central administration, and consequently a series of radical administrative reforms had to be undertaken. Thus one reform led to another; but Peter was not dismayed by the magnitude of the task, and worked vigorously in all departments with a sublime disregard for the clamour of reactionary opponents and for the feelings and prejudices of his subjects in general. A prudent ruler in his position would have sought to preserve the outward forms while changing the inner substance, but Peter was not at all prudent in that sense. Very often he wantonly provoked opposition, as when he shaved off his beard and compelled his chief officials to do likewise, though he well knew that the operation was regarded by the ignorant masses and the pious of all ranks as a sinful defacing of the image of God. In his eyes the beard was a symbol of the old régime, and as such it must be removed. Reckless of consequences, he swept away the venerated ceremonial formalities which his ancestors had scrupulously observed, openly scoffed at ancient usage, habitually dressed in foreign costume, and generally chose foreign heretics as his boon companions. In adopting foreign innovations, he showed, like the Japanese of the present day, no sentimental preference for any particular nation, and was ready to borrow from the Germans, Dutch, English, Swedes or French whatever seemed best suited for his purpose. The innovations, it must be admitted, did not prove so efficient as he expected, because human nature and traditional habits cannot be changed as quickly as institutions. When the Boyar Duma became the Senate, and the *Priказ* or administrative departments were organized under the name of Colleges, and when every important town was endowed with a *Rathhaus*, a *Polizeimeister*, gilds, aldermen, and all the municipal paraphernalia of western Europe, the vices of the old institutions survived in the new. Notwithstanding the changes in organization and terminology, the officials remained ignorant, indolent, careless, indifferent to the public welfare, high-handed and extortionate, and the local self-government which was intended to enlighten and control them proved sadly wanting in vitality and practically worthless. So inefficient, indeed, were the reforms as a whole, and so unvisited to the national character and customs, that the Slavophil critics of a later date could maintain plausibly the paradoxical thesis that in regard to internal administration Peter was anything but a national benefactor. However that may be, it must be confessed even by Slavophiles that he dragged his countrymen, more by force than by persuasion, from the paths of traditional routine and pushed them along with all his might on the broad road of progress in the modern sense of the term. Abandoning the ancient Muscovite capital, where many influential personages were fanatically hostile to his innovations and not a few of the superstitious inhabitants regarded him with horror as Antichrist, he built at the mouth of the Neva a new capital which was to serve as "a window through which his people might look into Europe"; and laying aside the national title of tsar he proclaimed himself (1711) emperor (Imperator) of all Russia—much to the surprise and indignation of foreign diplomatic chancelleries, which resented the audacity of a semi-barbarous potentate in claiming to be

Peter the Great's reforms.

Foundation of St. Petersburg.

equal in rank with the head of the Holy Roman Empire. Gradually, however, the chancelleries had to withdraw their protests, for it came to be generally recognized that the semi-barbarian, who died at the early age of fifty-three, had transformed the oriental tsardom of Muscovy into a state of the Western type and had made it a powerful member of the European family of nations (see PETER I.).

IV. *The Modern Empire.*—On the death of Peter (1725) the internal tranquillity and progress of the empire were again seriously threatened by the uncertainty of the order of succession, and the autocratic power which he had wielded so vigorously passed into the hands of a series of weak, indolent sovereigns who were habitually guided by personal caprice and the advice of intriguing favourites rather than by serious political considerations. During this period, which lasted from 1725 to 1762, the male line of the Romanov dynasty became extinct, and the succession passed to various members of the female line, which intermarried with German princes. In this way German influence was enormously increased, and was represented by men of considerable capacity holding the highest official positions, such as Biren, Münnich and Ostermann. The main events of the period may be summarized very briefly. Peter, by his first marriage, had a son, the unhappy cesarevich Alexius (q.v.), who figures more largely in imaginative literature than in history—a narrow-minded, obstinate, pious youth, who had no sympathy with his father's violent innovations, and was completely under the influence of the old Muscovite reactionary faction. Intimidated by the paternal anger and threats he took refuge in Austria, and when he had been induced by illusory promises to return to Russia he was tried for high treason by a special tribunal, and after being subjected to torture died in prison (1718). To avert the danger of a man of this type succeeding to the throne Peter made a law by which the reigning sovereign might choose his successor according to his own judgment, and two years later he caused his second wife,

Catherine, the daughter of a Lithuanian peasant, to be crowned with all due solemnity, "in recognition of the courageous services rendered by her to the Russian Empire." This gave Catherine a certain right to the throne at her husband's death, and her claims were supported by Peter's most influential coadjutors, especially by Prince Menshikov, an ambitious man of humble origin who had been raised by his patron to the highest offices of state. On the other hand the great nobles of more conservative tendencies wished to get the young son of the cesarevich Alexius made emperor under their own control. The former faction triumphed, and Catherine reigned for about a year and a half, after which the son of the cesarevich Alexius, Peter II.,

occupied the throne from 1727 to 1730. At first he was under the tutelage of Menshikov, who wished him to marry his daughter, but he soon contrived, with the aid of the Dolgorukis and other old families, to get his imperious tutor arrested and exiled to Siberia. The Dolgorukis and their friends thus came into power, and on the death of Peter II. in 1730 they offered the throne to Anne, duchess of Courland, a daughter of Ivan V., elder brother of Peter the Great, on condition of her signing a formal document by which the seat of government should be transferred from St Petersburg to Moscow, and the autocratic power should be limited and controlled by a grand council composed of their own faction. Anne accepted the condition and became empress, but when she discovered that the attempt to limit her powers in favour of a small conservative oligarchy was extremely unpopular among all classes, she submitted the question to an assembly of 800 ecclesiastical and lay dignitaries, and at their request the unlimited autocratic rule was re-established. Her reign (1730-40) was a régime of methodical German despotism on the lines laid down by her uncle, Peter the Great, and as she was naturally indolent and much addicted to frivolous amusements, the administration was directed by her favourite Biren (q.v.) and other men of German origin. Having no male issue,

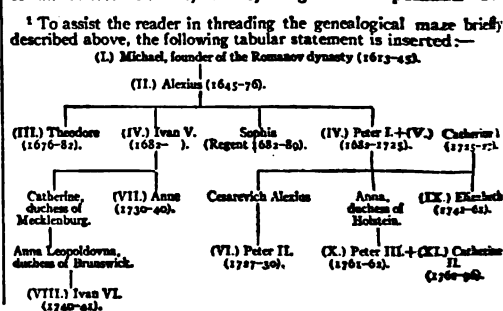

Anne,  
1730-40.

she chose as her successor the infant son of her niece, Anna Leopoldovna, duchess of Brunswick, and at her death the child was duly proclaimed empress, under the name of Ivan VI., but in little more than a year he was dethroned by the partisans of the Princess Elizabeth, a daughter of Peter the Great and Catherine I. As a true daughter of the great Russian reformer, Elizabeth (1741-61) relegated the German element to a subordinate position in the administration and gave her confidence to genuine Russians like Bestuzhev, Vorontsov, Razumovski (hermorganatic husband) and the Shuvalovs. Her hatred of Germans showed itself likewise in her persistent struggle with Frederick the Great, which cost Russia 300,000 men and 30 millions of roubles—an enormous sum for those days—but in the choice of a successor she could not follow her natural inclinations, for among the few descendants of Michael Romanov there was no one, even in the female line, who could be called a genuine Russian. She proclaimed, therefore, as heir-apparent the son of her deceased elder sister Anna, Charles Peter Ulrich, duke of Holstein-Gottorp, a German in character, habits and religion, and tried to Russianize him by making him adopt the Eastern Orthodox faith and live in St Petersburg during the whole of her reign; but her well-meant efforts were singularly unsuccessful. Impervious to Russian influence, he remained true to his original nationality, and by his undisguised aversion to everything in his adopted country and his passionate, childish admiration of Frederick the Great, he made himself so unpopular that within a few months of his accession, in December 1761, he was dethroned and assassinated by the partisans of his ambitious and able consort, the famous Catherine II.<sup>1</sup>

During the long reign of Catherine II. (1762-96) Russia made rapid progress in civilization, and came to be fully recognized as one of the Great Powers. Coming after a series of incompetent rulers, the German princess proved herself a worthy successor to Peter the Great both in home and in foreign affairs; but she was not a mere imitator. Peter had endeavoured to import from western Europe the essentials of good government and such of the useful arts as were required for the development of the natural resources of the country; Catherine did likewise, but she did not restrict herself to purely utilitarian aims in the narrower sense of the term. She strove to impart also something of the refinement and ornamental attributes of Western civilization, and aspired to raise her adopted fatherland intellectually and artistically to the west-European level. This new departure she lost no time in proclaiming to the world. Within a few months of her accession, having heard that the publication of the famous French *Encyclopédie* was in danger of being stopped by the French government on account of its irreligious spirit, she proposed to Diderot that he should complete his great work in Russia under her protection. Four years later she endeavoured to embody in a legislative form the principles of enlightenment which she had imbibed from the study of the French philosophers. A Grand Commission, which might be called a consultative parliament, composed of 652 members of all classes—officials, nobles, burghers and peasants—and

Catherine II.,  
1762-96.

<sup>1</sup> To assist the reader in threading the genealogical maze briefly described above, the following tabular statement is inserted:—

of various nationalities, was called together at Moscow to consider the needs of the empire and the means of satisfying them. The instructions for the guidance of the Assembly were prepared by the empress herself and were, as she frankly admitted, the result of "pillaging the philosophers of the West," especially Montesquieu and Beccaria. As many of the democratic principles frightened her more moderate and experienced advisers, she wisely refrained from immediately putting them into execution. After holding more than 200 sittings the so-called Commission was dissolved without getting beyond the realm of theory and *piu desideria*. Subsequently very important reforms were introduced, not by the vote of an assembly, but by the *fat* of the autocratic power. The large

*Administrative reforms.* territorial units of administration created by Peter the Great were broken up into so-called "governments" (*gubernii*) and further subdivided into districts (*uyezdy*), and each government was confided to the care of a governor and a vice-governor assisted by a council. A certain amount of local self-government was entrusted to the nobles and the burghers, and the judicial administration was thoroughly reorganized in an enlightened and humane spirit. The great estates of the Church, on which were settled about a million serfs, were secularized and assimilated with the state-domains. At one moment the idea of emancipating all the serfs was entertained, but the project was speedily abandoned, because it would have alienated the nobles—the only class on which Catherine could rely for support. To conciliate them she greatly extended the area of serfage by making large grants of land and serfs to courtiers and public servants who had specially distinguished themselves. About education a great deal was spoken and written, and a certain amount of progress was effected. Whilst primary education was neglected, secondary schools were created in the principal towns and a Russian Academy was founded in St Petersburg. In the imperial court, so far as outward decorum and refinement were concerned, there was an immense improvement, and the upper section of the old Russian *Dворянство* became a noblesse with French aristocratic conceptions and ideals. A taste for French literature spread rapidly, and the poets and dramatists of Paris found clever imitators in St Petersburg.

By such means Catherine made herself very popular in the upper ranks of society, but as a woman and a usurper who did little or nothing to lighten the burdens of the people she failed to gain the loyalty and devotion of the masses. In the first part of her reign popular discontent found expression in various forms, and on one occasion it produced a serious insurrection. In 1773 a Don Cossack called Pugachev, who was so uneducated that he could not even sign the manifestoes written for him, declared himself to be Peter III., and announced that he was going to St Petersburg to punish his faithless wife and place his son Paul on the throne. Many believed, or affected to believe, in the pretender, and in a short time he gathered around him a large force of Cossacks, peasants, Tatars and Tschuvash, swept over the basin of the lower Volga, executed mercilessly the landed proprietors, seized and pillaged the town of Kazan, and kept the whole country in a state of alarm for more than a year. Finally, after a crushing defeat in which 2000 of the insurgents were killed and 6000 taken prisoners, he was betrayed by some of his followers and executed in Moscow. His name and exploits still live in the popular legends, and the insurrection is often referred to in revolutionary pamphlets as a laudable popular protest against tyrannical autocracy.

In foreign affairs Catherine devoted her attention mainly to pushing forward the Russian frontier westwards and southwards, and as France was the traditional ally of Sweden, Poland and Turkey, she adopted at first the so-called *système du Nord*, that is to say, a close alliance with Prussia, England and Denmark against France and Austria, who had buried their traditional enmity in the famous alliance of 1756. The first step westwards was taken in Courland, which lay between Russian territory and

the Baltic coast. At the time of her accession the duchy was ruled by a son of the Polish king Augustus III., and he gave a pretext for aggression by refusing to allow Russian troops returning from the Seven Years' War to pass through his territory: For this unfriendly act he was deposed and replaced by Biren, who had previously been duke of Courland (1737-40) and had since been an exile in Siberia and Yaroslav. Under Biren (1763-60) and his son and successor (1760-95), as nominees of Catherine, Courland was completely under Russian influence until 1795, when it was formally incorporated with the empire. The next country to feel the expansive tendencies of Russia was Poland, which had now very little power of resistance. Whilst Russia, Austria, Prussia and France were becoming powerful monarchies with centralized administration, Poland had remained a weak feudal republic with an elected king chosen under foreign influence and fettered by constitutional restrictions. All political authority was in the hands of turbulent nobles who quarrelled among themselves, who were always inclined to submit the questions at issue to the arbitrament of arms, and who did not scruple to invite foreign powers to intervene on their behalf. The middle classes, which were making other countries rich and powerful, existed only in an embryonic condition. Instead of a well-organized army of the modern type there was merely an undisciplined militia composed almost exclusively of irregular cavalry; and the national defences as a whole were so weak that, in the opinion of such a competent authority as Maurice of Saxony, the country might easily be conquered by a regular army of 48,000 men. Here was a tempting field for the application of Catherine's aggressive policy, and if she had had to deal merely with the Poles she would have had an easy task. Unfortunately for the success of her schemes she had to reckon with stronger states which were anxious to check the Russian advance, and which were determined, in the event of aggression, to have a share of the plunder. Frederick the Great was at that moment impatient to extend and consolidate his kingdom by getting possession of the basin of the lower Vistula, which separated eastern Prussia from the rest of his dominions, while Austria had also claims on Polish territory and would certainly not submit to be excluded by her two rivals. In these circumstances Catherine hesitated to bring matters to a crisis, but her hand was forced by Frederick, and in 1772 the first partition of Poland took place without any very strenuous resistance on the part of the victim. This national disaster opened the eyes of many Polish patriots to the necessity of changing radically the old order of things, and an attempt was made by them to remove some of the more glaring absurdities of the existing constitution: the throne was declared to be hereditary, the *liberum veto* by which any petty noble could annul the most important decision of the national assembly was abolished, the royal authority was greatly strengthened, and the towns were empowered to send deputies to the Diet (1791). Such salutary reforms were naturally unwelcome to the aggressive neighbours who wished to preserve the traditional anarchy in order to have new facilities for intervention, and as Russia had signed with the puppet-king in 1768 a treaty by which the constitution could not be modified without her consent, she had a plausible ground for protest. She waited, however, until a deputation of the malcontents, who regretted the loss of *liberum veto* and who were afraid that the party of reform might undertake the emancipation of the serfs, came to St Petersburg and asked for support in defence of the ancient liberties. Then an imperial manifesto reminding the Poles of the treaty of 1768 was issued and a large Russian force entered the Ukraine. This led to the second partition (1793), by which Russia obtained the eastern provinces with three millions of inhabitants. Even now the work of spoliation was not complete. When the patriots under Kosciuszko made a desperate effort to recover the national independence the struggle produced a third partition (1795), by which the remainder of the kingdom was again divided between Russia, Prussia and Austria. Thus Poland disappeared for a time from the map of Europe.

Russia's advance westward raised indirectly the Eastern Question, because it threatened two of France's traditional allies, Sweden and Poland, and Choiseul considered that the best means of checkmating Catherine's aggressive schemes was to incite France's third traditional ally, Turkey, to attack her. This was not a difficult matter, because the Sublime Porte had many things to complain of in the past and had good reason to fear aggression in the near future. War was accordingly declared in 1768, but it proved disastrous for the sultan; and he had to sign in 1774 the treaty of Kuchuk-Kainarji, which gave Russia a firm hold on the Black Sea and the lower Danube (see *TURKEY: History*). The Tatars of the Bug, of the Crimea and of the Kuban were liberated from the suzerainty of the Porte; Azov, Kinburna and all the fortified places of the Crimea were ceded to Russia; the Bosphorus and Dardanelles were opened to Russian merchant-vessels; and Russian ambassadors obtained the right to intervene in favour of the inhabitants of the Danubian principalities. Ten years later the semblance of independence which was left to the khans of the Crimea was destroyed and the peninsula formally annexed to the empire.

The peace concluded at Kuchuk-Kainarji was not of long duration. Catherine had conceived an ambitious plan of solving radically the Eastern Question by partitioning Turkey as she and her allies had partitioned Poland, and she had persuaded the emperor Joseph II. to take part in the scheme. It was intended that Russia should take what remained of the northern coast of the Black Sea, Austria should annex the Turkish provinces contiguous to her territory, the Danubian principalities and Bessarabia should be formed into an independent kingdom called Dacia, the Turks should be expelled from Europe, the Byzantine empire should be resuscitated, and the grand-duke Constantine, second son of the Russian heir-apparent, should be placed on the throne of the Palaeologi. Rumours of this gigantic scheme reached Constantinople, and as Catherine's menacing attitude left little doubt as to her aggressive intentions the Porte presented an ultimatum and finally declared war (1787). Fortune again favoured the Russian arms, but as Austria was less successful and signed a separate peace at Sistova in 1791, Catherine did not obtain much material advantage from the campaign. By the peace of Jassy, signed in January 1792, she retained Ochakov and the coast between the Bug and the Dniester, and she secured certain privileges for the Danubian principalities, but the Turks remained in Constantinople, and the realization of the famous Greek project, as it was termed, had to be indefinitely postponed.

During the first years of the French Revolution Catherine's sympathy with philosophic liberalism rapidly evaporated, and she did all in her power to stimulate the hostility of the European sovereigns to the democratic movement; but she carefully abstained from joining the Coalition, and waited patiently for the moment when the complications in western Europe would give her an opportunity of solving independently the Eastern Question in accordance with Russian interests. That moment never came. In November 1796, when the country was not yet prepared to enter on a decisive struggle with Turkey, Catherine died at the age of sixty-six, and was succeeded by her son Paul, whom she had kept during her long reign in a state of semi-captivity.

The short reign of Paul (1796-1801) resembled in many points the still shorter one of his father, Peter III. Both sovereigns were childishly wayward and capriciously autocratic; both were recklessly indifferent to the feelings, convictions and wishes of those around them; both took a passionate interest in the minutiae of military affairs; as Peter had conceived a boundless admiration for Frederick the Great, so Paul conceived a similar admiration for Napoleon, and both suddenly reversed the national policy to suit this feeling; both were singularly blind to the consequences of their foolish conduct; and both fell victims to court conspiracies which could be in some measure justified, or at least excused, on patriotic grounds.

Paul left no deep, permanent mark on Russian history. In internal affairs he wished to undo what his mother had done, but his impulsive, incoherent efforts in that direction merely dislocated the administrative mechanism without producing any tangible results. In foreign affairs he displayed the same capriciousness and want of perseverance. After proclaiming his intention of conferring on his subjects the blessings of peace, he joined in 1798 an Anglo-Austrian coalition against France; but when Austria paid more attention to her own interests than to the interests of monarchical institutions in general, and when England did not respect the independence of Malta, which he had taken under his protection, he succumbed to the artful blandishments of Napoleon and formed with him a plan for ruining the British empire by the conquest of India. Having roused, by what ought perhaps to be called his insanity, the enmity, distrust and fear of all around him, including some members of his own family, he was assassinated on the night of the 23rd to 24th of March 1801, and was succeeded by his son Alexander I.

The early part of Alexander's reign (1801-25) was a period of generous ideas and liberal reforms. Under the influence of his Swiss tutor, Frederick César de Laharpe, he had imbibed many of the democratic ideas of the time, and he aspired to put them in practice, with the assistance at first of three young friends, Novosiltsov, Adam Czartoryski and Strogonov, who were his intimate counsellors and were popularly known as the *Triumvirate*, and later of Mikhail Speranski (*q.v.*). Some of the more oppressive measures of the previous reign were abolished; the clergy, the nobles and the merchants were exempted from corporal punishment; the central organs of administration were modernized and the Council of the Empire was created; the idea of granting a constitution was academically discussed; great schemes for educating the people were entertained; parish schools, gymnasia, training colleges and ecclesiastical seminaries were founded; the existing universities of Moscow, Vilna and Dorpat were reorganized and new ones founded in Kazan and Kharkov; the great work of self-emanicipation was begun in the Baltic provinces. In all these schemes Alexander took a keen personal interest; but his enthusiasm was soon cooled by practical difficulties, and his attention became more and more engrossed by foreign affairs.

At that time, in respect of foreign affairs, Russia was entering on a new phase of her history. Hitherto she had confined her efforts to territorial expansion in eastern Europe and in Asia, and she had sought foreign alliances merely as temporary expedients to facilitate the attainment of that object. Now she was beginning to consider herself a powerful member of the European family of nations, and she aspired to exercise a predominant influence in all European questions. This tendency was already shown by Catherine when she created the League of Neutrals as an arm against the naval supremacy of England, and by Paul when he insisted that his peace negotiations with Bonaparte should be regarded as part of a general European pacification, in which he must be consulted. Alexander insisted still more strongly on this claim, and in the convention which he concluded with the First Consul in October 1801 it was agreed that the maintenance of a just equilibrium between Austria and Prussia should be taken as an invariable principle in the plans of both parties, that the integrity of the kingdom of the Two Sicilies should be respected, that the duke of Württemberg should receive in Germany an indemnity proportionate to his losses, that the dominions of the elector of Bavaria should be preserved intact, and that the independence of the Ionian Islands should not be violated. Having obtained these important concessions the tsar imagined for a moment that in any further territorial changes he would be consulted and his advice allowed due weight, and he seems even to have indulged in the hope that the affairs of Europe might be directed by himself and his new ally. His illusion was soon dispelled, because the aims and policy of the two potentates were utterly irreconcilable. Whilst

the one strove to erect bulwarks against French aggression, the other was preparing the ground for fresh annexations. During 1803-4 the breach between the two rivals widened, because Napoleon became more and more aggressive and unceremonious in Italy and Germany. Before the end of 1803 Alexander had come to perceive the necessity of resisting him energetically in order to save Europe from complete subjection, and in August 1804 he recognized that an armed conflict was inevitable. It broke out in the following year, and after the battles of Austerlitz (December 1805) and Friedland (June 1807), in which the Russians were completely defeated, the two sovereigns had their famous interviews at Tilsit, at which they not only made peace but agreed to divide the world between them, with a sublime indifference to the interests of other states. The grandiose project was at once vaguely outlined in three formal documents, to the intense satisfaction of both parties, and on both sides there was much rejoicing at the conclusion of such an auspicious alliance; but the diplomatic honeymoon was not of long duration. The mutual assurances of unbounded confidence, admiration and sympathy, if there was any genuine sincerity in them, represented merely a transient state of feeling. Napoleon, who could brook no equal, was nourishing the secret hope that his confederate might be used as a docile subordinate in the realization of his own plans, and the confederate soon came to suspect that he was being duped. His suspicions were intensified by the hostile criticisms of the Tilsit arrangement among his own subjects and by the arbitrary conduct of his ally, who continued his aggressions in reckless fashion as if he were sole master of Europe. The sovereigns of Sardinia, Naples, Portugal and Spain were dethroned, the pope was driven from Rome, the Rhine Confederation was extended till France obtained a footing on the Baltic, the grand-duchy of Warsaw was re-organized and strengthened, the promised evacuation of Prussia was indefinitely postponed, an armistice between Russia and Turkey was negotiated by French diplomacy in such a way that the Russian troops should evacuate the Danubian principalities, which Alexander intended to annex to his empire, and the scheme for breaking up the Ottoman empire and ruining England by the conquest of India, which had been one of the most attractive baits in the Tilsit negotiations, but which had not been formulated in the treaty, was no longer spoken of. At the same time Napoleon threatened openly to crush Austria, and in 1809 he carried out his threat by defeating the Austrian armies at Wagram and elsewhere, and dictating the treaty of Schönbrunn (October 14).

Russia now remained the only unconquered power on the continent, and it was evident that the final struggle with her could not be long delayed. It began in 1812 by the advance of the *Grande Armée* on Moscow, and it ended in 1815 at Waterloo. During those three years Alexander was the chief antagonist of Napoleon, and it was largely due to his skill and persistency that the allies held together and freed Europe permanently from the Napoleonic domination. When peace was finally concluded, he had obtained that predominant position in European politics which had been the object of his ambition since the commencement of his reign, and he now believed firmly that he had been chosen by Providence to secure the happiness of the world in general and of the European nations in particular. In the fulfilment of this supposed mission he was not very successful,

because his conception of national happiness and the means of obtaining it differed widely from that of the peoples whom he wished to benefit. They had fought for freedom in order to liberate themselves not only from the yoke of Napoleon but also from the tyranny of their own governments, whereas he expected them to remain submissively under the patriarchal institutions which their native rulers imposed on them. Thus, in spite of his academic sympathy with liberal ideas, he became, together with Metternich, a champion of political stagnation, and co-operated willingly in the reactionary measures against the revolutionary movements in Germany, Italy and Spain. In the affairs of his own

country he refrained from developing and extending the liberal institutions which he had created immediately after his accession, and he finally adopted in all departments of administration a strongly reactionary policy. This naturally caused profound disappointment and dissatisfaction in the liberal section of the educated classes and especially among the young officers of the regiments which had spent some years in western Europe. Some of these officers had been in touch with the revolutionary movements, and had adopted the idea then prevalent in France, Germany and Italy that the best instrument for assuring political progress was to be found in secret societies. In Russia such societies began to be formed about 1816. The tsar, though he came to know of their existence, refrained from taking repressive measures against them, and when he died suddenly at Taganrog on the 1st of December 1825, two of them made an attempt to realize their political aspirations. The heir to the throne was the late tsar's eldest brother, Constantine, but he declined, for private reasons, to accept the succession, *Nicholas* and a few days elapsed before the second brother, *Nicholas*, *1825-55.* *Nicholas*, was proclaimed emperor. Taking advantage of this short interregnum, some members of the secret societies, mostly officers of the Guards, organized a mutiny among the troops quartered in St Petersburg and in Podolia, with a view to effecting a political revolution, but the movement was easily suppressed, and the ringleaders, known subsequently as the Decembrists, were severely punished (see *NICHOLAS I.*).

Nicholas was a blunt soldier incapable of comprehending his brother's sentimental sympathy with liberalism. The Decembrists' abortive attempt at revolution and the Polish insurrection of 1831, which he crushed with great severity, confirmed him in his conviction that Russia must be ruled with a strong hand. That conviction he put into practice with extreme rigour during the thirty years of his reign (1825-55), endeavouring by every means at his disposal to prevent revolutionary ideas from germinating spontaneously among his subjects and from being imported from abroad. For this purpose he created a very severe press-censorship and an expensive system of passports, which made it more difficult for Russians to visit foreign countries. It would be unjust, however, to say that he was the determined enemy of all progress. Progress was to be made in certain directions and in a certain way. Not only was the army to be well drilled and the fleet to be carefully equipped; but railways were to be constructed, river-navigation was to be facilitated, manufacturing industry was to be developed, commerce was to be encouraged, the administration was to be improved, the laws were to be codified and the tribunals were to be reorganized. All this was to be done, however, under the strict supervision and guidance of the autocratic power, with as little aid as possible from private initiative and with no control whatever of public opinion, because influential public opinion is apt to produce insubordination. When the results proved unsatisfactory, remedies were sought in increased administrative supervision, draconian legislation and severe punishment, and no attempt was made to get out of the vicious circle. In the last months of his life, under the influence of a great national disaster, the conscientious, persistent autocrat began to suspect that his system was a mistake, but he still clung to it obstinately. "My successor," he is reported to have said on his death-bed, "may do as he pleases, but I cannot change!"

This steadfast faith in autocratic methods and the exaggerated fear of revolutionary principles were shown in foreign as well as in home affairs. Like Alexander in the last period of his reign, Nicholas considered himself the supreme guardian of European order, and was ever on the watch to oppose revolution in all its forms. Hence he was generally in strained relations with France, especially in the time of Louis Philippe, who became king not by the grace of God but by the will of the people. During the revolutionary ferment of 1848-49 he urged the Prussian king to refuse the imperial crown, co-operated with the Austrian emperor in suppressing the Hungarian insurrection, and compelled the Prussians to withdraw their support from the insurgents

Europe.

in Schleswig-Holstein. Unfortunately for the peace of the world his habitual policy of maintaining the existing state of things was frequently obscured and disturbed by his desire to maintain and increase his own and his country's prestige, influence and territory. By the Persian War, which broke out in 1826, in consequence of frontier disputes, he annexed the provinces of Erivan and Nakhichevan, and during the whole of his reign the conquest of the Caucasus was systematically carried on. With regard also to the Ottoman empire his policy cannot be said to have been strictly conservative. As protector of the Orthodox Christians he espoused the cause of the rayahs in Greece, Servia and Rumania. Under a threat of war he obtained in 1826 the Convention of Akerman, by which the autonomy of Moldavia, Walachia and Servia was confirmed, free passage of the straits was secured for merchant ships and disputed territory on the Asiatic frontier was annexed, and in July 1827 he signed with England and France the treaty of London for the solution of the Greek question by the mediation of the Powers. As the sultan rejected the mediation, his fleet was destroyed by the combined squadrons of the three Powers at Navarino; and as this "outward event" did not suffice to overcome his resistance, a Russian army crossed the Danube and after two hard-fought campaigns advanced to Adrianople. Here, on the 14th of September 1829, was signed a treaty by which the Porte ceded to Russia the islands at the mouth of the Danube and several districts on the Asiatic frontier, granted full liberty to Russian navigation and commerce in the Black Sea, and guaranteed the autonomous rights previously accorded to Moldavia, Walachia and Servia. By the 10th article of the treaty, moreover, Turkey acceded to the protocol of the 22nd of March 1829, by which the Powers had agreed to the erection of Greece into a tributary principality. This attempt of Russia to secure the sole prestige of liberating Greece was, however, frustrated by the action of the other Powers in putting forward the principle of the independence of the new Greek state, with a further extension of frontiers.

The result of the war was to make Russia supreme at Constantinople; and before long an opportunity of further increasing her influence was created by Mehemet Ali, the ambitious pasha of Egypt, who in November 1831 began a war with his sovereign in Syria, gained a series of victories over the Turkish forces in Asia Minor and threatened Constantinople. Sultan Mahmud II. after appealing in vain to Great Britain for active assistance turned in despair to Russia. Nicholas immediately sent his Black Sea fleet into the Bosphorus, landed on the Asiatic shore a force of 10,000 men, and advanced another large force towards the Turkish frontier in Bessarabia. Under pressure from

England and France the Egyptians retreated and the Russian forces were withdrawn, but the tsar had meanwhile (July 8, 1833) concluded with the sultan the treaty of Unkiar-Skelessi, which constituted ostensibly a defensive and offensive alliance between the two Powers and established virtually a Russian protectorate over Turkey. In a secret article of the treaty the sultan undertook in the event of a *casus foederis* arising, and in consideration of being relieved of his obligations under the articles of the public treaty, to close the Dardanelles to the warships of all nations "au besoin," which meant in effect that in the event of Russia being threatened with an attack from the Mediterranean he would close the Dardanelles against the invader. England and France protested energetically and the treaty remained a dead letter, but the question came up again in 1840, after Mahmud's renewed attempt to crush Mehemet Ali had ended in the utter defeat of the Turks by Ibrahim at Nezib (June 24, 1839). This time Mehemet Ali was supported by the French government, which aimed at establishing predominant influence in Egypt, but he was successfully opposed by a coalition of Great Britain, Russia, Austria and Prussia, which checkmated the aggressive designs of France by the convention of London (July 15, 1840) (see MEHEMET ALI and TURKEY). In this way the development of Russian policy with regard to Turkey was checked for some years, but the project of confirming and extending the Russian

protectorate over the Orthodox Christians was revived in 1852, when Napoleon III. obtained for the Roman Catholics certain privileges with regard to the Holy Places in Palestine. At the same time Austria intervened in Montenegrin affairs and induced the sultan to withdraw his troops from the principality. In these two incidents the tsar perceived a diminution of Russian prestige and influence in Turkey, and Prince Menshikov was sent on a special mission to Constantinople to obtain reparation in the form of a treaty which should guarantee the rights of the Orthodox Church with regard to the Holy Places and confirm the protectorate of Russia over the Orthodox rayahs, established by the treaties of Kainarji, Bucharest and Adrianople. The resistance of the sultan, supported by Great Britain and France, led to the Crimean War, which was terminated by the taking of the Sevastopol (September 1855) and the treaty of Paris (March 30, 1856). By that important document Russia reluctantly consented to a strict limitation of her armaments in the Black Sea, to withdrawal from the mouths of the Danube by the retrocession of Bessarabia which she had annexed in 1812, and finally to a renunciation of all special rights of intervention between the sultan and his Christian subjects. Nicholas did not live to experience this humiliation. He had died at St Petersburg on the 2nd of March 1855 and had been succeeded by his eldest son, Alexander II.

The first decade of Alexander's reign is commonly known in Russia as "the epoch of the great reforms," and may be described as a violent reaction against the political and intellectual stagnation of the preceding period. The repressive system of Nicholas, in which all other public interests were sacrificed to that of making Russia a great military power, the guardian of order in Europe and the predominant factor in the Eastern Question, had been tried and found wanting. Ending in a military disaster and a diplomatic humiliation, it had failed to attain even the narrow object for which it had been created. This was clearly perceived and keenly felt by the educated classes, and as soon as the strong hand of the uncompromising autocrat was withdrawn, they clamoured loudly for radical changes in the aims and methods of their rulers. Russia must adopt, it was said, those enlightened principles and liberal institutions which made the Western nations superior to her not only in the arts of peace but even in the art of war; only by imitating her rivals could she hope to overtake and surpass them in the race of progress. On that subject there was wonderful unanimity, and the few persons who could not join in the chorus had the prudence to remain silent. For the first time in the history of Russia public opinion in the modern sense became a power in the state and influenced strongly the policy of the government. Though the young emperor was of too phlegmatic a temperament to be carried away by the prevailing excitement and of too practical a turn of mind to adopt wholesale the doctrinaire theories of his self-constituted, irresponsible advisers, he recognized that great administrative and economic changes were required, and after a short period of hesitation he entered on a series of drastic reforms, of which the most important were the emancipation of the serfs, the thorough reorganization of the judicial administration and the development of local self-government. All these undertakings, in which the humane, liberal-minded autocrat received the sympathy, support and co-operation of the more enlightened of his subjects, were successfully accomplished. The serfs were liberated entirely from the arbitrary rule of the landowners and became proprietors of the communal land; the old tribunals which could be justly described as "dens of iniquity and incompetence," were replaced by civil and criminal law-courts of the French type, in which justice was dispensed by trained jurists according to codified legislation, and from which the traditional bribery and corruption were rigidly excluded; and the administration of local affairs—roads, schools, hospitals, &c.—was entrusted to provincial and district councils freely elected by all classes of the population. In addition to these great and beneficent changes, means were taken for developing more rapidly the

vast natural resources of the country, public instruction received an unprecedented impetus, a considerable amount of liberty was accorded to the press, a strong spirit of liberalism pervaded rapidly all sections of the educated classes, a new imaginative and critical literature dealing with economic, philosophical and political questions sprang into existence, and for a time the young generation fondly imagined that Russia, awakening from her traditional lethargy, was about to overtake, and soon to surpass, on the path of national progress, the older nations of western Europe.

These sanguine expectations were not fully realized. The economic and moral condition of the peasantry was little improved by freedom, and in many districts there were signs of positive impoverishment and demoralization. The local self-government institutions after a short period of feverish and not always well-directed activity, showed symptoms of organic exhaustion. The reformed tribunals, though incomparably better than their predecessors, did not give universal satisfaction. In the imperial administration, the corruption and long-established abuses which had momentarily vanished, began to reappear. Industrial enterprises did not always succeed. Education produced many unforeseen and undesirable practical results. The liberty of the press not unfrequently degenerated into licence, and sane liberalism was often replaced by socialistic dreaming. In short, it became too evident that there was no royal road to national prosperity, and that Russia, like other nations, must be content to advance slowly and laboriously along the rough path of painful experience. In these circumstances sanguine enthusiasm naturally gave way to despondency, and the reforming zeal of the government was replaced by tendencies of a decidedly reactionary kind. Partly from disappointment and nervous exhaustion, and partly from a conviction that the country required rest in order to judge the practical results of the reforms already accomplished, the tsar refrained from further initiating new legislation, and the government gave it to be understood that the epoch of the great reforms was closed.

In the younger ranks of the educated classes this state of things produced keen dissatisfaction, which soon found vent in revolutionary agitation. At first the agitation was of an academic character and was dealt with by the press-censure; but it gradually took the form of secret associations, and the police had to interfere. There were no great, well-organized secret societies, but there were many small groups, composed chiefly of male and female students of the universities and technical schools, which worked independently for a common purpose. Finding that the walls of autocracy could not be overturned by blasts of revolutionary trumpets in the periodical press and in clandestinely printed seditious proclamations, the young enthusiasts determined to seek the support of the masses, or, as they termed it, "to go in among the people" (*idili v narod*). Under the disguise of doctors, midwives, school teachers, governesses, factory hands or common labourers, they sought to make proselytes among the peasantry and the workmen in the industrial centres by revolutionary pamphlets and oral explanations. For a time the propaganda had very little success, because the uneducated peasants and factory workers could not understand the phraseology and abstract principles of socialism; but when the propagandists descended to a lower platform and spread rumours that the tsar had given all the land to the peasants, and was prevented by the proprietors and officials from carrying out his benevolent intentions, there was a serious danger of agrarian disorders, and energetic measures were adopted by the authorities. Wholesale arrests were made by the police, and many of the accused were imprisoned or exiled to distant provinces, some by the regular tribunals, and others by so-called "administrative procedure" without a formal trial. The activity of the police and the sufferings of the victims naturally produced intense excitement and bitterness among those who escaped arrest, and a secret organization calling itself the Executive Committee announced in its clandestinely printed organs that the functionaries who distinguished themselves in the suppression of the propaganda would be "removed." A number

of prominent officials were accordingly condemned to death by this secret terrorist tribunal, and in some cases the sentences were carried out. General Mezentsov, the head of the political police, was assassinated in broad daylight in one of the principal streets of St Petersburg, and in the provinces a good many officials of various grades shared the same fate. As these acts of terrorism had quite the opposite of the desired effect, repeated attempts were made on the life of the emperor, and at last the carefully laid plans of the conspirators were successful. On the 13th of March 1881, when returning from a military parade to the Winter Palace, Alexander II. was terribly wounded by the explosion of a bomb, and died shortly afterwards. (For details of this revolutionary movement, see Nihilism.)

In respect of foreign policy the reign of Alexander II. differed widely from that of Nicholas. The Eastern Colossus no longer inspired respect and fear in Europe. Until the country had completely recovered from the exhaustion of the Crimean War the government remained in the background of European politics. Its attitude was graphically described in the famous declaration of Prince Gorchakov: "La Russie ne boude pas; elle se recueille." On one point, however, this description was not accurate; Russia sulked so far as Austria was concerned, for she could not forget that the emperor Francis Joseph, by his wavering and unfriendly conduct towards her during the Crimean War, had ill repaid her assistance to the Habsburg Monarchy in 1849, and had fulfilled the cynical prediction of Prince Schwarzenberg that his country would astonish the world by her ingratitude. It was not without secret satisfaction, therefore, that Prince Gorchakov watched the repeated defeats of the Austrian army in the Italian campaign of 1859, and he felt inclined to respond to the advances made to him by Napoleon III.; but the germs of a Russo-French alliance, which had come into existence immediately after the Crimean War, ripened very slowly, and they were completely destroyed in 1863 when the French emperor wounded Russian sensibilities deeply by giving moral and diplomatic support to the Polish insurrection. On that occasion Bismarck helped Gorchakov to ward off the threatened intervention of France and England, and he thereby founded the cordial relations which subsisted between the cabinets of Berlin and St Petersburg down to 1878, and which contributed powerfully to the creation of the German empire by defending the Prussian cabinet against the jealousy and enmity of Austria and France. In return for these services Bismarck helped Russia to recover a portion of what she had lost by the Crimean War, for it was thanks to his connivance and diplomatic support that she was able in 1871 to denounce with impunity the clauses of the treaty of Paris which limited Russian armament in the Black Sea. Had the tsar been satisfied with this important success, which enabled him to rebuild Sevastopol and construct a Black Sea fleet, his reign might have been a peaceful and prosperous one, but he tried to recover the remainder of what had been lost by the Crimean War, the province of Bessarabia and predominant influence in Turkey. To effect this, he embarked on the Turkish War of 1877-78, which ended in disappointment. Though the campaign enabled him to recover Bessarabia at the expense of his Rumanian ally, it did not increase Russian prestige in the East, because the Russian army was repeatedly repulsed by the Turks, and when at last it reached Constantinople, it was prevented from entering the city by the threatening attitude of England and Austria. In the field of diplomacy there was likewise disappointment. The concessions extorted from the Porte in the preliminary treaty of San Stefano (March 3, 1878) were revived and considerably modified in favour of Turkey by the congress of Berlin (June 13-July 13, 1878); see EUROPE: history.

Much greater success attended the efforts of Russian diplomacy and Russian arms in Asia. By the treaty of Aigun (May 28, 1858), and without any military operations, the cession of a great part of the basin of the Amur was obtained from China. Six years later began the rapid expansion of Russia in Central Asia, and at the end

Russo-Turkish War of 1877-78.

Russian expansion in Asia.

of Alexander II.'s reign her domination had been firmly established throughout nearly the whole of the vast expanse of territory lying between Siberia on the north and Persia and Afghanistan on the south, and stretching without interruption from the eastern coast of the Caspian to the Chinese frontier. The greater part of the territory was formally incorporated into the empire, and the petty potentates, such as the khan of Khiva and the amir of Bokhara, who were allowed to retain a semblance of their former sovereignty, became obsequious vassals of the White Tsar.

The assassination of Alexander II. by the terrorists made a profound impression on his son and successor, and determined the general character of his rule. Alexander III. *Alexander III.* (1881-94), who had never sympathized with liberalism in any form, entered frankly on a reactionary policy, which was pursued consistently during the whole of his reign. He could not, of course, undo the great reforms of his predecessor, but he amended them in such a way as to counteract what he considered the exaggerations of liberalism. Local self-government in the village communes, the rural districts and the towns was carefully restricted, and placed to a greater extent under the control of the regular officials. The reformers of the previous reign had endeavoured to make the emancipated peasantry administratively and economically independent of the landed proprietors; the conservatives of this later era, proceeding on the assumption that the peasants did not know how to make a proper use of the liberty prematurely conferred upon them, endeavoured to re-establish the influence of the landed proprietors by appointing from amongst their "land-chiefs," who were to exercise over the peasants of their district a certain amount of patriarchal jurisdiction. The reformers of the previous reign had sought to make the new local administration (*zemstvo*) a system of genuine rural self-government and a basis for future parliamentary institutions; these later conservatives transformed it into a mere branch of the ordinary state administration, and took precautions against its ever assuming a political character. Even municipal institutions, which had never shown much vitality, were subjected to similar restrictions. In short, the various forms of local self-government, which were intended to raise the nation gradually to the higher political level of western Europe, were condemned as unsuited to the national character and traditions, and as productive of disorder and demoralization. They were accordingly replaced in great measure by the old autocratic methods of administration, and much of the administrative corruption which had been cured, or at least repressed, by the reform enthusiasm again flourished luxuriantly.

In a small but influential section of the educated classes there was a conviction that the revolutionary tendencies, which culminated in Nihilism and Anarchism, proceeded from the adoption of cosmopolitan rather than national principles in all spheres of educational and administrative activity, and that the best remedy for the evils from which the country was suffering was to be found in a return to the three great principles of Nationality, Orthodoxy and Autocracy. This doctrine, which had been invented by the Slavophiles of a previous generation, was early instilled into the mind of Alexander III. by Pobédonostsev (*q.v.*), who was one of his teachers, and later his most trusted adviser, and its influence can be traced in all the more important acts of the government during that monarch's reign. His determination to maintain autocracy was officially proclaimed a few days after his accession. Nationality and Eastern Orthodoxy, which are so closely connected as to be almost blended together in the Russian mind, received not less attention. Even in European Russia the regions near the frontier contain a great variety of nationalities, languages and religions. In Finland the population is composed of Finnish-speaking and Swedish-speaking Protestants; the Baltic provinces are inhabited by German-speaking, Lett-speaking and Eath-speaking Lutherans; the inhabitants of the south-western provinces are chiefly Polish-speaking Roman

Catholics and Yiddish-speaking Jews; in the Crimea and on the Middle Volga there are a considerable number of Tatar-speaking Mahommedans; and in the Caucasus there is a conglomeration of races and languages such as is to be found on no other portion of the earth's surface. Until recent times these various nationalities were allowed to retain unmolested the language, religion and peculiar local administration of their ancestors; but when the new nationality doctrine came into fashion, attempts were made to spread among them the language, religion and administrative institutions of the dominant race. In the reigns of Nicholas I. and Alexander II. these attempts were merely occasional and intermittent; under Alexander III. they were made systematically and with very little consideration for the feelings, wishes and interests of the people concerned. The local institutions were assimilated to those of the purely Russian provinces; the use of the Russian language was made obligatory in the administration, in the tribunals and to some extent in the schools; the spread of Eastern Orthodoxy was encouraged by the authorities, whilst the other confessions were placed under severe restrictions; foreigners were prohibited from possessing landed property; and in some provinces administrative measures were taken for making the land pass into the hands of Orthodox Russians. In this process some of the local officials displayed probably an amount of zeal beyond the intentions of the government, but any attempt to oppose the movement was rigorously punished. Of all the various races the Jews were the most severely treated. The great majority of them had long been confined to the western and south-western provinces. In the rest of the country they had not been allowed to reside in the villages, because their habits of keeping vodka-shops and lending money at usurious interest were found to demoralise the peasantry, and even in the towns their numbers and occupations had been restricted by the authorities. But, partly from the usual laxity of the administration and partly from the readiness of the Jews to conciliate the needy officials, the rules had been by no means strictly applied. As soon as this fact became known to Alexander III. he ordered the rules to be strictly carried out, without considering what an enormous amount of hardship and suffering such an order entailed. He also caused new rules to be enacted by which his Jewish subjects were heavily handicapped in education and professional advancement. In short, complete Russification of all non-Russian populations and institutions was the chief aim of the government in home affairs.

In the foreign policy of the empire Alexander III. likewise introduced considerable changes. During his father's reign its main objects were: in the west, the maintenance of the alliance with Germany; in south-eastern Europe, the recovery of what had been lost by the Crimean War, the gradual weakening of the Sultan's authority, and the increase of Russian influence among the minor Slav nationalities; in Asia, the gradual but cautious expansion of Russian domination. In the reign of Alexander III. the first of these objects was abandoned. Already, before his accession, the bonds of friendship which united Russia to Germany had been weakened by the action of Bismarck in giving to the cabinet of St Petersburg at the Berlin congress less diplomatic support than was expected, and by the Austro-German treaty of alliance (October 1879), concluded avowedly for the purpose of opposing Russian aggression; but the old relations were partly re-established by secret negotiations in 1880, by a meeting of the young tsar and the old emperor at Danzig in 1881, and by the meeting of the three emperors at Skierniewice in 1884, by which the Three Emperors' League was reconstituted for a term of three years (see EUROPE, *History*). Gradually, however, a great change took place in the tsar's views with regard to the German alliance. He suspected Bismarck of harbouring hostile designs against Russia, and he came to recognize that the permanent weakening of France was not in accordance with Russian political interests. He determined, therefore, to oppose any further disturbance of the balance of power in favour

*Foreign policy.*

of Germany, and when the treaty of Skierniewice expired in 1887 he declined to renew it. From that time Russia gravitated slowly towards an alliance with France, and sought to create a counterpoise against the Triple Alliance of Germany, Austria and Italy. The tsar was reluctant to bind himself by a formal treaty, because the French government did not offer the requisite guarantees of stability, and because he feared that it might be induced, by the prospect of Russian support, to assume an aggressive attitude towards Germany. He recognized, however, that in the event of a great European war the two nations would in all probability be found fighting on the same side, and that if they made no preparations for concerted military action they would be placed at a grave disadvantage in comparison with their opponents of the Triple Alliance, who were believed to have already worked out an elaborate plan of campaign. In view of this contingency the Russian and French military authorities studied the military questions in common, and the result of their labours was the preparation of a military convention, which was finally ratified in 1894. During this period the relations between the two governments and the two countries became much more cordial. In the summer of 1891 the visit to Kronstadt of a French squadron under Admiral Gervais was made the occasion for an enthusiastic demonstration in favour of a Franco-Russian alliance; and two years later (October 1893) a still more enthusiastic reception was given to the Russian Admiral Avelan and his officers when they visited Toulon and Paris. But it was not till after the death of Alexander III. that the word "alliance" was used publicly by official personages. In 1895 the term was first publicly employed by M. Ribot, then president of the council, in the Chamber of Deputies, but the expressions he used were so vague that they did not entirely remove the prevailing doubts as to the existence of a formal treaty. Two years later (August 1897), during the official visit of M. Félix Faure to St Petersburg, a little more light was thrown on the subject. In the complimentary speeches delivered by the president of the French Republic and the tsar, France and Russia were referred to as allies, and the term "nations alliees" was afterwards repeatedly used on occasions of a similar kind.

In south-eastern Europe Alexander III. adopted an attitude of reserve and expectancy. He greatly increased and strengthened his Black Sea fleet, so as to be ready for any emergency that might arise, and in June 1886, contrary to the declaration made in the Treaty of Berlin (Art. 59), he ordered Batum to be transformed into a fortified naval port, but in the Balkan Peninsula he persistently refrained, under a good deal of provocation, from any intervention that might lead to a European war. The Bulgarian government, first under Prince Alexander and afterwards under the direction of M. Stamboloff, pursued systematically an anti-Russian policy, but the cabinet of St Petersburg confined itself officially to breaking off diplomatic relations and making diplomatic protests, and unofficially to giving tacit encouragement to revolutionary agitation.

In Asia, during the reign of Alexander III. the expansion of Russian domination made considerable progress. A few weeks after his accession he sanctioned the annexation of the territory of the Tekke Turkomans, which had been conquered by General Skobelev, and in 1884 he formally annexed the Merv oasis without military operations. He then allowed the military authorities to push forward in the direction of Afghanistan, until in March 1885 an engagement took place between Russian and Afghan forces at Panjdeh. Thereupon the British government, which had been for some time carrying on negotiations with the cabinet of St Petersburg for a delimitation of the Russo-Afghan frontier, intervened energetically and prepared for war; but a compromise was effected, and after more than two years of negotiation a delimitation convention was signed at St Petersburg on 20th July 1887. The forward movement of Russia was thus stopped in the direction of Herat, but it continued with great activity farther east in the region of the Pamirs, until another Anglo-Russian convention was signed in 1895. During the whole reign of Alexander III. the increase of terri-

tory in Central Asia is calculated by Russian authorities at 429,895 square kilometres.

On 1st November 1894 Alexander III. died, and was succeeded by his son, Nicholas II., who, partly from similarity of character and partly from veneration for his father's memory, continued the existing lines of policy in home and foreign affairs. The expectation entertained in many quarters that great legislative changes would at once be made in a liberal sense was not realized. When an influential deputation from the province of Tver, which had long enjoyed a reputation for liberalism, ventured to hint in a loyal address that the time had come for changes in the existing autocratic régime, they received a reply which showed that the emperor had no intention of making any such changes. Private suggestions in the same sense, offered directly and respectfully, were no better received, and no important changes were made in the legislation of the preceding reign. But a great alteration took place noiselessly in the manner of carrying out the laws and ministerial circulars. Though resembling his father in the main points of his character, the young tsar was of a more humane disposition, and he was much less of a doctrinaire. With his father's aspiration of making Holy Russia a homogeneous empire he thoroughly sympathized in principle, but he disliked the systematic persecution of Jews, heretics and schismatics to which it gave rise, and he let it be understood, without any formal order or proclamation, that the severe measures hitherto employed would not meet with his approval. The officials were not slow to take the hint, and their undue zeal at once disappeared. Nicholas II. showed, however, that his father's policy of Russification was neither to be reversed nor to be abandoned. When an influential deputation was sent from Finland to St Petersburg to represent to him respectfully that the officials were infringing the local rights and privileges solemnly accorded at the time of the annexation, it was refused an audience, and the leaders of the movement were informed indirectly that local interests must be subordinated to the general welfare of the empire. In accordance with this declaration, the policy of Russification in Finland was steadily maintained, and caused much disappointment, not only to the Finlanders, but also to the other nationalities who desired the preservation of their ancient rights.

In foreign affairs Nicholas II. likewise continued the policy of his predecessor, with certain modifications suggested by the change of circumstances. He strengthened the cordial understanding with France by a formal agreement, the terms of which were not divulged, but he never encouraged the French government in any aggressive designs, and he maintained friendly relations with Germany. In the Balkan Peninsula a slight change of attitude took place. Alexander III., indignant at what he considered the ingratitude of the Slav nationalities, remained coldly aloof, as far as possible, from all intervention in their affairs. About three months after his death, de Giers, who thoroughly approved of this attitude, died (26th January 1895), and his successor, Prince Lobanov, minister of foreign affairs from 19th March 1895 to 30th August 1896, endeavoured to recover what he considered Russia's legitimate influence in the Slav world. For this purpose Russian diplomacy became more active in south-eastern Europe. The result was perceived first in Montenegro and Servia, and then in Bulgaria. Prince Ferdinand of Bulgaria had long been anxious to legalize his position by a reconciliation, and as soon as he got rid of Stamboloff he made advances to the Russian government. They were well received, and a reconciliation was effected on certain conditions, the first of which was that Prince Ferdinand's eldest son and heir should become a member of the Eastern Orthodox Church. As another means of opposing Western influence in south-eastern Europe, Prince Lobanov inclined to the policy of protecting rather than weakening the Ottoman empire. When the British government seemed disposed to use coercive measures for the protection of the Armenians, he gave it clearly to be understood that any such proceeding would be opposed by Russia. After Prince Lobanov's death and the appointment

Death of  
Alexander  
III.; suc-  
cession of  
Nicholas  
II.

of Count Muraviev as his successor in January 1897, this tendency of Russian policy became less marked. In April 1897, it is true, when the Greeks provoked a war with Turkey, they received no support from St Petersburg, but at the close of the war the tsar showed himself more friendly to them; and afterwards, when it proved extremely difficult to find a suitable person as governor-general of Crete (see CRETE), he recommended the appointment of his cousin, Prince George of Greece—a selection which was pretty sure to accelerate the union of the island with the Hellenic kingdom. How far the recommendation was due to personal feeling, as opposed to political considerations, it is impossible to say.

In Asia, after the accession of Nicholas II., the expansion of Russia, following the line of least resistance and stimulated by the construction of the Trans-Siberian railway, *Russia and Japan in the Far East.* took the direction of northern China and the efrate little kingdom of Korea. A great part of the eastern section of the railway was constructed on Chinese territory, and elaborate preparations were made for bringing Manchuria within the sphere of Russian influence. With this view, the cabinet of St Petersburg, at the close of the Chino-Japanese War in 1895, objected to all annexations by Japan in that quarter, and insisted on having the treaty of Shimonoseki modified accordingly. Subsequently, by obtaining from the Tsungli-Yaman a long lease of Port Arthur and Tallenwan and a concession to unite those ports with the Trans-Siberian by a branch line, she tightened her hold on that portion of the Chinese empire and prepared to complete the work of aggression by so-called "spontaneous infiltration." From Manchuria, it was assumed, the political influence and spontaneous infiltration would naturally spread to Korea, and on the deeply indented coast of the Hermit Kingdom might be constructed new ports and arsenals more spacious and strategically more important than Port Arthur.

This grandiose project was unexpectedly destroyed by the energetic resistance of Japan, who had ear-marked the Hermit Kingdom for herself, and who declared plainly that she would never tolerate the exclusive influence of Russia in Manchuria. In vain the Russian diplomatists sought to overcome her opposition by dilatory negotiations, in the firm conviction that a small island kingdom in the Pacific would never have the sudsacity to attack a power which had conquered and absorbed the whole of Northern Asia. Their calculations proved erroneous. Convinced that the onward march of the Colossus could not be permanently arrested by mere diplomatic conventions, the cabinet of Tokio suddenly broke off diplomatic relations and commenced hostilities (February 8, 1904). For Russia the war proved a series of uninterrupted reverses both on land and on sea, until it was terminated by the treaty of Portsmouth in October 1905 (see RUSSO-JAPANESE WAR).

What contributed powerfully to the conclusion of peace was the fact that the Russian government was hampered by internal troubles. The old Liberal movement and the *Revolutionary movement in Russia.* terrorist organizations which had been suppressed by Alexander III. were being resuscitated, and the liberal and revolutionary leaders, taking advantage of the unpopularity of the war, were agitating for the convocation of a Constituent Assembly, which should replace the hated bureaucratic régime by democratic institutions. With great reluctance the tsar consented to convoke a consultative chamber of deputies as a sop to public opinion, but that concession stimulated rather than calmed public opinion, and shortly after the conclusion of peace the Liberals and the Revolutionaries, combining their forces, brought about a general strike in St Petersburg together with the stoppage of railway communication all over the empire. Panic-stricken for a moment, the government issued a manifesto proclaiming Liberal principles and promising in vague language all manner of political reforms (October 30, 1905), and when the inordinate expectations created by this extraordinary document were not at once realized, preparations were made for overthrowing the existing régime by means of an armed insurrection. Many

believed that the end of autocracy had come, and an extemporized Council of Labour Deputies, anxious to play the part of a *Comité de Salut Public*, was ready to take over the supreme power and exercise it in the interests of the proletariat. In reality the revolutionary movement was not so strong and the government not so weak as was generally supposed. Mutinies occurred, it is true, during the next few weeks in Kronstadt and Sevastopol, and in December there was street-fighting for several days in Moscow, but such serious disorders were speedily suppressed, and thereafter the revolutionary manifestations were confined to mass meetings, processions with red flags, attempts on the lives of officials and policemen, robberies under arms and agrarian disturbances.

Notwithstanding the unsatisfactory results of the October manifesto the tsar kept his promise of convoking a legislative assembly, and on the 10th of May 1906 the first Duma was opened by his majesty in person; but it was so systematically and violently hostile to the government and so determined to obtain executive, in addition to its legislative, functions, that it was dissolved on the 23rd of July without any legislative work being accomplished. The second Duma, which met on the 5th of March 1907, avoided some of the mistakes of its predecessor, but as a legislative assembly it showed itself equally incompetent, and a large section of its members were implicated in a well-organized attempt to spread sedition in the army by revolutionary propaganda. It was dissolved, therefore, on the 16th of June 1907, and the electoral law which had given such unsatisfactory results was modified by imperial ukase.

The third Duma was subsequently convoked for the 14th of November 1907. (D. M. W.)

*Development of the Russian Constitution.*—At the end of 1910 the Russian revolution, which seemed at one time to promise an overturn as complete as that of the *ancien régime* in France, would seem to have entered on a path of orderly and conservative development, and it is possible, now that the smoke of combat has cleared away, to form some estimate of the forces through the interplay of which this result has been achieved. At the outset the superficial resemblance between the revolutionary movement in Russia and that of 1789 in France was striking: there was the same breakdown of the *The Russian Revolution.* traditional machinery of government, the same general outcry for control by a representative national assembly, the same gradual and reluctant concessions wrung from the crown under pressure of disaffection in the army, popular *émigrés*, the assassination of unpopular officials, and the burning of country houses by organized bands of peasants. Similar, too, was the revelation, when freedom of speech was at last allowed, of the unhappy effect of the long divorce of the intellect of the country from any experience of practical politics. But here the analogy breaks down. France in 1789, though its ancient provincial boundaries survived, had long since been welded into a nation conscious of its common interests; Russia remains a vast empire, composed of the most heterogeneous, sometimes even mutually hostile, elements, whose antagonisms were bound to be an element of weakness in any assembly truly representative of all sections of the people. In France the Revolution had been the work of the middle classes; in Russia an indigenous middle class has, comparatively speaking, no existence, the peasants forming the overwhelming majority of the population.<sup>1</sup> The supreme peril to the autocracy in Russia lay in the genuine grievances of the peasants, less political than economic, which had opened their minds to revolutionary propaganda. These grievances once removed, and their legitimate land-hunger satisfied, the peasants would become a bulwark of the established order, whatever that might be, as had happened in similar circumstances in Austria in 1849. As for the revolutionary "intellectuals," without the lever of agrarian discontent they

<sup>1</sup> In 1897 only 15% of the population were engaged in commerce or industry, including the work-people. Of the middle class, moreover, a large proportion were Jews and Germans. The peasants numbered 75%.

were practically powerless, the more so as their political activity consisted mainly in "building theories for an imaginary world." The *bourgeois* revolutionists of France had all been *philosophes*, but their philosophy had at least paid lip-service to "reason", the Russian revolutionists who formed the majority of the first and second Dumas, as though inspired by the exalted nonsense preached by Tolstoi,<sup>1</sup> subordinated reason to sentiment, until—their impracticable temper having been advertised to all the world—it became easy for the government to treat them as a mere excrescence on the national life, a malignant growth to be removed by a necessary operation. In 1909 the number of exiles for political reasons from Russia was reckoned at 180,000; but the third Duma, purged and packed by an ingenious franchise system, was in its third year passing measures of beneficent legislation, in complete harmony with the government. It is proposed to trace briefly the steps by which this result was obtained.

In order to explain the course of the revolution which came to a head in 1905 it is necessary to say a few words about constitutional plans and liberal experiments, initiated from above, which had preceded it. Of the ancient *zemski sobor* (assembly of the country) it is unnecessary here to say much, though Nicholas II. was pressed by the more reactionary elements to model his parliament on this rough equivalent of the Western states-general. The *zemski sobor*, which had played a considerable part in the struggle of the tsars against the great boyars in the 17th century, had met but once since the days of Peter the Great.<sup>2</sup> The origin of the present constitution of Russia must be sought, not in this ancient and obsolete institution, but in the artificial constitution elaborated by Mikhail Speranski (q.v.) in 1809 at the instance of the emperor Alexander I. Of Speranski's plan only the establishment of the Imperial Council (January 1st, 1810) was realized in his lifetime.<sup>3</sup> In 1864, however, the emperor Alexander II. carried the scheme a step further by the creation of elected provincial assemblies (*zemstvos*), to which in 1870 elected municipal councils (*dumas*) were added. The opportunity thus given for debate naturally stimulated the movement in favour of constitutional government, which received new impulses from the sympathetic attitude of the emperor Alexander II., his grant in 1879 of a constitution to the liberated principality of Bulgaria, and the multiplication of Nihilist outrages which pointed to the necessity of conciliating Liberal opinion in order to present a united front against revolutionary agitation. In January 1881 Count Loris-Melikov, minister of the interior, proposed to convene a "general commission" to examine legislative proposals before these were laid before the Imperial Council; this commission was to consist of members elected by the *zemstvos* and the larger towns, and others nominated in the provinces having no *zemstvos*. The plan was approved by Alexander II. on the very morning of his assassination (February 17th, 1881), but it was never promulgated. The new tsar, Alexander III., was an apt pupil of his tutor Pobedonostsev (q.v.), the celebrated procurator of the Holy Synod, for whom the representative system was "a modern lie," and his reign covered a period of frank reaction, during which there was not only no question of granting any fresh liberties but those already conceded (e.g. the principle of the separation of the administrative and judicial functions) were largely curtailed. The result of this policy of repression, associated as it was with gross incompetence and corruption in the organs of the administration, was the rapid spread of the revolutionary movement, which gradually permeated the intelligent classes and ultimately

<sup>1</sup> "Tolstoi observed that that was argument and reason, and that he paid no attention to them; he only guided himself (he said) by sentiment, which he felt sure told him what was good and right!"—Interview with Meltschnikoff in Sir Ray Lankester's *Science from an Easy Chair*, p. 43.

<sup>2</sup> In 1767, when Catherine II.—in a mood of encyclopaedist enlightenment—summoned it. The meeting confined its attention to economic questions, and had no political character whatever.

<sup>3</sup> In his speech at the opening of the first Polish parliament at Warsaw in 1818, Alexander I. publicly announced his intention of granting free institutions to Russia.

affected even the stolid and apparently immovable masses of the peasantry.

The movement came to a head, as a result of the disasters of the war with Japan, in 1904. The assassination of the minister of the interior Plehve, on the 14th of July, by the revolutionist Sazonov was remarkable as a symptom mainly owing to the widespread sympathy of the European press of all shades of opinion with the motives of the assassin. It was clear that the system with which the murdered minister's name had been associated stood all but universally condemned, and in the appointment of the conciliatory Prince Sviatopolk-Mirski as his successor the tsar himself seemed to concede the necessity for a change of policy.<sup>4</sup> In November, with the tacit consent of the police, a private assembly of eminent members of local *zemstvos* and municipal *dumas* was held in St Petersburg to discuss the situation. The majority of this decided to approach the crown with a suggestion for a reform of the Russian system on the basis of a national representative assembly, an extension of local self-government, and wider guarantees for individual liberty. The day on which the deputation laid these views before Prince Mirski was hailed by public opinion as recalling the 5th of May 1789, the date of the meeting of the French states-general at Versailles. The emperor, however, whatever his own views, was surrounded by reactionary influences, of which the most powerful were the empress-mother, Pobedonostsev the procurator of the Holy Synod, Count Muraviev and the Grand-duke Sergius. The imperial *ukas* of the 12th of December enunciating reforms affecting the peasants, workmen and local *zemstvos* failed to satisfy public opinion; for there was no word in it of constitutional government. Petitions continued to flow in to the emperor's cabinet, praying for a national representation, from the *zemstvos*, from the nobles and from the professional classes, and their moral and was enforced by general agitation, by partial strikes, and by outrages which culminated at Moscow in the murder of the Grand-duke Sergius (February 4th, 1905). In the imperial councils the resisting forces still seemed to have the upper hand. Prince Mirski resigned, his resignation being immediately followed by a reactionary imperial manifesto reaffirming the principle of autocracy (February 18th). Bulygin, Mirski's successor, had no knowledge of this until after its publication; he hastened to the tsar and obtained the issue on the same day of a rescript which, while reserving the "fundamental laws of the empire" inviolate, stated the emperor's intention of summoning the representatives of the people to aid in "the preparation and examination of legislative proposals." A commission of inquiry, under the emperor's presidency, was now established to elaborate the means for carrying this promise into effect. On the 6th of June, in reply to a deputation of the second congress of *zemstvos* headed by Prince Trubetzkoi, the emperor promised the speedy convocation of a National Assembly. When, however, on the 6th of August, the new law was promulgated, it was found that the "Imperial Duma" was to be no more than a consultative body, charged with the examination of legislative proposals before these came before the Imperial Council, the duty and right of passing them into law being still reserved for the autocrat alone. The members of the Duma, moreover, were placed at the mercy of the government by a clause empowering the Directing Senate to suspend or deprive them. The promulgation of this truncated constitution was greeted by a furious agitation, culminating in September in a general strike, rightly described as the most remarkable political phenomenon of modern times. For days the whole mechanism of civilized existence in Russia was at a standstill, all intercourse

<sup>4</sup> Sazonov's sentence of twenty years' hard labour was commuted by Nicholas II. to fourteen years.

<sup>5</sup> *Duma* = council, assembly (*dumat*, to think over, reflect upon). The name was first suggested by Speranski, under Alexander I., for the suggested parliament of delegates from the *zemstvos* and local *dumas*.

with the outside world cut off; until at last the government was forced to yield, and on the 17/30th of October 1905 the tsar issued the famous manifesto promising to Russia a constitution based on the main principles of modern Liberalism: national representation, freedom of conscience and opinion, guarantees for individual liberty.

The enormous programme of constitutional reform foreshadowed in the manifesto had to be elaborated in haste by Count Witte, the minister of the interior, under circumstances by no means promising. The organs of government seemed paralysed by the repudiation of the principle on which their authority was based, and the empire to be in danger of falling into complete anarchy. The revolutionary terrorists took advantage of the situation to multiply outrages, popular agitation was fomented by a multitude of new journals preaching every kind of extravagant doctrine, now that the censor no longer dared to act; in December the trouble culminated in a formidable rising in Moscow. The revolutionary terrorists were countered by the terrorists of the reaction who, under the name of "the Union of the Russian People," began an organized extermination of the elements supposed to be hostile to the traditional régime. The "black band" (*chernaya sotnia*), or "black hundreds," as they were branded by public opinion, directed their attacks especially against the Jews, and *pogroms*,<sup>1</sup> i.e. organized wholesale robbery and murder of Jews, occurred in many places, it was believed with the connivance of the police and veiled approval in exalted quarters.

Meanwhile the political parties which were to divide the new Duma had taken shape. Apart from the extremists on one side or the other, frank reactionaries on the Right and Socialists on the Left, two main divisions of opinion revealed themselves in the congresses of the *zemstvos* that met at Moscow in September and November. In the former there had been a fusion between the Radicals, supporters of the autonomy of Poland and a federal constitution for the empire, and the Independence party (*Osvobodkdeniya*) formed by political exiles at Paris in 1903, the fusion taking the name of Constitutional Democrats, known (from a word-play on the initials K.D.) as "Cadets." The more moderate elements found a rallying cry in the manifesto of October, took the name of "the Party of 17 October," and became known as "Octobrists." In the *zemstvo* congress of November the "Cadets" protested against the "grant" of a constitution already elaborated, and demanded the convocation of a Constituent Assembly. The Octobrists, on the other hand, supported Count Witte's moderate programme, the most important provisions of which were the extension (11 December 1905) of the suffrage under the stillborn constitution of August, and (20 February 1906) the reorganization of the Duma as the Lower House, and of the Imperial Council (half of which was to be elective) as the Upper House<sup>2</sup> in the new parliament.

The elections were held in March 1906, and on the 27th of April the emperor Nicholas II. solemnly opened the first Duma of the Empire. The "Cadets" commanded an overwhelming majority in the Lower House, and their intractable temper and ignorance of affairs became at once apparent. The address in reply to the speech from the throne, voted after a debate in which abstract theories had triumphed over common sense, demanded universal suffrage, the establishment of pure parliamentary government, the abolition of capital punishment, the expropriation of the landlords, a political amnesty, and the suppression of the Imperial Council. When the minister of the interior, M. Goremykin, who had succeeded Witte at the head of the government, met these preposterous demands with a flat refusal, the House voted, on the motion of M. Kuzmin-Karaviev, for an appeal to the

people (July 4).<sup>3</sup> Four days later the government dissolved the Duma, M. Goremykin at the same time being replaced by M. Stolypin. The "Cadets" refused to accept this action and, in imitation of the famous meeting in the tennis-court at Versailles, adjourned to Vyborg in Finland, where, under the ex-president of the Duma, M. Muromtsov, they drew up and issued a manifesto calling on the Russian people to refuse taxes and military service. Its sole result, apart from the punishment which afterwards fell on its authors, was to show how little the majority of the dissolved Duma had represented the Russian people. Isolated mutinies in the army followed, and terrorist outrages here and there—notably, in August, the dastardly bomb outrage in the Isle of Apothecaries at St Petersburg, which seriously injured one of M. Stolypin's little daughters; but the mass of the nation and of the army remained wholly unmoved, while the repetition of troubles was made more difficult by the establishment of field courts martial with summary powers.

The second Duma met on the 6th of March 1907. M. Stolypin had not ventured to alter the electoral law without parliamentary consent, but with the aid of a complaisant Senate the provisions of the existing law were interpreted in a restrictive sense for the purpose of influencing the elections. The result was, however, hardly more satisfactory to the government. The "Cadets," it is true, lost many seats both to the Socialists and to the extreme Right, but they held the balance of the House, of which the Octobrists and the Right together only constituted one-fifth, and their leader, M. Golovin, was elected president of the House. The temper of the second Duma, was, indeed, even more democratic than that of the first; but M. Stolypin did his best to work in harmony with it, realizing that under the existing law another dissolution could but lead to a like result, and shrinking from the only alternative—an alteration of the law by a *coup d'état*, a course which could only be justified on the plea of extreme necessity. On the 19th of March he laid before the House his programme of reforms, which included the emancipation of the peasants from the control of the communes and the handing over to them of the crown lands and imperial estates. The majority, however, refused to be reconciled. The abolition of the field courts martial was demanded; on the 13th of April a bill for the expropriation of landlords was carried by a two-thirds majority,<sup>4</sup> and the 30th the Army Bill would have been lost but for the Polish vote. The crisis came with the discovery of a treasonable plot for the subornation of the army, in which many Socialist members of the Duma were involved. On the 14th of June Stolypin's proposal for the arrest of 16 members and the indictment of 55 was shelved by being referred to a committee.

The excuse for which the government had been waiting was thus provided, and two days later the Duma was dissolved. An imperial *ukaz* fixed the new elections for the 14th of September, and the meeting of the third Duma for the 14th of November; at the same time, in violation of the October manifesto, the electoral law was altered, so as to secure a representation at once more Russian and more conservative. The non-Russian frontier provinces (*okraina*s) had even before been under-represented (one member for every 350,000 inhabitants, as against one for every 250,000 in the central provinces); the members returned by Poland, the Caucasus and Siberia were now reduced from 80 to 30, those from the Central Asian steppes (23) were swept away altogether; the total number of deputies was reduced from 524 to 442. Even more drastic were the changes in the electoral machinery, by far the most complicated in Europe, established by the law of 1905.<sup>5</sup> This was based on the principle of indirect

<sup>1</sup> Of this M. Chasles remarks that it would have been a revolutionary act even in republican France.

<sup>2</sup> They were condemned in 1907 to three months' imprisonment and loss of civil rights.

<sup>3</sup> This was reversed, on the 8th of June, by 238 votes to 191, after a patient exposition by M. Stolypin of the fact that there was plenty of land in Russia for the peasants without any attack on private property.

<sup>4</sup> The electoral law covers 107 octavo pages.

Constitutional  
manifesto  
of October  
17/30,  
1905.

The  
"Union  
of the  
Russian  
People."

Develop-  
ment of  
political  
parties.

The first  
Duma.

The  
Vyborg  
manifesto.

The  
second  
Duma.

Alteration  
by *ukaz*  
of the  
electoral  
law.

<sup>1</sup> *Pogrom*—pillage, destruction.

<sup>2</sup> See the section *Government and Administration*, above.

election, through a series of electoral colleges. It was a simple matter to manipulate these so as to throw the effective power into the hands of the propertied classes without ostensibly depriving any one of the vote.<sup>1</sup> The result was that in the third Duma, which met on the 15th of November 1907, the conservative Right preponderated as much as the Left had done in its two predecessors. Its president, M. Khomiakov, had been one of the founders of the "Union of 17 October," but even the Octobrists formed but a third of the House and were compelled to act with the reactionaries of the Right; and the vice-president, Prince Volkonsky, was a member of the Union of the Russian People.

On the whole, the new Duma was fairly representative of the changed temper of the Russian people, disillusioned and weary of anarchy. The government had done wisely in obscuring the passion for democratic ideals by an appeal to Russian chauvinism, an appeal soon to bear fruit in disuniting the revolutionary parties. The congress of *sensitors*, hitherto the focus of Liberalism, had petitioned the government, before the opening of the third Duma, to take measures for the restoration of order. The authorities began to exhibit something of their old spirit. M. Dubrovin, president of the Union of the Russian People and organizer of *pogroms*, having written a letter of congratulation to the tsar on the occasion of the *coup d'état*, received a gracious reply; the hideous reign of terror of the "Black Hundred" in Odessa did not prevent the Grand-duke Constantine from accepting the badge of membership of the Union. The ordinary laws, too, had been suspended; the fining and confiscation of newspapers had been resumed, and the "Cadets" had been forbidden to hold a congress. All this, however, did not argue an intention on the part of the government to revert to the autocratic *status quo*. M. Stolypin indeed defended the *coup d'état* in the Duma on the ground that the autocrat had merely altered what the autocrat had originally granted; but, while laying stress on the necessity for restoring order in the body politic, he announced a long programme of reforms, including agrarian measures, reform of local government and its extension in the frontier provinces, and state insurance of workmen. The most far-reaching of these reforms, carried in the first session of the third Duma, was the partial abolition of the communal and family ownership of land, which involved the establishment of a class of true peasant-proprietors.<sup>2</sup> Besides this, the Duma had passed before its adjournment on the 28th of October 1908 much useful legislation, some 300 bills in all, including two for the building of important railways on the Amur and in Siberia. Nor had it exhibited by any means a wholly docile spirit. On the 7th of June, for instance, M. Guchkov attacked the maladministration in the navy, pointing out that no reforms were possible so long as grand-dukes were at the head of its departments. The Duma endorsed this all but unanimously, and as the result the Grand-dukes Peter and Sergius resigned their posts of inspector-general of Engineers and Ordnance respectively, and the Grand-duke Nicholas his chairmanship of the Committee of National Defence. A year later the Duma again came into collision with the government in a matter highly illuminating of the struggle between the ancient traditions and the new ideas in Russia. On the 14th of June 1909 a bill was passed removing the disabilities hitherto attaching to some 15,000,000 of Old Believers. In spite of strenuous government opposition, inspired by the authorities of the Orthodox Church, amendments were carried allowing dissenting ministers to assume ecclesiastical titles and to preach, and permitting Christians to join non-Christian religions or even to describe themselves as unbelievers. Thus a step forward was made in securing the freedom of conscience proclaimed in the October manifesto and denounced by a synod of Orthodox bishops at Kiev in 1908, though the rights granted by the Duma were seriously curtailed in the Imperial Council, and have been largely rendered a dead letter by the action of the administration.

Meanwhile the pan-Russian movement had been gaining space. At first it had seemed that the new birth of Russia would lead to a revival of pan-Slavism, directed not, as in the middle of the 19th century, against Austria but against Germany. In May 1908 a deputation of the Slav members of the Austrian *Reichsrath* paid a ceremonial visit to the Duma at St Petersburg, and in this "neo-Slav" demonstration M. Dmowski, leader of the Polish party in the Duma, took part. In the following year, however, the situation was completely altered, a result due to the growing anti-Polish feeling in the Duma and, more especially, to the support given by the Austrian Slavs to the annexation of Bosnia and Herzegovina. This event caused the utmost excitement in Russia; the crown prince of Serbia, who arrived in St Petersburg on the 28th of October to ask for the armed assistance of the tsar, was received with enthusiasm by all classes of the people; and, though armed intervention was impossible, M. Isvolsky took the lead in the abortive demand for a European conference (see EUROPE: History). Neo-Slav dreams were now replaced by a passionate desire to consolidate the Russian empire on a purely Russian basis. Even the remnant of the "Cadets" had by this time renounced their sympathy with Polish aspirations, and in the matter of Finland the Duma proved itself even more imperial than the emperor himself. The Finnish question is dealt with elsewhere (see FINLAND: History). Here it may suffice to mention, as illustrating the changed temper of the Russian national assembly, *The Duma and Finland*, that the Russian majority of the Duma included among the imperial questions in Finland which the Finnish diet ought to refer to the imperial legislature not only all military matters—as the tsar demanded (Rescript of October 14)—but the question of the use of the Russian language in the grand-duchy, the principles of the Finnish administration, police, justice, education, formation of business companies and of associations, public meetings, the press, the customs tariff, the monetary system, means of communication, and the pilot and lighthouse system. The old tendency illustrated by the outcome of the revolutionary movements of 1848 was once more in evidence—the tendency of merely artificial theories of democratic liberty to succumb to the immemorial instinct of race and race ascendancy.

As an international force Russia had been, of course, all but completely crippled by the outcome of the Japanese War and the subsequent revolution. Her recovery, however, *International position of Russia*, revealed the immense reserves of her strength. On the 30th of July 1907 she signed a convention with Japan of mutual respect for treaty and territorial rights, and guaranteeing the integrity of China. On the 31st of August of the same year the long period of mutual suspicion between Great Britain and Russia was closed by a convention for an amicable settlement of all questions likely to disturb the relations of the two Powers in Asia generally, including the demarcation of Persia into spheres of influence (see PERSIA: History). This new *entente* with Great Britain, cemented by a visit paid by King Edward VII. to the tsar at Reval on the 9th June 1908, helped to knit close once more the loosened alliance with France, and so to preserve the threatened balance of Europe. That in the work of restoring its military position the Russian government had the support of the Russian parliament was proved by a subsidy of £11,000,000 voted by the Duma, on the 30th of December 1909, for the special service of the reorganization and redistribution of the army (W. A. P.)

**BIBLIOGRAPHY.**—The history of Russia, especially that of the last few years, has formed the subject of a vast number of works, of very varying authority, in many languages. In Russia itself the first great history of the Russian empire was that of N. M. Karamzin (12 vols., St. Petersburg, 1818-29; French translation, 11 vols., 1819-26), which, though reactionary in tone and largely superseded, remains a classic. The next monumental history of Russia, that of Sergei Mikhailovich Soloviev (29 vols., Moscow, 1863-77), marks the enormous advance made since Karamzin's day in historical method and research. Soloviev's history, from the earliest times to 1774, is based throughout on original investigation of sources, and therefore, though inferior to Karamzin's work as

<sup>1</sup> See above, *Government and Administration*.

<sup>2</sup> The law establishing individual peasant-proprietorship was passed on December 21st.

literature, is incomparably superior to it in authority. Of other works it is only possible to give a classified selection. In general, the reader must be warned that most Russian works on history, especially those dealing with recent years, are inspired by a violent party bias—the inevitable result of the conflict of diametrically opposed political ideals,—and this quality is shared by not a few foreign books about Russia.

*Sources.*—See Sienkiewicz, *Recueil de documents relatifs à la Russie, 1500-1842* (1872); Soloviev, *Russian Historical Writers (Pisatel'i russkoi ist.)*, collected works, vol. xviii. sqq.; Nikolai Ivanovich Kostomarov (1817-1885), professor of history at Kiev and St Petersburg, whose monographs and researches are collected in his *Sobranie sochineny* (collected works, 21 vols., St Petersburg, 1903-6); V. Burtsev and S. M. Kravchinski, *Za sto let, 1800-1896*. Documents relating to the political and social movements in Russia (London, 1897). There is a French translation by L. Leger (Paris, 1884), of the chronicle of Nestor, the main source for early Russian history. The publications of the Imperial Russian Historical Society of St Petersburg, amounting to upwards of 100 vols., are of great value. For diplomatic history, see F. F. de Martens, *Recueil des traités conclus par la Russie avec les puissances étrangères* (St Petersburg, from 1878 still incomplete), which contains valuable historical introductions based on unpublished sources; A. N. Rambaud, *Recueil des instructions aux ambassadeurs de France*, vols. viii. and ix., *Russie, 1657-1793* (Paris, 1890).

*General Works.*—In addition to those of Karamzin and Soloviev, already mentioned, see R. Nisbet Bain, *The Pupils of Peter the Great . . . 1697-1740* (Westminster, 1897); *The Daughter of Peter the Great . . . A History of Russian Diplomacy under the Empress Elizabeth Petrovna, 1741-1762* (1899); *The First Romanovs, 1613-1725* (1905); K. N. Bestuzhev-Riumin, *Russkaya istoriya* (2 vols., St Petersburg, 1872), especially for internal history and social life; A. Brückner, *Gesch. Russlands . . . bis zum Tode Peters des Grossen* (Gotha, 1896); Gaston Créhanne, *Histoire de la Russie depuis la mort de Paul I.* (Paris, 1882; 2nd ed. extended to 1894, *ibid.*, 1896); T. von Bernhardt, *Geschichte Russlands . . . 1614-1837* (3 vols., Leipzig, 1868-78); J. W. A. von Eckardt, *Russland vor und nach dem Kriege* (1879; Eng. trans. 1880); N. Flerovskii, *Three Political Systems: Nicholas I., Alexander II., Alexander III.* (Russ., Geneva, 1897; Germ. transl. Berlin, 1898); V. Kluchevskii, *Kurs russkoi istorii* (1904-8); A. Kleinschmidt, *Drei Jahrhunderte russischer Geschichte, 1500-1898* (Berlin, 1898); A. Krause, *Russia in Asia, 1558-1800* (1898); W. R. Morfill, *Russia* (Story of the Nations Series, New York, 1891), *History of Russia* (New York, 1902); H. H. Munro, *Rise of the Russian Empire* (Boston, 1900); F. Neuburger, *Russland unter Kaiser Alexander III.* (Berlin, 1895); W. R. S. Ralston, *Early Russian History—1613* (1874); A. N. Rambaud, *Histoire de la Russie* (Paris, 1878; new ed. 1900; Eng. transl. of 1st ed. by L. B. Lang, 2 vols., 1879); Theodor Schiemann, *Russland, Polen und Litauen bis im xviii. Jahrhundert* (2 vols., in Oncken's *Allgemeine Gesch.*, Berlin, 1886-87), *Gesch. Russlands unter Kaiser Nikolaus I.* (vol. i., "Kaiser Alexander I und die Ergebnisse seiner Lebensarbeit," Berlin, 1904, vol. ii. 1908), with appendices giving many unpublished documents; J. H. Schnitzler, *Gesch. des Russischen Reichs* (Leipzig, 1874); F. H. Skrine, *The Expansion of Russia, 1815-1900* (Cambridge, 1903); V. L. P. Thomsen, *The Relation between Ancient Russia and Scandinavia and the Origin of the Russian State* (London, 1877); the series of works by K. Waliszewski under the general title of *Les Origines de la Russie moderne: L'Héritage de Pierre le Grand, 1725-41* (Paris, 1900), *La Dernière de Romanov* (1902), *La Crise révolutionnaire, 1814-1814* (1906), *Le Berceau d'une dynastie. Les Premiers Romoffs, 1682-1700*. For the relations of Russia with the papacy, see T. Pierling, *Russie et le Saint-Siège, 1417-1758* (4 vols., 1896-1907). The only history of Little Russia is that in Russian by D. N. Bantshyn-Kamenskii (Moscow, 1842). Of the numerous books on the Russian revolutionary movement, besides those of "Stepniak," Kropotkin, and other revolutionary writers, the following may be mentioned: C. A. de Arnaud, *The New Era in Russia* (Washington, 1890); E. von der Brüggen, *Das heutige Russland* (Eng. trans. "Russia of To-day," 1904); G. Drage, *Russian Affairs* (New York, 1904); P. N. Miliukov, *La Crise russe* (Paris, 1907; an earlier English edition appeared in 1905); Bernard Pares, *Russia and Reform* (1907); A. Thun, *Geschichte der revolutionären Bewegungen in Russland* (Leipzig, 1883); Konni Zilliacus, *The Russian Revolutionary movement* (London, 1905).

*Economic Works.*—Georges Alloua, *La Crise agraire en Russie* (Paris, 1905); Anatole Leroy-Beaulieu, *L'Empire des Tsars* (3 vols., Paris, 1882-88; Eng. trans., 1896), an admirable account, partly historical, partly based on personal observation of the government, religion and the social and economic conditions of Russia; Combes de Lestrade, *La Russie économique et sociale* (Paris, 1896); "Nikolai" (pseudonym of Danielson), *Histoire des développements économique de la Russie depuis l'abolition du serfage* (Paris, 1899). *Law and Constitution.*—A. Chasles, *Le Parlement russe* (Paris, 1910); H. D. Edwards, *Das Staatsrecht Russlands* (vol. iv. of Marquardsen's *Handbuch des öffentlichen Rechts*, Freiburg, 1888); S. N. Harper, *The New Electoral Law for the Russian Duma* (Chicago, 1908); J. Kapnist, *Code d'organisation judiciaire russe* (Paris,

1893); V. Kluchovski, *Boyerskaya Duma* (1882), an account of the boyars' duma from the 10th to the 17th century; Maksim M. Kovalevsky, *Modern Customs and Ancient Laws of Russia* (London, 1891); Max von Ottinger, *Abriss des russischen Staatsrechts* (1899); F. de Rocca, *Les Assemblées dans la Russie ancienne; Zemski Sobors* (1899); L. Z. Slonimskii, *Polit. entislopyediya* (t. 1, 1907), compiled in a fuller bibliography of Russian history in vol. xvii. of the *Historians' History of the World* ("Times" ed., 1907), which also includes considerable extracts from Russian works not elsewhere translated. Many additional works will be found in "Russia" in the *Subject Index* of the London Library (1909).

(W. A. P.)

**RUSSIAN LANGUAGE.** For the characteristics which this special branch of the Slavonic family shares with the rest, for a table showing the Russian alphabet and the transliterations of it used in this and in other (non-linguistic) articles of the *Encyclopaedia*, and for the points which distinguish Russian alike from the Southern (Balkan) and from the North-Western (Polish, Cech, &c.) branches of Slavonic, see SLAVS. These latter points, fully treated under corresponding sections of the article SLAVS, are here summarized:—

I. Proto-Slavonic (Proto-Sl.) half vowels *š* and *ř* have disappeared as such: *š* (ʒ), though still written at the ends of words, is mute; it serves but to show that the foregoing consonant is "hard." See V. below for "hard" and "soft" (denoted by *'*) consonants, not the "hard" = surd, *tenis*, "soft" = sonant, *media* of Eng. usage. Where a vowel was indispensable to help out a group of consonants, *š* has been replaced by *o* or *e*, but these vowels sometimes appear without such justification (e.g. *ogont*, Lat. *ignis*); *ř* when so needed becomes *e*, otherwise it disappears or else leaves a trace in the "softness" of the preceding consonant, in which case it is still written: Old Slavonic (O.S.), *sǫnŭ*, "sleep"; *dŭst*, "day"; R. *sonŭ* (*š* mute), *denŭ* (d'én).

II. Proto-Sl. *y* survives in R. and Polish. The sound is a "high-mixed-narrow *i*," pronounced with the lips as for *i* and the tongue as for *y*, not unlike Eng. *y* in "rhythm." After labials there is a distinct *w* sound before the vowel. After gutturals it has become *i*.

III. Treatment of Liquids: retention of *r'* instead of the *r* of N.W. Slav.; retention as in Polish of hard *l* (between *l* and *w*, not unlike Eng. *l* in "milk," "people"); helping out of sonant *r* and *l* by a vowel put in before the *r* or *l*; especially the so-called full vocalism by which, e.g. Proto-Sl. \**gorŭs*, "town," became R. *gorodŭ*, O.S. *gradŭ*, Polish, *gród*; Proto-Sl. \**mĕlko*, "milk," R. *molo*, O.S. *mĕlko*, Polish, *mleko*.

IV. Proto-Sl. nasals: *q* (Fr. *ou*), became R. *u*; *ę* (Fr. *in*), R. *a*, *ja*; O.S. *paŭt*, "way"; *peŭt*, "five"; R. *put*, *paŭt*.

V. Softening (Palatalization, &c.): Proto-Sl. *tj*, *dj* gave R. *č*, *š*, Proto-Sl. \**mĕlja*, "candle"; \**mĕdja*, "boundary"; R. *sŭčĕa*, *m'čĕa*. Proto-Sl. *pj*, *bj*, *vj*, *mj* gave R. and S. Slav. *pl*, *bl*, *vl*, *ml*, e.g. R. *s' eml'a*; Polish, *siemia*, "land." Before Proto-Sl. soft vowels *e*, *ĕ*, *i*, *ĭ* consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clean a contact with the palate. Then what amounted to a new *j* developed in R., as *f* became practically *je*; *e* and *ĕ* (orig. *i*) came to sound as *je*, *ĕ* as *ja* at the beginning of a syllable, and all together with *i* began very much to soften the preceding consonant in literary R.; however, this new *j* never broke down the consonant into a palatalized sibilant or affricate, though it had this effect in White Russian (Wh. R.) and Polish.

The result is that almost every consonant in Russian can be pronounced "hard" or "soft," a distinction which is very difficult for a foreigner to make, as his tendency is to overdo the softness and pronounce a full *j* after the consonant instead of the palatal element melting into it. This is encouraged by the alphabetic system by which the letters *e* (ĕ), *o*, *u*, *ŭ*, stand for *je*, *ju*, *ja* at the beginning of a syllable, but after a consonant merely indicate that the consonant is soft, the vowel being the same as in *o*, *y*, *a* (ĕ, *u*, *e*), *e*, *o*, *u* stands for *f*-*a* rather than for *f*-*ja*. A soft consonant in its turn narrows the vowel before it, e.g. the vowel in *jelŭ*, "fir," is like *a* in "Yale"; that in *jeŭt*,

\* marks a hypothetical form

"ate," like *e* in "yell": *e* and *ě* (*ě*) are now indistinguishable, except that accented *e* before a hard consonant has a tendency to be pronounced *jo*, e.g. *ś elā*, "of villages," is pronounced *ś' ol*, but *ślā*, "sat," *ś' el*: *ě = jo* is sometimes denoted by *ě*.

VI. Great Russian has kept *g* where Little Russian (Lit. R.) and Wh. R., like Čech and High Sorb, now have *h*.

VII. A specially Russian point is that Proto-Sl. *je* and *ju* beginning a word, appear in R. as *o* and *u*; O.S. *jednā*, "one," *jutro*, "morning," R. *odinā*, *utro*.

VIII. Russian has lost the distinctions of quantity which survive in Čech and S. Slav., but its accent is free as in S. Slav. The accent is extremely capricious, often falling differently in different cases of the same noun, or persons of the same tense, also it is an expiratory accent, so strong that the unaccented syllables are much slurred over and their vowels dulled. In learning Russian it is therefore most important to pay great attention to the accent, and at first to read accented texts.

The above phonetic peculiarities have marked Russian as far back as we can trace it. In the earliest documents it appears with an apparatus of grammatical forms practically identical with that ascribed to primitive Slavonic. The history of the language is not so much that of its phonetic decay as that of its morphological simplification and syntactic development. The tracing of this process is rendered difficult by the fact that O.S. was the ecclesiastical and literary language until the 17th century, and though in the end the O.S. texts suffer modifications, producing the Russian form of Church Slavonic, it is only by accident that the Russian forms appear in them. Russian is better represented in additions made by the scribe, as in the colophon of the Ostromir gospel (A.D. 1056/57), the oldest dated O.S. MS. In a certain number of legal documents dating from the 12th century onwards Russian forms definitely predominate, but the subject-matter is too limited to offer much material.

**Borrowings.**—The effect of the Church language upon Russian has been very strong, comparable to that of Latin upon French or English: O.S. forms of words and suffixes, betrayed by their phonetic peculiarities though pronounced more or less *à la russe*, have in some cases ousted the native forms, in other cases the two exist side by side; the Slav. form generally has the more dignified or metaphorical, the Russian the simpler and more direct sense: even some of the grammatical terminations (e.g. pres. part. act.; certain forms of the adj., &c.) are Slavonic; but speakers are quite unconscious of using anything that is not Russian (see S. Buliř, *Church Slavonic Elements in Modern Russian*, St P., 1893), and not till the 18th century did even grammarians understand the difference. Less important elements have been the Tatar which gave names for many Oriental things such as weapons, jewels, stuffs, garments and some terms concerned with government, and the Polish, which during the 17th century supplied many terms needed to express European things and ideas. In the 18th century such importations were made from Latin and all the Western European languages, in Peter's time mostly from German and Dutch (for nautical terms, English supplied some), in Catherine's rather from French, which had become the language of the aristocracy. During the first quarter of the 19th century modern Russian found itself and discarded superfluous Slavonic and European borrowings alike. Since then fresh loan-words have mostly belonged to the international quasi-Greek terminology, though like German R. sometimes prefers analogous compounds made from its own roots.

Literary Russian as spoken by educated people throughout the empire is the Moscow dialect (see below) modified by these influences. It is still a highly inflected language, comparable in that respect rather to Latin and Greek than to the languages of western Europe, though during historic time it has lost many of the grammatical forms whose full development we can study in O.S., and whose presence we can assert in the scanty remains of Old R. This process has relieved it of the dual number, save for certain survivals; in the nouns, of the vocative case (save for certain ecclesiastical forms), and many

of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more cumbersome forms of the compound, adjective; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a participle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantival declensions, *-a*, *-o*, *-i*, and traces of *-u* and consonantal stems, a special pronominal declension with many tricky forms, an adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maze. The forms of the verb are easier, as only the present indic. has three persons, the imperat. has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number. The infinitive and four participles offer no special difficulty, but the gerundives or verbal adverbs, from the old masc. nom. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under SLAVS. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Such a language, though less difficult than it is generally supposed, is learned much better if some preliminary study is devoted to the accidence, before the student launches out into conversation, as otherwise the habit may be acquired of disregarding the terminations and speaking very incorrectly.

**Dialects.**—Russian dialects fall into two main divisions—Great (Velikorusskij), including White (Bělorusskij) Russian, and Little Russian (Malorusskij). The latter is spoken in a belt reaching from Galicia and the Northern Carpathians (see RUTHENIANS) through Podolia and Volhynia and the governments of Kjev, Chernigov, Półtáva, Khárkov and the southern part of Voronezh to the Don and the Kubán upon which the Dněpr Cossacks were settled. To the south of this belt in "New Russia" the population is much mixed, but Little Russians on the whole predominate. In all there must be about 30,000,000 Little Russians.

The Great Russian division includes all other Russian speakers—the main body to the N. and E. of the Little Russians, the settlers in Siberia, the Caucasus and along the southern coast, the educated classes, officials and many townsmen throughout the empire, probably not less than 70,000,000 speakers exclusive of White Russians. On the whole it is very conservative, and therefore, in spite of its vast extent, is wonderfully uniform. It falls into two main dialect groups—the northern or *o* group and the southern or *a* group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the spelling, unaccented *o* remaining *o*, but *o* is in general rather like *u*, while *e* before hard consonants is apt to be *jo* and before soft consonants *i*. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostromá, are alone free from a further peculiarity, a tendency to mix up *c* and *č* which can be traced in the ancient documents of Nówgorod and has spread with the Nówgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or *a* group of dialects pronounces unaccented *o*, *e* and even *i* as *a* or *ja*; with this goes a tendency to pronounce *g* as *h*, and to mix up *u* and *v*. The Moscow dialect, which is the foundation of the literary language, and White Russian, are both best classed with the *a* dialect.

The Moscow dialect really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented *o* as *a*, but in the *jo* for accented *o*

before a hard consonant it is akin to the North and it has also kept the northern pronunciation of *g* instead of the southern *h*. So too unaccented *e* sounds like *i* or *ji*.

White Russian, in the governments of Vitėbsk, Mohilėv and Minsk, and adjoining parts of Pskov, Smolėnsk, Chernigov and Vilna (some 10,000,000 speakers), appears at first so different from Great Russian that it was long classed as a separate division. It was the official language of the Lithuanian principality afterwards merged in Poland and hence was under strong Polish influence. Little R. was under somewhat similar influence, so that the two dialects have approximated in some respects; but originally White Russian was not much nearer Lit. R. than was any other south Gt. R. dialect. In its main characteristic Wh. R. approximates to Polish, but this likeness goes deeper than the surface Polonisms above referred to, as it falls into its natural place in the classification of Slavonic languages by the phenomena of "softening." Accordingly *i* and *ĭ*, when soft or before soft *v*, become *e* and *ĕ*, e.g. R. *l'ĭto*, "body," *d'ĭlo*, "deed," *m'ed'ĭtsi*, "bear." Wh. R. *l'elo*, *d'ĕlo*, *m'ad'ĕtsi*, Polish *cielo*, *dziedo*, *niedźwiędź*. Other special points which distinguish Wh. R. from the other *a* dialects are a tendency to confuse *u* and *v* and to pronounce either of them as a *w*, the same sound also taking the place of hard *l* closing a syllable; *r* is always hard; *f*, a sound essentially non-Slavonic, appears as *ch* or *chv*, e.g. *chrancus*, R. *francus*, "a Frenchman," *Chv'odar*, R. *Fodor*, "Theodore."

In incidence we may note the preservation of the vocative; of the sibilants before case terminations where R. has restored gutturals by analogy, e.g. locatives *nasz*, *ruč*, *sasz*, R. *noż*, *rukę*, *sochę*, from *noż*, "foot," *ruká*, "hand," *sochá*, "plough"; and of the 3rd sing. pres. ind. in *ĕ* for *ĭ*, or without any *ĭ*. *V'ad'ĕt'ĕr'ad'ĕ* for R. *ved'otĭ*, "leads."

On the boundary between Wh. R. and the Novgorod dialect the former has the latter's confusion of *e* and *ĕ*.

The best account of Wh. R. is E. Karakij, *Sketch of the Sounds and Forms of Wh. R. Speech* (Moscow, 1886); there is a dictionary by Nosovič (St. P., 1875). Bezsonov, *Wh. R. Songs* (Moscow, 1871), and P. V. Schein in a whole series of publications give good specimens of the dialect.

The Little Russian dialect claims to be a literary language; it has established this claim in Galicia (see RUTHEINIANS), but its use as such is much restricted in Russia. The Little Russians differ from the Great Russians not only in language but in physical type, customs, domestic architecture and folk-lore; but though Russophobes have tried to prove that this is due to the Finnish element in the Great Russians, it cannot be substantiated, and the Little Russians, especially the descendants of the Cossacks, have no small Tatar element in them. For the last three centuries they have been under strong Polish influence, and this has had great effect upon the vocabulary but not much on phonetics or morphology. Little Russian is divided into three main groups of dialects: those of Hungary, which show an approximation to Slovak; those of Galicia, which rather recall Polish; and those of the Ukrain and other districts in Russia, which gradually shade into South Great Russian and White R., though the love of the sound *a* is noticeably absent. Little Russian is rather characterized by itacism; for original *y* and original *i* have coincided in a sound between *i* and *y* not unlike the Eng. short *i*, and original *ĕ*, also *e* and even *o* after having been lengthened in compensation for lost semi-vowels are now represented by *i*.

Further, Little Russian has reduced the common Russian softening, only keeping it before *a* and *o* and *i* for *ĕ* and *o*, and hardening the consonant before *e* and original *i*. In common with Wh. R. it has *h* for *g*, a vocative case, gutturals made sibilant before *ĭ* (for *ĕ*) in oblique cases, 3rd sing. without the *ĭ*, 1st plur. in *-mo* and *-me* instead of *mŭ*, *nn* for *nj*, *ll* for *lj*, *ll* for *lj*, *w* for *v*, *v* and hard *l*, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed *ĕ*, *e* and *o* is sufficient to mark a dialect as Little Russian. The Russian alphabet is modified for Little Russian

use as *r=h* and hence *v=g*; *e* is used for the *e* which does not soften the preceding vowel, *u* for the thick and *i* for the pure *i*.

**BIBLIOGRAPHY.**—*Dictionaries: Dict. of the R. Language*, published by the Second Section of the Imperial Academy of Sciences (4 vols., St. Petersburg, 1847; new ed., 1891.—); V. I. Dahl, *Explanatory D. of Living Great R. Language* (Moscow, 1880).—*Edited by J. Baudouin de Courtenay* (1906); I. Sreznevskij, *Materials for Dict. of Old R. Language* (to T.) (St. P. 1903); *Attempt (Opyt) at a Great R. Provincial Dict.* (Supplement to the old Dict. of the Acad.) (St. P.; 1852); A. Alexandrov, *R.-Eng. and Eng.-R. Dict.* (2 vols., St. P.); J. Pawlowsky, *R.-Deutsches Wörterbuch* (Riga, 1900).

Grammatik* (Leipzig, 1900); R. Abicht, *Die Hauptschwierigkeiten der R. Sprache* (Leipzig, 1897); P. Boyer, M. Speranski and S. Harper, *Russian Reader* (Chicago, 1906).

*Little Russian Grammar: St. Smal'-Stockyi and Fed. Gartner, Russka Grammatyka* (Lemberg, 1893); see also Miklosich, *Vergl. Gram. d. Slav. Sprachen, passim* (Vienna, 1875-83).

Many accented texts are published by R. Gendard, Leipzig. Th. Buslaev, *Historical R. Chrestomathy* (Moscow, 1861), gives specimens of Russo-Slavonic, Old R. and Dialects. The chief periodicals containing scientific papers on the R. language are the *Sbornik* (Miscellany) and *Izvestia* (Bulletin) of the Second Section of the St. P. Academy, and the *Zapiski* (Transactions) of the Philological Faculties of the Russian universities. Old Russian Texts are published mostly by the Obščestvo L'ubitel' Drevnej Pis'mennosti (Soc. of Lovers of Ancient Literature) in St. Petersburg. (E. H. M.)

**RUSSIAN LITERATURE.** To get a clear idea of Russian literature, it will be most convenient for us to divide it into oral and written. The first of these sections includes the interesting *byliny*, or "tales of old time," as the word may be translated, which have come down to us in great numbers, as they have been sung by wandering minstrels all over the country. The scholars who have given their attention to these compositions have made the following division of them into cycles: (1) that of the older heroes; (2) that of Vladimir, prince of Kiev; (3) that of Novgorod; (4) that of Moscow; (5) that of the Cossacks; (6) that of Peter the Great; (7) the modern period. These poems, if they may be so styled, are not in rhyme; the ear is satisfied with a certain cadence which is observed throughout. For a long time they were neglected, and the collection of them began only towards the conclusion of the 17th century. The style of Russian literature which prevailed from the time of Lomonosov was wholly based upon the French or pseudo-classical school. It was, therefore, hardly likely that these peasant songs would attract attention. But when the gospel of romanticism was preached and the *History* of Karamzin appeared, a new impulse was given to the collection of all the remains of popular literature. In 1804 appeared a volume based upon those which had been gathered together by Cyril or Kirsha Danilov, a Cossack, at the beginning of the 18th century. They were received with much enthusiasm, and a second edition was published in 1818. In the following year there appeared at Leipzig a translation of many of these pieces into German, in consequence of which they became known much more widely. This little book of 160 pages is important because the originals of some of the *byliny* translated in it are now lost. Since that time large collections of these poems have been published, edited by Rybnikov, Hilferding, Sreznevskij, Avenarius and others.

These curious productions have all the characteristics of popular poetry in the endless repetitions of certain conventional phrases—the "green wine," "the bright sun" (applied to a hero), "the damp earth" and others. The heroes of the first cycle are monstrous beings, and seem to be merely impersonifications of the powers of nature; such are Volga Vseslavich, Mikula Selianiovich and Sviatogor. They are called the *bogatyri starsšie*. Sometimes we have the giants of the mountain, as Sviatogor, and the serpent Gorinich, the root of part of both

names being *gora* (mountain). The serpent Gorinich lives in caves, and has the care of the precious metals. Sometimes animal natures are mixed up with them, as *smei-bogatyr*, who unites the qualities of the serpent and the giant, and bears the name of Tugarin Zmievich. There is the Pagan Idol (*Idolskoe Paganstvo*), a great glutton, and Nightingale the Robber (*Solovoy Razboinik*), who terrifies travellers and lives in a nest built upon six oaks.

In the second cycle the legends group themselves round the celebrated Prince Vladimir of Kiev. The chief hero is Ilya Muromets, who performs prodigies of valour, and is of gigantic stature and superhuman strength. The cycle of Novgorod deals with the stories of Vasiliï Buslaevich and Sadko, the rich merchant. The fourth cycle deals with the autocracy; already Moscow has become the capital of the future empire. We are told of the taking of Kazan, of the conquest of Siberia by Yermak, of Ivan the Terrible and his confidant Maliuta Skuratovich. It is observable that in the popular tradition Ivan is not spoken of with any hatred. As early as 1619 some of these *byliny* were committed to writing by Richard James, an Oxford graduate who was in Russia as chaplain of the embassy. The most pathetic is that relating to the unfortunate Xenia, the daughter of Boris Godunov. Yermak, the conqueror of Siberia, forms the subject of a very spirited lay, and there is another on the death of Ivan the Terrible. Considering the relation in which she stood to the Russians, we cannot wonder that Marina, the wife of the false Demetrius, appears as a magician. Many spirited poems are consecrated to the achievements of Stenka Razin, the bold robber of the Volga, who was for a long time a popular hero. The cycle of Peter the Great is a very interesting one. We have songs in abundance on the achievements of the tsar, as the taking of Azov in 1696. There is also a poem on the execution of the *streltsy*, and another on the death of Peter. In the more modern period there are many songs on Napoleon. The Cossack songs, written in the Little Russian language, dwell upon the glories of the *sech*, the sufferings of the people from the invasions of the Turks and Mongols, the exploits of the Haidamaks and, lastly, the fall of the Cossack republic. Besides these, the Russians can boast of large collections of religious poems, many of them containing very curious legends. In them we have a complete store of the beliefs of the Middle Ages. A rich field may be found here for the study of comparative mythology and folk-lore. Many of them are of considerable antiquity, and some seem to have been derived from the Midrash. Some of the more important of these have been collected by Besonov. Besides the *byliny* or legendary poems, the Russians have large collections of *skazki* or folk-tales, which have been gathered together by Sakharov, Afanasiev and others. They also are full of valuable materials for the study of comparative mythology.

Leaving the popular and oral literature, we come to what has been committed to writing. The earliest specimen of Earliest Russian writer. Russian, properly so called, must be considered the Ostromir Codex, written by the *diak* Gregory at the order of Ostromir, the *posadnik* or governor of Novgorod. This is a Russian recension of the Slavonic Gospels, of the date 1056-57. Of the year 1073 we have the *Izbornik* or "Miscellany" of Sviatoslav. It was written by John the *diak* or deacon for that prince, and is a kind of Russian encyclopaedia, drawn from Greek sources. The date is 1076. The style is praised by Buslaev as clear and simple. The next monument of the language is the *Discourse concerning the Old and New Testament*, by Hilarion, metropolitan of Kiev. In this work there is a paenegyric on Prince Vladimir of Kiev, the hero of so much of the Russian popular poetry. Other writers are Theodosius, a monk of the Petcherskiy cloister, who wrote on the Latin faith and some *Pouchenia* or "Instructions," and Luke Zhidiata, bishop of Novgorod, who has left us a curious *Discourse to the Brethren*. From the writings of Theodosius we see that many pagan habits were still in vogue among the people. He finds fault with them for allowing these to continue, and also for their drunkenness; nor do the monks escape his censures

Zhidiata writes in a more vernacular style than many of his contemporaries; he eschews the declamatory tone of the Byzantine authors.

With the so-called *Chronicle of Nestor* (*q.v.*) begins the long series of the Russian annalists. There is a regular catena of these chronicles, extending with only two breaks *Annals and travellers.* to the time of Alexis Mikhailovich, the father of Peter the Great. Besides the work attributed to Nestor, we have chronicles of Novgorod, Kiev, Volhynia and many others. Every town of any importance could boast of its annalists, Pskov and Suzdal among others. In some respects these compilations, the productions of monks in their cloisters, remind us of the *Anglo-Saxon Chronicle*, dry details alternating with here and there a picturesque incident; and many of these annals abound with the quaintest stories. There are also works of early travellers, as the igumen Daniel, who visited the Holy Land at the end of the 11th and beginning of the 12th century. A later traveller was Athanasius Nikitin, a merchant of Tver, who visited India in 1470. He has left a record of his adventures, which has been translated into English and published for the Hakluyt Society. Later also is the account written by the two merchants, Korobeinikov and Grekov. They were sent with a sum of money to the Holy Sepulchre to entreat the monks to pray without ceasing for the soul of the son of Ivan the Terrible, whom his father had killed. A curious monument of old Slavonic times is the *Pouchenie* ("Instruction"), written by Vladimir Monomakh for the benefit of his sons. This composition is generally found inserted in the *Chronicle of Nestor*; it gives a quaint picture of the daily life of a Slavonic prince.

In the 12th century we have the sermons of Cyrill, the bishop of Turov, which are attempts to imitate in Russian the florid Byzantine style. In his sermon on Holy Week, Christianity is represented under the form of spring, Paganism and Judaism under that of winter, and evil thoughts are spoken of as boisterous winds. And here may be mentioned the many lives of the saints and the Fathers to be found in early Russian literature. Some of these have been edited by Count Bezborodko in his *Pamiatniki Starinnoy Russkoy Literatury* ("Memorials of Ancient Russian Literature").

We now come to the story of the expedition of Prince Igor, which is a kind of *bylina* in prose, and narrates the expedition of Igor, prince of Novgorod-Severskiy, against the Polovtzes. The manuscript was at one time preserved in a monastery at Yaroslavl, but was burnt in the great fire at Moscow in the year 1812. Luckily the story had been edited (after a fashion) by Count Musin-Pushkin, and a transcript was also found among the papers of the empress Catherine. The original was seen by several men of letters in Russia, Karamzin among the number. There is a mixture of Christian and heathen allusions, but there are parallels to this style of writing in such a piece as the "Discourse of a Lover of Christ and Advocate of the True Faith," from which an extract has been given by Buslaev in his *Chrestomathy*. There is a great deal of poetical spirit in the story of Igor, and the metaphors are frequently very vigorous. Mention is made in it of another bard named Boyan, but none of his inspirations have come down to us. A strange legend is that of the tsar Solomon and Kitovras, but the story occurs in the popular literatures of many countries. Some similar productions among the Russians are merely adaptations of old Bulgarian tales, especially the so-called apocryphal writings. The *Zadonskikhina* is a sort of prose poem much in the style of the "Story of Igor," and the resemblance of the latter to this piece and to many other of the *skazania* included in or attached to the Russian chronicle, furnishes an additional proof of its genuineness. The account of the battle of the "Field of Woodcocks," which was gained by Dmitri Donskoy over the Mongols in 1380, has come down in three important versions. The first bears the title "Story of the Fight of the Prince Dmitri Ivanovich with Mamai"; it is rather meagre in details but full of expressions showing the patriotism of the writer. The second version is more complete in its historical details, but still is not without

anachronisms. The third is altogether poetical. The *Poviest o Drakule* ("Story of Drakula") is a collection of anecdotes relating to a cruel prince of Wallachia who lived in the 15th century. (See RUMANIA, *History*.) Several of the barbarities described in it have also been assigned to Ivan the Terrible.

The early Russian laws present many features of interest, such as the *Russkaya Pravda* of Yaroslav, which is preserved in the chronicle of Novgorod; the date is between 1018 and 1054. The laws show Russia at that time to have been in civilization quite on a level with the rest of Europe. But the evil influence of the Mongols was soon to make itself felt. The next important code is the *Sudebnik* of Ivan III., the date of which is 1497; this was followed by that of Ivan IV. of the year 1550, in which we have a republication by the tsar of his grandfather's laws, with additions. In the time of this emperor also was issued the *Stoglav* (1551), a body of ecclesiastical regulations. Mention must also be made of the *Ulozhenie* or "Ordinance" of the tsar Alexis. This abounds with enactments of sanguinary punishment: women are buried alive for murdering their husbands; torture is recognized as a means of procuring evidence; and the knout and mutilation are mentioned on almost every page. Some of the penalties are whimsical: for instance, the man who uses tobacco is to have his nose cut off; this was altered by Peter the Great, who himself practised the habit and encouraged it in others.

In 1553 a printing press was established at Moscow, and in 1564 the first book was printed, an "Apostol," as it is called, i.e. a book containing the Acts of the Apostles and the Epistles. The printers were Ivan Feodorov and Peter Timofeiev; a monument has been erected to the memory of the former. As early as 1548 Ivan had invited printers to Russia, but they were detained on their journey. Feodorov and his companions were soon, however, compelled to leave Russia, and found a protector in Sigismund III. The cause appears to have been the enmity of the copyists of books, who succeeded in drawing over to their side the more fanatical priests. The first Slavonic Bible was printed at Ostrog in Volhynia in 1581. Another press, however, was soon established at Moscow; up to 1600 sixteen books had been issued there.

A curious work of the time of Ivan the Terrible is the *Domostroy*, or "Book of Household Management," which is said to have been written by the monk Sylvester. This priest was at one time very influential with Ivan, but ultimately was banished to the Solovetskiy monastery on the White Sea. The work was originally intended by Sylvester for his son Anthemius and his daughter-in-law Pelagia, but it soon became very popular. We have a faithful picture of the Russia of the time, with all its barbarisms and ignorance. We see the unbending authority of the husband in his own household; he may inflict personal chastisement upon his wife; and her chief duty lies in ministering to his wants. To the reign of Ivan the Terrible must also be assigned the *Chetii-Miniei* or "Book of Monthly Readings," containing extracts from the Greek fathers, arranged for every day of the week. The work was compiled by the metropolitan Macarius, and was the labour of twelve years. An important writer of the same period was Prince Andrew Kurbskiy, descended from the sovereigns of Yaroslavl, who was born about 1528. In his early days Kurbskiy saw a great deal of service, having fought at Kazan and in Livonia. But he quarrelled with Ivan, who had begun to persecute the followers of Sylvester and Adashev, and fled to Lithuania in 1563, where he was well received by Sigismund Augustus. From his retreat he commenced a correspondence with Ivan, in which he reproached him for his many cruelties. Ivan in his answer declared that he was quite justified in taking the lives of his slaves if he thought it right to do so. Kurbskiy died in exile in 1583. He also wrote a life of Ivan, but Bestuzhev Riumin thinks that his hatred of Ivan led him to exaggerate, and he regrets that Karamzin should have followed him so closely. Besides the answers of

Ivan to Kurbskiy, there is his letter to Cosmas and the brotherhood of the Cyrillian monastery on the White Lake (Bielo Ozero), in which he reproaches them for the self-indulgent lives they are leading. Other works of the 16th century are the *Stepennaya Kniga*, or "Book of Degrees" (or "Pedigrees"), in which historical events are grouped under the reigns of the grand-dukes, whose pedigrees are also given; and the *Life of the Tsar Feodor Ivanovich* (1584-98), written by the patriarch Job.

To the beginning of the 17th century belongs the *Chronograph* of Sergius Kubasov of Tobolsk. His work extends from the creation of the world to the accession of Michael Romanov, and contains interesting accounts of such of the members of the Russian royal family as Kubasov had himself seen. Something of the same kind must have been the journal of Prince Mstislavskiy, which he showed the English ambassador Jerome Horsey, but which is now lost.<sup>1</sup>

To the time of the first Romanovs belongs the story of the siege of Azov, a prose poem, which tells us, in an inflated style, how in 1637 a body of Cossacks triumphantly repelled the attacks of the Turks. There is also an account of the siege of the Troitsa monastery by the Poles during the "Smutnoe Vremya," or Period of Troubles, as it is called—that which deals with the adventures of the false Demetrius and the Polish invasion which followed. But all these are surpassed by the work on Russia of Gregory Karpov Kotoshikhin. He served in the ambassador's office (*posolskiy prikaz*), and when called upon to give information against

his colleagues fled to Poland about 1664. Thence he passed into Sweden and wrote his account of Russia under Alexis Mikhailovich at the request of Count Delagardie, the chancellor. He was executed in 1667 for slaying in a quarrel the master of the house in which he lived. The manuscript was found by Professor Soloviev of Helsingfors at Upsala and printed in 1840. The picture which Kotoshikhin draws of his native country is a sad one, and from his description, and the facts we gather from the *Domostroy*, we can reconstruct the Old Russia of the time before Peter the Great. Perhaps, as an exile, Kotoshikhin allowed himself to write too bitterly. A curious work is the *Uriadnik Sokolnichia Puti* ("Directions for Falconry"), which was written for the use of the emperor Alexis, who, like many Russians of old time, was much addicted to this pastime. The Serb, Yuri Krzhanich, who wrote in Russian, was the first pan-Slavist, anticipating Kollar by one hundred and fifty years or more. He wrote a critical Serbian grammar (with comparison of the Russian, Polish, Croatian and White Russian), which was edited from the manuscripts by Bodianski in 1848. For his time he had a very good insight into Slavonic philology. His pan-Slavism, however, sometimes took a form by no means practical. He went so far as to maintain that a common Slavonic language might be made for all the peoples of that race—an impossible project which has been the dream of many enthusiasts. He was banished to Siberia, and finished his grammar at Tobolsk. He also wrote a work on the Russian empire in the middle of the 17th century, completed in 1676, which was edited by Besonov in 1860. The picture drawn, as in the corresponding production of Kotoshikhin, is a very gloomy one. To this period belongs the life of the patriarch Nikon by Shusheria. The struggles of Nikon with the tsar, and his emendations of the sacred books, which led to a great schism in Russia, are well known. They have been made familiar to Englishmen by the eloquent pages of the late Dean Stanley.<sup>2</sup> From this revision may be dated the rise of the Raskolniks (Dissenters) or Staro-obriadtzi (those who adhere to the old ritual). With Simeon Polotzki (Polotskiy) (1628-1680) the old period of Russian

<sup>1</sup> Horsey says: "I read in their cronicells written and kept in secret by a great priem prince of that country named Knez Ivan Fedorovich Mstislavskoe, who, out of his love and favour, imparted unto me many secrets observed in the memory and process of his time, which was fowercore years, of the state, natur, and government of that comonwealth.—Bond, *Russia at the Close of the Sixteenth Century* (Hakluyt Society, 1850)."

<sup>2</sup> *Lectures on the Eastern Church.*

literature may be closed. He was tutor to the tsar Feodor, son of Alexis, and may be said to have helped to introduce the culture of the West into Russia, as he was educated at Kiev, then a portion of Polish territory. Polotski came to Moscow about 1664. He wrote religious works (*Voenets Vicyr*, "The Garland of Faith"), and composed poems and religious dramas (*The Prodigal Son*, *Nebuchadnezzar*, &c.). He has left us some droll verses on the tsar's new palace of Kolomenskoe, which are very curious doggerel. The artificial lions that roared, moved their eyes, and walked especially delighted him. There does not seem to be any ground for the assertion (often met with even in Russian writers) that Sophia, the sister of Peter the Great, was acquainted with French, and translated some of the plays of Molière.

And now all things were to be changed. Russia was to adopt the forms of literature in use in the West. One of the chief helpers of Peter the Great in the education of the people was Feofane (Theophanes) Procopovich (1681-1736), author of the Ecclesiastical Regulations and some plays, who advocated the cause of science; the old school was defended by Stephen Yavorskiy (1658-1722), whose *Rock of Faith* was written to refute the Lutherans and Calvinists. Another remarkable writer of the times of Peter the Great was Pososhkov (b. 1673), a peasant by birth, who produced a valuable work on *Poverty and Riches*. Antioch Kantemir (1708-1744), son of a former hospodar of Moldavia, wrote some clever satires still read; they are imitated from Boileau. He also translated parts of Horace. Besides his satires, he published versions of Fontenelle's *Pluralité des Mondes* and the histories of Justin and Cornelius Nepos. He was for some time Russian ambassador at the courts of London and Paris. But more celebrated than these men was

Michael Lomonosov (q.v.). He was an indefatigable writer of verse and prose, and has left odes, tragedies, didactic poetry, essays and fragments of epics.

Vassili Tatistchev (1686-1750) was the author of a Russian history which is interesting as the first attempt in that field. He was disgraced for peculation, and died at Astrakhan, as governor, in 1750. His work was not given to the world till after his death. There had been a slight sketch published before by Khilkov, entitled the *Marrow of Russian History*. Basil Triediakovski (1703-1769) was born at Astrakhan, and we are told that Peter, passing through that city at the time of his Persian expedition, had Triediakovski pointed out to him as one of the most promising boys of the school there. Whereupon, having questioned him, the tsar said, with truly prophetic insight, "A busy worker, but master of nothing." His *Islemakhida*, a poem in which he verified the *Télémaque* of Fénelon, drew upon him the derision of the wits of the time. He had frequently to endure the rough horse-play of the courtiers, for the position of a literary man at that time in Russia was not altogether a cheerful one. His services, however, to the Russian language were great.

From the commencement of the reign of Elizabeth Russian literature made great progress, the French furnishing models. Alexander Sumarokov (1718-1777) wrote prose and verse in abundance—comedies, tragedies, idylls, satires and epigrams. He is, perhaps, best entitled to remembrance for his plays, which are rhymed, and in the French style. His *Dmitri Samozvanets* ("Demetrius the Pretender") is certainly not without merit. Some of the pieces of Kniazhin had great success in their time, such as *The Chatterbox*, *The Originals* and especially *The Fatal Carriage*. He is now almost forgotten. In 1756 the first theatre was opened at St Petersburg, the director being Sumarokov. Up to this time the Russians had acted only religious plays, such as those written by Simeon Polotski. The reign of Catherine II (1762-96), herself a voluminous writer, saw the rise of a whole generation of court poets. Everything in Russia was to be forced like plants in a hot-house, she was to have Homers, Findars, Horaces and Virgils. Michael

Kheraskov (1733-1807) wrote besides other poems two enormous epics—the *Rossada* in twelve books, and *Vladimir* in eighteen; they are now but little read. Hippolitus Bogdanovich (1743-1803) wrote a pretty lyric piece, *Dushenka*, based upon La Fontaine, and telling the old story of the loves of Cupid and Psyche. With Ivan Khemntzer begins the long list of fabulists; this half-original form of literature, so common in countries ruled absolutely, has been very popular in Russia. Khemntzer (1744-1784), whose name seems to imply a German origin, began by translating the fables of Gellert, but afterwards produced original

specimens. A writer of real national comedy appeared in Denis von Vian, probably of German extraction, but born at Moscow (1744-1792). His best production is *Nedorosl* ("The Minor"), in which he satirizes the coarse features of Russian society, the ill-treatment of the serfs, and other matters. He saw France on the eve of the great Revolution, and has well described what he did see. Russian as he was, and accustomed to serfdom, he was yet astonished at the wretched condition of the French peasants. The great poet of the age of Catherine, the laureate of her glories, was Gabriel Derzhavin (1743-1816). He essayed many styles of composition, and was a great master of his native language. There is something grandiose and organ-like in his high-sounding verses; unfortunately he occasionally degenerates into bombast. His versification is perfect, and he had the courage to write satirically of many persons of high rank. His *Ode to God* is the best known of his poems in Western countries. He was a student of Ossian, and of Edward Young, the author of the *Night Thoughts*. Other celebrated poems of Derzhavin are *Felitsa*, *Odes on the Death of Prince Meshchersky*, *The Nobleman*, *The Taking of Ismail*, and *The Taking of Warsaw*. His *Memoirs* were published in 1857.

An unfortunate author of the days of Catherine was Alexander Radistchev (1749-1802), who, having, in a small work, *A Journey to St Petersburg and Moscow*, spoken too severely of the miserable condition of the serfs, was punished by banishment to Siberia, from which he was afterwards allowed to return, but not till his health had been permanently injured by his sufferings. An equally sad fate befell the spirited writer Nicholas Novikov (1744-1818), who, after having worked hard as a journalist, and done much for education in Russia, fell under the suspicion of the government, and was imprisoned by Catherine. On her death he was released by her successor. The short reign of Paul was not favourable to literary production; the censorship of the press was extremely severe, and many foreign books were excluded from Russia.

But a better state of things came with the reign of Alexander, one of the glories of whose day was Nicholas Karamzin (q.v.). His chief work is his *History of the Russian Empire*, but he appeared in the fourfold aspect of historian, novelist, essayist and poet. Nor need we do more than mention the celebrated Archbishop Platon (q.v.). Ivan Dmitriev (1760-1837) wrote some pleasing lyrics and epistles, but without much force. He appears from his translations to have been well acquainted with the English poets. Ozerov (1769-1816) wrote a great many tragedies, which are but little read now. They are in rhyming alexandrines. He occasionally handled native subjects with success, as in his *Dmitri Donskoy* (1807) and *Yaropolk and Oleg* (1798). In Ivan Kriloff (q.v.) the Russians found their most genial fabulist. As Derzhavin was the poet of the age of Catherine, so Vassili Zhukovskiy (1783-1852) may be said to have been that of the age of Alexander. He is more remarkable, however, as a translator than as an original poet. With him Romanticism began in Russia. He became reader to the empress and afterwards tutor to her children. In 1802 he published his version of Gray's *Elegy*, which at once became a highly popular poem in Russia. Zhukovskiy translated many pieces from the German (Goethe, Schiller, Uhland) and English (Byron, Moore, Southey). One of his original productions, "The Poet in the Camp of the Russian Warriors," was on the lips of every one at the time of the War of the Fatherland (*Otechestvennaya Voyna*) in 1812. He produced versions of the episode of Nala and Damayanti from the *Mahabharata*, of Rustum and Zohrab from the *Shah-Namah*, and of a part of the *Odyssey*. In the case of these three masterpieces, however, he was obliged to work from literal translations (mostly German), as he was unacquainted with the original languages. The *Iliad* was translated during this period by Gnedich, who was familiar with Greek. He has produced a faithful and spirited version, and has naturalized the hexameter in the Russian language with much skill. Constantine Batiushkov (1787-1855) was the author of many elegant poems, and at the outset of his career promised much, but sank into imbecility, and lived in this condition to an advanced age. Merzliakov and Tziganov deserve a passing notice as the writers of songs some of which still keep their popularity. During his short life (1799-1837) Alexander Pushkin produced many celebrated poems, which will be found enumerated in the article devoted to him (see PUSHKIN). In Alexander Griboyedov (1795-1829) (q.v.) the Russians saw the writer of one of their most clever comedies (*Gore et Uma*), which may perhaps be translated "The Misfortune of being Too Clever" (lit. "Grief out of Wit"). Ivan Kozlov (1774-1838) was author of some pretty original lyrics, and some translations from the English, among others Burns's *Cotter's Saturday Night*. He became a cripple and blind, and his misfortunes elicited some cheering and sympathetic lines from Pushkin, which will always be read with pleasure.

has left us many exquisite lyrics. A genuine bard of the people, and one of their most truly national authors, was Alexis Koltsov (1809-1842), the son of a tallow merchant of Voronezh. He has left us a few exquisite lyrics, which are to be found in all the collections of Russian poetry. He died of consumption after a protracted illness. Another poet who most resembled Koltsov was Ivan Nikitin (1826-1861), born in the same town, Voronezh. His best poem was *Kulak*. Nikitin, to support his relations, was obliged to keep an inn, this he was afterwards enabled to change for the more congenial occupation of a bookseller. The novel in Russia has had its cultivators in Zagoskin and Lazhechnikov, who imitated Sir Walter Scott. The most celebrated of the romances of Zagoskin was *Yuri Mstoslavskiy*, a tale of the expulsion of the Poles from Russia in 1612. The book may even yet be read with interest it gives a very spirited picture of the times; unfortunately, a gloss is put upon the barbarity of the manners of the period. Among the better known productions of Lazhechnikov are *The Heretic* and *The Palace of Ice*. A flashy but now forgotten writer of novels was Thaddeus Bulgarin (1789-1850) author of *Ivan Vyshigin*, a work which once enjoyed considerable popularity.

The first Russian novelist of great and original talent was Nicholas Gogol (1809-1852) (*q.v.*). In his *Dead Souls* he satirized all classes of society, some of the portraits being wonderfully vivid. Being a native of Little Russia, he describes its scenery and the habits of the people, especially in such stories as the *Old-Fashioned Household*, or in the more powerful *Taras Bulba*. This last is a highly wrought story, giving us a picture of the savage warfare carried on between the Cossacks and Poles. Gogol was also the author of a good comedy, *The Revisor*, wherein the petty pilferings of Russian municipal authorities are satirized. In his *Memoirs of a Madman* and *Portrait*, he shows a weird and fantastic power which proves him to have been a man of strong imagination. The same may be said of *The Cloak*, and the curious tale *Vii* ("The Demon"), where he gives us a picture of Kiev in the old days.

In the field of fiction Gogol had various famous successors, concerning whom details will be found in separate articles. It must suffice here to enumerate Alexander Herzen (d. 1869);

**Literature.** Ivan Goncharov (1812-1891); Dmitri Grigorovich (1822-1899), author of *The Fisherman* and *The Emigrants*; Alexis Pisemskiy (1822-1900); Michael Saltikov (1826-1899); Feodor Dostoevskiy (1821-1881); Alexander Ostrovskiy (1823-1886); Feodor Riashetnikov (1841-1871); Count A. Tolstoy (1817-1875), also famous as a dramatist; and greater than all these Ivan Turgeniev (1819-1883), and Count L. Tolstoy (1828-1910), the last of whom ranks as much more than a man of letters.

In Visarion Belinski the Russians produced their best critic. For thirteen years (1834-47) he was the Aristarchus of Russian literature and exercised a healthy influence. In his later days he addressed a withering epistle to Gogol on the newly adopted reactionary views of the latter.

Since the time of Karamzin the study of Russian history has made great strides. He was followed by Nicholas Polevoy (1775-1842), who wrote what he called the *History of the Russian*

**Historians.** *People* (6 vols., 1829-33), but his work was not received with much favour. Polevoy was a self-educated man, the son of a Siberian merchant; besides editing a well-known Russian journal, *The Telegraph* (suppressed in 1834), he was also the author of many plays, among others a translation of *Hamlet*. Since his time, however, the English dramatist has been produced in a more perfect dress by Kroneberg, Druzhinin and others. Sergius Soloviev (1820-1879) was the author of a *History of Russia* which may be described rather as a quarry of materials for future historians of Russia than an actual history. In 1885 died N. Kostomarov, the writer of many valuable monographs, of which those on Bogdan Khmelinitzkiy and the False Demetrius deserve special mention. From 1847 to 1854 Kostomarov, whose interest in the history of Little Russia and its literature made him suspected of separatist views, wrote nothing, his having been banished to Saratov, and forbidden to teach or publish. But after this time his literary activity began again, and, besides separate works, the leading Russian reviews, such as *Old and New Russia*, *The Historical Messenger*, and *The Messenger of Europe*, contained many contributions from his pen of the highest value. Constantine Kavelin (1818-1855) was the author of many valuable works on Russian law, and Kalatchev published a classical edition of the old Russian codes. Ilovaitskiy and Gedeonov attempted to upset the general belief that the founders of the Russian empire were Scandinavians. A good history of Russia (1855) was published by N. Ustrialov, but his most celebrated work was his *Tsarstvennoye Petra Velikogo* ("Reign of Peter the Great"); in this many important documents first saw the light, and the circumstances of the death of the unfortunate Alexis were made clear. Russian writers of history have not generally occupied themselves with any other subject than that of their own country, but an exception may be found in the writings of Timofei Granovskiy (1813-1855), such as *Abbe Sager* (1849) and *Four Historical Portraits* (1850). So also Kudriav-

tsov, who died in 1850, wrote on "The Fortunes of Italy, from the Fall of the Roman Empire of the West till its Reconstruction by Charlemagne." He also wrote on "The Roman Women as described by Tacitus." We may add Kareyev, professor at Warsaw, who wrote on the condition of the French peasantry before the Revolution. Other writers on Russian history have been H. Pogodine (d. 1873), who compiled a *History of Russia till the Invasion of the Mongols* (1871), and especially I. Zabelin, who has written a *History of Russian Life from the most Remote Times* (1876), and the *Private Lives of the Czars and Czars* (1869 and 1872) and a *History of Moscow*. Leashkov has written a *History of Russian Law to the 18th Century*, and Tchitcherina a *History of Provincial Institutions in Russia in the 17th Century* (1856). To these must be added the work of Zagoskin, *History of Law in the State of Muscovy* (Kazan, 1877). Professor Michael Kovalevskiy, of the university of Moscow, wrote an excellent work on *Communal Land Tenure*, in which he investigates the remains of this custom throughout the world. In 1885 Dubrovin published an excellent history of the revolt of Pugachev. The valuable work by Alexander Pypin (b. 1833) and Vladimir Spasovitch, *History of Slavonic Literatures*, is the most complete account of the subject, and has been made more generally accessible by the German translation of Pech N. Tikhonravov (1832-1893) wrote a *Chronicle of Russian Literature and Antiquities* (5 vols., 1850-61). The *History of Slavonic Literature* by Schafarik, published in 1826, has long been antiquated. A history of Russian literature by Paul Polevoy has appeared, which has gone through two editions. The account of the Polish rebellion of 1863 by Berg, published in 1873, which gave many startling and picturesque episodes of the celebrated struggle, was withdrawn from circulation. It appeared originally in the pages of the Russian magazine *Serapis*.

Nicholas Nekrasov, who died in 1877, left six volumes of poetry which in many respects remind us of the writings of Crabbe; the poet is of that realistic school in which Russian authors

so much resemble English. Another writer of poetry deserving mention is Ogarev, for a long time the companion in exile of Herzen in England; many of his compositions appeared in the *Polar Star* of the latter, which contains the interesting autobiographical sketches of Herzen, entitled *Byloe i Dnesh* ("The Past and my Thoughts"). Apollon Maikov (1821-1847) at one time enjoyed great popularity as a poet; he is a kind of link with Pushkin, of whose elegance of versification he is an imitator. Another poet of a past generation was Prince Viazemskiy (1792-1878). Graceful lyrics were written by Mei, Fet (whose name would apparently prove Dutch extraction, Veth), Stcherbina, and, going a little further back, Yazykov, the friend of Pushkin, and Khomiakov, celebrated for his Slavophile propensities. To these may be added Mille Zhadovskaya, Benediktov, Podolinskiy and Titchev. Polonskiy (1820-1898) contributed exquisite lyrics to the *Vestnik Yevrope*.

Excellent works on subjects connected with Slavonic philology have been published by Vostokov, who edited the *Ostromir Codex*, and Sreznnevskiy and Bodianskiy, who put forth an edition of the celebrated codex used at Reims for the coronation of the French kings. After their deaths their work was carried on by Professor Grot (*Philological Investigations*, also many critical editions of Russian classics), Budilovich, professor at Warsaw, Potebnya of Kharkov, and Baudoin de Courtenay, who, among other services to philology, has described the Slavonic dialect spoken by the Resanians, a tribe living in Italy, in two villages of the Julian Alps. The songs (*byliny*) of the Russians have been collected by Zakrevskiy, Rybnikov, Hilferding, Barsov and others, and their national tales by Sakharov, Afanasev and Erlenvain. Kotliarevskiy, Tereshenko and others have treated of their customs and superstitions. S. Stanislav Mikutskiy, professor at the university of Warsaw, has published his *Materials for a Dictionary of the Roots of the Russian and all Slavonic Dialects*, but it represents a somewhat obsolete school of philology. The Early Russian Text Society continues its useful labours, and has edited many interesting monuments of the older Slavonic literature. Two valuable codices have been printed in Russia, Zographus and Marianus, interesting versions of the Gospels in Paleslavonic. They were edited by the learned Croat Jagić, who occupied the chair of Sreznnevskiy in St Petersburg. An excellent *Talks on Slavonic Velikoruskogo Yazika* ("Explanatory Dictionary of the Great Russian Language") was compiled by Vladimir Dahl. Alexander Hilferding published some valuable works on ethnology and philology, among others on the Polabs, an extinct Slavonic tribe who once dwelt on the banks of the Elbe. The Russians have not exhibited many works in the field of classical or other branches of philology. Exception, however, must be made of the studies of Tchubinov in Georgian, Minayev in the Indian and Tsvetayev in the old languages of Italy.

In moral and mental philosophy the Russians have produced but few authors. We meet with some good mathematicians, Lobachevskiy among others, and in natural science the publications of the Society for Natural History at Moscow have attracted considerable attention. *Recent Literature.*—The death of Nekrasov in 1877 deprived Russia of her most eminent poet since the days of Pushkin and

Lermontov. During the last generation of the 19th century most of the Titans of her literature departed, and cannot be said to have left successors of equal merit. Dostoevskiy, Pisemskiy, Turgeniev, Goncharov, Ostrovskiy and Saltykov followed each other to the grave in rapid succession. Leo Tolstoy alone remained, a veritable patriarch, whose views on life gave him a world-interest beyond even the contributions of his great prose fiction. In 1895 Apukhtin, author of many graceful lyrics, died; in 1897 Apollon Maikov, and soon afterwards Polonskiy. These men were well known throughout Russia. A new school of poets has sprung up, consisting for the most part of the so-called decadents and symbolists. Among them may be mentioned A. Korinskiy; Ivan Bunin, who has published an excellent translation of Longfellow's *Hiawatha*; and Constantine Balmont. The last of these has given to the public several volumes of lyrics, many of which exhibit a graceful imagination. He has been a successful translator of Shelley, and of Edgar Allan Poe, Ibsen and Calderon. We must also mention V. Briusov and K. Sluchevskiy, Mme. Gippius-Mereshkovskaya and Mme. Myrrha Lkhvitskaya. Excellent historical novels have been written by Mereshkovskiy (Merejkovskiy (q.v.)). The drama is not in a flourishing condition. Very little of merit has been produced since the great trilogy (1866-69) of Alexis Tolstoy dealing with the reign of Ivan the Terrible—full of picturesque horrors for the dramatist—and the bourgeois comedies of Ostrovskiy.

If we turn to history, in which the Russians have always shown considerable talent, we can cite some really good work. We cannot here find room to discuss the memoirs and other documents which appear in the *Russian Antiquary* (*Russkaya Starina*), the *Historical Messenger* (*Istoricheskiy Vestnik*) and other journals, the name of which is legion. In 1897 Professor Bestuzhev-Riumin, of the university of St Petersburg, died. He had held his chair of history since 1865. His valuable *History of Russia* must now remain a torso only, the first volume and the first half of the second having alone appeared. Soloviev and Kostomarov are dead. The famous school of Russian historians is thus almost extinct. But some excellent writers in this department have come to the front. Professor Miluiukov has started his *Sketches of the History of Russian Culture* (*Ocherki po istorii russkoi kultury*), which has been much read. Professor Bilbasov wrote a *History of Catherine II*, and N. Schilder a *Life of Alexander I*. D. Evarntskiy has added a third volume to his interesting work on the Zaporozhian Cossacks. The Russians have always enjoyed a considerable reputation as memoir-writers, and the *Recollections of Mme. Smirnova*, which first appeared in the *Northern Messenger* (*Sieverniy Vestnik*), proved very interesting. Pushkin appears here before us in the most minute details of his everyday life. The centenary of his birth (1899) was signalized by the publication of many interesting monographs on his strange career. The details furnished by his nephew, L. Pavlistchev, were especially noteworthy. The second volume appeared of the classical *History of the Russian Church*, by E. Golubinskiy. A valuable contribution to early Russian history was furnished by the *Legal Antiquities* (*Yuridicheskie Drennosti*) of V. Serguievich, by which quite a new light has been thrown upon the Russian *sobor*. The well-known savant, Maxime Kovalevskiy, published the second volume of his *Economic Development of Europe to the Rise of Capitalism in Moscow in the Sixteenth Century*. This book analyzes the conditions under which economic production was developed in Old Russia. S. Platonov published a *History of the Insurrections in Russia in the Sixteenth and Seventeenth Centuries*. He holds entirely new views on the *strichina*, the famous bodyguard of Ivan the Terrible. Professor B. Kliuchevskiy, of the university of Moscow, published in 1883 a valuable book on the Russian Duma, as the privy council of the emperors was called, and in 1899 he issued his *Aids to Lectures on Russian History*. Russian writers have not often devoted themselves to the political and social conditions of other countries, but an exception must be made in the case of the books by Professor Vinogradov, formerly of Moscow, notably his *Investigations into the Social History of England in the Middle Ages* (1887). The learned author, who was called to Oxford as Corpus professor of jurisprudence, also prepared an edition of this work for the English public. In fiction no new writers appeared of equal calibre to Gogol, Turgeniev, Dostoevskiy and Tolstoy. But A. Chekhov showed considerable power in his short stories. Some of the tales of Gorki (q.v.), Bertel and Yasinskiy are also of great merit. The brilliant Gershvin died insane in 1888.

A few words must be said on the literature of the Russian dialects, the Little and White Russian. The Little Russian is rich in *zhaski* (tales) and songs. Peculiar to them is the *duma*, a narrative poem which corresponds in many particulars with the Russian *bylina*. Since the commencement of the 19th century, the Little Russian *dumy* have been repeatedly edited, as by Makimovich Metlinskiy and others, and an elaborate edition was undertaken by Dragomanov and Antonovich. Just as the *byliny* of the Great Russians, so also these *dumy* of the Little Russian admit of classification, and they have been divided by their latest editors as follows: (1) the songs of the *druzhina*, treating of the early princes and their followers; (2) the Cossack period (*Kosachestvo*), in which the Cossacks are

found in continual warfare with the Polish *pan*s and the attempts of the Jesuits to introduce the Roman Catholic religion; (3) the period of the *Haidamaka*, who formed the nucleus of the national party, and prolonged the struggle.

The foundation of the Little Russian literature (written, as opposed to the oral) was laid by Ivan Kotliarevskiy (1769-1838), whose travesty of part of the *Aeneid* enjoys great popularity among some of his countrymen. Others, however, object to it as tending to bring the language or dialect into ridicule. A truly national poet appeared in Taras Shevchenko, born at the village of Kiriivka, in the government of Kiev, in the condition of a serf. The strange adventures of his early life he has told us in his autobiography. He did not get his freedom till some time after he had reached manhood, when he was purchased from his master by the generous efforts of the poet Zhukovskiy and others. Besides poetry, he occupied himself with painting, with considerable success. He unfortunately became obnoxious to the government, and was punished with exile to Siberia from 1847 to 1857. He did not long survive his return, dying in 1861, aged forty-six. No one has described with greater vigour than Shevchenko the old days of the Ukraine. In his youth he listened to the village traditions handed down by the priests, and he has faithfully reproduced them. In the powerful poem entitled *Haidamaki* we have a graphic picture of the horrors enacted by Gonta and his followers at Uman. The funeral of the poet was a vast public procession; a great cairn, surmounted with a cross, was raised over his remains, where he lies buried near Kaniov on the banks of the Dnieper. His grave has been styled the "Mecca of the South Russian Revolutionists." A complete edition of his works, with interesting biographical notices—one contributed by the novelist Turgeniev—appeared at Prague in 1876. Besides the national songs, excellent collections of the South Russian folk-tales have appeared, edited by Dragomanov, Rudchenko, and others. Many of these are still recited by the *kozvaki*, or wandering pedlars. A valuable work is the *Zapiski o Vostochnykh Russakh* ("Papers on Southern Russia"), published at St Petersburg in 1857 by Pasholinskiy at Kaniv. After he got into trouble (with Kostomarov and Shevchenko) for his political views, the late works of this author show him to have undergone a complete change. Other writers using the Little Russian language are Marko-Vovchok (that is, Madame Eugenia Markovitch) and Yuri Fedkovich, who employs a dialect of Bukovina. Fedkovich, like Shevchenko, sprang from a peasant family, and served as a soldier in the Austrian army against the French during the Italian campaign. Naturally we find his poems filled with descriptions of life in the camp. Like the Croat Preradovic, he began writing poetry in the German language, till he was turned into more natural paths by some patriotic friends. A collection of songs of Bukovina was published at Kiev in 1875 by Lonachevskiy. Eugene Zelechovskiy compiled a valuable *Dictionary of Little Russian*. There is a good grammar by Osadta, a pupil of Milkosich.

In the White Russian dialect are to be found only a few songs, with the exception of portions of the Scriptures and some legal documents. A valuable dictionary has been published by Nosovich, but this is one of the most neglected of the Russian dialects. Collections of White Russian songs have been published by Shein and others.

**RUSSO-JAPANESE WAR, 1904-5.** The seizure by Russia of the Chinese fortress of Port Arthur, which she had a few years previously, in concert with other powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of her eastward expansion and her need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equally naturally. But the whole course of this expansion had been watched with suspicion by Japan, from the time of the Saghalien incident of 1875, when the island power, then barely emerging from the feudal age, had to cede her half of the island to Russia, to the Shimomoseki treaty of 1895, when the powers compelled her to forego the profits of her victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St Petersburg, and these representations became more vigorous when, in 1903, Russia seemed to be about to extend her Manchurian policy into Korea. No less than ten draft treaties

*The Little Russian Dialect, or Malo-Russian.*

*White Russian Dialect.*

were discussed in vain between August 1903 and February 1904, and finally negotiations were broken off on February 5th.<sup>1</sup> Japan had already on the 4th decided to use force, and her military and naval preparations, unlike those of Russia, kept pace with her diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. She too had her projects of expansion and hegemony, and by the Chino-Japanese War she had gained a start over her rival. The reply of the Western powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish themselves in Chinese harbours. From that moment Japanese policy was directed towards establishing her own hegemony and meeting the advance of Russia with a *fait accompli*. But her armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy grew year by year, the tone of Japanese policy became firmer. In 1902 her position was strengthened by the alliance with England, in 1903 her army, though in the event it proved almost too small, was considered by the military authorities as sufficiently numerous and well prepared, and the arguments of the Japanese diplomatists stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the minister of war, Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok. His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Further, Dragomirov, a higher military authority even than Kuropatkin, declared that "Far Eastern affairs were decided in Europe." Thus Russia entered upon the war both unprepared in a military sense, and almost entirely indifferent to its causes and its objects. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of some 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.<sup>2</sup> The strategical problem for Japan was, how to strike a blow sufficiently decisive to secure her object, before the at present insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimate. In consequence, far from applying the "universal service" principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force, but this policy had the result that, as there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive,

half-trained elements had to be sent to the front in considerable numbers—indeed the ration strength of the army was actually trebled. The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan herself and place her hegemony in the Far East beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade her in superior force, and as Port Arthur was the station of the fleet that might convey an invasion, as well as the symbol of the longest-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific Squadron, the object was to keep the two halves of that squadron, at Port Arthur and Vladivostok respectively, separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the break-up of the ice, the army could only disembark at Chemulpo, far from the objective, or at Dainy under the very eyes of its defenders. The army could therefore, for the moment, only occupy Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On the 8th of February the main battle-fleet, commanded by Vice-Admiral Togo, was on the way to Port Arthur. During the night his torpedo-boats surprised the Russian squadron in harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo-craft tried to run in past the batteries, several attempts were made to block the harbour entrance by sinking vessels in the fairway, and free and deadly use was made by both sides of submarine mines. But, though not destroyed, the Port Arthur squadron was paralysed by the instantaneous assertion of naval superiority.

Admiral Alexiev, the tsar's viceroy in the Far East and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea.<sup>3</sup> For a time, when in place of Admiral Starck (who was held responsible for the surprise of February), Admiral Makárov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electro-mechanical mines was laid by the Japanese in the night of April 12th-13th, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine-field. Makárov, however, crossed it without accident, and pursued the cruisers until Togo's battle-fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine-field, and this time the mines were effectual. The flagship "Petropavlovsk" was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor operations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaimamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports. The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had

Makárov at Port Arthur.

<sup>1</sup> Belated declarations of war appeared on the 10th.

<sup>2</sup> The total Russian army on a peace footing is almost 1,000,000 strong.

<sup>3</sup> A vivid picture of the state of affairs in the navy at this period is given in Semenov's *Raspkuta* (Eng. trans.).

to be made, not on the Straits of Tsushima, but as far north as possible. Chemulpo, nearer by 50 m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uriu disembarked troops at Chemulpo under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (General Kuroki) was gradually brought over during February and March, in spite of an unbeaten and, under Makárov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land, such strategy was an exceedingly difficult game to play. But *adpat*, had Makárov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15th), two of Japan's largest battleships, the "Hatsume" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with five hundred souls. But the admiral was not on board. The Russian sailors said, when Makárov's fate was made known, "It is not the loss of a battleship. The Japanese are welcome to two of them. It is *he*." Not only the skill, but the force of character required for playing with fire, was wanting to Makárov's successors.

It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no *battle* until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Mukden or at Liao-Yang. But he had to reckon with the fleet<sup>1</sup> at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea, there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance, he pushed out a strong covering detachment towards the Yalu.

But little by little he succumbed to his *milieu*, the atmosphere of false confidence and passivity created around him by Alexieiev. After he had minutely arranged the Eastern Detachment in a series of rearguard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zaslulich, told him that "it was not the custom of a knight of the order of St George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on the 30th of April ordered the attack to begin at daylight on the 1st of May. For several miles above Antung the rivers Yalu and Aiho are

parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd divisions was assigned the frontal attack on the Chiuliencheng position, where the Russians had about one-half of their forces under Major-General Kashtalinski. On the 30th of April, Inouye's 12th division accomplished its task of clearing the high ground up to the Aiho. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zaslulich's mediocre generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river, stormed forward under a heavy fire. A few moments afterwards Zaslulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th division) encountering no very serious resistance, crossed the Aiho and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankguard. Fresh attempts were made by subordinates to form rearguards, but Zaslulich made no stand even at Feng-hwang-cheng, and the Japanese occupied that town unopposed on the 5th of May. The Japanese losses were 1100 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2500 out of some 7000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—I. Siberian Corps (Stakelberg), Niu-chwang and Kaiping; II. Siberian Corps, Liao-Yang. Zaslulich (III. Corps and various other units) had still 21,000. In the Port Arthur "fortified rayon," under Lieut.-General Stoessel (IV. Corps), were 27,000 men, and General Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stoessel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her 2nd Army (General Oku, 1st, 3rd, 4th and 5th divisions) during April, and sent it to Chinampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Pitszewo. Here, under the protection of a continuous chain of war-vessels between the Elliot

Kuropatkin's plan.

Landing of the Japanese 2nd Army.

<sup>1</sup> Not, as is often assumed, the fortress itself.

Islands and the mainland, Oku began to disembark on the 5th of May. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan Hill, at the narrowest part of the peninsula, where part of a Russian division (3000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On the 26th of May took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th division on his right, assisted by its gunboats,

forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from ~~Nanshan~~ higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4500 out of 30,000 engaged or 15%, that of the Russians fully half of the 3000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th divisions). The 10th division, forming the nucleus of the 4th Army, had begun to land at Takushan on the 19th of May. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest

distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian Eastern Detachment, which was three days' march at most from Feng-hwang-cheng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian Southern Detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13th, Kuroki's on June 24th; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unpursued troops quickly regained their *moral*, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast),<sup>1</sup> Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuiling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Mukden. The subsidiary protective forces on either flank of Zasluch had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reasserted himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward, Kuropatkin allowed his subordinates little or no initiative. A few days later, Zasluch's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Mukden. But on the 6th of May he learned that the Japanese 1st Army had again halted at Feng-hwang-cheng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The Eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.<sup>2</sup> It was at this moment of doubt that Alexeiev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an "active" policy (19th May). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, "Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur," were needed to bring him definitely to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, but so did Moreau; the generality of lesser men have obeyed, but so did Suwárov.

Stakelberg's I. Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But

it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the Southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the Eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aiho and Yalu valleys, the right (Mishchenko's Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the "Ussuri Army" about Vladivostok; and Stessel's two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Feng-hwang-cheng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuiling. Oku's 2nd Army (4 divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeiev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was "the capture of the Nanshan position and thereafter an advance on Port Arthur." Yet another object was given him, to "relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces," and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7th, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on the 14th of June, as he expected, he came upon Stakelberg's detachment in an entrenched position. On the 14th and 15th, attacking sharply on the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1200 men out of 35,000 engaged, while the Russians, with a loss of at least 3600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition.

Meantime, except for the movement on Siu-yen already mentioned,<sup>3</sup> and various reconnaissances in force by Keller's main body and by Rennenkampff's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Feng-hwang-cheng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on the 1st of May.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Münchengrätz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenu. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for

<sup>3</sup> The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th division from Takushan helped to drive away Mishchenko's Cossacks,

on the 23rd of June an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battleships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their sea-borne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed ahead a few miles to cover a larger supply area. On the 1st of July the Vladivostok squadron appeared in the Tsushima Straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for eleven days at Kaiping, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the Eastern Detachment, massed about two army corps.

On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skillfully, and the Japanese were repulsed with a loss of 1200 men. Zarubayev, who had used *Tashichiao* only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshulling South.<sup>1</sup>

The 1st Army, after its long halt at Feng-hwang-cheng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on the 24th of June, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motienling pass, however, had been seized without difficulty, and Keller's power of counter-attack had been reduced to nothing by the despatch of most of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Feng-hwang-cheng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1000 men in the action at the Motienling (17th July), but it was at least ascertained that considerable forces were still on the Japanese right,

and upon the arrival of a fresh army corps from Europe Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20 m. of front in two halves, separated by 6 m. of impassable mountain, and knowing well the danger of a "cordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked

on the 31st of July, all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd divisions (action of Yang-tzu-ling) on the Russian front and flank failed, the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2400, to the Japanese 1000 men.

This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire on Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Bilderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bombproofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants.

The Japanese, too, had effected their object, and as they converged on their objective, the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But, as the event was to prove, the military policy of Japan had failed to produce the requisite number of men for the desired Sedan, and so, instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Moltke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

On the 25th of August the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitze river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of 25th-26th, and 26th of August, Kuroki advanced, fighting heavily all along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Taitzeho. The retirement of the Russian Southern Force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitzeho, but the divisions that were to come up on its left were held fast by their

<sup>1</sup> The 5th division of the 2nd Army had been sent to join the 10th as the latter approached Hsimucheng. The Guard brigade of Kuroki's army which had served with Nozu in the advance had now returned to Feng-hwang-cheng.

opponents. The 29th was an uneventful day, on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitzeho above and below the town, and their forces were massed most closely on either side of the "Mandarin" road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuroki extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitzeho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the 2nd division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, which had no military significance, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves that he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakeberg and Zarubayev, before withdrawing silently into the

lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of the 1st of September—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies, and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitzeho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the XVII. Corps from Europe. But the right of the 1st Army (12th division) was threatened by the gathering storm of the counterstroke from the side of Yental Mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone, the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki, who had conceived the mistaken idea of a general retreat of the Russians on Mukden, was preparing

to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the XVII. Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai Mines, then came the I. Siberian Corps (Stakelberg), then the X. Corps, then the XVII. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th division which was executing the proposed "pursuit," gave way—part of his force in actual rout—and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the X. Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai Mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden.

Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of General Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th brigade on Manjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this brilliantly successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war would have ended on Japan's own terms. As it was, after another day's fighting, Kuropatkin drew off the whole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 12th division on the 4th of September. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources. At St Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign, like the second half of the war of 1859, was nothing more than a series of violent and resultless encounters of huge armies—armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang and Magenta.

At this time the siege of Port Arthur had only progressed so far that the besiegers were able to realize the difficulties before them. Nogi landed on the 1st of June, and his army (1st and 11th divisions) gradually separated itself from Oku's and got into position for the advance on Port Arthur. Dalny, the commercial harbour, was seized without fighting, and a month was spent in preparing a base there. But so far from retiring within his fort-line Stessel took up a strong position outside. Dislodged from this on the 26th of June, the Russians checked Nogi's further advance on July 3-4 by a fierce, though unsuccessful, counterstroke. Having been reinforced by the 99th division and two extra brigades of infantry, Nogi advanced again on the 26th. The Russians, having had a month wherein to entrench themselves, held out all along the line; but after two days and one night of fighting amongst rocks and on precipitous hill-sides, the Japanese broke through on the night of July 27-28. Stessel then withdrew in good order into Port Arthur, which in the two months he had gained by his fighting manœuvre had been considerably strengthened. Nogi had already lost 8000 men.

The defences of Port Arthur, as designed by the Russians in 1900, and owing to the meagre allotment of funds only partially carried out before the war, had some tincture, but no more, of modern continental ideas. There was a continuous enceinte of plain trace

round the Old Town, at a distance of 1000 to 2000 yds. from it, which had not and could not have had any influence on the issue of the siege. The main line of defence followed the outer edge of the amphitheatre of hills surrounding the harbour. These hills had their greatest development on the N.E. side, their outer crests being some 4000 yds. from the Old Town. West of the Lun river the defensive line offered by the hills is less defined, and the line adopted for the permanent works was on the north only 3000 yds. from the harbour and 2000 yds. from the New Town. Running S.W. and S. back to the coast, it gradually draws in quite close to the S.W. end of the harbour. The total length of this line from sea to sea is some 12 m. Its most obvious weakness is that 5000 yds. N.W. of the harbour and New Town the now famous "203-Metre Hill" overlooks both. Here it had been intended to construct permanent works, but considerations of expenditure had caused this to be deferred.

On this main line of defence some seven or eight permanent works had been disposed (it is difficult to define with accuracy, as some of the concreted works were little better than semi-permanent in character). Some of these had been prepared with interior parapets and platforms of concrete for medium guns. Fort Erh-Lung was of this character. The general design appears to have been grounded on the French detached forts of the seventies (see FORTIFICATION), as the front parapet was designed for infantry and the interior, 10 ft. higher, for guns. The ditch, 30 ft. deep, excavated in the rock, was flanked by countercarp galleries. The living casemates were under the gorge parapet. A grave defect in the design was that there was no covered communication between these casemates and the parapets. Fort Chi-Kuan had no artillery parapet. The ditch, 12 to 15 ft. deep, was defended by countercarp galleries. The casemates in the gorge, partially cut off from the terreplein by a couple of deep sunk yards or areas, could be defended in the last resort as a keep. In addition to this the terreplein was retrenched. In both of these forts there was an apparently meaningless projection at the gorge. It is possible that these were embryonic "batteries traïdores" to flank the intervals. Fort Sung-Shu was of the same type as Chi-Kuan. These three were the only permanent forts seriously attacked.

The permanent works were supplemented before the siege began by a prodigious development of semi-permanent works and trenches. Every knoll had its redoubt or battery, and the trenches were arranged line behind line, to give supporting, cross and enfilade fire in every direction. Thus on the north front, from Chi-Kuan battery to Sung-Shu, a distance of about two miles, there were three permanent forts and seven semi-permanent works and batteries. Behind these was the "Chinese Wall," and behind that more batteries and trenches. On the north-west front, 203-Metre Hill, in advance of the main line, was occupied by strong semi-permanent works, with trenches and redoubts to either flank; and 174-Metre Hill, 1500 yds. beyond it, was also held. The Lun-Ho valley where it cut through the line was closed by entanglements and fougasses, and swept by batteries on each side. In front of the centre, the Waterworks Redoubt, a semi-permanent work covering the Port Arthur water supply, and connected by trenches with the four Temple Redoubts a mile away to the west, formed a strong advanced position. Wire entanglements were disposed in repeated lines in front of the defences, but they were not of a strong type. The Russians, with the resources of the fleet at their disposal (just as at Sevastopol), used great numbers of machine guns and electric lights, and the available garrison at first was probably, including sailors, 47,000 men.

Such were the defences that the Japanese attacked, with a force at the outset (30th of July) little more than superior numerically to the defenders, and an entirely inadequate siege train (18 6-in. howitzers, 60 4-7-in. guns and howitzers, and about 200 field and mountain guns). They were imperfectly informed of the strength of the garrison and the nature of the defences. Recollections of their easy triumph in 1894 and perhaps thoughts of Sevastopol, German theories of the "brusque attack," the fiery ardour of the army, and above all the need of rapidly crushing or expelling the squadron in harbour, combined to suggest a bombardment and general assault. The bombardment began on the 19th of August and continued for three days, while the infantry was spreading along the front and gaining ground where it could. The real assault was made on the night of the 21st on the two Pan-Lung forts (semi-permanent) on the centre of the north-eastern front. The fighting was of the most severity, and continued through the 22nd; and although the stormers captured the two forts they were absolutely unable to make any further progress under the fire of the permanent forts Erh-Lung and Chi-Kuan on either side of, and the Wan-tai fort behind, Pan-Lung. Every attempt to bring up supports to the captured positions failed, and the Russians concentrated on the spot from all quarters. On the night of the 23rd-24th, just as the assault was being renewed, Stessel delivered a fierce counter-attack against the lost positions, and the result of an all-night battle was that though the forts were not recaptured, the assault was repulsed with over 5000 casualties, and the Japanese in Pan-Lung were isolated. This sortie raised the spirits of the Russians to the highest pitch. They seemed indeed to have broken the spell of defeat. On the Japanese side 15,000

Defences  
of Port  
Arthur.

men had been killed and wounded in three weeks. The Russians strengthened their works around the captured forts in such a way as effectually to prevent farther advance, and the Japanese 3rd Army had now to resign itself to a methodical siege. Small sorties, partial attacks<sup>1</sup> and duels between the Japanese guns and the generally more powerful ordnance of the fortress continued. The siege approaches were first directed against the Temple-Waterworks group, which was stormed on the 19th and 20th of September. Pan-Lung was connected with the Japanese lines by covered ways, approaches were begun towards several of the eastern forts, and on the 20th of September 180-Metre Hill was stormed, though the crest was untenable under the fire from 203-Metre Hill. The Japanese were now beginning to pay more attention to the western side of the fortress, and from the 19th to the 22nd there was hard fighting around 203-Metre Hill, the attack being eventually repulsed with the loss of 2000 men. Operations in the west were thereupon abandoned for the time being, and the eastern forts remained the principal objective of the attack. Heavier howitzers had been sent for from Japan, and on the 1st of October the first batteries of 28 centimetre (11 in.) howitzers came into action. They fired a shell weighing 485 lb., with a bursting charge of 17 lb. On the 12th, the Japanese took the trenches between the Waterworks Redoubt and Erh-Lung, and cut the water-supply. Saps were then pushed on against Erh-Lung, and to help in their progress a Russian advanced work called "G" was captured on the 16th, by a skillfully combined attack of infantry and artillery. From this time forward there was a desperate struggle at the saps-heads on the north front.<sup>2</sup>

On the 26th of October another assault was made on Chi-Kuan

<sup>1</sup> A particular feature of these constant night-fights was the effective use of the defenders' searchlight, not only to show up the enemy but to blind him.

<sup>2</sup> Hand grenades and extemporized trench mortars were used on both sides with very great effect. The Japanese hand grenades consisted of about 1 lb of high explosive in a tin case; the Russian cases were of all sorts, including old Chinese shell. The Japanese employed wire-netting screens to stop the Russian grenades. Various means were tried for the destruction of entanglements. Eventually it was found that the best plan was to sap through them.

Fort and Battery, and was continued at intervals, varied by Russian counter-attacks, till the 2nd of November. By this time the Japanese were becoming disheartened. They had incurred an additional loss of 13,000 men without substantial gain, except a lodgment on the counterscarp of Sung-Shu. This prepared the way for mining, which had already been begun at Erh-Lung. On the 17th of November seven mines were exploded at Sung-Shu, which blew in the back of the counterscarp galleries. At Erh-Lung on the 20th of November three mines were exploded, which half filled the ditch, and the Japanese later on sapped across to the escarp over the *débris*. At Chi-Kuan, the counterscarp gallery had been breached by an ill-managed Russian mine on the 23rd of October and the Japanese got in through the breach and made a lodgment. They did not, however, get possession of the whole of the counterscarp galleries before about the middle of November. On the 22nd of November the Japanese assaulted the trench round Chi-Kuan battery. It was captured and retaken by counter-attack twice between 6 p.m. and 1 a.m. In this fight each side was using corpses as breastworks.

On the 26th of November another assault was made on the same lines as that of the 30th of October. By this time the besiegers were sapping under the escarpments of the northern forts, and it would have been better to delay. But the situation was serious in the extreme. In Manchuria Kuropatkin's army had reasserted itself. From Europe Rozhstvenski's squadron was just setting sail for the Far East. Marshal Oyama sent his principal staff officers to stimulate Nogi to fresh efforts, and some exhausted units of the besieging army were replaced by fresh troops from Japan. With 100,000 men and this urgent need of immediate victory, Nogi and the marshal's staff officers felt bound to make a third general assault. The siege works had indeed made considerable progress. The ditches of Sung-Shu and Erh-Lung were partially filled. They held most of the ditch of Chi-Kuan Fort and were cutting down the escarp, and two parallels had been made only 30 yds. from the Chinese Wall at "G" and Pan-Lung.

The general attack was made at 1 p.m. At Sung-Shu the stormers got into the fort, but suffered much from the artillery on the western side of the Lun-ho valley, and were beaten out of it again in 20 minutes; 2000 men tried in vain to get up the Lun-ho valley to take Sung-Shu in rear. At Erh-Lung they could not get over the outer parapet. At "G" they took a portion of the Chinese Wall and lost

it again, other trenches with a cross fire being behind. At Pan-Lung the machine guns on the Wall prevented them from leaving the parallel. At Chi-Kuan Fort the crepepin of the fort had been covered with entanglements defended by machine guns on the gorge parapets, and the Japanese could make no way. Briefly, there was a furious fight all along the line, and nothing gained. On the 27th of November, after losing 12,000 men, the assault was abandoned. On the north front the Japanese returned to mining.

But so urgent was the necessity of speedy victory that the fighting had to continue elsewhere. And at last, after every other point had been attempted, the weight of the attack was directed on 203-Metre Hill. A battery of 11-inch howitzers was established only one mile away. On the 28th of November assaults were made and failed. On the 30th of November an attack with fresh troops failed again. On the 1st of December there was a heavy bombardment by the big howitzers, which obliged the Russians to take shelter in rear of the ruined works. On the 2nd of December the Russians tried a counter-attack. During the next two days the artillery were busy. The engineers sapped up to the ruins of the western work, saw the shelters on the reverse slope and directed artillery fire by telephone. Thirty-six guns swept the ground with shrapnel. Finally on the 5th of December the Japanese attacked successfully. Their losses in the last ten days at 203-Metre Hill had been probably over 10,000. Those of the Russians were about 5000, chiefly from artillery fire.

This was the turning-point of the siege. At once the 11-inch howitzers, assisted by telephone from 203-Metre, opened upon the Russian ships; a few days later there were wholly *hors de combat*, and at the capitulation only a few destroyers were in a condition to escape. The siege was now pressed with vigour by the construction of batteries at and around 203 Metre, by an infantry advance against the main western defences, and by renewed operations against the eastern forts. The escarp of Chi-Kuan was blown up, and at the cost of 800 men, General Samedya (11th division), personally leading his stormers, captured the great fort on the 19th of December. The escarp of Ehr-Lung was also blown up, and the ruins of the fort were stormed by the 9th division on the 28th of December, though a mere handful of the defenders prolonged the fighting for eight hours and the assailants lost 1000 men. Sung-Shu suffered a worse fate on the 31st, the greater part of the fort and its defenders being blown up, and on this day the whole defence of the eastern front collapsed. The Japanese 7th and 1st divisions were now advancing on the western main line; the soul of the defence, the brave and capable General Kondratenko, had been killed on the 15th of December, and though the Japanese seem to have anticipated a further stand, Stessel surrendered on the 2nd of January 1905, with 24,000 effective and slightly wounded and 15,000 wounded and sick men, the remnant of his original 47,000. The total losses of the 3rd Japanese Army during the siege were about 92,000 men (58,000 casualties and 34,000 sick).

Meanwhile the Japanese navy had scored two important successes. After months of blockade and minor fighting, the Russian Port Arthur squadron had been brought to action on the 10th of August. Admiral Vitheft, Makarov's successor, had put to sea shortly after the appearance of the 3rd Army on the land front of Port Arthur. The battle opened about noon, 10 m. south of the harbour; the forces engaged on each side varied somewhat, but Togo finally had a superiority. Admiral Vitheft was killed. As the Russians became gradually weaker, the Japanese closed in to within 3 m. range, and Prince Ukhtomsky (who succeeded to the command on Vitheft's fall) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Port Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already earned a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Port Arthur, until near the close of the siege, when, after going ashore and examining the remnant of the Russian fleet from 203-Metre Hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kaimura's squadron, after various adventures, at last succeeded on the 14th of August in engaging and defeating the Russian Vladivostok squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and thenceforward only the Baltic fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the

mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in October 1904, whether she could endure the drain of men and money, if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuropatkin's offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

After the battle of Liao-Yang Kuropatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and since the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point 9 m. west of the railway, through Yentai Station and Yentai Mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin's intention was to work round the Japanese right on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrenching each strip of ground gained, and finally with the centre—i.e. Bilderling, left—and Stakelberg, to envelop and crush the 1st Army, which formed the Japanese right, keeping the 4th Army (Nozu) and the 2nd Army (Oku) in countenance by means of Bilderling's main body. The manoeuvre began on the 5th of October, and by the evening of the 10th, after four days of fairly heavy advanced-guard fighting, chiefly between Bilderling and Nozu, Stakelberg was in his assigned position in the mountainous country, facing west towards Liao-Yang, with his left on the Taitseho. The advance of Bilderling, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yentai, and the

demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counter-attack. Kuroki with only a portion of the 1st Army was left to defend at least 15 m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Kuroki displayed the greatest skill, but he was of course pressed back by the four-to-one superiority of the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had entrenched every step of their previous advance, and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged *à fond* instead of gradually withdrawing as Kuropatkin intended, and at any rate it is unquestioned that in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th division of Kuroki's army was almost at its last gasp and must have yielded to fresh pressure, but Kuropatkin himself suspended the general offensive on the 13th of October. In the fighting of the 13th-16th of October the Russians gradually gave back as far as the line of the Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. The fighting, irregular but severe, continued. Kuropatkin was so far averse to retreat that he ordered a new offensive, which was carried out on the 16-17th. Putilov and Novgorod hills, south of the Sha-ho, were stormed by the Russians, and the Japanese made several efforts to retake these positions without success. Kuropatkin wished to continue the offensive, but his corps commanders offered so much opposition to a further offensive that he at last gave up the idea. The positions of the rival armies from the 18th of October, the close of the battle of the Sha-ho, to the 26th of January 1905, the opening of the battle of Sandepu (Heikoutai)—a period almost entirely devoid of incidents—may be described by the old-fashioned term "winter quarters." The total losses of the Russians are stated as 42,000 men, but this is very considerably exaggerated; the Japanese acknowledged 20,000 casualties.

In January 1905, apart from Mishchenko's cavalry raid in rear

<sup>1</sup> As regards food and ammunition, the resources of the defence were not by any means exhausted, and General Stessel and other senior officers of the defence were tried by courts-martial, and some of them convicted, on the charge of premature surrender.

of Oyama's forces (January 8th-16th) the only change in the relative positions of Oyama and Kuropatkin as they stood after the battle of the Sha-ho was that the Japanese had extended somewhat westwards towards the Hun-ho. The Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Gripenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January, Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Gripenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandou (Heikoutai), fought in a terrible snow-storm on the 26th and 27th of January 1905, came near to being a great Russian victory. But the usual *discours* of Russian operations and their own magnificent resistance saved the Japanese, and after two days' severe fighting, although Gripenberg had not been checked, Kuropatkin, in face of a counter-attack by Oyama, decided to abandon the attempt. The losses were roughly 8000 Japanese to over 10,000 Russians.

Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Gripenberg and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line in front of Mukden from the Hun-ho, through the Putilov and Novgorod hills on the Sha-ho, to the mountains, was 47 m. long, the armies from right to left being II. (Kaulbars), III. (Bilderling) and I. (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40 m. long, were Oku (2nd Army), Nozu (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yantai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation

when the Japanese forestalled them by advancing on the 21st of February. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up **Mukden**, in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (25th February), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denuded his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on the 28th of February, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (1st-2nd March) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing W. and S.W. respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and like Grant at Petersburg in 1864, extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Yantai, to help Nogi. It was not before the evening of the 6th of March that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On

the rest of the line severe local fighting had continued, but the Russian positions were quite unshaken, and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of the 2nd of March—had returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly. Nogi and Kaulbars stood fast, facing each other on the west front; after the arrival of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it inwards towards the Russian line of retreat. Bilderling and Linievich were now close in to Mukden and along the Hun-ho. On the other side Oku had taken over part of Nogi's line, thus freeing the 3rd Army for further extension to the north-west, and the rest of the 2nd Army, the 4th, the 1st and the 5th were approaching the Hun-ho from the south (March 8th). On this day the

Russian fighting between Nogi and Kaulbars was very severe, and Kuropatkin now made up his mind to retreat towards Tieling. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward, Oku now occupied all the original line of the 3rd Army, Nozu alone was left on the south front, and Kuroki and Kawamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at and east of Mukden, the movement continued, and though it was not executed with entire precision, and the rearguards suffered very heavily, the Russians managed to draw off in safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kawamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the seventeen divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could only be undertaken after an interval of re-organization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had ever been before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on the 13th-15th of October 1904, the fleet steamed down the North Sea, expecting every night to be attacked by torpedo-boats. On the 21st, in their excitement, they opened fire on a fleet of British trawlers on the Dogger Bank (q.v.), and several fishermen were killed. This incident provoked the wildest indignation, and Russia was for some days on the verge of war with England. A British fleet "shadowed" Rozhdestvenski for some time, but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozhdestvenski heard of the fall of Port Arthur, and the question of returning to Russia arose. But a reinforcement under Rear-Admiral Nebogatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, Nebogatov joining at Kamranh Bay in Cochin China. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the faster-vessels were tied to the movements of many "lame ducks." Rozhdestvenski had, moreover, numerous store-ships, colliers, &c. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the various courses open to him, Togo prudently chose that of awaiting Rozhdestvenski in home waters. The Russians left Kamranh on the 14th of May, and for a time disappeared into the Pacific. It was assumed that

they were making for Vladivostok either via Tsushima Strait or by the Pacific. Rozhdestvenski chose the former course, and on the 27th of May the fleets met near Tsushima. About 1.45 p.m., the Russians, who were still in a close cruising formation, attempted to open out for battle as the Japanese approached. The Russian battleships, originally heading N.N.E., swerved to the E. as the Japanese battle squadron passed across their front. Togo's fire was concentrated first on the "Oslabria," the leading Russian battleship, and by 2.25 she was *hors de combat*. At this time both the battle-fleets were running E. Togo, concentrating his fire on each ship in succession, and seeking by superior speed to head off the Russians, now inclined towards the S.E., and the Russians conformed. At 3, the Russian flagship "Suzarov" had fallen out of the line, though still firing. Rozhdestvenski himself had been wounded, and the command had devolved on Nebogatov. Shortly afterwards the Russians suddenly turned N., and sought to pass, across the wake of Togo's battle-fleet, up the straits. Thereupon the leading Japanese ships promptly turned through, covered by the rear ships, which ran past them on the original course and then came round in succession; this manoeuvre was so well executed that the Japanese again headed off their enemy, who swerved for the second time towards the E. The Japanese thereupon executed the same manoeuvre as before, but the Russians were suffering far more severely. Meanwhile, the cruisers on both sides had been heavily engaged. The Russian cruisers kept on the right of their battleships, while the Japanese, very superior in speed, ran S., S.E. and E. across the rear of the enemy's main squadron, and about 3 ranged up alongside the Russian cruisers. The latter were slower, and hampered by the crowd of damaged battleships, store-ships and colliers; before 5 they were in the greatest confusion, which was presently increased by the battleship squadron, now turned back and heading W., with Togo in pursuit. The Russians again broke out northward; but some of the Japanese squadrons hung on to the remnant of the enemy's battle-fleet, and the others dealt with the numerous Russian vessels that were unable to keep up. Then Togo called off his ships, and gave the torpedo craft room and the night in which to act. At daylight the larger ships joined in again, and before long the whole Russian fleet, with few exceptions, had been captured or sunk.

After the disasters of Mukden and Tsushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and *pourparlers* were set on foot. The war meanwhile drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, re-organizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Saghalien (July 8-30), and another, General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth, New Hampshire, on the 9th of August, and by the end of the month the belligerents had agreed as to the main points at issue, that Russia should cede the half of Saghalien, annexed in 1875, surrender her lease of the Kwangtung peninsula and Port Arthur, evacuate Manchuria and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on the 23rd of August 1905.

**BIBLIOGRAPHY.**—The first place in the already numerous works on the war is by the general consent of military Europe awarded to General Sir I. S. M. Hamilton's *A Staff Officer's Scrap Book*, and the second to the reports of the British attachés (*The Russo-Japanese War: British Officers' Reports*, War Office, 1908). Other first-hand narratives of importance are the American officers' reports (*Reports of Military Observers*, General Staff, U.S.A.); Major v. Tettau's *18 Monate beim Heere Russlands*; von Schwarz, *Zehn Monate beim Heere Kuropatkin's*, and Kuropatkin's own work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal "Streiflicht" (*Einzelchriften über den russ.-japanischen Krieg*); the volumes of lectures delivered at the Russian Staff College after the war, French translation (*Conférences sur la guerre russo-japonaise faites à l'Académie Nicolas*); British official *History of the Russo-Japanese War* (1907- ); German official *Russisch-japanischer Krieg* (1906- ); English translation by K. von Donat; Löffler, *Der Russisch-Japanische Krieg* (Leipzig, 1907; French trans.); L. Gianni-Trapani, *La Guerra russo-japonese* (Rome, 1908); E. Bujac, *La Guerre russo-japonaise* (1909). Of critical studies the most important are Cordonnier's "Les Japonais sur Mandchourie" (*Revue d'Infanterie*, 1910); and Culmann, *Étude sur les caractères généraux de la guerre en extrême-orient* (Paris, 1906). One naval narrative of absorbing interest has, however, appeared, Semenov's *Raspisla* (English trans.).

**RUSSO-TURKISH WARS (1828-29 and 1877-78).** The earlier wars between Russia and Turkey possess little military interest to-day, and are scarcely remembered except as the occasion of Suvarov's exploits. The first of the three 19th-century (1806-1812) wars, however, though much less vigorously fought than the preceding wars, at any rate introduced the "Eastern question" into European politics as a factor affecting the balance of power, and its cessation at the moment of Napoleon's advance on Moscow had a great effect on the emperor's Russian campaign.

The second war is more celebrated. It was a reflex of the Greek War of Independence, and began with the invasion of Rumania by the Russians in May 1828. One corps invested and took Braila, another passed by Bucharest and besieged Rustchuk and Silistria, and a third crossed the Danube below Isacka. The first and the last were united as an army under the tsar and advanced through the Dobrudja on Shumla. But after a considerable amount of fighting it was decided that the Turks here were too strong for the invaders, and the tsar drew off his forces by degrees towards Varna, which was besieged next. But the Shumla troops were thus gradually set free to join the Turkish field army under the grand vizier, which, however, merely menaced, without seriously attacking, the besiegers of Varna. The place surrendered on the 10th of October 1828, and the tsar at once turned upon the grand vizier, attacked him on the river Kamchik (15th October) and forced him to retreat to Aidos.

Meantime, however, Silistria offered a gallant resistance. Even when the besiegers were reinforced from the main army they could not master the defence, and when winter came on the siege was abandoned, and the Russians drew off into Rumania into winter quarters. In Asia, meanwhile, a Russian army under Prince Paskievich had advanced from Tiflis, and captured Kars and other places, while the Black Sea fleet secured the surrender of Poti. Paskievich next defeated the Turks at Akhalzik (27th August), captured Ardahan, and advanced by Bayazid to the upper Euphrates. But coming there into conflict with the fierce Kurds, he gave up further enterprises and, leaving garrisons in the strong places, took his army back into the Caucasus for the winter.

In 1829 Diebitsch took over the command of the 70,000 men on the Danube, and resolved to carry the war over the Balkans. As a preliminary the fleet seized Sozopolis (Sisepol). A second and vigorously pressed siege of Silistria ended with the surrender of the place on June 30th, the Turkish operations for the expulsion of the Sozopolis garrison and the relief of Silistria being dilatory as before. The Turkish army was at this time in process of reorganization on a European model, which added to the difficulties of their situation. The grand vizier, Reschid Mehmet, in May attempted to combine the Rustchuk and Shumla garrisons for the expulsion of the Russians from Varna, but unsuccessfully, the two columns being beaten in detail. Soon afterwards Diebitsch, with part of the army investing Silistria, marched against him and defeated him at Tcherkovna (11th June). Immediately after this Diebitsch carried out the brilliant passage of the Balkans and advanced to Adrianople, which laid Constantinople at his mercy, and brought about an immediate peace. A month after its signature, a Turkish army from the west, attempting to recapture Adrianople behind Diebitsch, was defeated on the 16th October at Arnaut Kaliessi. In Asia, meantime, Paskievich, after relieving Akhalzik, where his garrison had been blockaded, won two victories on two successive days at Kainly and Milli Duzov (1st and 2nd June), and captured a number of fortresses, his victorious advance being arrested only by the terms of peace. (X.)

*The War of 1877-78*—On 24th April 1877, the tsar declared war against Turkey, with the avowed object of righting the wrongs of the Christians in Turkey. The Turco-Servian war was just over. Contrary to expectation the Turks had proved victorious. Hostilities had ceased in October 1876, though it was not till 1st March 1877 that peace had been signed. During 1876 the Turks had also quelled an insurrection of the Christians

in Bulgaria, when the treatment they meted out to the Christians and the cry of "Bulgarian atrocities" had aroused the sentimental sympathies of Europe.

The Danube formed the Turkish frontier. Flowing west to east along the southern boundary of Rumania, it turned to the north and then to the east to the Black Sea, enclosing the Dobrudja, an inhospitable and difficult region, of rectangular shape, some 100 m. N. to S. by 30 to 60 m. E. to W., which was the extreme northern part of the Turkish dominions.

The Russians did not anticipate that the opposition to be encountered from the Turkish forces would be of a serious nature. As for natural obstacles, there were the Danube and the Balkans directly across their route, but the passage of these was not likely to cause any serious delay.

The Turkish fortresses of the Quadrilateral—Rustchuk, Silistria, Shumla and Varna—could be avoided, and Nikopol and Vidin were more or less isolated. It would only be necessary to cover the lines of communication from the action of the garrisons of these places. It was known that Osman Pasha was at Vidin with what remained of the Turkish force which had defeated the Servians the previous year, and it would be necessary to detach a force to operate against him. There would be some delay in the forwarding of supplies, due to the fact that the Rumanian railway was of different gauge to the railways of Russia, but this would not be serious. This line, the only railway through Rumania, ran from Galatz to Bucharest, where one branch ran west by Slatina and the other to Giurgevo on the Danube, where it connected with a line south of the river from Rustchuk to Shumla and Varna through Rasgrad. It was generally imagined that the advance to Constantinople would be of the nature of a triumphal march. By a clause of the Treaty of Paris of 1856 the Russian naval forces in the Black Sea had been destroyed, and though this clause was revoked in 1871, in 1877 the Turks possessed the undoubted command of the sea. Had things been different, an advance through the Dobrudja, with a safe line of supply by water, would have offered many advantages. Under existing circumstances, with Turkish gunboats on the Danube and ironclads on the Black Sea, such a course was out of the question.

The plan of campaign formed by the Russians was as follows: One corps was to enter the Dobrudja to protect the line of communication against any Turkish advance east of the Danube, while the remainder would cross the Danube between Rustchuk and Nikopol, cross the Balkans and advance on Adrianople. Detached forces would meanwhile mask the "Quadrilateral" and the Turkish force at Vidin.

A Convention had been made with Rumania, allowing the passage of the Russians through the country. The Rumanians proclaimed their independence of Turkey, and although the tsar declined their offer of active co-operation for the time being, their troops occupied Calafat, facing Vidin, and early in May their batteries engaged the guns of Vidin across the river. The Russian army with which it was proposed to carry on the war, consisted of six army corps and two rifle brigades. Each corps was formed of one cavalry and two infantry divisions. There were in addition 74 squadrons and 52 guns of Cossacks. Each infantry division had 48, and each cavalry division 12 guns. This force had been mobilized in the November of the previous year, and was now distributed as follows:—

Commander-in-chief:	The grand-duke Nicholas, with headquarters at Kishinev.
VII. Army Corps	. . . Odessa and Tatar Bunar.
XI. "	. . . Tarutinskaja and Kanassany.
VIII. "	. . . Kishinev.
XII. "	. . . Ungheni.
IX. "	. . . Winnica.
X. "	. . . Crimea.
Rifle Brigades	. . . Bestomak.

The mobilization of the IV., XIII., and XIV. Army Corps had been ordered in December 1876, but they would not be ready to move till the following month—May 1877. In

addition to the above, there were heavy artillery with 400 siege guns, engineers with pontoon trains, naval launches, and the necessary supply trains. The total Russian forces numbered 200,000 combatants of all arms, with 850 field and 400 siege guns.

For some months prior to the tsar's declaration, Turkey had realized that war was inevitable, but such preparations as were made were far from adequate. Abdul Kerim, who had commanded in Servia the previous year, was still acting as commander-in-chief, but the task set him was not an easy one. With the Russians in front, the Servians and Montenegrins, whose action was known to be uncertain, on the flank, and the Christian population of Bulgaria, in sympathy with the Russians, in the midst, it required a younger and more energetic man, with a greater knowledge of the art of war than he possessed, to plan and to carry out a successful defence of the Moslem dominions. The prospect of war had aroused the Turks, and the nation had taken steps to prepare for the conflict, but they lacked trained leaders. The Turkish officers were but ill-instructed. Works on the art of war did not exist in the Turkish language. General conscription existed in Turkey, but there was an entire absence of organization. Theoretically, each of the six districts into which the empire was divided should have produced an army of four corps, but it was only on paper. Practically the troops were not organized in corps. At the outbreak of war, Osman's force, some 30,000 strong, was at Vidin; a few battalions were spread along the Danube from Vidin to Silistria, with a brigade of infantry at Nikopol, another at Sistova, and the best part of two divisions at Rustchuk. Abdul Kerim's headquarters were at Shumla where there were two more infantry divisions. A cavalry division was in process of organization. Varna was the base of supply and was connected by rail with Shumla and Rustchuk. Sulciman Pasha with some 40,000 men was still in Montenegro. The total Turkish forces in Europe at that time were about 120,000 men with 450 guns, but they were disseminated instead of being concentrated, or grouped in view of a rapid concentration. Abdul Kerim's plan, or rather his idea, was, that the Russians would find some difficulty in the first place in forcing the passage of the Danube, and when they had succeeded in this, they would be bound to enter the zone of the Quadrilateral, where he hoped, operating with the fortresses as supports, to deal with them successfully. As regards the Turkish fleet, at the outset, in addition to a fleet of 8 ironclads below Braila, there were 7 monitors and 18 wooden ships of war on the Danube between Hirsova and Vidin.

In the matter of armament the Turks had the advantage. The artillery were armed with a Krupp breech-loading gun, which was better than the Russian bronze gun, while the Peabody-Martini rifles of the infantry were superior to the Russian Krenk. The firearm of the Turkish cavalry was the Winchester repeating carbine, which was inferior to the short Berden with which the Russian cavalry was armed. But this advantage in armament was discounted by the fact that, from motives of economy, the Turkish soldier had done but little rifle practice.

Hostilities commenced on the 24th of April, when the Russian army advanced in three columns towards Bucharest, the eastern flank covered by the XI. Corps which marched to Galatz. By the end of May the bulk of the Russian forces were assembled at Bucharest practically opposite the intended point of passage, with the advanced guard under General Skobelev at Giurgevo, and cavalry observing the river line from Turmu Magureli to Kalarashi. It was now decided to await the arrival of the IV., XIII., and XIV. Corps and the necessary bridging material for the passage of the Danube.

On June 15th the troops were disposed as follows: 8th Cavalry Division at Turmu Magureli; 12th at Oltenitza; and at Kalarashi; Advanced Guard at Giurgevo; XI. Army Corps

at Oltenitza and Giurgevo; VIII., XII., XIII., XIV., at Bucharest; IX. at Slatina; IV. at Slobodasia; XIV. at Galatz; VII. at Odessa; X. in the Crimea. Meanwhile steam launches were brought overland, and the Russians, by means of torpedoes, submarine mines and their shore batteries, had succeeded in clearing the Danube of Turkish vessels between Nikopolis and Rustchuk. Two of the smaller ironclads had been sunk, the remainder of the flotilla driven under the shelter of the fortresses, while barricades of mines effectually isolated them and prevented them from again entering the zone of operations. Of the large ironclads on the lower Danube, one was sunk near Sulina, and from that time the remainder stayed in Sulina harbour.

On June 22nd the XIV. Army Corps crossed into the Dobrudja at Galatz and advanced south, the Turkish detachment there retiring before them. Pontoons having been brought by rail, the necessary rafts and boats (which had been constructed at Slatina on the Aluta) were floated down to the neighbourhood of Zimnita, and on June 24th siege batteries opened fire on Nikopol and Rustchuk, while the IX. Army Corps made a feint of crossing just below Nikopol. These measures were effective in confusing the Turkish commander as to the Russian intentions, and on the night of June 26/27th, 12 companies of rifles, with a squadron and 6 guns, were landed on the south bank opposite Zimnita, and within twenty-four hours the whole of the VIII. Corps had crossed the river. By July 2nd the Russians had completed a bridge over the river, which is 1000 yds. wide at this part. At Sistova was a Turkish brigade of infantry. The commander, in the early morning of the 27th, received information from his outposts of the crossing, but instead of moving with his whole force, sent two battalions to oppose it. The Russians drove them back, and when reinforced, advanced against the heights in rear of Sistova, which were occupied with a loss of 800 men, the Turkish troops retreating to Tirnova and Nikopol. The Turks had remained ignorant of the Russians' concentration in Rumania and no attempt had been made to discover their plans. Abdul Kerim remained inactive in the fortresses of the Quadrilateral, and even when he heard of the crossing at Sistova, decided that it was but a demonstration. No measures were taken to observe the Russians. They were thus able to complete their crossing practically undisturbed, and this although it was never likely that the Russians would voluntarily select a point of passage leading into the Quadrilateral. Everything pointed to a crossing between Nikopol and Rustchuk. The best course for the Turks under existing circumstances would have been to leave garrisons in the fortresses, to observe the river line and to push reconnaissances to the north of the river, and to dispose the field army in a central position, whence it could concentrate on any point as soon as the enemy's intentions were revealed.

On June 30th Lieut.-General Gurko was put in command of a detachment composed of 10 battalions, 31 squadrons and 32 guns, with which he was ordered to advance rapidly to Tirnova to gain possession of a pass over the Balkans, to damage railways and telegraphs, and to endeavour to stir up a Bulgarian revolt. He crossed the Danube by the Russian bridge on July 3rd and occupied Tirnova on July 7th, the Turkish garrison retreating to Osman Bazar. At Tirnova he learned that the Shipka Pass was occupied by 3000 Turks, and that none of the remaining passes were held in any force. He then determined to cross by the Hainkoi Pass and to turn the Shipka. He started from Tirnova on the 12th July, on which day the head of the VIII. Corps reached the town. Hainkoi was occupied on the 14th, a detachment of 300 Turks being driven away. Gurko then sent two squadrons to cut the telegraph at Yeni Zagra, and leaving a garrison to hold the pass, set out for Kazanlik on July 16th. It had been arranged that a force from the VIII. Corps should attack the Shipka Pass (q.r.) from the north on the 17th, Gurko attacking simultaneously from the south; but his advance was delayed

*1st Period.—  
The Russian advance and passage of the Danube.*

*2nd Period.—  
Operations in Bulgaria to the fall of Tirnova.*

by small bodies of the enemy, and he failed to co-operate, with the result that the attack from the north was repulsed. The Turkish commander, however, evacuated the pass that night (July 18th/19th). It was occupied by the Russians on July 19th, and held till the end of the war. Gurko's detachment was followed across the Danube bridge by the XII. and XIII. Army Corps, which crossed between July 3rd and 8th and moved towards the Jantra river; the IX. Corps was across by July 10th and advanced on Nikopol; the XL Corps crossed July 10th-15th; and finally the IV. Corps between July 20th and 30th. The VIII. Corps had meanwhile advanced on Tirnova, as we have seen.

On July 3rd Abdul Kerim received orders from Constantinople to advance against the Russians, and set out with the force from Shumla for Rustchuk, immediately preceded by the cavalry division. Still no attempt was made to gain contact with the Russians and discover their intentions. From Rustchuk, Abdul Kerim advanced towards the Jantra, and after a skirmish with the Turkish cavalry and a Russian cavalry brigade again retired. Realizing Abdul Kerim's incapacity, and rendered anxious by Gurko's successful advance, the authorities at Constantinople now decided to give the command to Mehemet Ali. He superseded Abdul Kerim on July 19th, and at once ordered the concentration of all available forces at Rasgrad. Meanwhile Osman Pasha, who had till now been condemned to inactivity at Vidin, received permission to march.

Vidin, with its modern fortifications and heavy armament, and with the Danube on one side and marshy ground towards the interior, was a place of considerable strength. But with the Russians south of the Danube there could no longer be any justification for keeping Osman's 30,000 men isolated. Leaving garrisons in Vidin and the other towns along the Danube from Nikopol to Rakovitz, and to bar the roads from Servia, Osman left Vidin with the remaining 19 battalions, 6 squadrons and 9 batteries on July 13th. His original plan was to join the 10 battalions under Haiiri Pasha, then garrisoning Nikopol, and attack the Russian flank between Biela and Tirnova; but on July 15th he received news that the Russians were attacking Nikopol, and he then decided to march straight to Plevna, where there was a garrison of 3000 men under Atouf Pasha.

*First battle of Plevna.* Osman reached Plevna (q.v.) on July 19th, and once took up a position which had been previously reconnoitred by Atouf Pasha, on the hills to the north-east and east of the town. He had arrived just in time. On July 26th the Russian IX. Corps had taken Nikopol, and on the 18th orders were received to occupy Plevna with one division. At 5 a.m. on July 20th General Schilder-Schuldner, with the 5th Division IX. Corps and other forces, attacked Osman's position. No preliminary reconnaissance was made, and the Russians, after an artillery bombardment lasting about an hour, attacked at four points with separate columns. By midday the Russians were in retreat, having lost over 2800 men. There was no pursuit. On July 20th Osman was reinforced by fourteen battalions from Sofía, and the following day sent Rifaat Pasha with six battalions, a battery and some Circassian cavalry to occupy Lovcha in order to secure his communications with Sofía.

Osman's force at Plevna, within three days' march of the one Russian bridge over the Danube and flanking their line of operations, could not be neglected, and General Krüdener, commanding the IX. Corps, received orders to attack again as soon as possible. After the battle of the 20th he had been reinforced by brigades of the IV. and XII. Corps and a cavalry division. With this force, 30,000 in all, he attacked on July 30th. Krüdener advanced in two columns, cavalry covering both flanks. Skobelev, with the cavalry on the southern flank, was subsequently reinforced by infantry, so there were practically three columns of attack. A general reserve of one brigade was kept at Karagatsch (16 m. east of Plevna). After an artillery engagement which lasted

*Second battle of Plevna.* from 8.30 a.m. till 2.30 p.m. the infantry advanced. The

fighting lasted till sunset, when the Russians withdrew to Karagatsch, having lost 7300 officers and men. The Turkish casualties were 2000. General Krüdener, having reconnoitred the position, had hesitated to attack with the force available, and only acted in obedience to the orders received from headquarters, then 80 m. distant at Tirnova. His defeat was an unpleasant surprise for the Russians. Their plans were rudely upset, and their attention was now directed solely to the taking of Plevna. Headquarters were moved from Tirnova back to Bulgareni, Gurko was called back from south of the Balkans, the Rumanian army was called in to co-operate, orders were issued for the Guards and Grenadier Corps and the 24th and 26th infantry divisions to mobilize, 188,000 of the 1st Ban militia and three divisions of the reserve were called out, and the 2nd and 3rd infantry divisions and the 3rd Rifle Brigade from Moscow district, where they had been mobilized, were at once ordered to the front.

At this time the position of the Russians was as follows; the XIV. and part of the VII. Corps were north of the Danube, covering the communications; the IV. and IX. Corps were opposed to Osman Pasha at Plevna and his garrisons of Lovcha and Orchanie (the advanced depot of the Plevna force), the XI., XII. and XIII. Corps were along the White Lom facing Mehemet Ali, who was on the line Rasgrad-Eski Djuma with a force of about 80,000 infantry with 60 guns and a few regiments of cavalry, in addition to the garrisons of the fortresses; a small garrison on the Shipka Pass. Gurko was south of the Balkans, where Suleiman Pasha had a force of some 30,000 men. The Russian casualties since the commencement had reached 15,000, and their numbers south of the Danube did not exceed 130,000. Suleiman Pasha could have joined Osman or Mehemet Ali, avoiding the Shipka, and a vigorous offensive against the Russian flank at that time held out every prospect of success. The Shipka Pass would of necessity have been evacuated, but all through we find the Turkish commanders with their eyes fixed on geographical, which were sometimes strategic, points, and losing sight of the fact that the Russian army was their first objective. It is true that the ministers at Constantinople were largely responsible for the faulty strategy, but the generals in the field were also to blame. It was the moment for vigorous action on the part of the Turks. The moral equilibrium of the enemy was upset and the whole army demoralized by this second defeat at Plevna, but not a move was made. Again Osman failed to pursue. He was weak in cavalry, but he had sufficient to keep in touch with the enemy, who were utterly demoralized, and could have followed on with his whole force. He was but 35 m. distant from Sistova, and the result of the demolition of the bridge would have been incalculable. He was subsequently forbidden by Constantinople to assume the offensive, but it was not necessary to consult ministers as to pursuit after a successful battle, and they cannot be held responsible for this. The other Turkish commanders received news of the results of the battles of Plevna with incredulity, and likewise failed to turn them to account.

South of the Balkans was Suleiman's army. He was ordered from Montenegro on July 1st, and, leaving garrisons along the Montenegrin frontier, embarked at Antivari on July 15th. Disembarking at Dedeagatch on the 21st, he moved thence by train to Adrianople. His command, increased by some 15 battalions under Reouf Pasha, raised in the Balkan zone, amounted to approximately 30,000 men, and he was ordered to retake the Shipka Pass and to join Osman Pasha. Suleiman arrived at Karabunar on July 20th and moved to Eski Sagra, where he was joined by Reouf Pasha. Gurko, who had been resting about the Shipka Pass, ignorant of the arrival of Suleiman, moved against Reouf Pasha on the 27th of July, and found himself confronted by their combined forces on the 31st. He was attacked by Suleiman that day and was forced to retire. His force consisted of 15,000 men, including six battalions of Bulgarian volunteers which had just been raised. The following day he retreated across the Balkans by Hainkiof, where he left two brigades to hold the Hainkiof and Elena Passes, the

Bulgarian troops joining the garrison on the Shipka. Suleiman remained at Yeni Zagra till the 17th of August, when he set out for the Shipka. On August 21st the heights east of the pass were taken, and during the next few days there was desperate fighting; but the original garrison was gradually reinforced, and the Russians held on. In this fighting the Russian losses amounted to close on 4000, while the Turkish casualties were about treble that number. Suleiman now intrenched himself close to the Russian position, and there he remained till Sept. 17th, when after a three days' bombardment he again assaulted the position, but was repulsed with considerable loss. This was the last assault made on the Russian position. Suleiman replaced Mehemet Ali as commander-in-chief on Oct. 2nd, and was himself succeeded by Reouf Pasha. Thus, under orders from Constantinople, Suleiman frittered away his opportunity and his army in a fruitless attempt to retake the Shipka Pass.

It was not till the middle of August that Mehemet Ali decided to move against the Russians and ordered an advance. The Cesarevich (afterwards Alexander III.), who was opposing him with the XI., XII. and XIII. Corps, in all about 50,000, was extended on the line of the White Lom from Pirgos to Eski Djuma. On August 22nd and 23rd there were engagements about Ayaalaz, resulting in the retirement of the Russians. On August 30th he attacked at Karahassankoi and drove the Russians across the river. On September 3rd he crossed the White Lom and again defeated them at Katzelevo, the enemy retiring behind the Banitcha Lom. On September 12th Mehemet Ali continued his advance, but halted on the 14th for a week. He then made an attack on Cerkovna on the 21st, but was repulsed with a loss of 1600 men, and two days later retired his army behind the White Lom. He had effected nothing. As will be seen later, the Russian operations against Plevna had not been in any way disturbed. The containing force under the Cesarevich had retired a certain distance, but it still held the main Turkish army. Mehemet Ali's original plan had been to advance by Osman Bazar, effect a junction with Suleiman, and move on Timova. But Suleiman was averse to his plan and it was negated at Constantinople, though if this plan had been carried out with vigour, the position of the Russians should have been critical. He then advanced on a front of 50 m. instead of moving concentrated, which is the explanation of his failure. It is true that he was much hampered by the state of his cavalry, which was exhausted, and consequently was without information, while the Russians were well served. Mehemet Ali now concentrated his force, but at this juncture he was superseded by Suleiman Pasha.

To return to Plevna. At this time the Russians were disposed in a semicircle round Plevna, their right or N. flank resting on Ribina and the S. flank resting on Bogot. *Third battle of Plevna.* On August 30th Osman had moved out with a column of all arms towards Pelishat. The following day he engaged the Russians. The Turks lost 300 killed and 1000 wounded, and the Russian losses were about 1000. It is difficult to say what was the object of this sortie, which was of the nature of a reconnaissance in force. It achieved nothing. The Turks were not defeated, but retired again into Plevna the same evening. By the end of August the whole of the Rumanian army had crossed the Danube, and during the first days of September the first Russian reinforcements, consisting of the 2nd and 3rd infantry divisions and the 3rd Rifle Brigade, had arrived and joined the forces round Plevna. Mehemet Ali's advance and the assaults on the Shipka had been repulsed. The Russians could expect no further reinforcements before October, and it was therefore decided to make a third attempt to take Plevna, but first of all to occupy Lovcha. Skobelev had already made an unsuccessful attempt on August 6th, and General Prince Imeretinski, with a force of two infantry divisions and a brigade of Cossacks, in addition to Skobelev's mixed brigade, was now entrusted with the task. The garrison under Rifaat Pasha amounted to 8 battalions, 6 guns and some Circassians. Fighting commenced

on Sept. 1st and on the 3rd the Turks were driven out, most of the survivors finding their way to Plevna, and bringing 5 guns with them. The Russians lost 1500, the Turks 2500. On Sept. 2nd, Osman set out with a strong relieving column from Plevna, but on the 4th, hearing that the Russians had already occupied the town, he turned back and reached Plevna on the 6th. On Sept. 5th, 8 battalions and 2 batteries reached Orkhanie, and Osman's force, including the Lovcha troops, numbered about 30,000 men and 72 guns. The Russian forces, including the Rumanians, numbered about 90,000. Their plan was, after a long artillery bombardment, to attack the eastern front with the Rumanian forces, the south-eastern front with the IV. and IX. Corps and the southern front with Imeretinski's command. The attacks were to be simultaneous. The cavalry divisions were to be kept in rear and close to the flank of the attacking infantry. During the night of Sept. 6th/7th the troops were moved into preparatory position, and batteries were constructed at 3000 to 5000 yds. from the outer works. The artillery bombardment was commenced at 6 a.m. on Sept. 7th, and continued till midday Sept. 11th. So far the infantry had only been engaged on the south flank, where Skobelev had succeeded Imeretinski in the command. He had succeeded in advancing to within 2000 yds. of the southern Turkish redoubts and had entrenched himself. The orders for Sept. 11th were for the infantry assaults to be delivered at 3 p.m. after a six hours' cannonade. A dense fog interfered with the artillery bombardment. At the end of the day the Rumanians had taken No. 1 Grivitza redoubt, the attack on the S.E. front had been repulsed and Skobelev had established himself within 1000 yds. of Plevna, having taken Kavanlik and Issa forts. On Sept. 12th the Turks retook these forts and drove Skobelev back. During the next two days the Russians continued to bombard the works, but no further attack was made. The Rumanians remained in possession of the Grivitza redoubt, defeating an attempt made by the Turks to retake it on Sept. 14th. The Russians then decided to retire and entrenched themselves on a line with Verbitza-Radishevo, with their cavalry extending to the Vid on either flank. There was no question of pursuit; in the first and second battles the numbers had been about equal, but now the Russians were vastly superior and Osman would have been crushed by a powerful counter-attack.

In their third battle the Turks had lost 5000, while the Russian casualties amounted to close on 20,000. The Russian bombardment, lasting four days, had effected nothing. It had not caused 200 casualties. The object of the artillery is to cover the advance of the infantry, and the arms must work in combination. The defender does not expose himself to the artillery fire unless compelled to do so by the approaching infantry. The Russians failed to realize this and practically wasted their ammunition. They had again failed to reconnoitre the position and attacked along the whole front instead of pressing home in strength at the decisive points. Their attacks were not even simultaneous, and Osman was able to shift his reserves from point to point. In addition to this, when the Russians retired one-third of their force had not been engaged. The defects in their plan of action are largely attributable to the fact that though control was nominally centred in one man, senior officers were present who interfered with his arrangements.

It was now decided to complete the investment of Plevna, and Todleben, the defender of Sevastopol, was entrusted with supreme control of the operations. He arrived on the scene on Sept. 28th, but it was not till Oct. 24th that the investment was completed, and, meanwhile, on Sept. 24th and again on Oct. 8th, strong reinforcements arrived, raising the Turkish force under Osman to 84 battalions, 25 squadrons and 96 guns, with an effective of 48,000 men. Plevna had been re-victualled and the sick and wounded had been sent back to Orkhanie. General Krilov, who had been operating west of the Vid, with 52 squadrons and 30 horse artillery guns, had failed to prevent these movements, and was superseded by General Gurko on Oct. 8th. The Russian

Guards Corps had all reached Plevna by Oct. 20th, and two divisions were at once placed under Gurko's orders, raising his command to 35,000 infantry, 10,000 cavalry and 48 guns. His instructions were to capture the Turkish positions along the Sofia road. He compelled the garrison of Dolni-Dubnik to retire into Plevna, and captured Gorni Dubnik and Telis with their garrisons after severe fighting on Oct. 24th and 28th. Osman's force was thereby reduced by 12 battalions. About the middle of November the opposing forces were distributed as follows: 6 divisions along the Lom, under the Cesarevich, facing Suleiman's army; 3 divisions holding the Shipka under Radetzky; 1 division at Lovcha; 2½ divisions west of the Vid under Gurko; and 12 divisions east of the Vid, invading Plevna. The XIV. Corps was in the Dobrudja, the VII. Corps about Odessa and the X. Corps in the Crimea.

On the Turkish side Suleiman advanced across the Lom, leaving small garrisons in the fortresses, and attacked at Mechka **Turkish** on Nov. 19th, and at Mechka and Tristenik on Nov. **move-** 26th, and again on Dec. 12th, but each time without **ments.** success, and he retired across the Lom. South of the Balkans Vessil Pasha had succeeded Reouf Pasha on the Shipka. He continued to contain the three Russian divisions there, but made no attempt to dislodge them, beyond small offensive demonstrations made with the object of concealing the departure of large drafts which were sent to Sofia.

At Sofia and Orkhanie, the Turks were forming an army of recruits and reservists with the object of advancing to the relief of Osman. Mehemet Ali was entrusted with the command. Osman had already asked the sultan's permission to evacuate Plevna, with a view to co-operating with Mehemet Ali, but permission was refused. It was not till the investment was completed that the sultan changed his mind, too late, and gave his sanction to the move. The Russians received information of Mehemet Ali's intended advance, and as the force round Plevna amounted to 191 battalions, 120 squadrons and 650 guns, it was decided that Gurko should move with his detachment towards Sofia. He concentrated his force at Yablonitza on Nov. 5th and succeeded in driving the Turkish advanced guard from Orkhanie. Mehemet Ali now occupied a strong position covering the Arabi Konak Pass over the Balkans, and, with a force of 43 battalions with cavalry and guns, made no attempt to relieve Osman.

Osman Pasha, his supplies having given out, eventually decided on a sortie. His troops had been short of food since the beginning of November, and the number of sick had risen to 10,000. His plan was to break through to the west and make for Sofia via Berkovitz. The Russians observed the preparations made and concentrated sufficient force at the threatened point, with the result that Osman and his army of 40,000 men capitulated. The Turkish losses in the action were about 6000 and the Russians lost about 1500. The Russians now decided, notwithstanding the difficulties due to the winter season, to push on across the Balkans. The VII. and X. Corps were still left guarding the Russian coasts. The Cesarevich was left north of the Balkans with 71,000 men to guard the communications. Gurko's force was raised to 80,000. Leaving a containing force to oppose the Turks at the Arabi Konak Pass positions, he crossed by the Curiak Pass. The Turks retired unobserved, and after a feeble stand at Tashkosen retreated to Kustendil. Gurko occupied Sofia on Jan. 4th. Radetzky's force at the Shipka was raised to 66,000, with which force, having defeated Vessil Pasha, he was to join Gurko south of the Balkans. Radetzky commenced operations on Jan. 5th. Keeping one division to hold the works on the Shipka, he moved the remainder of the force in two columns under Skobelev and Prince Mirski, who were to cross one on each side and attack simultaneously from the south. Vessil Pasha held an entrenched camp at Shenovo with some 12,000 men; the remainder of his force was in position on the mountains. Owing to the difficulties of the crossing, Skobelev was delayed. Mirski attacked on

Jan. 8th and was repulsed. The following day Skobelev and Mirski attacking together were successful, and Vessil Pasha capitulated with his force, some 36,000, of whom 6000 were sick and wounded. Vessil Pasha had pointed out the danger of his position on Jan. 7th, but, contrary to Suleiman's advice, the war minister, believing an armistice imminent, had ordered him to hold on to the Shipka Pass. Mehemet Ali's force, dangerously delayed owing to interference by the minister of war, eventually reached Tatar-Bazardjik, which was selected by Suleiman (now commander-in-chief) for the concentration of his forces. Having received news of the capture of the Shipka force he retired on Philippopolis, with Gurko's forces closely pursuing. But Radetzky's forces had already pushed on and practically cut Suleiman off from Adrianople. After some engagements about Philippopolis on Jan. 15th, 16th and 17th, he retreated towards the Aegean Sea through the Rhodope mountains, having lost most of his guns, and reached Enos about Jan. 28th, whence what remained of his force was conveyed by water to Constantinople.

Suleiman had again missed his opportunity. The Russians crossed the Balkans in a wide front of about 180 miles, and there was opportunity for successful action by a capable commander. There were not only the columns commanded by Gurko and Radetzky, but also a third column under General Kartsoff, which crossed by the Trojan Pass, after which it joined Gurko's force. There were the troops under Mehemet Ali about Sofia, Vessil Pasha's force about the Shipka, and the main army on the Lom, which had been withdrawn south of the Balkans after the fall of Plevna, so that Suleiman, who had been appointed commander-in-chief, had an available force of 130 battalions, 120 guns and a proportion of cavalry. The fortified town of Adrianople offered a strong central position at which to concentrate his forces, and with this point as support, acting on interior lines, he could have dealt with the invading and widely separated columns in detail. But he missed his opportunity and left his scattered forces to be overwhelmed by superior numbers in each instance. The minister for war was undoubtedly responsible to a great extent for this faulty strategy, but the blame falls on the head of Suleiman as commander-in-chief. There was no object in leaving Vessil Pasha on the Shipka. All available forces should have been concentrated in a sound strategical situation.

The Servians had crossed the frontier after the fall of Plevna, and the Montenegrins were also pressing on. On Jan. 16th the Russians occupied Adrianople, and on Jan. 30th they were facing the Buyuk Tchemedji lines, with their flanks resting on the Black Sea and the Sea of Marmora. Mehemet Ali was in command of what remained of the Turkish armies behind the lines. On Jan. 31st an armistice was arranged, and on March 3rd the treaty of San Stefano was signed, the terms of which were modified later at the Berlin Conference in June and July 1878.

The Russo-Turkish War proved once for all the great value of improvised fortifications, in other words, of spade work in warfare, and the advantages of field works as regards invisibility against artillery fire. It was not only at Plevna that field intrenchments were made use of. Notable instances were the defence of Lovcha by the small Turkish garrison of 8 battalions with one battery, which from their entrenchments kept Skobelev with over 20,000 men and 90 guns at bay for three days, inflicting on him a loss of over 1500 men. Again, at Gorni Dubnik on Oct. 24th, 3500 Turks with 4 guns held their works throughout the day against 20,000 Russians with 60 guns, inflicting a loss on them of over 3300, and eventually were forced to surrender by a surprise attack under cover of darkness, when their ammunition had run short, and their numbers had been reduced by 1500 casualties. In the attack the success of Skobelev stands out, and we find that he had realized the necessity of intrenching the ground he had gained.

The war was brought to a conclusion, but the Turks had not been beaten in battle. With the exception of the fighting round Plevna and the rout of Suleiman's army at Philippopolis

Balkans  
and ad-  
vance to  
Constanti-  
nople.*

there had been no decisive battles. The Turks had been defeated owing to the incapacity of their leaders, none of whom had previously commanded an army organized according to modern ideas. They were ignorant of strategic principles. Then, again, the interference with the generals in the field by the authorities at Constantinople had in each case resulted in the disasters which invariably follow the attempt of civilian amateurs to control warlike operations.

On the Russian side, the enemy had been at first despised, and consequently the forces originally employed were inadequate, which meant subsequent delays, losses and expense. The command of the sea had proved of little value to the Turks. Their flotilla rendered them no assistance. In the early stages it could have materially assisted by landing reconnoitring parties N. of the Danube, and by interfering with the Russians when crossing the river. The Russian bridge offered a tempting objective throughout the campaign, but commanders with the requisite dash and initiative were not forthcoming. The defeat of the Turks was due in the first place to the failure of their politicians to ensure the adequate organization and training of the army during peace time, in the second place to the want of a commander who had educated himself to undertake the responsibilities entrusted to him. (J. H. V. C.)

A separate campaign had been waged, as before, in Asia Minor. Here the Turks under Mukhtar Pasha had 57,000 men in two corps, the one on the side of Batoum and Ardahan, the other between Erzerum and Kars. His opponent, Loris Melikov, had at first only some 28,000 infantry, but a disproportionate number of Cossack *Sotnias*. The Russians advanced in three weak columns. On the 17th of May after bombardment the right column stormed Ardahan. The right and centre columns then closed inwards upon Kars, which they besieged, but the siege was given up in July, after Mukhtar, advancing to its relief with 35,000 men, had repulsed Melikov's attack at Zivin (June 26th). The left column occupied Bayazid without difficulty, but when it had proceeded thence on the Erzerum road the Russian garrison was blockaded by the Turks and the column retraced its steps to relieve the place. After this it halted at Igdir in the Araxes valley. Meanwhile the Turks on the coast had advanced, in concert with their fleet, and raised an insurrection amongst the Mahomedans of the littoral. They were eventually repulsed, but the insurrection was not completely suppressed until the summer of 1878.

In August Mukhtar, who had followed up Melikov's retreat from Kars, and won the victory of Kizil-Tepe, led 30,000 men in front of this position, and behind them the Kars garrison of 10,000. Ismail on the Bayazid side had 40,000; Dervish, at Batoum 17,000. But after an interval of two months Melikov was reinforced, while drafts for the armies in Europe were taken from Mukhtar, and the grand-duke Michael, assuming command of the Russians, defeated his opponent completely in the battle of the Aladja Dagh (Oct. 15th). The remnants of Mukhtar's army retreated on Erzerum, and while part of the Russian army besieged Kars, and part attempted to cut off the retreat of Ismail on the Bayazid road, while the corps from the Araxes valley followed the latter up. Ismail slipped past them, however, and rejoined Mukhtar at Erzerum. But the two together were no longer able to resist the superior numbers of the Russians, who defeated them in a last battle at Dexe Boyun (Nov. 4th). Kars was stormed on the night of the 11th of November.

**RUST** (O.E. *räst*, a word which appears in many Teutonic languages, cf. Du. *roest*, Ger. *rost*); in origin it is allied with "ruddy" and "red," the reddish-brown powdery substance which forms on the surface of iron or steel exposed to atmospheric corrosion. Formerly the process was regarded as oxidation pure and simple, and, although it was known that iron did not rust in dry air, yet no attempt was made to explain why water was necessary to the action. F. Crace-Calvert in 1871 showed that the carbon dioxide of the atmosphere was a factor; and in 1888 Crum Brown published the theory—termed the "carbonic acid theory"—that water and carbon dioxide react with iron to form ferrous carbonate and hydrogen, the ferrous carbonate being subsequently oxidized by moist oxygen to ferric hydrate and regenerating carbon dioxide, which again reacts with more iron. This theory was controverted by Wyndham Dunstan, who attempted to prove that carbon dioxide was not necessary to rusting; and in place of the acid theory, he set up a scheme which involved the production of hydrogen peroxide. G. T. Moody has since shown that when all traces of carbon dioxide are removed (which is a matter

of great experimental difficulty) iron may be left in contact with oxygen and water for long periods without rust appearing, but on the admission of carbon dioxide specks are rapidly formed. It also appears that rust changes in composition on exposure to the atmosphere, both the ferrous oxide and carbonate being in part oxidized to ferric oxide. Acids, other than carbonic, may promote rusting; this is particularly the case with ironwork exposed to the acids—sulphurous, nitric, &c.—contained in smoke. It is probable that the action depends upon the presence of iron, oxygen and water, and some acid which makes the water an electrolyte.

Steel differs in many ways from iron in respect of atmospheric corrosion; the heterogeneous nature of steel gives occasion to a selective rusting, ferrite is much more readily attacked than the cementite and pearlite; moreover, the introduction of other elements may retard rusting; this is particularly the case with the nickel-steels.

**RUSTCHUK** (Bulg. *Russe*), the capital of the department of Rustchuk, Bulgaria, on the right bank of the Danube, where it receives the E. Lom. Pop. (1906) 33,552. Rustchuk is the headquarters of a military division and of a naval flotilla stationed on the Danube. As a river-port and the terminus of railways from Varna and from Sofia via Trnovo, it has much commercial importance; and it possesses tobacco and cigarette factories, soap-works, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In the time of the Romans Rustchuk was one of the fortified points along the line of the Danube. In the *Tabula Peutingeriana* it appears as Prisca, in the *Antonine Itinerary* as Seranaprista, in the *Notitia* as Seragmaprista and in Ptolemy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. In 1810 it was captured by the Russians, who destroyed the fortifications. It played an important part in the Russo-Turkish Wars of 1828-29, 1853-54 and 1877-78. In 1877 it was nearly destroyed by the Russian artillery stationed in the Rumanian town of Giurgevo, on the opposite bank of the Danube.

**RUSTENBURG**, a district and town of the Transvaal, South Africa. The district originally included all the N.W. part of the country, but is now of much smaller dimensions. Its S. border is marked by the Magaliesberg and other hills forming the N. escarpment of the high veld and the watershed between the Vaal and Limpopo. Several of the headstreams of the Limpopo rise within the district on the N. slopes of the Magaliesberg. The climate of the district is sub-tropical and the principal cultivation is that of tobacco, and fruit trees, notably oranges. The opening of the railway to Pretoria in 1906 led to a marked development of trade. In an amphitheatre formed by the hills and 61 m. by rail W. of Pretoria is the town of Rustenburg with a population (1904) of 1815. The town is one of the oldest in the Transvaal, having been founded in 1850 by the *Voottrekkers*. It was at Rustenburg that the volksraad met in March 1852 to ratify the Sand River Convention granting independence to the Transvaal Boers. At the time it was feared that there would be civil war between Hendrik Potgieter and Andries Pretorius, but they were reconciled in Potgieter's tent. Later Rustenburg became the home of the Kruger family. It was occupied by the British under R. S. Baden Powell in June 1900.

**RUSTICATION** (i.e. the making "rustic" or countrified, from Lat. *rūs*, country; thus the term "rusticate" is used for taking a country holiday, or in academic circles to be "rusticated" is to be sent away from a university for punishment), in architecture, the technical term (French equivalent *bossage*) given to masonry in which the centre part of the face of the stone is either left rough as it came from the quarry, or is worked in various ways to give variety to the surface. The earliest example exists in the platform at Pasargadae in Persia (560 B.C.), erected by Cyrus, where the edge round the four sides of the stone forms a draft, two or three inches wide, worked with a chisel, the centre

part being left rough. Similar work exists at Arak-el-Emir in Palestine (151 B.C.). The finest examples are those of the walls of the temple at Jerusalem, and at Hebron, where the stones are of immense size and the rustication projects sometimes over a foot. The Crusaders' castles in Palestine are all boldly rusticated, but the projecting portions have been worked over with a chisel in diagonal lines, and this enables them to be distinguished from the earlier masonry. In the five-sided tower at Nuremberg and the Burg-Capelle at Rothenburg, the rustication has a decorative value, so that in later work it was employed for the quin-stones of towers. The masonry of the Palazzo Vecchio, and of the Pitti, Strozzi and Riccardi-palaces, all in Florence, and of other palaces in Siena and Volterra, is rusticated. Rustication was employed in terraces and grottos in Italy, where on account of its extravagances it gave rise to the term "grotesque." In the later Renaissance the edges of the stone were bevelled off, with a sunk joint in addition; and the treatment was known as vermiculated, if in imitation of earth burrowed by worms; marine, if with small shell holes; stalactitic, if carved in imitation of lime deposits, &c. In Italy the projecting portions were sometimes worked into facets. Rustication was introduced into England by Inigo Jones, who, in old Somerset House, York Stairs Watergate, the gateway of the Botanical Garden at Oxford, and elsewhere, used it only in alternate courses, his example being followed by other architects of the Renaissance. The term is now applied to the ashlar blocks of masonry which alternate with the circular drums of columns in many public buildings.

**RÜSTOW, FRIEDRICH WILHELM** (1821-1878), Swiss soldier and military writer, was a Prussian by birth. He entered the service of his native country, and served for some years, until the publication of *Der Deutsche Militärstaat vor und während der Revolution* (Zürich, 1850) brought him official condemnation. He was sentenced by a court-martial to a long term of fortress imprisonment, but succeeded in escaping to Switzerland. He obtained military employment in the service of the Republic, and in 1857 was major on the engineer staff. Three years later he accompanied Garibaldi in the famous expedition against the two Sicilies as colonel and chief of the staff, and to him must be ascribed the victories of Capua (19th Sept. 1860) and the Voltorno (1st Oct. 1860). At the end of the campaign he once more settled down at Zürich. At the outbreak of the war of 1870 he offered his services to Prussia, but was not accepted. In 1878, on the foundation of a military professorship at Zürich, Rüstow applied for the post, and, on its being given to another officer, lost heart and committed suicide.

Two younger brothers, both Prussian soldiers, were also distinguished men. The elder, **ALEXANDER** (1824-1866), is remembered for his work *Der Küstenkrieg* (Berlin, 1848); the younger, **CAESAR** (1826-1866), was one of the foremost experts of his time in the design and construction of military rifles, and the writer of several treatises on that subject, of which we may mention *Die Kriegshandfeuerwaffen* (Berlin, 1857-64). Both Alexander and Caesar fell on the field of battle in the war of 1866, at Königgrätz and Dermbach respectively.

Amongst F. W. Rüstow's works, which covered nearly every branch of the military art, a large number must be mentioned. Historical—*Heerwesen und Kriegsführung Julius Cæsars* (Gotha, 1855; 2nd ed., Nordhausen, 1862), *Kommentar zu Napoleon III.'s Geschichte Julius Cæsars* (Stuttgart, 1865-67), *Geschichte des Griechischen Kriegswesens* (in collaboration with Köchly, Aarau, 1852), *Militär. Biographien* (David, Xenophon, Monüse) (Zürich, 1858), *Geschichte der Infanterie* (Gotha, 1857-58; 3rd ed., 1884), *Die Ersten Feldzüge Napoleons 1796-1797* (Zürich, 1867), *Der Krieg von 1805 in Deutschland und Italien* (Frauenfeld, 1854), *Geschichte des Ungarischen Insurrektionkrieges 1848-49* (Zürich, 1860), reminiscences of 1860 in Italy (Leipzig, 1861) and monographs on the campaigns of 1848-49 in Italy (Zürich, 1849) and the Crimean War (Zürich, 1855-56). Critical and General—*Allgemeine Taktik* (Zürich, 1858; 2nd ed., 1868), *Kriegspolitik und Krieggebrauch* (Zürich, 1876), *Militär-Handwörterbuch* (Zürich, 1859), *Die Feldherrnkunst des XIX. Jahrhunderts* (Zürich, 1857; 3rd ed., 1878-79), *Der Krieg und seine Mittel* (Leipzig, 1856). He also wrote *Annalen des Königreichs Italien* (Zürich, 1862-63).

See Zernin, "F. W. Rüstow," in *Unsere Zeit*, vol. 2 (Leipzig, 1882).

**RUTEBEUF**, or **RUSTEBUEF** (fl. 1245-1285), French *trouvère*, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a *nom de guerre*, and is variously explained by him as derived from *rude banf* and *rude auvre*. He was evidently of humble birth, and he was a Parisian by education and residence. Paulin Paris thought that he began life in the lowest rank of the minstrel profession as a *jongleur*. Some of his poems have autobiographical value. In *Le Mariage de Rutebeuf* he says that on the 2nd of January 1261 he married a woman old and ugly, with neither dowry nor amiability.<sup>1</sup> In the *Complainte de Rutebeuf* he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX., for relief. Other poems in the same vein reveal that his own miserable circumstances were chiefly due to a love of play, particularly a game played with dice, which was known as *griesche*. It would seem that his distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anceau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V. of Navarre (d. 1270), and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the *Pauvre de Rutebeuf* he addresses Louis IX. himself.

The piece which is most obviously intended for popular recitation is the *Dit de l'Herberie*, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse *conte*, and the five of his *fabliaux* that have come down to us are gay and amusing. The matter, it may be added, is sufficiently gross. The adventures of *Frère Denyse le cordier*, and of "*la dame qui alla trois fois autour du moulin*," find a place in the *Cent Nouvelles nouvelles*.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defence of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders who were supported by Pope Alexander IV., and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burnt together with the *Péris des derniers temps* attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of *Renart le Bestourné*, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the *Voie de Paradis*, the description of a dream, in the manner of the *Roman de la Rose*.

The best work of Rutebeuf is to be found in his satires and verse *contes*. A miracle play of his, *Le Miracle de Théophile*, is one of the earliest dramatic pieces extant in French. The subject of Theophilus, the Cilician monk who made a pact with the devil, which was afterwards returned to him by the intervention of the Virgin, was a familiar one with the story-tellers of the middle ages. Rutebeuf can claim no priority in the choice of the subject, which had been treated dramatically in the Latin piece ascribed to the nun Hroswitha of Gandersheim, but his piece has considerable importance in dramatic history.

The *Cœuvres* of Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr Adolf Kressner

<sup>1</sup> It has been suggested that Brunetto Latini was thinking of Rutebeuf when he wrote in his *Liure du Trésor*: "Le Rire, le jeu, voilà la vie du jongleur, qui se moque de lui-même, de sa femme, de ses enfants, de tout le monde."

(*Rustnef's Gedichte*; Wolfenbüttel, 1885). See also the article by Paulin Paris in *Hist. litt. de la France* (1842), vol. xx. pp. 719-83, and *Rulebnf* (1891), by M. Léon Clédat, in the *Grands Écrivains français* Series.

**RUTH, BOOK OF**, in the Old Testament. The story of Ruth (the Moabitess, great-grandmother of David) is one of the Old Testament Hagiographa and is usually reckoned as the second of the five *Megilloth* (Festal Rolls). This position corresponds to the Jewish practice of reading the book at the feast of Pentecost; Spanish MSS., however, place it at the head of the *Megilloth*; and the Talmud (*Baba Bathra*, 14b) gives it the first place among all the Hagiographa. On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although it was very natural that a later rearrangement should transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, and the presumption is that it found a place in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. See BIBLE: *Old Testament*, section I. "Canon"; CANTICLES; LAMENTATIONS.

That the book of Ruth did not originally form part of the series of "Former Prophets" (Joshua-Kings) is further probable from the fact that it is quite untouched by the process of "prophetic" or "Deuteronomistic" editing, which helped to give that series its present shape after the fall of the kingdom of Judah. The narrative has no affinity with the point of view which looks on the history of Israel as a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God.<sup>1</sup> But if the book had been known at the time when the history from Joshua to Kings was edited it could hardly have been excluded from the collection; the ancestry of David (iv. 17, 18-22) was of greater interest than that of Saul, which is given in 1 Sam. ix. 1, whereas the old history names no ancestor of David beyond his father Jesse.

In truth the book of Ruth presents itself as dealing with times far back (Ruth i. 1), and takes delight in depicting details of antique life and obsolete usages (iv. 7); it

**Date.** views the stormy period before the institution of the kingship through the softening atmosphere of time, which imparts to the scene a gentle sweetness very different from the harsher colours of the old narratives of the book of Judges. It has indeed been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xiii.); but the same argument would prove that the book of Esther was written before Ezra. The very designation of a period of Hebrew history as "the days of the judges" is based on the Deuteronomistic additions to the book of Judges (ii. 16 sqq.) and does not occur till the period of the exile. It is true that the language has some features which appear to link it with the narratives in Samuel and Kings, but it might fairly be assumed either that the book is the work of a late author well acquainted with the earlier literature, or that an old narrative had undergone some rewriting at a later age. No definite conclusion can be drawn from the fact that the language stands in marked contrast to that of Chronicles, Ezra, Nehemiah, &c., since writings presumably more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Like the stories appended to Judges (by a post-Deuteronomist hand) the book of Ruth connects itself with Bethlehem, the traditional birthplace of David. Some connexion between Bethlehem and Moab has been found in the (now corrupt) text of 1 Chron. iv. 22 (where the Targum and late rabbinical exegesis discover references to the story of Ruth), and is more explicitly suggested by the isolated 1 Sam. xxii. 3 sqq. which evidently knew of some relationship between Moab and the illustrious descendant of Boaz and Ruth. Next, the writer claims the sympathy of his readers

<sup>1</sup> The religious pragmatism lacking in the original is in part supplied by the Targum (i. 5, 6).

for Ruth, upon whose Moabite origin he frequently insists, and this feature is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxiii. 3; Neh. xiii.; Ezra ix. seq.). The independent evidence for the present post-exilic form of the book has consequently led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only do we have a beautiful portrait of a woman of Moabite origin, but she becomes the ancestress of David himself, and in the days of these measures the charming and simple story would inevitably suggest the question whether the exclusiveness of Judaism could not be carried too far. There is no reason, however, to believe that this was the original object of the story. It contains other features of considerable interest to which more importance seems to be attached, and the writer is evidently an artist who takes manifest delight in the touching and graceful details of his picture, and is not simply guided by a desire to impart historical information or to enforce some particular lesson.

One does not look for absolute consistency in oriental narratives, and even this little book contains several internal intricacies which demand investigation. The genealogy from Perez to David in iv. 18-22 is of little value since Salma (Salmon), father of Boaz, is a Calebite clan-name, not associated with its earlier seat S. of Hebron as in Judges i.; 1 Sam. xxv., &c., but as "father" of Bethlehem, representing exilic or later conditions (1 Chron. ii. 51; see CALLEB). Apart from other signs of a late date in this list of the ancestors and descendants of Boaz, iv. 12 certainly implies that the genealogical lines of Perez and Boaz were not identical, and thus verses 18-22 in the opinion of most scholars are a later addition.

Further, the story involves points of old family usage which are no longer clear. The well-known custom which gives the nearest heir of the dead a right to inherit the widow is naturally distinct from the levirate (*g.*), where it is the brother's duty to marry his widowed sister-in-law if childless, and where the eldest son succeeds to the name and inheritance of the deceased. In Hebrew usage the refusal to perform the levirate brought ignominy (see Deut. xxv. 5-10), and Gen. xxviii. relates how Tamar, when Shelah was not given to her, obtained a child through her father-in-law Judah (see esp. vers. 14, 26).<sup>2</sup> In addition to these customs to prevent the alienation of the estate and to perpetuate the family name, the post-exilic story in Num. xxvii. 1-11, xxxvi. gives daughters the right of inheritance provided they do not marry outside the tribe. Although the levirate still continued (Matt. xxii. 24 sqq.), the late laws in Lev. xviii. 16, xx. 21, as also this story, may be aimed against it. Finally, the *gôl* ("next kinsman," lit. "avenger"; see Driver, *Ency. Bib. col.* 1745 sqq.) has the first right of purchase to an estate (Jer. xxxii. 6-15), and indeed must redeem the property which his needy relative might be compelled to sell (Lev. xxv., see ver. 25). Now it appears that Boaz combines the essential duty of the *gôl* in purchasing the estate over which Naomi holds rights, and at the same time marries, not Naomi, who is now old, but her daughter-in-law Ruth, in order to perpetuate her husband's family. Naomi, who had realized the impossibility of the levirate in her case (i. 11 seq.), returned home a disconsolate and childless widow (i. 20 seq.), but the filial Ruth fell in with her plans and put herself entirely into the hands of the kinsman Boaz (iii.). In the happy finale, Naomi is the recipient of congratulations upon the birth of a son to the faithful Ruth (iv. 17a, "there is a son born to Naomi"); the name of the dead is thus "raised up" (iv. 5, 10), and the child Obed is clearly recognized

<sup>2</sup> See further, W. R. Smith, *Kinship and Marriage in Early Arabia*, 2nd ed. p. 105; Wellhausen, *Götting. Gelehrte Anzeig.* (1893), pp. 455 seq. Ruth iv. 7 refers to the custom of drawing off the shoe as a sign of renunciation (cf. Deut. loc. cit., and G. A. Smith, *Ency. Bib. col.* 5196 head), and ver. 12 to the story of Tamar and Judah. Compare, for the retention of simple methods of transacting business, the striking of hands (Prov. vi. 1, xxii. 26).

as of the line of Elimelech and Mahlon (Naomi's husband and son). In point of fact, a nearer kinsman than Boaz had agreed to purchase the estate (as *gōel*), which Naomi evidently had not yet sold (see commentaries on iv. 3); but he was unwilling to marry Ruth (reading in ver. 5, "and also Ruth thou must buy"; cf. ver. 10), recognizing that if a son were born the estate would revert to the line of Elimelech, thus leaving him at a disadvantage. He was evidently unprepared for what seems a novel condition (contrast Boaz in iii. 12 seq.), although, from the felicitations in iv. 11-13, the issue of the marriage is actually reckoned to the husband (Boaz). It is improbable that these conflicting features in v. 11-13 and ver. 17a, and all that they involve, co-existed, and it is possible that the former (with the implied reference to the coming David) is not part of the original. However, as in the equally complicated story in Gen. xxviii., it is difficult to trace the extent or growth of the various motives, e.g. the primary interest in Naomi, the romantic marriage of Ruth, the selling of the land (which comes only in ch. iv.), &c.

LITERATURE.—See S. R. Driver, *Literature of Old Testament*, who, with C. F. Kent (*Beginnings of Heb. Hist.* p. 310 seq.), favours a pre-Exilic origin. An exilic date has found the support of Ewald and König, but that it is now of the post-exilic age is the opinion of most writers. See further W. R. Smith's art. "Ruth" in *Ency. Brit.* 9th ed. (several portions of which have been retained by the present writer), revised and supplemented by T. K. Cheyne in *Ency. Bib.*; A. Bertholet, *Kurzer Handkommentar* (1898); W. Nowack, *Handkommentar* (1902); and (with special reference to traces of earlier mythological motives) H. Winckler, *Altorient. Forschungen* (iii. 66 seq.). For the customs discussed above, see I. Benzinger, *Ency. Bib.* col. 2949 seq.; J. A. Bever, *Theol. Stud. u. Krit.* (1903), pp. 328 seq., 502 seq. (with G. A. Barton's art. "Ruth" in *Jew. Encycy.*); and T. W. Juynboll, *Theolog. Tijdschr.* (1906), pp. 158 sqq.

(W. R. S.; S. A. C.)

**RUTHENIANS**, a name applied to those of the Little Russians who are Austrian subjects. The name is a form of the word *Russian*. The Ruthenians were separated from the bulk of Russians by the accident of the two feudal principalities of the old Red Russia, Halicz and Volhynia, having fallen to Lithuania, which in turn was united with Poland. At the partition of Poland no one troubled about ethnological boundaries. The language is in substance like the Little Russian of the Ukraine, though it has marked differences; the most interesting dialects are those in the extreme W., which approach to Slovak and that of the Huzuli in Bukovina. The Ruthenians number some three million in Galicia, Bukovina, and in the Carpathians along the edges of Hungary from the 21st meridian eastwards. Throughout Galicia the Poles form the aristocracy, though in two-thirds of it Ruthenians form the bulk of the population, while the middle class is Jewish or German. The Ruthenians are therefore under an alien yoke both politically and economically: in religion they mostly belong to the Uniate Church, acknowledging the Pope but retaining their Slavonic liturgy and most of the outward forms of the Greek Church. Their intellectual centre is Lemberg (Lviv or Lwów), where some lectures in the university are given in their language, and they are agitating for it to have equal rights with Polish. Yet here Little Russian is freer than in the Russian empire, and in Lemberg is the centre of its literature, the society called by the name of *Ševčenko*, the Little Russian poet. This society publishes voluminous transactions in a special orthography and deals with everything concerning Little Russia, its archaeology, people and language.

See summary of the work of the *Ševčenko* for ten years in *Archiv f. slavische Phil.* xxvii. (1905), p. 279.

**RUTHENIUM** [symbol Ru, atomic weight 101.7 (O=16)], in chemistry, a metallic element, found associated with platinum, in platinum ore and in osmiridium. The metal may be obtained from the residues obtained in the separation of osmium from osmiridium. These are washed with ammonium chloride until the filtrate is colourless, ignited, fused with caustic potash and nitre, the melt dissolved in water and nitric acid added to the solution until the colour of potassium ruthenate disappears. A precipitate of ruthenium oxide gradually separates: this is collected and ignited in a graphite crucible and finally fused in

the oxyhydrogen furnace (F. Sainte-Claire Deville and H. J. Debray, *Ann. chim. phys.*, 1859, (3), 56, p. 406). For other methods see C. E. Claus, *Pogg. Ann.*, 1845, 65, p. 200; E. Frémy, *Comptes rendus*, 1854, 38, p. 1008; T. Wilm, *Ber.*, 1883, 16, p. 1524. A purer ruthenium is obtained by A. Gutbier and L. Trenkner (*Zeits. anorg. Chem.*, 1905, 45, p. 166) by heating the crude metal (obtained by other processes) in a current of oxygen until all the osmium is volatilized as tetroxide. The residue is then fused with caustic potash and nitre, dissolved in water, saturated with chlorine and distilled on the water-bath in a current of chlorine. Pure ruthenium tetroxide distils over. This is then dissolved in water, reduced by alcohol and ignited in oxygen. Ruthenium in bulk resembles platinum in its general appearance, and has been obtained crystalline by heating an alloy of ruthenium and tin in a current of hydrochloric acid gas. Its specific gravity (after fusion) is 12.063 (A. Joly, *Comptes rendus*, 1893, 116, p. 430). It fuses easily in the electric arc. It oxidizes superficially when heated, but fairly rapidly when ignited in an oxidizing blowpipe flame, forming a black smoke of the oxide. It is also oxidized when fused with caustic potash and nitre, forming a ruthenate. Acids have practically no action on the metal, but it is soluble in solutions of the alkaline hypochlorites. Like most of the other metals of the group, it absorbs gases. A colloidal form has been obtained by A. Gutbier and G. Hofmeier (*Jour. prakt. Chem.*, 1905, (2), 71, p. 452) by reducing ruthenium salts with hydrazine hydrate in the presence of gum-arabic.

Several oxides of ruthenium have been described, the definite existence of some of which appears to be doubtful. The dioxide, RuO<sub>2</sub>, is formed by heating sulphate, or by heating the metal in a current of oxygen. It crystallizes in octahedra isomorphous with stannic oxide. It is insoluble in acids and decomposes when heated to a sufficiently high temperature. Fusion with caustic potash converts it into a mixture of potassium ruthenate and ruthenium sesquioxide, Ru<sub>2</sub>O<sub>3</sub>, which is a black, almost insoluble powder. An oxide of composition Ru<sub>3</sub>O<sub>4</sub> is obtained as a black hydrated powder when the peroxide is heated with water for some time. It becomes anhydrous at about 310° C., and is unattacked by acids and alkalis. The peroxide, RuO<sub>4</sub>, is formed when a solution of potassium ruthenate is decomposed by chlorine, or by oxidizing ruthenium compounds with potassium chlorate and hydrochloric acid, or with potassium permanganate and sulphuric acid. It forms a golden yellow crystalline mass, which sublimes slowly in vacuo, and melts at 25.5° C. It blackens on exposure to moisture, and decomposes when exposed to light. It is insoluble in water, but gradually decomposes, forming a hydrated oxide, Ru<sub>2</sub>O<sub>3</sub>.H<sub>2</sub>O. It is readily reduced. Its vapour possesses a characteristic smell, somewhat resembling that of ozone. Ruthenium dichloride, RuCl<sub>2</sub>, is obtained (in solution) by reducing the sesquichloride by sulphuretted hydrogen or zinc. It is stable in the cold. The sesquichloride, Ru<sub>2</sub>Cl<sub>3</sub>, is formed when a mixture of chlorine and carbon monoxide is passed over finely divided ruthenium heated to 350° C. (Joly, *Comptes rendus*, 1892, 114, p. 291). It is a brown powder which is readily decomposed by boiling water. It absorbs ammonia readily, forming Ru<sub>2</sub>Cl<sub>3</sub>.7NH<sub>3</sub>. Numerous double chlorides are known, e.g. Ru<sub>2</sub>Cl<sub>3</sub>.4KCl; Ru<sub>2</sub>Cl<sub>3</sub>.4NH<sub>4</sub>Cl, &c. The pure tetrachloride, RuCl<sub>4</sub>, has not been isolated, but is chiefly known in the form of its double salts, such as potassium ruthenium chloride, K<sub>2</sub>RuCl<sub>6</sub>, which is obtained when finely divided ruthenium is fused with caustic potash and potassium chloride is gradually added to the fused mass (U. Antony and A. Luchen, *Gass.*, 1899, 29, 11, p. 82). It is a red-brown crystalline powder, which is soluble in water. A similar ammonium salt has been obtained. Ruthenium sulphides are obtained when the metal is warmed with pyrites and some borax, and the fused mass treated with hydrochloric acid first in the cold and then hot. The insoluble residue contains a mixture of two sulphides, one of which is converted into the sulphate by nitric acid, whilst the other (a crystalline solid) is insoluble in acids. Ruthenium sulphate, Ru(SO<sub>4</sub>)<sub>3</sub>, as obtained by oxidizing the sulphide, is an orange-yellow mass which is deliquescent and dissolves in water, the solution possessing a strongly acid reaction. *Rouge de Ruthène*, Ru<sub>2</sub>(OH)<sub>2</sub>.Cl<sub>2</sub>(NH<sub>3</sub>), is obtained from ammonia and ruthenium sesquichloride at 40° C., the product being purified by crystallization from ammonia. It forms small brown lamellae which dissolve slowly in water to give a fuchsin-red solution possessing a violet reflex. The solution possesses a considerable tinctorial power, dyeing silk in the cold. Potassium ruthenium cyanide, K<sub>2</sub>Ru(CN)<sub>6</sub>.3H<sub>2</sub>O, formed when potassium ruthenate is boiled with a solution of potassium cyanide, crystallizes in colourless plates which are soluble in water. A ruthenium silicide, RuSi<sub>3</sub>, has been prepared by H. Moissan (*Comptes rendus*, 1903, 137, p. 229) by the

direct combination of the two elements in the electric furnace. It forms very hard metallic-looking crystals, burns in oxygen and is not attacked by acids. Potassium ruthenate,  $K_2RuO_7 \cdot H_2O$ , obtained by fusion of the metal with caustic potash and nitre, crystallizes in prisms which become covered with a black deposit on exposure to moist air. It is soluble in water, giving an orange-red solution which becomes green on standing, and gradually deposits the hydrated pentoxide,  $Ru_2O_5 \cdot H_2O$  (H. Debray and A. Joly, *Comptes rendus*, 1888, 106, p. 1494). The *per-ruthenate*,  $KRuO_6$ , formed by the action of chlorine on the ruthenate, or of alkalis on the peroxide at  $50^\circ C.$ , is a black crystalline solid which is stable in dry air but decomposes when heated strongly. On the nitroso, nitroso-ammonium and nitroso-diammonium compounds see C. E. Claus, *Ann.*, 1856, 98, p. 317; A. Joly, *Comptes rendus*, 1888, 107, p. 994; 1889, 108, pp. 854, 1300; 1890, 111, p. 969; L. Brizard, *ibid.*, 1896, 122, p. 730; 1896, 123, p. 182. The atomic weight of ruthenium was determined by A. Joly (*Comptes rendus*, 1889, 188, p. 946), who obtained the values 101.5 and 101.3.

**RUTHERFORD, MARK**, the pen-name of William Hale White, English author, who was born at Bedford about 1830. His father, William White, a member of the nonconformist community of the Bunyan Meeting, removed to London, where he was well known as a doorkeeper of the House of Commons; he wrote sketches of parliamentary life for the *Illustrated Times*, papers afterwards collected by his son as *The Inner Life of the House of Commons* (1897). The son was educated for the Congregational ministry, but the development of his views prevented his taking up that career, and he became a clerk in the admiralty. He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," *The Autobiography of Mark Rutherford* (1881), *Mark Rutherford's Delirance* (1885), and *The Revolution in Tanner's Lane* (1887). Under his own name he translated Spinoza's *Ethic* (1883). Later books are *Miriam's Schooling*, and *other Papers* (1890), *Catherine Furze* (2 vols., 1893), *Clara Hoggood* (1896), *Pages from a Journal, with other Papers* (1900), and *John Bunyan* (1905). Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time.

**RUTHERFORD, WILLIAM GUNION** (1853–1907), English scholar, was born in Peeblesshire on the 17th of July 1853. He was educated at St Andrews and Oxford, where he graduated in natural science, with a view to following the medical profession, which he abandoned in favour of a scholastic career. From 1883 to 1901 he was headmaster of Westminster school; and his death, on the 19th of July 1907, deprived classical scholarship in England of one of its most brilliant modern representatives. Rutherford devoted special attention to Attic idioms and the language of Aristophanes. His most important work, the *New Phrynichus* (1882), dealing with the Atticisms of the grammarian, was supplemented by his *Babrius* (1883), a specimen of the later Greek, which was the chief subject of C. A. Lobeck's earlier commentary (1820) on Phrynichus. His edition (1896–1905) of the Aristophanic scholia from the Ravenna MS. was less successful. Mention may also be made of his *Elementary Greek Accidence and Lex Rex*, a list of cognate words in Greek, Latin and English.

**RUTHERFORD** (or RUTHERFORD), **SAMUEL** (c. 1600–1661), Scottish divine, was born about 1600 at the village of Nisbet, Roxburghshire. He went to college at Edinburgh in 1617, graduating M.A. in 1621, and two years afterwards was elected professor of humanity. On account of an alleged indiscretion before his marriage in 1626 he was dismissed his professorship in that year, but, after studying theology, he was in 1627 appointed minister of Anwoth, Kirkcudbrightshire, and soon took a leading place among the clergy of Galloway. In 1636 his first book, entitled *Exercitationes Apologeticae pro Divina Gratia*—an elaborate treatise against Arminianism—appeared at Amsterdam. Its severe Calvinism led to a prosecution by the bishop, Thomas Sydserf, in the High Commission Court, first at Wigton and afterwards at Edinburgh, with the result that Rutherford was deposed from his pastoral office, and sentenced to confinement in Aberdeen during the king's pleasure.

His banishment lasted from September 1636 to February 1638, and the greater number of his published *Letters* belong to this period of his life. He was present at the signing of the Covenant in Edinburgh in 1638, and at the Glasgow Assembly of the same year he was restored to his parish. In 1639 he was appointed professor of divinity in St Mary's College, St Andrews. He only accepted the position on the condition that he should be allowed to act as colleague to Robert Blair in the church of St Andrews. He was sent up to London in 1643 as one of the eight commissioners from Scotland to the Westminster Assembly. Remaining at his post over three years, he did great service to the cause of his party. In 1642 he had published his *Peaceable and Temperate Plea for Paul's Presbytery in Scotland*, and the sequel to it in 1644 on *The Due Right of Presbyteries* provoked Milton's contemptuous reference to "mere A. S. and Rutherford" in his sonnet *On the New Forcers of Conscience under the Long Parliament*. In 1644 also appeared Rutherford's *Lex Rex, a Dispute for the Just Prerogative of King and People*, which gives him a recognized place among the early writers on constitutional law; it was followed by *The Divine Right of Church Government and Excommunication* (1646), and *Free Disputation against Pretended Liberty of Conscience* (1648), characterized by Bishop Heber as "perhaps the most elaborate defence of persecution which has ever appeared in a Christian country." Among his other works are *The Tryal and Triumph of Faith* (1645), *Christ Dying and Drawing Sinners to Himself* (1647), and *Survey of the Spiritual Antichrist* (1648). In 1647 he returned to St Andrews to become principal of the New College there, and in 1648 and 1651 he declined successive invitations to theological chairs at Harderwijk and Utrecht. After the Restoration in 1660, his *Lex Rex* was ordered to be burned. He was deprived of all his offices, and on a charge of high treason was cited to appear before the ensuing parliament. His health utterly broke down, and he drew up, on the 26th of February 1661, a *Testimony*, which was posthumously published. He died on the 23rd of the following March.

The fame of Rutherford now rests principally upon his remarkable *Letters*, which, to the number of 215, were first published anonymously by M'Ward, an amanuensis, as *Josua Redivivus, or Mr Rutherford's Letters*, in 1664. They have been frequently reprinted, the best edition (365 letters) being that by Rev. A. A. Bonar (1848), with a sketch of his life. In addition to the other works already mentioned, Rutherford published in 1651 a treatise, *De Divina Providentia*, against Molinism, Socinianism and Arminianism; of which Richard Baxter, not without justice, remarked that "as the *Letters* were the best piece so this was the worst he had ever read."

See also a short *Life* by Rev. Dr Andrew Thomson (1884); Dr A. B. Grosart in *Representative Nonconformists*; Dr Alexander Whyte, *Samuel Rutherford and some of his Correspondents* (1894); Rev. R. Gilmour, *Samuel Rutherford* (1904).

**RUTHERGLEN** (locally pronounced *Räglen*), a royal municipal and police burgh of Lanarkshire, Scotland. Pop. of royal burgh (1901) 18,279. It is situated on the left bank of the Clyde, 2½ m. by the Caledonian railway S.E. of Glasgow, with the E. of which it is connected by a bridge. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I., by which Sir John Menteith undertook to betray Wallace to the English. The principal public building is the town hall, dating from 1861. The industries include collieries, chemical works, dye-works, cotton- and paper-mills, chair-making, tube-making, pottery, rope- and twine-works and some shipbuilding. It forms one of the Kilmarnock group of parliamentary burghs, with Dumbarton, Port-Glasgow, Renfrew and Kilmarnock.

Rutherglen was erected into a royal burgh by David I. in 1226. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of the city. In early times it had a castle, which was taken by Robert Bruce from the English in 1313. It was kept in good repair till after the battle of Langside (1568), when it was burnt by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen prior to the battles of Drumclog and Bothwell Brig (1679).

**RUTHIN** (*Rhudd dda*, "red fortress"), a municipal and contributory parliamentary borough (with Denbigh and Holt) and market town of Denbighshire, N. Wales, situated on a hill rising from the river Clwyd, 21 m. from Chester, and 215 from London by rail. Pop. (1901) 2643. It is on the Great Western railway (Denbigh, Corwen & Ruthin branch). Apart from the legends of Arthur and his limestone block (shown in the market-place), the first event of note in its history is its connection with the de Grey de Ruthyn family (the first lord died 1533). Owen Glendower attacked it unsuccessfully in 1400. It was sold by the de Greys to Henry VII., and Elizabeth gave it to the earl of Warwick. In 1646, after two months' siege, it was dismantled by the Parliamentarians. The new castle occupies the same site, and is built of the same coloured sandstone as the old. New buildings for the Free Grammar School (founded in 1595 by Gabriel Goodman, dean of Westminster, who also in 1590 had built the hospital for twelve decayed housekeepers), were opened in the town in 1893. The old (conventual) Anglican church of St Peter, once belonging to "Les Bons-hommes," and made collegiate in 1310 by John de Grey, has a perpendicular north aisle roof, nearly 500 panels of carved oak, and cloisters which have been made into a house for the warden of the hospital. Agriculture is the staple, but there are chemical, aerated waters, bricks, terra-cotta and other manufactures.

**RUTHVEN**, the name of a noble Scottish family which traces its descent from a certain Thor, who settled in Scotland during the reign of David I. In 1488 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. His eldest son William was killed at Flodden in 1513, and consequently his grandson William succeeded him in the title, and after holding the offices of extraordinary lord of session and keeper of the privy seal died in December 1552, leaving three sons. The eldest of these, Patrick, 3rd Lord Ruthven (c. 1520-1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died on the 13th of June 1566. Ruthven wrote for Queen Elizabeth a *Relation of the murder*, which is preserved in MSS. in the British Museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573-1651), distinguished himself, in the service of Sweden, which he entered about 1600. As a negotiator he was very useful to Gustavus Adolphus because of his ability to "drink immeasurably and preserve his understanding to the last," and he also won fame on the field of battle. Having taken part in the Thirty Years' War and been governor of Ulm, he left the Swedish service and returned to Scotland, where he was employed by Charles I. He defended Edinburgh Castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. But his faculties had begun to decay, and in 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on the 2nd of February 1651. He left no sons and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1541-1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI., known as the raid of Ruthven, and he was the last-known custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attainted and executed in May 1584 (see GOWRIE, 3RD EARL OF).

The 2nd Lord Ruthven left a son, Alexander (d. 1599), the founder of the family of Ruthven of Freeland, and the grandfather of Sir Thomas Ruthven (d. 1673), on whom Charles II. bestowed the title of Lord Ruthven of Freeland in 1651. When his son David died unmarried in April 1701 the title of Baroness Ruthven was assumed by the latter's sister, Jean (d. 1722), although according to some authorities the peerage had become extinct. It was, however, assumed in 1722 by Isobel (d. 1732), wife of James Johnson, who took the name of Ruthven on succeeding to the family estates; and their son, James Ruthven (d. 1783), took the title and was allowed to vote at the elections of Scots representative peers. In 1853 the barony again descended to a female, Mary Elizabeth Thornton (c. 1784-1864), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, and their grandson, Walter James Hore-Ruthven (b. 1838), became the 8th baron in 1864.

See the *Ruthven Correspondence*, edited with introduction by the Rev. W. D. Macray (1868); J. H. Round, "The Barony of Ruthven of Freeland" in *Joseph Foster's Collectanea Genealogica* (1881-85); and Sir R. Douglas, *The Peerage of Scotland* (new ed. by Sir J. B. Paul).

**RUTILE**, the most abundant of the three native forms of titanium dioxide (TiO<sub>2</sub>); the other forms being anatase (*q.v.*) and brookite (*q.v.*). Like anatase, it crystallizes in the tetragonal system, but with different angles and cleavages, it being crystallographically related to cassiterite, with which it is isomorphous. The crystals resemble cassiterite in their prismatic habit and terminal pyramid planes (fig. 1) and also in the twinning: the prism planes are striated vertically. Geniculated twins, with *c* (101) as twin-plane, are of frequent occurrence, and the twinning is usually several times repeated, giving rise to triplets (fig. 2), sextets and octets. Twin-lamellae are often

FIG. 1.

FIG. 2.

present in the crystals. Acicular crystals are sometimes twinned together to form reticulated skeletal plates to which the name "sagenite," from Gr. *σαγήνη* (a net), is applied. A rarer type of twinning, on the plane (301), gives rise to heart-shaped or kite-shaped forms. There are distinct cleavages parallel to the faces of the prisms *m* (110) and *a* (100). The colour is usually reddish-brown, though yellowish in the very fine needles, and black in the ferruginous varieties ("nigrine" and "limonite-rutile"): the streak is pale brown. The name rutile, given by A. G. Werner in 1803, refers to the colour, being from the Latin *rutilus* (red). Crystals are transparent to opaque, and have a brilliant metallic-adamantine lustre. The hardness is 6½ and the specific gravity 4.2, ranging, however, up to 5.2 in varieties containing 10% of ferric oxide. The refractive indices and the positive birefringence are high.

Rutile occurs as a primary constituent in eruptive rocks, but more frequently in schistose rocks. As delicate acicular crystals it is often enclosed in mica and quartz: in mica (*q.v.*) it gives rise to the phenomenon of asterism; and clear transparent quartz (rock-crystal) enclosing rutile is often cut as a gem under the name of "Venus' hair stone" (*Veneris crinis* of Pliny). Larger crystals occur in the cavities of granite and crystalline schists; very large twinned crystals have been found at Graves Mountain in Lincoln county, Georgia, and good specimens have been obtained from several places in Norway and the Swiss and Tirol Alps. As a secondary mineral, rutile in the form of minute needles is of wide distribution in various sedimentary rocks, especially clays and slates. As rounded grains it is often met with in auriferous sands and gravels. The mineral has little economic value: it has been used for imparting a yellow colour to glass and porcelain, and for this purpose is mined at Risør and other places in Norway. (L. J. S.)

**RUTILIUS CLAUDIUS NAMATIUS**, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, *De Reditu Svo*, in elegiac metre, describing a coast voyage from Rome to Gaul in A.D. 416. The literary excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father, whom he calls Lachanius, had held high offices in Italy and at the imperial court, had been governor of Tuscia (Etruria and Umbria), then imperial treasurer (*comes sacrarum largitionum*), imperial recorder (*quaestor*), and governor of the capital itself (*praefectus urbis*). Rutilius boasts his career to have been no less distinguished than his father's, and particularly indicates that he had been secretary of state (*magister officiorum*) and governor of the capital (l. 157, 427, 467, 501). After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. He witnessed the chequered career of Stilicho as actual, though not titular, emperor of the West; he saw the hosts of Radagaisus rolled back from Italy, only to sweep over Gaul and Spain; the defeats and triumphs of Alaric; the three sieges and final sack of Rome, followed by the marvellous recovery of the city; Heraclian's vast armament dissipated; and the fall of seven pretenders to the Western diadem. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

While making but few direct assertions about historical characters or events, the poem forces on us important conclusions concerning the politics and religion of the time. The attitude of the writer towards paganism is remarkable. The whole poem is intensely pagan, and is penetrated by the feeling that the world of literature and culture is and must remain pagan; that outside paganism lies a realm of barbarism. The poet wears an air of exalted superiority over the religious innovators of his day, and entertains a buoyant confidence that the future of the ancient gods of Rome will not belie their glorious past. Invective and apology he scorns alike, nor troubles himself to show, with Claudian, even a suppressed grief at the indignities put upon the old religion by the new. As a statesman, he is at pains to avoid offending those politic Christian senators over whom pride in their country had at least as great power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only to attack the monks, whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian emperor had forced by thousands into the ranks of his army. Judaism Rutilius could assail without wounding either pagans or Christians, but he intimates, not obscurely, that he hates it chiefly as the evil root whence the rank plant of Christianity had sprung.

We read in Gibbon that "Honorius excluded all persons who were adverse to the catholic church from holding any office in the state," that he "obstinately rejected the service of all those who dissented from his religion," and that "the law was applied in the utmost latitude and rigorously executed." Far different is the picture of political life impressed upon us by Rutilius. His voice is assuredly not that of a partisan of a discredited and overborne faction. We see by the aid of his poem a senate at Rome composed of past office-holders, the majority of whom were certainly pagan still. We discern a Christian section whose Christianity was political rather than religious, who were Romans first and Christians afterwards, whom a new breeze in politics might easily have wafted back to the old religion. Between these two sections the broad old Roman toleration reigns. Some ecclesiastical historians have fondly imagined that after the sack of Rome the bishop Innocent returned to a position of predominance. No one who fairly reads Rutilius can cherish this idea. The air of the

capital, perhaps even of Italy, was still charged with paganism. The court was far in advance of the people, and the persecuting laws were in large part incapable of execution.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," annihilated those defences of Alps and Apennines which the provident gods had interposed between the barbarians and the Eternal City, and planted the cruel Goths, his "skin-clad" minions, in the wild sanctuaries of the empire. His wife was wickeder than the wife of the Trojan horse, than the wife of Althaea or of Scylla. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own mother, but Stilicho the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. The relations, however, between Alaric and Stilicho had been closer and more mysterious than those between Alaric and Theodosius, and men who had seen Stilicho surrounded by his body-guard of Goths not unnaturally looked on the Goths who assailed Rome as Stilicho's avengers. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism. His crowning sin (recorded by the poet alone) was the destruction of the Silylline books—a sin worthy of one who had decked his wife in the spoils of Victory, the goddess who had for centuries presided over the deliberations of the senate. This crime of Stilicho alone is sufficient in the eyes of Rutilius to account for the disasters that afterwards befell the city, just as Merobaudes, a generation or two later, traced the miseries of his own day to the overthrow of the ancient rites of Vesta.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. If he lacks the genius of Claudian, he also lacks his overloaded gaudiness and his large exaggeration, and the directness of Rutilius shines by comparison with the laboured complexity of Ausonius. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Merobaudes. At any rate, in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

Of the many interesting details of the poem we can only mention a few. At the outset we have an almost dithyrambic address to the goddess Roma, whose glory has ever shone the brighter for disaster, and who will rise once more in her might and confound her barbarian foes. The poet shows as deep a consciousness as any modern historian that the grandest achievement of Rome was the spread of law. Next we get incidental but not unimportant references to the destruction of roads and property wrought by the Goths, to the state of the havens at the mouths of the Tiber, and the general decay of nearly all the old commercial ports on the coast. Most of these were as desolate then as now. Rutilius even exaggerates the desolation of the once important city of Cosa in Etruria, whose walls have scarcely changed from that day to ours. The port that served Pisa, almost alone of all those visited by Rutilius, seems to have retained its prosperity, and to have foreshadowed the subsequent greatness of that city. At one point on the coast the villagers everywhere were "soothing their wearied hearts with holy merriment," and were celebrating the festival of Osiris.

**AUTHORITIES.**—All existing MSS. of Rutilius are later than 1494, and are copies from a lost copy of an ancient MS. once in the monastery of Bobio, which disappeared about 1700. The *editio princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burmann (1731, in his edition of the minor Latin poets), Wernsdorff (1777, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Müller (Teubner, Leipzig, 1870), and another by Vessey (1904); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Müller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Claudius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (4, 5) be correct, Müller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire de la destruction du Paganisme en Occident* (1835), may be especially mentioned, and one in Pichon's *Derniers écrivains profanes* (1906). (J. S. R.)

**RUTILIUS RUFUS, PUBLIUS**, Roman statesman, orator and historian, born c. 158 B.C. He was on intimate terms with the younger Scipio, under whom he served in the Numantine War (134), and he also accompanied Q. Metellus Numidicus in the campaign against Jugurtha (109). In 105 he was elected to the consulship, and restored the discipline of the army and introduced an improved system of drill. Subsequently, he went as legate to Q. Mucius Scaevola, governor of Asia. By assisting his superior in his efforts to protect the provincials from the extortions of the *publicani*, or farmers of taxes, Rufus incurred the hatred of the equestrian order, to which the *publicani* belonged. In 92 he was charged with the very offence of extortion which he had done his utmost to prevent. The charge was absurd, but as the juries at that time were chosen from the equites, his condemnation was only to be expected. Rufus accepted the verdict with the resignation befitting a Stoic and pupil of Panaetius. He retired to Mytilene, and afterwards to Smyrna, where he spent the rest of his life, and where Cicero saw him as late as the year 78. Although invited by Sulla to return to Rome, Rufus refused to do so. It was doubtless during his stay at Smyrna that he wrote his autobiography and a history of Rome in Greek, part of which is known to have been devoted to the Numantine War. He possessed a thorough knowledge of law, and wrote treatises on that subject, some fragments of which are quoted in the Digests. He was also well acquainted with Greek literature.

See Cicero, *Pro Pontico*, 17, *Brutus*, 22, 30; Livy, *epit.* 70; Macrobius, *Sat.* 1. xvi. 34; Appian, *Hisp.* 88; Athenaeus iv. p. 168; W. H. Suringar, *De Romanis Autobiographis* (Leiden, 1846); H. Peter, *Hist. Rom. Reliquiae*, t. cclxi-cclxviii. (life), fraga. p. 187; A. H. J. Greenidge, *Hist. of Rome*, i. p. 484.

**RUTLAND, EARLS AND DUKES OF.** The 1st earl of Rutland was Edward Plantagenet (1373-1415), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525, Thomas Manners was created earl of Rutland, and his descendants have held this title to the present day.

Thomas was a favourite of Henry VIII., who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516-1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth. His son Edward, 3rd earl (c. 1548-1587), who was also a favourite with Elizabeth, left no sons, and the barony of Ros, which had hitherto descended with the earldom, passed to his daughter Elizabeth (d. 1591), wife of William Cecil, earl of Exeter; his successor in the earldom was his brother John (d. 1588), whose son Roger, 5th earl (1576-1612), married a daughter of Sir Philip Sidney. The barony of Ros was restored to the main line of the family in the person of Francis, 6th earl (1578-1632), who inherited it in 1618 as heir general of his cousin William Cecil, Lord Ros (1590-1618); but it was again separated from the earldom of Rutland on the death of Francis without male issue, and the assumption of the courtesy title of Lord Ros by the eldest son of subsequent earls of Rutland appears to have had no legal basis.

The 8th earl, a cousin of his predecessor and also of the 6th earl, was John (1604-1699), eldest son of Sir George Manners (d. 1623) of Haddon, a descendant of Sir John Manners, the second son of the 1st earl. His son John, 9th earl (1638-1711), a partisan of the revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquis of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquis of Dorchester, was a very celebrated legal case, being the first instance of divorce *a vinculo* by act of parliament, a divorce *a mensa et thoro* having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1656-1779), was the father of John Manners, marquis of Granby (q.v.), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquis of Granby he represented Cambridge University in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He was instrumental in procuring the entrance of the younger Pitt to the House of Commons, and remained through life an intimate friend of that statesman. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784. He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was "the duke" in Disraeli's *Coningsby*; the latter's two sons, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. Both these sons succeeded in turn to the dukedom, Lord John Manners succeeding his brother Charles Cecil John, the 6th duke (1815-1888), as 7th duke of Rutland (see below) in 1888. In 1891 he was made a knight of the Garter, being the tenth earl and the sixth duke of Rutland of the same creation to wear this illustrious order.

**RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF** (1818-1906), English statesman, was born at Belvoir Castle on the 13th of December 1818, being the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of Byron's guardian, the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

Melbourne's Whig government had been doomed for some time before it went out in June 1841. The Tories came in with a large majority under Peel, and among Manners's friends who were successful in the constituencies, besides Gladstone, were Smythe, afterwards 7th Viscount Strangford, at Canterbury; Baillie-Cochrane, afterwards 1st Lord Lamington, at Bridport; and Disraeli at Shrewsbury. Cherishing many of the ideas of the cavaliers of the 17th century, and full of political and literary ardour, Lord John was soon prominent in the social group which revolved round Lady Blessington. In 1841 he committed some of his loyalist and other fancies to a volume called *England's Trust, and other Poems*, which he dedicated to his friend Smythe, and in which occurred the familiar line about "laws and learning" and "our old nobility." Before the end of this year Manners had definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class *bourgeoisie*, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of

the peasantry and the labouring classes. At the same time its members looked for a regeneration of the Church, and the rescue of both the Church and Ireland from the trammels inherited from the Whig predominance of the 18th century. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong *Plea for National Holidays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was ultimately passed in May 1847. In October during that year he took part in, and spoke at, the brilliant *société* held at the Manchester Athenaeum under the presidency of Disraeli. A few days later he and his friends attended a festival at Bingley, in Yorkshire, to celebrate the allotment of land for gardens to working men, a step which, through the agency of his father, he had done a great deal to further. About the same time Smythe dedicated to him his *Historic Fancies* as to "the Sir Philip Sidney of our generation." Manners figured as Lord Henry Sidney in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in *Sybil* and Waldershare in *Endymion*. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as *English Ballads*, chiefly patriotic and historical, in 1850. In the same year he wrote the letterpress for an atlas of coloured views by J. C. Schetky; and he published several pamphlets, one on the *Church of England in the Colonies*, in 1851. During the three short administrations of Lord Derby (1851, 1858, and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885-86, and was head of the department when sixpenny telegrams were introduced. Finally, in the Conservative government of 1886-92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on the 4th of August 1906 at Belvoir Castle.

He was succeeded as 8th duke by his eldest son (b. 1852), who had been Conservative M.P. for the Melton division of Leicestershire from 1888 to 1895; and whose wife, as marchioness of Granby, became well known as a clever artist, a volume of her *Portraits* of various distinguished men and women being published in 1899.

**RUTLAND**, a midland county of England, bounded N. and E. by Lincolnshire, N. and W. by Leicestershire, and S.E. by Northamptonshire. It is the smallest county in England, having an area of 152 sq. m. The surface is pleasantly undulating, ridges of high ground running E. and W., separated by rich valleys. The principal of these valleys is the vale of Catmose, in the Oakham district, to the N. of which rises a tableland commanding wide views into Leicestershire. The vale maintains its reputation for richness of soil assigned to it by Drayton in his *Poly-Olbion*. This, the N.W. part of the county is also the district of the well-known Cottesmore hunt.

The royal forest of Lyfield, or Lezfield, which included the greater part of the hundreds of Oakham and Martinsley, once extended over the county between Oakham and Uppingham, and patches of it still exist. To the S. of Uppingham it was known as Beaumont Chase. The river Welland, flowing N.E., forms the S.E. boundary of Rutland with Northamptonshire. The Gwash, or Wash, which rises in Leicestershire, flows eastward through the centre of the county, and just beyond its borders in Lincolnshire joins the Welland. The Chater, also rising in Leicestershire and flowing E., enters the Welland about 2 m. from Stamford. The Eye, forming part of the S.W. boundary, is also tributary to the Welland.

**Geology**.—The county consists entirely of Jurassic formations, viz. of Liassic and Oolitic strata—the harder beds, chiefly limestone containing iron, forming the hills and escarpments, and the clay-beds the slopes of the valleys. The oldest rocks are those belonging to the Lower Lias in the N.W. The bottom of the vale of Catmose is formed of marlstone rock belonging to the Middle Lias, and its sides are composed of long slopes of Upper Lias clay. The Upper Lias also covers a large area in the W. of the county, and is worked for bricks at Luffeham and Seaton. The lowest of the Oolitic formations is the Northampton sand, which has yielded iron ore at Manton and Cottesmore. The Lincolnshire Oolitic limestone prevails in the E. of the county N. of Stamford. It is largely quarried for building purposes, the quarries at Ketton, Clipsbam, and Casterton being famous beyond the boundaries of the county. The Great Oolite and Estuarine beds prevail towards the S.E. Glacial deposits of boulder clay, sand and gravel, mask the older strata in many places.

**Industries**.—In the E. and S.E. districts the soil is light and shallow. In the other districts it consists chiefly of a tenacious but fertile loam, and in the vale of Catmose the soil is either clay or loam, or a mixture of the two. The prevailing redness, which colours even the streams, is owing to the ferruginous limestone carried down from the slopes of the hills. The name of the county is by some authorities derived from this characteristic of the soil, but the explanation is doubtful. The E. of the county is chiefly under tillage and the W. in grass. Nearly nine-tenths of the total area (a high proportion) is under cultivation, wheat being by far the most important grain crop. Turnips and swedes occupy the greater part of the area under green crops. The rearing of sheep (Leicesters and South Downs) and cattle (Shorthorns) occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and boot-making.

The main line of the Great Northern railway intersects the N.E. corner, and branches of that system, of the London & North-Western, and of the Midland railways, serve the remainder of the county.

**Population and Administration**.—The area of the ancient and administrative county is 97,273 acres, with a population in 1891 of 20,659, and in 1901 of 19,709. The county contains five hundreds. There are no municipal boroughs or urban districts. The county town is Oakham (pop. 3294), and other towns are Uppingham (2588) and Ketton (1041). The county is in the midland circuit, and assizes are held at Oakham. It has one court of quarter sessions, but is not divided for petty-sessional purposes. There are 58 civil parishes. The county is in the diocese of Peterborough, and contains 42 ecclesiastical parishes or districts, wholly or in part. It returns one member to parliament.

**History**.—The district which is now Rutland was probably occupied by a tribe of Middle Angles in the 6th or 7th century, and was subsequently absorbed in the kingdom of Mercia. Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life with remainder to Westminster Abbey, Rutland did not rank as a county at the time of the Domesday Survey, in which the term Rutland is only applied to that portion assessed under Nottinghamshire, while the S.E. portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiceslea. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll of 1150, but as late as the 14th century it is designated "Rutland Soke" in the *Vision of Piers Plowman*, and the curious connexion with Nottinghamshire, a county which does not adjoin it at any point, was maintained up to the reign of Henry III., when the sheriff of Nottingham was by statute appointed also escheator in Rutland. Of the five modern hundreds of Rutland, Alstoe and Martinsley appear in the Domesday Survey of Nottinghamshire as wapentakes, Martinsley at that date including the modern hundred of Oakham Soke; East hundred

and Wrangdike hundred are mentioned in the middle of the 12th century, the latter formerly including the additional hundred of Little Casterton. The shire-court for Rutland was held at Oakham.

Rutland was originally included in the diocese of Lincoln, and in 1291 formed a rural deanery within the archdeaconry of Northampton; but on the erection of Peterborough to an episcopal see by Henry VIII. in 1541, the archdeaconry of Northampton, with the deanery of Rutland, was transferred to that diocese. In 1879 the deanery of Rutland was subdivided into three portions, and in 1876 it was placed within the newly-founded archdeaconry of Oakham.

Among the most conspicuous of the Norman lords connected with this county was Walkelin de Ferrers, who founded Oakham Castle in the 12th century. The castle was subsequently bestowed by Richard II., together with the earldom of Rutland (see above), on Edward, son of Edmund, duke of York. Essendine (Essenden or Essingdon) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Essenden bestowed on his grandson is retained by the earls of Salisbury. Sir Everard Digby, one of the conspirators in the Gunpowder plot, belonged to the family of Digby, of Stoke Dry. Burley-on-the-hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who entertained James I. there with Ben Jonson's *Mask of the Gypsies*.

The battle of Stamford was fought at Horn, near Exton, in March 1470 between Edward IV. and the Lancastrians, when from the precipitate flight of the latter the engagement became known as Losecoat Field. On the outbreak of the Civil War Rutland displayed a strong puritanical and anti-royalist sentiment, and in 1642 the sheriff and a large number of the gentry and nobility of the county forwarded a petition to the House of Lords begging that the county might be placed in a state of defence, and that the votes of papists and prelates might be disallowed; and again, in 1648, a memorial addressed to Lord Fairfax protested against the design of the parliament to treat with Charles.

Rutland has always been mainly an agricultural county. The Domesday Survey mentions numerous mills in Rutland, and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield Forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1793 by the extension of the Melton Mowbray canal to Oakham.

Two members were returned to parliament for the county of Rutland from 1295 until under the Redistribution of Seats Act of 1885 the representation was reduced to one member.

The only old castle of which there are important remains is Oakham, dating from the time of Henry II. and remarkable for its Norman hall. Of Essendine Castle only the moat remains. The Bede-house at Liddington dates from the end of the 14th century. Hambleton Hall, now a farm-house, is a good specimen of Jacobean architecture. Many old houses of the 17th and 18th centuries are to be met with in the villages. An interesting feature of the ecclesiastical architecture of the county is the frequent continuation of the round-headed arch after the Early English style had become fully developed; as, for instance, in the Early English churches at Great Casterton, Stretton, Empingham, Clipsham (Early English and Decorated), and St Peter's, Preston, where the nave arcade is Norman on one side and Early English on the other, but yet retains round-headed arches on both sides. Tickencote church is a remarkable specimen of late Norman work, with one of the finest chancel-arches extant in this style. Ketton church is transitional Norman, Early English, and early Decorated, the broach spire being of later date. St Mary's, Greettham, is a good example of Decorated, with fine tower and spire.

Blore, *History and Antiquities of the County of Rutland*, vol. 1, pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, *A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland* (London, 1870).

**RUTLAND**, a city and the county seat of Rutland county, Vermont, U.S.A., on Otter creek, about 67 m. S. by E. of

Burlington. Pop. (1900) 11,499, of whom 1533 were foreign-born, (1910 census) 13,546. Area, 8½ sq. m. It is served by the Delaware & Hudson (being a terminus of one of its branches) and the Rutland (New York Central system) railways. It is pleasantly situated within sight of the Green Mountains. Among its public buildings and institutions are the United States Government Building, the State House of Correction, the Rutland Free Library (1886, with 17,500 volumes in 1908), the H. H. Baxter Memorial Library, a Memorial Hall, the County Court House, the City Hall, and the City Hospital. The famous Rutland marble is quarried in W. Rutland (pop. in 1910, 3427 and Proctor (pop. in 1910, 2871), which were parts of the township of Rutland until 1886. In 1905 the value of the city's factory products was \$2,522,856 (28.8% more than in 1900). The township of Rutland was granted by New Hampshire in 1761 to John Murray of Rutland, Massachusetts, and about the same time it was granted (as Fairfield) by New York. No settlement was made until 1770, and in 1772 the place was again granted by New York under the name of Socialborough. From 1784 to 1804 Rutland was one of the capitals of Vermont, and the Capitol, built in 1784, is the second oldest building in the state. The *Rutland Herald*, one of the oldest newspapers in Vermont still published, was established as a Federalist weekly in 1794—a daily edition first appeared in 1861, and is now Republican. In 1847 the village of Rutland was incorporated, and in 1892 a portion of the township including the village was chartered as a city.

**RUTLEDGE, JOHN** (1739–1800), American jurist and politician, was born in Charleston, South Carolina, in 1739. He studied law in London and began to practise in Charleston in 1761. He was a delegate to the Stamp Act Congress in 1765, and to the Continental Congress in 1774–77 and 1782–83; he was chairman of the committee which framed the state constitution of 1776, and the first "president" (governor) of South Carolina in 1776–78. Disapproving of certain changes in the constitution, he resigned in 1778, but was elected governor in the following year, and served until 1782. From 1784 to 1789 he was a member of the state court of chancery. In the Constitutional Convention of 1787 he urged that the president and the Federal judges should be chosen by the national legislature, and preferably by the Senate alone, and that the president should be chosen for a term of seven years, and should be ineligible to succeed himself. Rutledge championed the Constitution in the South Carolina convention by which that instrument was adopted on behalf of the state. He was associate justice of the United States Supreme Court in 1789–91, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the Supreme Court of the United States in 1795, he presided during the August term, but the Senate refused to confirm the nomination, apparently because of his opposition to the Jay Treaty. His mind failed late in 1795, and he died in Charleston on the 23rd of July 1800.

His brother, **EDWARD RUTLEDGE** (1749–1800), a signer of the Declaration of Independence, was born in Charleston on the 23rd of November 1749. He studied law in his brother's office, and in London in 1769–73, and began to practise in Charleston in 1773. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in September 1776. As captain of artillery and later as lieutenant-colonel he served against the British in South Carolina in 1779–80, but he was captured near Charleston in 1780, and was imprisoned at St Augustine, Florida, for a year. He was a member of the state legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death in Charleston, on the 23rd of January 1800, he was governor of South Carolina.

**RUTLEY, FRANK** (1842–1904), English geologist and petrographer, was born at Dover on the 14th of May 1842. He was educated partly at Bonn, but his interest in geology was kindled at the Royal School of Mines, where he studied from 1862–64; he then joined the army, and served as lieutenant until 1867,

when he became an Assistant Geologist on the Geological Survey. Working then in the Lake district, he began to make a special study of rocks and rock-forming minerals, and soon qualified as acting petrographer on the Geological Survey. For several years he worked in this capacity at the Museum in Jermyn Street: he described the volcanic rocks of E. Somerset and the Bristol district in 1876, and wrote special memoirs on *The Eruptive Rocks of Brent Tor* (1878), and on *The Felsitic Lavas of England and Wales* (1885). He was the author of an exceedingly useful little book on *Mineralogy* (1874; 12th ed., 1900); also of *The Study of Rocks* (1879; 2nd ed., 1881), *Rock-forming Minerals* (1888), and *Granites and Greenstones* (1894); and of a number of petrographical papers, dealing with perlitic and spherulitic structures, with the rocks of the Malvern Hills, &c. In 1882 he was appointed lecturer on Mineralogy in the Royal College of Science, and held this post until ill-health compelled him to retire in 1898. He died in London on the 16th of May 1904.

Obituary (by H. B. Woodward), with bibliography, in *Geol. Mag.* (July 1904).

**RUTULL**, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no great distance from Aricia, and just W. of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Appuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vituli (see ITALY). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy. The same is suggested by the tradition adopted or moulded by Virgil, by which the leader of the people of the soil in their resistance to the settlement of Aeneas was the Rutulian prince Turnus, a name which, if any conjecture could be founded on it, might be held to point rather to Etruria than to any pure Italic source; he is represented as the *hospes* of the exiled Etruscan king Mezentius, and as taking up arms to defend him against his angry subjects. Pliny (iii. § 6) classes them, with the Siculi, among the primitive tribes that at one time or another inhabited part of Latium, and it is to be observed that they are not included in the thirty Latin communities who once took part in the Latin Festival on the Alban Mount (see further SICULI). (R. S. C.)

**RUUVIGNY, HENRI DE MASSUE, MARQUIS DE**, afterwards EARL OF GALWAY (1648-1720), was born at Paris on the 9th of April 1648, and was the son of the 1st Marquis de Ruuvigny, a distinguished French diplomatist, and a relative of Rachel, the wife of Lord William Russell. He saw service under Turenne, who thought very highly of him. Probably on account of his English connexions he was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a difficult mission which he executed with great skill. Succeeding his father as "general of the Huguenots," he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenots, he entered the service of William III. of England as a major-general, forfeiting thereby his French estates. In July 1691 he distinguished himself at the battle of Aughrim, and in 1692 he was for a time commander-in-chief in Ireland. In November of that year he was created Viscount Galway and Baron Portarlington, and received a large grant of forfeited estates in Ireland. In 1693 he fought at Neerwinden and was wounded, and in 1694, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1701, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was appointed in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was

decisively defeated. But he scraped together a fresh army, and, although infirm, was reappointed to his command by the home government. After taking part in one more campaign, and distinguishing himself by his personal bravery in action, he retired from active life. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. As most of his property in Ireland had been restored to its former owners, and all his French estates had long before been forfeited, parliament voted him pensions amounting to £1500 a year. He died unmarried on the 3rd of September 1720. The English peerage died with him, but not the French marquise.<sup>1</sup>

**RUVO**, a town and episcopal see of Apulia, Italy, in the province of Bari, 21 m. W. of the city of that name by steam tramway, 853 ft. above sea-level. Pop. (1901) 25,245. The cathedral, a basilica with a very lofty nave (50 high, indeed, that the gable of the façade is only slightly above the steep sloping roofs of the aisles, and the clerestory is very small), and with two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs probably to the 13th century. The interior has a fine triforium; it contains some interesting frescoes of the 15th century, and is unique in Apulia in having a gallery supported by corbels round the nave (see A. Avena, *Monumenti dell' Italia Meridionale*, Rome, 1902, 117). S. Giovanni Rotondo is an ancient circular baptistry with two large fonts. In the Palazzo Jatta is a famous and beautiful collection of vases and coins found in the Apulian tombs around the city; part of these, however, are now to be found in the museum at Naples. The Palazzo Spinola has an interesting Renaissance court. Ruvo occupies the site of the ancient Rubi, on the Via Trajana (see APPIA, VIA). Coins were issued by the city before it became Roman. (T. AS.)

**RUWENZORI**, more correctly Rursoro, said to be known also as Kokora, a mountain range in Central Africa, lying just north of the equator, and intersected near its eastern edge by 30° E. It has a length of about 65 m., with a maximum breadth of about 30 m., and its highest peaks rise above the limits of perpetual snow. The range as a whole, the major axis of which runs a little east of north, falls steeply on the west to the Central African rift-valley traversed by the Semliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the highlands of western Uganda. The upper parts are separated by fairly low passes into six groups of snowy summits, lying a little to the west of the central line, rising in each case more than 15,000 ft. above the sea and reaching, in the culminating point of the western group (Mount Stanley), about 16,800 ft.

The origin of the range seems connected with that of the rift-valley on the west, both being due to vertical displacements of the earth's crust. Ruwenzori has been formed by an upheaval *en masse* of a portion of the archæan floor of the continent, bounded east and west by lines of fracture, but resulting in a general dip from west to east. A further upheaval seems to have produced an ellipsoidal anticline, causing the strata to dip outwards at a generally high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, &c.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction, though there is abundant evidence that the glaciers were formerly far more extensive.

The upper region is almost entirely enveloped by day in thick cloud, which descends on the east to about 9000 ft., and lower still on the west. It sometimes lifts towards evening, giving a sight of the snowy peaks, but by 9 a.m. these have

<sup>1</sup> The later Viscounts Galway are descended from John Monckton (1695-1751), who was created viscount in 1727. His first wife's mother, wife of the 2nd duke of Rutland, was a daughter of Lady William Russell, and thus a connexion of the Ruuvignys.

once more been hidden. As a result, the climate is very humid, the rainfall being probably at least 100 in. annually, and the slopes are furrowed by numberless streams, the most important fed by the glaciers of the upper region, and afterwards flowing in deeply cut valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semliki, either directly or through Lake Dweru and the Albert Edward Nyanza.

As in other ranges of Central Africa the vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west (probably an outcome of the general climatic régime of Central Africa, as the range lies between the east African plateau and the relatively low-lying basin of the Congo), the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr R. B. Woosnam of the British Museum scientific expedition of 1906-7:—

Zones.	Upper Limits (East Side).
Grass . . . . .	6,500 ft.
Forest . . . . .	8,500 "
Bamboos . . . . .	10,000 "
Tree heaths . . . . .	12,500 "
Lobelias and Senecios . . . . .	14,500 "

above which is the summit region of snow and bare rock. The boundaries between the zones are not of course hard and fast lines, but merely indicate the levels between which the respective forms are specially characteristic, though they occur also in higher or lower zones. The forest zone is perhaps the best marked, being visible from a distance as a dark ring. On the west it merges in part with the low-lying forest of the Semliki valley. Owing to the abundance of moisture, mosses, hepaticae and lichens are prevalent in several of the zones, and bogs, with *Vaccinium* and other low-growing plants, are common above the forest zone. *Helichrysums* are abundant in the zone immediately below the snow, where they form large bushes. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, touracos, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of coccolasia and beans, has been placed at 6700 ft.

Attempts have been made to identify the range with the "Mountains of the Moon" of Ptolemy and other ancient writers, the snows of which were thought to feed the Nile lakes. But in view of the extreme vagueness of the statements and the absence of all detailed knowledge of the geography, it is far more likely that the rumours of snowy mountains really referred to Mounts Kenya and Kilimanjaro, especially as they seem to have been obtained rather from the east coast than from the direction of the Nile. In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887-89, though hints of high mountains had been obtained by Stanley himself and by Romolo Gessi in 1876 and by others from the neighbourhood of the Albert Nyanza. Stanley named the main mass Ruwenzori, and outlying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, &c.—the last named lying N.E. of Lake Dweru. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr Stuhlmann, Mr Scott Elliot, Mr J. E. Moore, Sir Harry Johnston, Mr Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs Grauer, Tegart and Maddox, and by Dr Wollaston and other members of the British Museum expedition, while later in the year the duke of the Abruzzi led a well-equipped expedition, including various scientists, to

the upper parts of the range, and with the help of trained Alpine guides ascended not only the culminating twin summits (which he named *Margarita* and *Alexandra* after the queens of Italy and England), but all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

**RUYSBROEK** (or **RUYSBROECK**), **JAN VAN** (1293-1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St Gudule, Brussels. When sixty years of age he withdrew with a few companions to the monastery of Groenedael, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were *De vera contemplatione* and *De septem gradibus amoris*, were published in 1848 at Hanover; also *Reflections from the Mirror of a Mystic* (1906) and *Die Zierde der geistlichen Hoehheit* (1901).

See Rufus M. Jones, *Studies in Mystical Religion*, pp. 308-14 (1909); M. Maeterlinck, *Ruysbroek and the Mystics, with selections from The Adornment of the Spiritual Marriage* (tr. by J. T. Stoddart, London, 1894); and art. **MYSTICISM**.

**RUYSDAEL** (or **RUYSDAAL**), **JACOB VAN** (c. 1628-1682), the most celebrated of the Dutch landscapists, was born at Haarlem. He appears to have studied under his father Izaak Ruysdael, a landscape painter, though other authorities make him the pupil of Berghem and of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1645. Three years later he was admitted a member of the guild of St Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobbema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites, with whom he was connected, petitioned the council of Haarlem for his admission into the almshouse of the town, and there the artist died on the 14th of March 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at the Hague, Amsterdam, Berlin, and Dresden. His favourite subjects are simple woodland scenes, similar to those of Everdingen and Hobbema. He is especially noted as a painter of trees, and his rendering of foliage, particularly of oak leafage, is characterized by the greatest spirit and precision. His views of distant cities, such as that of Haarlem in the possession of the marquess of Bute, and that of Katwijk in the Glasgow Corporation Galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely forest glades that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van

Everdingen, whose manner he copied at one period. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquess of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his seapieces. The art of Ruysdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skillful in technique. Figures are sparingly introduced into his compositions, and such as occur are believed to be from the pencils of Adrian Vandevelde, Philip Wouwerman, and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruysdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions, introducing into them an infinite variety of subtle contrasts in the formation of the clouds, the plants and tree forms, and the play of light. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape, and determine the light and shade of the objects.

Characteristic of his early period, from about 1646 to 1653, is the choice of very simple motifs and the careful and laborious study of the details of nature. The time between his departure from Haarlem and his settling in Amsterdam may have been spent in travelling and helped him to gain a broader view of nature and to widen the horizon of his art. Mr Otto Beit owns a magnificent view of the "Castle of Bentheim," dated 1654, from which it may be concluded that his wanderings extended to Germany. In his last period, from about 1675 onwards, he shows a tendency towards overcrowded compositions, and affects a darker tonality, which may partly be due to the use of thin paint on a dark ground. Towards the end, in his leaning towards the romantic mood, he preferred to draw his inspiration from other masters, instead of going to nature direct, his favourite subjects being rushing torrents and waterfalls, and ruined castles on mountain crests, which are frequently borrowed from the Swiss views by Roghman.

Ruysdael etched a few plates, which were reproduced by Amand Durand in 1878, with text by Georges Duplessis. The "Cornfield" and the "Travellers" are characterized by M. Duplessis as prints of a high order which may be regarded as the most significant expressions of landscape art in the Low Countries.

**RYAN, LACY** (c. 1694-1760), English actor, appeared at the Haymarket about 1709. By 1718 he had joined the company at Lincoln's Inn Fields, where he shared the lead with his friend Quin. In 1732 he followed the company to Covent Garden, and there he remained until his death. Iago, Cassius, Edgar (in *King Lear*) and Macduff were among his best parts.

**RYAZAN**, a government of central Russia, bounded by the governments of Moscow and Tula on the W., by Vladimir on the N., and by Tambov on the E. and S., with an area of 16,250 sq. m. Ryazan is an intermediate link between the central Great Russian governments and the steppe governments of the S.E.—the wide and deep valley of the Oka being the natural boundary between the two. On the left of the Oka the surface often consists of sand, marshes and forests; while on the right the fertile black-earth prairies begin, occupying especially the districts of Ranenburg, Sapozhok and Dankov. The whole of Ryazan is a plateau about 700 ft. above the sea, but deeply cut by the river valleys and numerous ravines. Iron-ores, limestone, grindstone grits, potters' clays, and thick beds of peat are worked, besides coal. The N. belongs to the forest regions, and, notwithstanding the wholesale destruction of forests, these (chiefly coniferous) in several districts still cover one-third of the surface. In the S., where the proximity of the steppes is felt, they are much less extensive, the prevailing species being oak, birch, and other deciduous trees. Altogether forests cover about one-fifth of the total area.

The Oka is the chief river; it is navigable throughout, and receives the navigable Pronya and Pra, besides a great many smaller streams utilized for floating timber. Steamers ply on the Oka to Kasimov and Nuzhny-Novgorod. The Don belongs to Ryazan in its upper course only. On the whole, the S. districts are not well watered. Small lakes are numerous in the broad depression

of the Oka and elsewhere, while extensive marshes occur in the N.E. districts; a few attempts at draining some of these beside the Oka have resulted in the reclamation of excellent pasture lands. The climate is a little warmer than at Moscow, the average temperature at the city of Ryazan being 40°; February, 3°; July, 67°.

The estimated population in 1906 was 2,100,000, and is nearly Great Russian throughout, containing only a trifling admixture of Tatars, Poles and Jews in towns. Some Tatars immigrated into the Kasimov region in the 15th century, and are noted for their honesty of character as well as for their agricultural prosperity. The people of the Pra river are described as Meshcheryaks, but their manners and customs do not differ from those of the Russians. The chief occupation is agriculture. Out of the total area only 8% is unfit for tillage, and between 50 and 60% is under crops; although the area under cultivation and the crops themselves are increasing, yet even here, in one of the wealthiest governments of Russia, the situation of the peasants is far from satisfactory. Live-stock breeding is rapidly falling off on account of want of pasture lands, but hay, which is abundant, especially on the rich meadow lands of the Oka, is exported. More than half of the land (52%) is owned by the village communities, 40% by private owners, 5% by the crown, and 2% by various institutions. During the last thirty years of the 19th century the nobles sold 36% (1,261,000 acres) of their lands, mainly to merchants and peasants; the latter cultivate two-thirds of the total cultivated area.

The principal crops are oats, rye and potatoes, with wheat, barley, buckwheat, flax, hemp, tobacco, hops and fruit. But the crops are insufficient for the needs of the inhabitants. Tobacco, hops, vegetables and fruit, however, are grown for export. Bee-keeping is developing and manufactures increasing, the factories being chiefly cotton and flax mills, flour mills, machine works, tanneries, soap works, boot, cement, glass and match factories, distilleries, and chemical works.

The government is divided into twelve districts, the chief towns of which are Ryazan, Dankov, Egorievsk, Kasimov, Mikhailov, Pronsk, Ranenburg, Ryazhsk, Sapozhok, Skopin, Spask and Zaraisk. Small industries, such as boat-building, the preparation of pitch and tar, the making of wooden vessels and sledges, mat-weaving and boot-making, are carried on in the villages, especially in the N., which belongs, properly speaking, to the Vladimir industrial region. Domestic trades, such as lace-making (supported by two schools) and embroidering on leather, give occupation to 40,000 women. Trade, especially in corn and manufactured goods, is brisk, and has been stimulated by the opening of coal-mines, e.g. in the district of Skopin. Considerable efforts have been made by the local governing bodies to increase the number of schools. Most interesting archaeological finds have been made in the government, and have been placed in the new museum at the city of Ryazan.

The Slavs began to colonize the region of Ryazan as early as the 9th century, penetrating thither both from the N.W. (Great Russians) and from the Dnieper (Little Russians). As early as the 10th century the principality of Murom and Ryazan is mentioned in the chronicles. During the following centuries this principality increased both in extent and in wealth, and included parts of what are now the governments of Kaluga and Moscow. Owing to the fertility of the soil, its Russian population rapidly increased, while the Finnish tribes which formerly inhabited it migrated farther E., or became merged among the Slavs. The Mongol invasion of 1239-42 stopped all development. The principality, however, still continued to exist; its princes strongly opposed the annexation by Moscow, making alliance with the Mongols and with Lithuania, but they finally succumbed, and the principality was definitely annexed in 1517.

**RYAZAN**, a town of Russia, capital of the government of the same name, 124 m. by rail S.E. of Moscow, on the elevated right bank of the Trubezh, a mile above its confluence with the Oka. Pop. (1897) 44,552. A wide prairie dotted with large villages, the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands, and actually has the aspect of an immense lake when it is inundated in the spring. Ryazan is the see of an archbishop of the Orthodox Greek Church. The cathedral, first built in the 17th century, was reconstructed in 1776. The Krestovozdvizhensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spask, also on the Oka. It is mentioned in annals as early as 1097, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks

of a small lake, a fort which received the name of Pereyaslav-Ryazanskiy. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazanskiy. The princes of Ryazan followed his example, and by and by completely abandoned the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1571. In 1365 and 1377 it was plundered and burned by the Tatars, but in 1460, 1513, 1521 and 1564 it was strong enough to repel them. Earthen walls with towers were erected after 1301; and in the 17th century a *kremi* or citadel still stood on the high crag above the Trubezh.

**RYAZHSK**, a town of Russia, in the government of Ryazan, 72 m. by rail S. of the city of Ryazan. Pop. (1897) 12,003. It is one of the chief railway junctions of Russia, where meet the lines from Moscow to S. Russia and Caucasia and from Poland to Samara and Siberia. It has become a centre for all the surrounding regions of Russia, and is a wealthy place.

**RYBINSK**, or **RUBINSK**, a town of Russia, in the government of Yaroslavl, 60 m. by river N.W. of Yaroslavl. It is connected by rail (186 m.) with Bologoye, on the line between St Petersburg and Moscow. It derives its importance from its situation on the Volga, opposite the mouth of the Sheksna, which connects the Volga with the regions around Lake Ladoga. Rybinsk has also an active trade in agricultural products from the neighbouring districts. The permanent population, which was 25,223 in 1897, is increased in the summer by nearly 100,000 workers from different parts of Russia.

**RYDBERG**, **ABRAHAM VIKTOR** (1828-1895). Swedish author and publicist, was born in Jönköping on 18th December 1828. He was educated at the high school of Växjö, and passed on to the university of Lund in 1851. While at school he was publishing verse and prose in the periodicals; some of these early miscellanies he collected in 1894 in the volumes called *Varia*. As a student he turned to more precise labours, and devoted himself to science. He had almost determined to adopt the profession of an engineer, when he was offered in 1855 a post on the staff of one of the largest Swedish newspapers. This caused his thoughts to return to imaginative literature, and it was in the feuilleton of this journal (the *Coleborgs Handels-och sjöfaristidning*) that Viktor Rydberg's romances successively appeared; he was editorially connected with it until 1876. *The Freebooter on the Baltic* (1857) and *The Last of the Athenians* (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with *The Bible's Teaching about Christ* (1862), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He followed this up by a number of contributions to the popular philosophy of religion, all inspired by the same reverent and yet searching spirit of inquiry. The modernity of his views led to his being opposed by the orthodox clergy, but by the wider public he was greatly esteemed. Nevertheless, it is said that it was his religious criticism which so long excluded him from the Swedish Academy, since he was not elected until 1877, when he had long been the first living author of Sweden. *Roman Days* is a series of archaeological essays on Italy (1876). He collected his poems in 1882; his version of *Faust* dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on the 22nd of September 1895. In Viktor Rydberg Sweden possessed a writer of the first order, who carried on the tradition of Boström and Geijer in philosophy and history, and possessed in addition a glow of imagination and a marvellous charm of style. He was an idealist of the old romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and perhaps, as a mere writer, the greatest. In personal character Rydberg was extremely like his writings—stately, ardent and ceremonious, with a fund of amiability which made him universally beloved. His premature death was the subject of national

mourning, and had even a historical significance, for with him the old romantic influence in Swedish literature ceased to be paramount. (E. G.)

**RYDE**, a municipal borough and watering-place in the Isle of Wight, England, 5 m. S.S.W. of Portsmouth. Pop. (1901) 11,043. It is beautifully situated on rising ground on the N.E. coast, overlooking Spithead. It occupies the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. About the close of the 18th century it was a small fishing hamlet, but it rapidly grew into favour as a watering-place. Ryde is connected by rail with the other towns in the island, and there is also steam-boat communication with Portsmouth, Southampton, Southsea, Portsea and Stoke's Bay. The pier, built originally in 1812, but since then greatly extended, forms a delightful promenade half a mile in length. The railway trains run out to its head, and an electric tramway also runs along it. The principal buildings are All Saints church, erected in 1870 from the designs of Sir Gilbert Scott, and other churches, the market house and town hall, the Royal Victoria Yacht club-house, the theatre and the Royal Isle of Wight Infirmary. There are golf-links near the town. The town was incorporated in 1868, and is governed by a mayor, 6 aldermen and 18 councillors. Area, 819 acres.

**RYDER**, **ALBERT PINKHAM** (1847- ), American artist, was born at New Bedford, Mass., on the 10th of March 1847. He was a pupil of William E. Marshall and of the schools of the National Academy of Design. Among his better known paintings are: "Temple of the Mind," "Jonah and the Whale," "Christ appearing unto Mary," "The Flying Dutchman," "Charity," and "The Little Maid of Arcadie." He became a member of the Society of American Artists in 1878, and a National Academician in 1906.

**RYE**, a market town and municipal borough in the Rye parliamentary division of Sussex, England, 11 m. N.E. by E. from Hastings, on the South-Eastern & Chatham railway. Pop. (1901) 3900. It rises on a sharp eminence above the S. of Romney Marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 m. from the town; this serves as a small harbour with a depth of 15 ft. at high tide, and there is some trade in coal, grain and timber. Fishing and shipbuilding are carried on, and there is a market for sheep (which are pastured in great numbers on the marshes), wool, grain and hops. The church of St Mary is of mixed architecture, chiefly Transitional, Norman and Early English; it is cruciform, with a low central tower. Of the old fortifications there remain portions of the town wall, a strong quadrangular tower built by William of Ypres, earl of Kent, and lord warden in the time of Stephen, and now forming part of the police station, and a handsome gate with a round tower on each side, known as the Land Gate, at the entrance into Rye from the London road. Picturesque old houses are numerous. In the low land S. of the town stands Camber Castle, one of the coastal defensive works of Henry VIII. In the vicinity are golf-links, to which a steam tram runs from the town. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 985 acres.

In the time of Edward the Confessor, Rye (Ris, Ryerot, La Rie) was a fishing village and, as part of the manor of "Rameslie," was granted by the king to the abbot and convent of Fécamp, by whom it was retained until Henry III. resumed it. By 1086 Rye was probably a port of consequence, and a charter of Richard I. shows that in the reign of Henry II., if not before, it had been added to the Cinque Ports. The fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were therefore built in the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. Rye was incorporated under a mayor and jurats

by the beginning of the 14th century, but possesses no charter distinct from the Cinque Ports. As a member of the Cinque Ports, which were summoned from 1322 onwards, Rye returned two representatives to parliament from 1366 until 1832; after that date one only until 1885. In 1290 the barons of the royal port of Rye were granted a three days' fair in September, altered in 1305 to March. The mayor and commonalty evidently held weekly markets on Wednesday and Friday before 1405, as in that year the Friday market was changed to Saturday. Ship-building has been carried on since the 13th century.

**RYE.** This cereal, known botanically as *Secale cereale*, is supposed to be the cultivated form of *S. montanum*, a wild perennial species occurring in the more elevated districts of parts of the Mediterranean region, and W. to Central Asia. Its cultivation does not appear to have

Rye (*Secale cereale*), about  $\frac{1}{2}$  nat. size.  
1, single spikelet; 2, single flower with awned plume and palea; 3, pistil; 4, grain.  
1, 2, 4, about two-thirds nat. size.

cultivation of the plant then, as now, in those regions. The origin of the Latin name *secale*, which exists in a modified form among the Basques and Bretons, is not explained. Rye is a tall-growing annual grass, with fibrous roots, flat, narrow, ribbon-like bluish-green leaves, and erect or decurved cylindrical slender spikes like those of barley. The spikelets contain two or three flowers, of which the uppermost is usually imperfect. The outer glumes are acute and glabrous, the flowering glumes lance-shaped, with a comb-like keel at the back, and the outer or lower one prolonged at the apex into a very long bristly awn. Within these are three stamens surrounding a compressed ovary, with two feathery stigmas. When ripe, the grain is of an elongated oval form, with a few hairs at the summit. When the ovaries of the plant become affected with a peculiar fungus (*Claviceps purpurea*) they become blackened and distorted, constituting ergot (*q.v.*).

In the S. of Great Britain rye is chiefly or solely cultivated as a forage-plant for cattle and horses, being usually sown in autumn for spring use, after the crop of roots, turnips, &c., is exhausted, and before the clover and lucerne are ready. For forage purposes it is best to cut early, before the leaves and haulms have been exhausted of their supplies to benefit the

grain. In the N. of Europe, and more especially in Scandinavia, Russia and parts of N. Germany, rye is the principal cereal; and in nutritive value, as measured by the amount of gluten it contains, it stands next to wheat, a fact which furnishes the explanation of its culture in N. latitudes ill-suited for the growth of wheat. Rye bread or black bread is in general use in N. Europe. The straw, which is prized on account of its length, is used for making hats and in the manufacture of paper. The bran is used for cattle-food and poultices, and the grain in the distillery.

**RYEZHITSA**, a town of Russia, in the government of Vitebsk, 150 m. N.W. from the town of Vitebsk and on the railway between St Petersburg and Warsaw. Its population increased from 7306 in 1867 to 10,681 in 1897; but its importance is mainly historical. The cathedral is a modern building (1846). Ryezhitsa, or, as it is called in the Livonian chronicles, Roazien, was founded in 1285 by the Teutonic Knights to keep in subjection the Lithuanians and Letts. The castle was continually the object of hostile attacks. In 1561 the Teutonic Knights gave it in pawn to Poland, and, though it was captured by the Russians in 1567 and 1577, and had its fortifications dismantled by the Swedes during the war of 1656-60, it continued Polish till 1773, when White Russia was united with the Russian empire.

**RYLAND, WILLIAM WYNNE** (1738-1783), English engraver, was born in London in July 1738, the son of an engraver and copper-plate printer. He studied under Ravenet, and in Paris under Boucher and J. P. le Bas. After spending five years on the continent he returned to England, and having engraved portraits of George III. and Lord Bute after Ramsay, and a portrait of Queen Charlotte and the Princess Royal after Francis Cotes, R.A., he was appointed engraver to the king. In 1766 he became a member of the Incorporated Society of Artists, and he exhibited with them and in the Royal Academy. In his later life Ryland abandoned line-engraving, and introduced "chalk-engraving," in which the line is composed of stippled dots, and in which he transcribed Mortimer's "King John Signing Magna Charta," and copied the drawings of the old masters and the works of Angelica Kauffman. In consequence of his extravagant habits his affairs became involved; he was convicted of forging bills upon the East India Company, and, after attempting to commit suicide, was executed at Tyburn on the 20th of August 1783.

**RYLANDS, JOHN** (1801-1888), English manufacturer and merchant, was born at St Helens, Lancashire, on the 7th of February 1801, and was educated at the grammar school in that town. In 1819 he, his elder brothers and his father, a manufacturer of cotton goods, founded the firm of Rylands & Sons, cotton goods and linen manufacturers, at Wigan. The business rapidly increased, dye-works and bleach-works were added, and the discovery of coal under some of the firm's property added materially to its wealth. In 1825 the partners became merchants as well as manufacturers, and subsequently acquired spinning mills at Bolton and elsewhere. In 1847, his father being dead and his brothers having retired, John Rylands assumed entire control of the business, which in 1873 was turned into a limited liability company. It has mills at Manchester, Bolton, and Wigan, and is now probably the largest concern of the kind in Great Britain. John Rylands was a benefactor to various charities, and was one of the original financiers of the Manchester Ship Canal. He died at Stretford on the 11th of December 1888. A permanent memorial, the John Rylands Library, was erected by his widow in Manchester in 1899.

**RYLE, JOHN CHARLES** (1816-1900), English bishop, was born at Macclesfield on the 10th of May 1816, and was educated at Eton and at Christ Church, Oxford, where he was Craven Scholar in 1836. After holding a curacy at Exbury in Hampshire, he became rector of St Thomas's, Winchester (1843), rector of Helmingham, Suffolk (1844), vicar of Stradbroke (1861), honorary canon of Norwich (1872), and dean of Salisbury (1880); but before taking this office was advanced to the new see of Liverpool, where he remained until his resignation, which took place three months before his death at Lowestoft on the 10th of June 1900.

yle was a strong supporter of the evangelical school. Among its longer works are *Christian Leaders of the Eighteenth Century* (1869), *Expository Thoughts on the Gospels* (7 vols., 1856-69), *Principles for Churchmen* (1884). His second son, HERBERT EDWARD RYLS (b. 1856), a distinguished Old Testament scholar, was made bishop of Exeter in 1901, and in 1903 bishop of Winchester.

RYLSK, a town of Russia, in the government of Kurak, 71 n. by rail W.S.W. of the town of Kurak. It is connected by a branch line with the Kurak-Kiev railway. Pop. (1897) 11,415. It has oil works, blast furnaces, and manufactories of soap and allow, and an active trade in corn, hemp, and scythes imported from Austria. It was founded in the 9th century, and is frequently mentioned in the annals from 1152 onwards. Its cathedral was built in the 15th century.

RYMER, THOMAS (1641-1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, described by Clarendon as "possessed of a good estate," and executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, with whom Rymer was "a great favourite," and "well known for his great critical skill in human learning, especially in poetry and history."<sup>1</sup>

He was admitted as *pensionarius minor* at Sidney Sussex College, Cambridge, on April 29, 1658, but left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. His first appearance in print was as translator of *Cicero's Princes* (1668), from the Latin treatise (1608) drawn up for Prince Henry. He also translated Rapin's *Reflections on Aristotle's Treatise of Poetics* (1674), with a preface in defence of the classical rules for unity in the drama, and followed the principles there set forth in a tragedy in verse, licensed September 13, 1677, called *Edgar, or the English Monarch*, which was a failure. The printed editions of 1678, 1691 and 1693 belong to the same issue, with new title-pages. Rymer's views on the drama were again given to the world in the shape of a printed letter to Fleetwood Shephard, the friend of Prior, under the title *The Tragedies of the Last Age Consider'd* (1678, 2nd ed. 1692). To *Ovid's Epistles Translated by Several Hands* (1680), with preface by Dryden, "Penelope to Ulysses" was contributed by Rymer, who was also one of the "hands" who "Englished" the Plutarch of 1683-86. The life of Nicias fell to his share. He furnished a preface to Whitelock's *Memoirs of English Affairs* (1682), and wrote in 1681 *A General Draught and Prospect of the Government of Europe*, reprinted in 1689 and 1714 as *Of the Antiquity, Power, and Decay of Parliaments*, where, ignorant of his future dignity, the critic had the misfortune to observe, "You are not to expect truth from an historiographer royal." He contributed three pieces to the collection of *Poems to the Memory of Edmund Waller* (1688), afterwards reprinted in Dryden's *Miscellany Poems*, and is said to have written the Latin inscription on Waller's monument in Beaconsfield churchyard. The preface to the posthumous *Historia Ecclesiastica* (1688) of Thomas Hobbes is said to have been by Rymer, but the *Life of Hobbes* (1681) sometimes ascribed to him was written by Richard Blackburne. He produced a congratulatory poem upon the arrival of Queen Mary in 1689. His next piece of authorship was to translate the sixth elegy of the third book of *Ovid's Tristia* for Dryden's *Miscellany Poems* (1692, p. 148). On the death of Thomas Shadwell in 1692 Rymer received the appointment of historiographer royal, at a yearly salary of £300. Immediately afterwards appeared his much discussed *Short View of Tragedy* (1693), criticizing Shakespeare and Ben Jonson, which produced *The Imperial Critick* (1693) of Dennis, the epigram of Dryden,<sup>2</sup> and the judgment of Macaulay that Rymer was "the

worst critic that ever lived." John Dunton (*Life and Letters*, p. 354), however, considered him "orthodox and modest," and Pope "one of the best critics we ever had" (*Spencer's Anecdotes*). Rymer contended that although Shakespeare possessed humour he had no genius for tragedy, Othello being merely "a bloody farce without salt or savour."

Within eight months of his official appointment Rymer was directed (August 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* (1693) of Leibnitz was taken by the editor as the model of the *Foedera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 he corresponded with Leibnitz, by whom he was greatly influenced with respect to the plan and formation of the *Foedera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant. G. Redpath published a MS. on the independence of the Scottish crown, by Sir T. Craig, entitled *Scotland's Sovereignty Asserted* (1695), and the subject was referred to by Bishop Nicolson in his *Scottish Historical Library* (1702). This led Rymer to address three *Letters to the Bishop of Carlisle* (1702-1706) explaining his action, and discussing other antiquarian matters. Sir Robert Sibbald answered the second letter (1704). The first and second letters are usually found together; the third is extremely rare. Rymer had now been for some years working with great industry, but was constantly obliged to petition the crown for money to carry on the undertaking. Up to August 1698 he had expended £1253, and had only received £500 on account.

At last, on November 20, 1704, was issued the first folio volume of the *Foedera, Conventiones, Litterae et cujuscumque generis Acta Publica inter reges Angliae et alias quosvis imperatores, reges, &c., ab. A.D. 1101 ad nostra usque tempora habita aut tractata*. The publication proceeded with great rapidity, and fifteen volumes were brought out by Rymer in nine years. Two hundred and fifty copies were printed; but, as nearly all of them were presented to persons of distinction, the work soon became so scarce that it was priced by booksellers at one hundred guineas. A hundred and twenty sheets of the fifteenth volume and the copy for the remainder were burnt at a fire at William Bowyer's, the printer, on January 30, 1712-13. Rymer died shortly after the appearance of this volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant.

For the greater part of his life Rymer derived his chief subsistence from a mortgage assigned to him by his father. His miscellaneous literary work could not have been very profitable. At one time he was reduced to offer his MSS. for a new edition for sale to the earl of Oxford. About 1703 his affairs became more settled, and he afterwards regularly received his salary as historiographer, besides an additional £200 a year as editor of the *Foedera*. Twenty-five copies of each volume were also allotted to him. He died at Arandel Street, Strand, December 14, 1713, and was buried in the church of St Clement Danes. His will was dated July 20, 1713. Tonson issued an edition of *Rochester's Works* (1714), with a short preface by the late historiographer. Another posthumous publication was in a miscellaneous collection called *Curious Amusements*, by M. B. (1714), which included "some translations from Greek, Latin and Italian poets, by T. *Tragedies of the Last Age* have been reprinted in his *Works* (1821), xv. pp. 383-396, and in Johnson's *Life of Dryden*. See also Dryden's *Works*, i. 377, vi. 251, xi. 60, xiii. 20. "I never came across a worse critic than Thomas Rymer," says Prof. George Saintsbury, who discusses his theories at length in *History of Criticism* (1902), pp. 391-397. See also A. Hofherr, *T. Rymer's dramatische Kritik* (1908).

<sup>1</sup> See Hickes, *Memoirs of John Kellwell* (1718), pp. 10-14.

<sup>2</sup> "The corruption of a poet is the generation of a critic" (*Ded. of the Third Miscellany*, in *Works* (1821), xii. p. 49), which is much more pointed than Beaconsfield's reference to critics as "men who have failed in literature and art" (*Lothair*, chap. xxv.). or Balzac's sly hit at Mérimée in similar terms. The poet's remarks on the

Rymer." Some of his poetical pieces were also inserted in J. Nichols's *Select Collection* (1780-86, 8 vols.), and two are reproduced in A. H. Bullen's *Musa Proterva* (1895).

Two more volumes of the *Foedera* were issued by Sanderson in 1715 and 1717, and the last three volumes (xviii., xix. and xx.) by the same editor, but upon a slightly different plan, in 1726-35. The latter volumes were published by Tonson, all the former by Churchill. Under Rymer it was carried down to 1586, and continued by Sanderson to 1694. The rarity and importance of the work induced Tonson to obtain a licence for a second edition, and George Holmes, deputy keeper of the Tower records, was appointed editor. The new edition appeared between 1727 and 1735. The last three volumes are the same in both issues. There are some corrections, enumerated in a volume, *The Emendations in the New Edition of Mr Rymer's Foedera*, printed by Tonson in 1730, and on the whole the second is an improvement upon the first edition. A third edition, embodying Holmes's collation, was commenced at the Hague in 1737 and finished in 1745. It is in smaller type than the others, and is compressed within ten folio volumes. The arrangement is rather more convenient; there is some additional matter; the index is better; the type is not so good, but it is to be preferred to either of the previous editions. When the volumes of the *Foedera* first appeared they were analysed by Leclerc and Rapin in the *Bibliothèque choisie et Bibliothèque ancienne et moderne*. Rapin's articles were collected together and appended, under the title of *Abregé historique des actes publics de l'Angleterre*, to the Hague edition. A translation, called *Acta Regia*, was published by Stephen Whatley, (1726-27), 4 vols. 8vo, reprinted both in 8vo and folio, the latter edition containing an analysis of the cancelled sheets, relating to the journals of the first parliament of Charles I., of the 18th volume of the *Foedera*.

In 1810 the Record Commissioners authorized Dr Adam Clarke to prepare a new and improved edition of the *Foedera*. Six parts, large folio, edited by Clarke, Caley and Holbrooke, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1381, was ultimately issued in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1817, 4to.

The wide learning and untiring labours of Rymer have received the warmest praise from historians. His industry was praised by Hearne (*Collections*, ii. 296). Sir T. D. Hardy styles the *Foedera* "a work of which this nation has every reason to be proud, for with all its blemishes—and what work is faultless?—it has no rival in its class" (*Syllabus*, vol. ii. xxxvi.), and Mr J. B. Mullinger calls it "a collection of the highest value and authority" (*Gardiner and Mullinger's Introduction to English History*, p. 224).

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869-85, 3 vols. 8vo). There is an unpublished life by Des Maizeaux (*Brit. Mus. Add. MS. No. 4223*), and a few memoranda in Bishop Kennet's collections (*Lansd. MS. No. 987*). See also *Dict. of Nat. Biogr.* vol. I. In Caulfield's *Portraits*, &c. (1819), i. 50, may be seen an engraving of Rymer, with a description of a satirical print of him as "a garretier poet." Rymer's two critical works on the drama are discussed by Sir T. N. Talfourd in the *Retrospective Review* (1820), vol. i. pp. 1-15.

Sir T. D. Hardy's *Syllabus* gives in English a condensed notice of each instrument in the several editions of the *Foedera*, arranged in chronological order. The third volume contains a complete index of names and places, with a catalogue of the volumes of transcripts collected for the Record edition of the *Foedera*. In 1869 the Record Office printed, for private distribution, Appendices A to E to a report on the *Foedera* intended to have been submitted by C. Purton Cooper to the late Commissioners of Public Records, "3 vols. 8vo (including accounts of MSS. in foreign archives relating to Great Britain, with facsimiles). In the British Museum is preserved (Add. MS. 24699) a folio volume of reports and papers relating to the Record edition. Rymer left extensive materials for a new edition of the *Foedera*, bound in 59 vols. folio, and embracing the period from 1115 to 1698. This was the collection offered to the earl of Oxford. It was purchased by the Treasury for £215 from a Mrs Anna Parnell, to whom Rymer left all his property, and is now in the British Museum (Add. MSS. Nos. 4573 to 4630, and 18911). A catalogue and index may be consulted in the 17th volume of Tonson's edition of the *Foedera*. The Public Record Office possesses a MS. volume, compiled by Robert Lemon about 1800, containing instruments in the Patent Rolls omitted by Rymer. In the same place may be seen a volume of reports, orders, &c., on the *Foedera*, 1808-11, and the transcripts collected for the new and unfinished edition. (H. R. T.)

**RYOT**, or **RAYAT** (from the Arabic *ra'a*, "to pasture"), properly a subject, then a tenant of the soil. The word is used throughout India for the general body of cultivators; but it has a special meaning in different provinces. The ryotwari

tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as zamindari; and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as ryotwari. Under zamindari tenure the land is held as independent property; while under ryotwari tenure it is held of the crown in a right of occupancy, which is under British rule both heritable and transferable. The former system prevails in northern and central India, and the latter in Bombay, Madras, Assam and Burma.

**RYSWICK, TREATY OF**, the peace which in 1697 ended the war between France on the one side and the Empire, England, Spain and Holland, on the other. Begun in 1689 under the leadership of the new king of England, William III., its object was to put a check on the ambitious designs of Louis XIV., and it raged in the Netherlands, the Rhineland, Italy, Ireland and Spain, in India and America and on the sea (see **GRAND ALLIANCE, WAR OF THE**). Negotiations for peace had begun in 1696, but they were soon broken off, William III. and the English parliament at this time refusing to treat except "with our swords in our hands." But in May 1697 they were renewed under the mediation of the king of Sweden. The French representatives had their headquarters at the Hague and those of the allies at Delft, the conferences between them taking place at Ryswick. For the first few weeks no result was reached, and in June William III. and Louis XIV., the protagonists in the struggle, each appointed one representative to meet together privately. The two chosen were William Bentinck, earl of Portland, and marshal Boufflers, and they soon drew up the terms of an agreement, to which, however, the emperor Leopold I. and the king of Spain would not assent. But in a short time Spain gave way, and on the 20th of September 1697 a treaty of peace was signed between France and the three powers, England, Spain and Holland, the Empire still holding aloof. William then persuaded Leopold to make peace, and a treaty between France and the Empire was signed on the 30th of October following.

The basis of the peace was that all towns and districts seized since the treaty of Nijmegen in 1679 should be restored. Then France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strassburg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons, Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish Palatinate.

For further details see C. W. von Koch and F. Schöfl, *Histoire abrégée des traités de paix* (1817-18); A. Moetsjens, *Actes et mémoires de la paix de Ryswick* (The Hague, 1725); A. Legrelle, *Notes et documents sur le traité de Ryswick* (Lille, 1894); and H. Vast, *Les Grands Traités du règne de Louis XIV* (Paris, 1893-99). See also L. von Ranke, *Englische Geschichte*, English translation as *History of England* (Oxford, 1875).

**RZHEV**, or **RZHOV**, a town of Russia, in the government of Tver, 76 m. S.W. of the town of Tver, occupying the bluffs on both banks of the Volga (here 350 ft. wide) near the confluence of the Vazuza. Pop. (1900) 31,514. It is the terminus of a branch line (85 m.) from the St Petersburg & Moscow railway, and is the centre of a large transit trade between Orel, Kaluga and Smolensk and the ports of St Petersburg and Riga. In the 12th century Rzhev belonged to the principality of Smolensk. Under the rulers of Novgorod it became from 1225 a subordinate principality, and in the 15th century the two portions of the town were held by two independent princes.

**S** the twenty-first letter of the Phoenician alphabet, is one of the four sibilants which that alphabet possesses. In the Phoenician alphabet it takes a form closely resembling the English W, and this when moved through an angle of 90° is the ordinary Greek *sigma* Σ. In Phoenician itself and in the other Semitic alphabets the position of the middle legs of the W is altered so that the symbol takes such forms as  $\Psi$  or  $\Upsilon$  ultimately ending sometimes in a form like  $\aleph$  laid sideways. In Greek, where Σ is the twentieth letter of the alphabet, or, if the merely numerical ς and Ϸ are excluded, the eighteenth, another form  $\zeta$  or  $\xi$  according to the direction of the writing is also widespread. This, which is the only form of the earliest period at Cumae, where it is also found more rounded  $\zeta$ , is the origin of the Latin S and its descendants. The development from the angular to the curved shape of S may be seen in its occurrences on the early cippus found in the Roman Forum in 1899. Apart from doubtful instances it is there six times clearly engraved; four of the instances are angular, the other two are more or less rounded. The Semitic name of the symbol is *shin*; the Greek name *sigma* may mean merely the hissing letter and may be a genuine Greek derivative from the verb *σίζω*, hiss. Some, however, see in it a corruption of the Semitic name *samkh*, the letter which corresponds in alphabetic position and in shape to the Greek ξ (x). The Dorian Greeks, however, as Herodotus tells us (i. 130), called that letter *son* which the Ionian Greeks called *sigma*; *son* seems more likely to be an attempt to reproduce the Semitic name. Herodotus says nothing of a difference in shape, but most authorities regard the form M, which with the value of s is practically confined to Doric areas, as being *son*. In the compound *σαμφορας*, *son* like *koppa* (*κοσφωριος*) was known to the Athenians as a brand for highbred horses (cf. Aristophanes, *Clouds*, 122, 1298, 23, 438). For the symbol T which was used at Ephesus and other places in Asia Minor and elsewhere for the sound represented by *ss* in Ionic Greek, by *rr* in Attic, see ALPHABET. Further points of difficulty in connexion with the sibilants are discussed under X and Z. The pronunciation of s was originally unvoiced: in English it is often used for the voiced sound as well, compare *lose* with *loose*, *house* with *houses*. At the end of words the voiced sound is often written with -s, the unvoiced with -ss as in *his* and *kiss*. In other cases the pronunciation can be ascertained only from the context, as in *use*, unvoiced for the substantive, voiced for the verb. Sometimes a difference of meaning is indicated by difference of spelling though the sounds in the two words are identical, as in *sur* and *sure*. The voiced form of s (i.e. z) readily passes into r in many languages: compare the Eng. *hare* with the Ger. *Hase*, the Eng. *ear* and Lat. *auris* with the Gothic *ausa* and Lithuanian *ausis*, "ear." Here also should be mentioned the sound *sh*, which, like *th*, is not a combination of sounds though written with two symbols. Hence in transcription from foreign languages and in works on phonetics it is represented by  $\int$  or  $\$$ . The difference in formation between s and  $\int$  is that the former is dental or alveolar, the latter is produced farther back and has at least two varieties. In the usual Eng. *sh* the tip of the tongue is bent backwards so that the tongue becomes spoon-shaped. The voiced sound to this is generally written z as in *azure*, but sometimes s as in *pleasure*. The sound of *sh* is also sometimes represented by s, as in *sure*, *sugar*. This is occasioned by the y-sound with which s now begins, and is carried further in dialect than in the literary language; *sure* and *suit*, for example, being pronounced in Scotland like the Eng. *shoe* and *shoot*. The *sh* sound is sometimes not even written with a sibilant, as in the pronunciation of the *ci* and *ti* of words like *rhetorician* and *nation*. (P. G.)

**SAALE**, a river of Germany, a tributary of the Elbe, rises between Bayreuth and Hof in the N.E. of Bavaria, springing out

of the Fichtelgebirge at an altitude of 2390 ft. It pursues a winding course in a northerly direction, and after passing the manufacturing town of Hof, flows amid well-wooded hills until it reaches the pleasant vale of Saalberg. Here it receives the waters of the Schwarz, in whose romantic valley lies the castle of Schwarzburg, the ancestral seat of the princes of the ruling house of Schwarzburg-Rudolstadt. From Saalberg the Saale enters the dreary limestone formation of Thuringia, sweeps beneath the barren, conical hills lying opposite to the university town of Jena, passes the pleasant watering-place of Kösen, washes numerous vine-clad hills and, after receiving at Naumburg the deep and navigable Unstrut, flows past Weissenfels, Merseburg, Halle, Bernburg and Kalbe, and joins the Elbe just above Barby, after traversing a distance of 226 m. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. The soil of the lower part of its valley is of exceptional fertility, and produces, amongst other crops, large supplies of sugar beetroot. Among its affluents are the Elster, Regnitz and Orla on the right bank, and the Ilm, Unstrut, Salza, Wipper and Bode on the left. Its upper course is rapid. Its valley, down to Merseburg, is picturesque, and even romantic, because of the many castles which crown the enclosing heights. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main, in the Bavarian district of Lower Franconia.

See Hartzberg, *Die historische Bedeutung des Saalefels* (Halle, 1895).

**SAALFELD**, a town of Germany, in the duchy of Saxe-Meiningen, picturesquely situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1905) 13,245. One of the most ancient towns in Thuringia, Saalfeld, once the capital of the extinct duchy of Saxe-Saalfeld, is still partly surrounded by old walls and bastions, and contains some interesting medieval buildings, among them being a palace, built in 1679 on the site of the Benedictine abbey of St Peter, which was destroyed during the Peasants' War. Other notable edifices are the Gothic church of St John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; and, standing on an eminence above the river, the Kitzstein, a palace said to have been originally erected by the German king Henry I., although the present building is not older than the 16th century. But perhaps the most interesting relic of the past in Saalfeld is the striking ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld is situated in one of the busiest parts of Meiningen and has a number of prosperous industries, including the manufacture of machinery, bricks, colours, malt, cigars, hosiery and vinegar. Other industries are brewing, printing and iron-founding, and there are ochre and iron mines in the neighbourhood.

Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. On the 10th of October 1806 a battle took place near Saalfeld between the French and the Prussians, during which Prince Louis Ferdinand of Prussia was killed.

See Wagner and Grobe, *Chronik der Stadt Saalfeld* (Saalfeld, 1865-1867), and Thümmel, *Kriegstage aus Saalfelds Vergangenheit* (Berlin, 1882).

**SAAR**, a river of Germany, a right-bank tributary of the Mosel. It rises in the Donon, an eminence of the Vosges, close to the Franco-German frontier, and flows at first north, then north-west and finally north again to its junction with the Mosel

now yields to that of a new people, the Homerites or Himyar, and the king henceforth bears the title "king of the Himyarites and Sabaeans." Naval expeditions from Berenice and Mysochorus to the Arabian ports brought back the information on which Claudius Ptolemy constructed his map, which still surprises us by its wealth of geographical names.

Sabaeen colonies in Africa have been already mentioned. That Abyssinia was peopled from South Arabia is proved by its language and writing; but the difference between the two languages is such as to imply that the settlement was very early and that there were many centuries of separation, during which the Abyssinians were exposed to foreign influences. New colonies, however, seem to have followed from time to time, and, according to the *Periplus* (§ 16), some parts of the African coast were under the suzerainty of the Sabaeen kings as late as the Sabaeo-Himyaritic period; the district of Azania was held for the Sabaeen monarch by the governor of Maphoritis (Ma'afir), and was exploited by a Sabaeen company. Naturally difficulties would arise between Abyssinia and the Sabaeen power. In the inscription of Adulis (2nd century) the king of Ethiopia claims to have made war in Arabia from Leucocome to the land of the Sabaeen king. And the Ethiopians were not without successes, for on the Greek inscription of Axūm (c. the middle of the 4th century) King Aezianes calls himself "king of the Axūmites, the Homerites, and Raidān, and of the Ethiopians, Sabaeans, and Silec." More serious was the conflict under Dhū-Nu'ās (Dhū-Nuwās of the Arab historians) in the beginning of the 6th century; it ended in the overthrow of the Himyarite king and the subjugation of Yemen, which was governed by a deputy of the Axūmite king, till (about 570) the conquerors were overthrown by a small band of Persian adventurers.

With the exception of what the South-Arabian Hamdānī relates of his own observation or from authentic tradition, the Mahomedan Arabic accounts of South Arabia and Sabaea are of little worth. The great event they dwell on is the bursting of the dam of Ma'rib, which led to the emigration northwards of the Yemenite tribes. We may be sure that this event was not the cause but the consequence of the decline of the country. When the inland trade fell away and the traffic of the coast towns took the sea route, the ancient metropolis and the numerous inland emporia came to ruin, while the many colonies in the north were broken up and their population dispersed. To this the Koran alludes in its oracular style, when it speaks (xxxiv. 17) of well-known cities which God appointed as trading stations between the Sabaeans and the cities He had blessed (Egypt and Syria), and which He destroyed because of their sins.

**Inscriptions.**—This abstract of the history of Yemen from ancient sources can now be verified and supplemented from inscriptions. Doubts as to the greatness and importance of the Sabaeen state, as attested by the ancients, and as to the existence of a special Sabaeen writing, called "Musnad," of which the Arabs tell, were still current when Niebuhr, in the 18th century, brought to Europe the first account of the existence of ancient inscriptions (not seen by himself) in the neighbourhood of Yarhū. Following this hint, Setzen, in 1810, was able to send to Europe, from porphyry blocks near Yarhū, the first copies of Sabaeen inscriptions. They could not, however, be read. But the inscriptions found by Wellsted in 1834 at Hīn Ghorāb were deciphered by Gesenius and Rödiger. Soon after this the courageous explorer Arnaud discovered the ancient Mariab, the royal city of the Sabaeans, and at great risk copied fifty-six inscriptions and took a plan of the walls, the dam, and the temple to the east of the city. These, with other inscriptions on stone and on bronze plates brought home by Englishmen, found a cautious and sound interpreter in Osiander. The historical and geographical researches of Kremer and Sprenger gave a fresh impulse to inquiry. Then Joseph Halévy made his remarkable journey through the Jauf, visiting districts and ruins which no European foot had trod since the expedition of Gallus, and returned with almost 800 inscriptions. Of more recent travellers S. Langer and E. Glaeser have done most for epigraphy, while Manzoni is to be remembered for his excellent geographical work.

The alphabet of the Sabaeen inscriptions is most closely akin to the Ethiopic, but is purely consonantal, without the modifications in the consonantal forms which Ethiopic has devised to express vowels. There are twenty-nine letters, one more than in Arabic, *Samech* and *Siw* being distinct forms, as in Hebrew. This alphabet, which is probably the parent of the South-Indian character, is undoubtedly derived from the so-called Phoenician alphabet, the

connecting link being the forms of the Saba inscriptions and of the Thamudaeen inscriptions found by Doughty and Euting. Of the latter we can determine twenty-six characters, while a twenty-seventh probably corresponds to Arabic *ḥ* (ح). A sign for *ḥ* also probably existed, but does not occur in the known inscriptions. In the Thamudaeen and Sabaeen alphabets the twenty-two original Phoenician characters are mostly similar, and so are the differentiated forms for *ḥ* and *ḥ*, while *ḥ*, *ḥ*, and probably also *ḥ* and *ḥ*, have been differentiated in many ways. This seems to imply that the two alphabets had a common history up to a certain point, but parted company before they were fully developed. The Thamudaeen inscriptions are locally nearer to Phoenicia, and the letters are more like the Phoenician; this character therefore appears to be the link connecting the Phoenician with Sabaeen writing. It may be noticed that a Thamudaeen legend has been found on a Babylonian cylinder of about 1000 B.C., and it is remarkable that the Sabaeen *sajara*, "write," seems to be borrowed from Assyrian *shatru*.

The language of the inscriptions is South Semitic, forming a link between the North Arabic and the Ethiopic, but is much nearer the former than the latter. Of the two dialects commonly called Sabaeen and Minaean the latter might be better called Hadramitic, inasmuch as it is the dialect of the inscriptions found in Hadramut, and the Minaeans seem undoubtedly to have entered the Jauf from Hadramut.

The inscriptions not only give names of nations corresponding to those in the Bible and in classical authors, but throw a good deal of fresh light on the political history of Yemen. The inscriptions and coins give the names of more than forty-five Sabaeen kings. The chronology is still vague, since only a few very late inscriptions are dated by an era and the era itself is not certain. But the rulers named can be assigned to three periods, according as they bear the title "mukrab of Saba," "king of Saba," or "king of Saba and Raidān." The last, as we know from the Axūm inscriptions, are the latest, and those with the title "mukrab" must be the earliest. Four princes of the oldest period bear the name *Yath'amar*, and one of these may, with the greatest probability, be held to be the "Itamar Sabai" who paid tribute to Sargos of Assyria. This helps us to the age of some buildings also. The famous dam of Ma'rib and its sluices were the work of this ancient prince—structures which Arnaud in the 19th century found in the same state in which Hamdānī saw them a thousand years ago. The power of these old sovereigns extended far beyond Ma'rib, for their names are found on buildings and monuments in the Jauf.

We cannot tell when the kings took the place of the mukrab, but the Sabaeo-Himyaritic period seems to begin with, or a little after, the expedition of Aelius Gallus. A fragmentary inscription of Ma'rib (Br. Mus., 33) was made by "Ilsharib Yahdib and Ya'zil Bayyin, the two kings of Saba and Raidān, sons of Far'm Yanhab, king of Saba." If this Ilsharib is identical with the *Ἰλσαρίης* of Strabo, king of Mariaba at the time of the Roman invasion, the inscription preserves a trace of the influence of that event on the union of the two kingdoms.

The inscriptions of the latest period present a series of dates—669, 640, 582, 573, 385—of an unknown era. Reinaud thought of the Seleucid era, which is not impossible; but Halévy observes that the fortress of Mawiyvat (now Hīn Ghorāb) bears the date 640, and is said to have been erected "when the Abyssinians overran the country and destroyed the king of Himyar and his princes." Referring this to the death of Dhū Nuwās (A.D. 525), Halévy fixes 115 B.C. as the epoch of the Sabaeen era. This ingenious combination accords well with the circumstance that the oldest dated inscription, of the year 385 (A.D. 270), mentions 'Aḥtar, Shama, and other heathen deities, while the inscriptions of 582 (A.D. 467) and 573 (A.D. 458), so far as they can be read, contain no name of a heathen god, but do speak of a god *Rahmānān*—that is, the Hebrew *Rahmān*, "the compassionate" (Arabic, *al-Rahmān*), agreeably with the fact that Jewish and Christian influences were powerful in Arabia in the 4th century. The only objections to Halévy's hypothesis are (1) that we know nothing of an epoch-making event in 115 B.C., and (2) that it is a little remarkable that the latest dated inscription, of the year 669 (A.D. 554), should be twenty-five years later than the Abyssinian conquest. An inscription found by Wrede at 'Obne is dated "in the year 120 of the Lion in Heaven," which we must leave the astronomers to explain.

The inscriptions throw considerable light not only on the Sabaeans but on other South-Arabian nations. The Minaeans, whose importance has been already indicated, appear in the inscriptions as only second to the Sabaeans, and with details which have put an end to much guesswork, e.g. to the idea that they are connected with Mial near Mecca. Their capital, Ma'in, lay in the heart of the Sabaeen country, forming a sort of enclave on the right hand of the road that leads northward from Ma'rib. South-west of Ma'in, on the west of the mountain range and commanding the road from Sa'a to the north, lies Barāqish, anciently Yathil, which the inscriptions and Arabic geographers always mention with Ma'in. The third Minaean fortress, probably identical with the *Kāssa* of the Greeks, lies in the middle of the northern Jauf, and north of the other two.

The three Minaean citadels lie nearly in this position (-.), with old Sabaeen settlements (Raïam) all round them, and even with some Sabaeen places (e.g. Nask and Kamnâ) within the triangle they form. The dialect of the Minaeans is sharply distinguished from the Sabaeans (see above). The inscriptions have yielded the names of twenty-seven Minaean kings, who were quite independent, and, as it would seem, not always friends of the Sabaeans, for neither dynasty mentions the other on its inscriptions, while minor kings and kingdoms are freely mentioned by both, presumably when they stood under the protection of the one or the other respectively. The Minaeans were evidently active rivals of the Sabaeen influence, and a war between the two is once mentioned. In Hadramut they disputed the hegemony with one another, the government there being at one time under a Minaean, at another under a Sabaeen prince, while the language shows now the one and now the other influence. The religions also of the two powers present many points of agreement, with some notable differences. Thus, puzzling as the fact appears, it is clear that the Minaeans formed a sort of political and linguistic island in the Sabaeen country. The origin of the Minaeans from Hadramut is rendered probable by the predominance of their dialect in the inscriptions, that country (except in that of Hisan Ghorâb), by the rule, already mentioned, of a Minaean prince in Hadramut, and by Pliny's statement (*H.N.* xii. 63) that frankincense was collected at Sabota (the capital of Hadramut; inscr.  $\mu\alpha\beta$ ), but exported only through the Gebanites, whose kings received custom dues on it, compared with xii. 69, where he speaks of Minaean myrrh "in qua et Atramiticae est et Gebaniticæ et Ausariis Gebbanitarum regno," &c., implying that Minaean myrrh was really a Hadramite and Gebanite product. All this suggests a close connexion between the Minaeans and Hadramut; and from the Minaean inscriptions we know that the Gebanites were at one time a Minaean race, and stood in high favour with the queen of Ma'in. Thus we are led to conclude that the Minaeans were a Hadramite settlement in the Jaul, whose object was to secure the northern trade road for their products. We cannot but see that their fortified posts in the north of the Sabaeen kingdom had a strategical purpose; and so Pliny (xii. 54) says, "Attungit et Minaei, pagus alius, per quos evehitur *uno bracte angusto* [from Hadramut]. Hi primi commercium turis fecerunt maximeque exercent, a quibus et Minaeanum dicitur est." Besides this road, they had the sea-route, for, according to Pliny, their allies, the Gebanites, held the port of Ocila. If the Minaeans were later immigrants from Hadramut, we can understand how they are not mentioned in Gen. x. In later times, as is proved by the Minaean colony in Al-Ola, which Euting has revealed to us, they superseded the Sabaeans in some parts of the north. In the 'Ola inscriptions we read the names of Minaean kings and gods. Notable also is the mention in I Chron. iv. 41 of the "Bedouin encampments ( $\beta\omega\delta\alpha$ ) and the Ma'inim" smitten by the Simeonites, which may possibly refer to the destruction of a Minaean caravan protected by these Bedouins. The LXX. at least renders Ma'inim by *Musulou*. It seems bold to conjecture that the Minaeans were in accord with the Romans under Aelius Gallus, yet it is noteworthy that no Minaean town is named among the cities which that general destroyed, though ruin fell on Nask and Kamna, which lie inside the Minaean territory.

The inscriptions seem to indicate that the monarchies of South Arabia were hereditary, the son generally following the father, though not seldom the brother of the deceased came between, apparently on the principle of seniority, which we find also in North Arabia. Eratosthenes (in Strabo xvi. 4, 3) says that the first child born to one of the magnates after a king came to the throne was his designated successor; the wives of the magnates who were pregnant at the king's accession were carefully watched, and the first child born was brought up as heir to the kingdom. There seems to be a mistake in the first part of this statement; what Eratosthenes will have said is that the oldest prince after the king was the designated successor. This law of succession explains how we repeatedly find two kings named together among the Sabaeans, and almost always find two among the Minaeans; the second king is the heir. The principle of seniority, as we know from North Arabian history, gives rise to intrigues and palace revolutions, and was probably often violated in favour of the direct heir. On the other hand, it readily leads to a limited power of election by the magnates, and in fact good Arabian sources speak of seven electoral princes. Some inscriptions name, besides the king, an eponymus, whose office seems to have been priestly, his titles being *dû harîf*, *eponymus* and *nashûw*, "sacrificer." All royal inscriptions are signed by him at the beginning and the end, and he appears with the king on coins.

**Religion.**—In spite of the many ruins of temples and inscriptions, the religion of the Sabaeans is obscure. Most of the many names of gods are mere names that appear and vanish again in particular districts and temples. One of the great national gods of the Sabaeans and Minaeans we know a little more. The worship of the heavenly bodies, for which there is Arabic evidence, had really a great place in Yemen. Sun-worship seems to have been peculiar to the Sabaeans and Hamdanites; and, if the Sabis of Sabota (Pliny) was in fact the sun deity Shams, this must be ascribed to Sabaeen influence. The Sabaeen Shams was a goddess, while the chief divinity of the Minaeans was the god 'Ahtar, a male figure, worshipped under several forms, of which the commonest are the Eastern 'Ahtar and

'Ahtar Dhû Kabû. Wadd and Nikrah, the gods of love and hate, are possibly only other forms of the two 'Ahtars. The Sabaeans also recognise 'Ahtar; but with them he is superseded by Almaqah, who, according to Hamdânî, is the planet Venus, and therefore is identical with 'Ahtar. The moon-god Sin appears on an inscription of Shabwat; but, according to Hamdânî, Haubas, "the drier," was the Sabaeen moon-god. On the Shabwat inscription 'Ahtar is the father of Sin, and it is noteworthy that these two deities also appear as nearly related in the Babylonian legend of 'Ishtar's descent to Hades, where 'Ishtar is conversely the daughter of the god Sin. The mother of 'Ahtar on another inscription is probably the sun. We find also the common Semitic Il (El) and a Dhû Samai answering to the northern Ba'al Shamayim. Three gods of the inscriptions are named in the Koran—Wadd, Yaghûth and Nasr. In the god-name Ta'lab there may be an indication of tree-worship. The many minor deities may be passed over; but we must mention the sanctuary of Riyâm, with its images of the sun and moon, and, according to tradition, an oracle. In conformity with old Semitic usage, pilgrimages were made at definite seasons to certain deities, and the Sabaeen pilgrim month, Dhû Hîjjârah, is the northern Dhû'l-Hîjja. The outlines, and little more, of a few of the many temples can still be traced. Noteworthy are the elliptic form of the chief temples in Ma'rib and Sirwâh, and the castle of Naqab-al-Hajar with its entrances north and south.

Sacrifices and incense were offered to the gods. The names for altar (*midhâh*) and sacrifice (*dhîbb*) are common Semitic words, and the altar of incense has among other names that of *miqfar*, as in Hebrew. A variety of spices—the wealth of the land—are named on these altars, as *rana*, *ladanum*, *costus*, *tarum*, &c. Frankincense appears as *lubân*, and there are other names not yet understood. The gods received tithes of the produce of trade and of the field, in kind or in ingots and golden statues, and these tributes, with freewill offerings, erected and maintained the temples. Temples and fortifications were often combined. The golden statues were votive offerings; thus a man and his wife offer four statues for the health of their four children, and a man offers to Dhû Samai statues of a man and two camels, in prayer for his own health and the protection of his camels from disease of the joints.

Their commerce brought the Sabaeans under Christian and Jewish influence; and, though in old days they were so closely connected with their life and trade to be readily abandoned, the great change in the trading policy, already spoken of, seems to have affected religion as well as the state. The inland gods lost importance with the failure of the overland trade, and Judaism and Christianity seem for a time to have contended for the mastery in South Arabia. Jewish influence appears in the name Rabmân (see above), while efforts at Christianization seem to have gone forth from several places at various times. According to Philostorgius, the Homerites were converted under Constantine II. by the Indian Theophilus, who built churches in Zafar and Aden. Another account places their conversion in the reign of Anastasius (491-518). In Nejrân Syrian missionaries seem to have introduced Christianity (Nöldeke). But, as the religion of the hostile Ethiopians, Christianity found political obstacles to its adoption in Yemen; and, as heathenism had quite lost its power, it is intelligible that Dhû Nuwâs, who was at war with Ethiopia before the last fatal struggle, became a Jew. His expedition against Christian Nejrân had therefore political as well as religious motives. The Ethiopian conquest rather hurt than helped Christianity. The famous *qâsîs* ( $\kappa\alpha\lambda\omega\lambda\epsilon\iota$ ) of Abrahâ in San'a seems to have been looked on as a sign of foreign dominion, and Islâm found it easy to supersede Christianity in Yemen.

**Coins.**—In older times and in many districts coins were not used, and trade was carried on mainly by barter. Nor have there been many great finds of coins; indeed most of the pieces in European collections probably come from the same hoard. At the same time the coins throw a general light on the relations of ancient Yemen. The oldest known pieces are imitations of the Athenian mintage of the 4th century B.C., with the legend AOE and the owl standing on an overturned amphora. The reverse has the head of Pallas with a Sabaeen N. Of younger coins the first series has a king's head on the reverse, and the old obverse is enriched with two Sabaeen monograms, which have been interpreted as meaning "majesty" and "eponymus" respectively. In a second series the Greek legend has disappeared, and, instead of the two Sabaeen monograms, we have the names of the king and the eponymus. A third series shows Roman influence and must be later than the expedition of Gallus. As the standard of the coins of Attic type is not Attic but Babylonian, we must not think of direct Athenian influence. The type must have been introduced either from Persia or from Phoenicia (Gaza). One remarkable tetradrachm with the Sabaeen legend Ahyth's is imitated from an Alexander of the 2nd century B.C., the execution being quite artistic and the weight Attic. There are also coins struck at Raydân and Harîb, which must be assigned to the Himyarite period (1st and 2nd century A.D.). The inscriptions speak of "bright Hayyilî coins in high relief," but of these none have been found. They also speak of *sela*'s pieces. The *sela*'s in late Hebrew answers to the older *shekel*, and the mention of it seems to point to Jewish or Christian influence.

The lexical material, in so far as it touches the Hebrew, was incorporated by D. H. Müller in the 10th-12th edition of the *Gesenius Lexicon* and is now incorporated by O. Weber in the 15th edition of the *Gesenius-Buhl Lexicon*. For collected literature see: up to 1892, F. Hommel's *Südarabische Christomathie*; from 1892 to 1909, O. Weber's *Studien zur südarabischen Altertumskunde*, iii. (D. H. M.)

**SABAKI**, a river of British East Africa which enters the Indian Ocean in 3° 12' S., just north of Malinda. The Sabaki rises (as the Athi) in 1° 42' S., and after flowing north-east 70 m. across the Kapote and Athi plains, turns south-south-east under the wooded slopes of the Yatta ridge, which shuts in its basin on the east. In 3° S. it turns east, and in its lower course (known as the Sabaki) traverses the sterile quartz-land of the outer plateau. The valley is in parts low and flat, covered with forest and scrub, and containing small lakes and backwaters connected with the river in the rains. At this season the stream—which rises as much as 30 ft. in places—is deep and strong and of a turbid yellow colour; but navigation is interrupted by the Lugard falls, about 100 m. from its mouth. Its total length is about 400 m. Apart from the numerous small feeders of the upper river, almost the only tributary is the Tsavo, from the east side of Kilimanjaro, which enters in about 3° S.

**SABAS**, ST (430-531), a Palestinian monk, born near Caesarea of Cappadocia. Becoming a monk in his childhood, he went to Jerusalem and lived as a hermit. After a time he established the "Great Laura" monastery in the neighbourhood of the Dead Sea, and later on the "New Laura," under St Basil's Rule. In the Lauras the young monks lived a cenobitical life, but the elders a semi-eremitical one, each in his own hut within the precincts of the Laura, attending only the solemn church services. Sabas was made exarch or superior of all the monasteries in Palestine, and composed a *Typicon* or Rule for their guidance. He took a prominent part, on the orthodox side, in the Monophysite and Origenistic controversies. His Laura long continued to be the most influential monastery in those parts, and produced several distinguished monks, among them St John of Damascus. It is now known as the monastery of Mar Saba. He is commemorated on the 8th of December.

Another saint of this name, surnamed "the Goth," suffered martyrdom at the hands of Athanaric the Visigoth in the reign of Valentinian, and he is commemorated on the 12th of April in

the Roman Martyrology, on varying days from 12th to 18th in the Greek Menologies.

Sabas's Life was written by his disciple Cyril of Scythopolis. The chief modern authority is A. Ehrhard in Wetzler u. Welte's *Kirchenlexikon* (ed. 2.) and *Römische Quartalschrift*, vii.; see also Helyot, *Histoire des ordres religieux* (1714), i. c. 16, and Max Heimbucher, *Orden u. Kongregationen* (1907), i. § 10. (E. C. B.)

**SABATIER**, LOUIS AUGUSTE (1830-1901), French Protestant theologian, was born at Vallon (Ardèche), in the Cévennes, on the 22nd of October 1830, and was educated at the Protestant theological faculty of Montauban and the universities of Tübingen and Heidelberg. After holding the pastorate at Aubenas in the Ardèche from 1864 to 1868 he was appointed professor of reformed dogmatics in the theological faculty of Strassburg. His markedly French sympathies during the war of 1870 led to his expulsion from Strassburg in 1872. After five years' effort he succeeded in establishing a Protestant theological faculty in Paris, and became professor and then dean. In 1886 he became a teacher in the newly founded religious science department of the *École des Hautes Études* of the Sorbonne. Among his chief works were *The Apostle Paul* (3rd ed., 1866); *Mémoire sur la notion hébraïque de l'Esprit* (1879); *Les Origines littéraires de l'Apocalypse* (1888); *The Validity of Christian Dogmas and their Power of Evolution* (1890); *Religion and Modern Culture* (1897); *Historical Evolution of the Doctrine of the Atonement* (1903); *Outlines of a Philosophy of Religion* (1897); and his posthumous *Religions of Authority and the Religion of the Spirit* (1904), to which his colleague Jean Réville prefixed a short memoir. These works show Sabatier as "at once an accomplished dialectician and a mystic in the best sense of the word." He died on the 12th of April 1901.

On his theology see E. Ménégou in *Expository Times*, xv. 30, and G. B. Stevens in *Hibbert Journal* (April 1903).

His brother, PAUL SABATIER, was born at St Michel de Chabrillanoux in the Cévennes on the 3rd of August 1858, and was educated at the faculty of theology in Paris. In 1885 he became vicar of St Nicolas, Strassburg, and in 1889, declining an offer of preferment which was conditional on his becoming a German subject, he was expelled. For four years he was pastor of St Cierge in the Cévennes and then devoted himself entirely to historical research. He had already produced an edition of the *Didaché*, and in November 1893 published his important *Life of St Francis d'Assisi*. This book gave a great stimulus to the study of medieval literary and religious documents, especially of such as are connected with the history of the Franciscan Order. In 1908 he delivered the Jowett Lectures on Modernism at the Passmore Edwards Settlement, London.

**SABAZIUS**, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of the great mother Cybele and of Attis. His chief attribute as a chthonian god was a snake, the symbol of the yearly renovation of the life of nature. Demosthenes (*De corona*, p. 313) mentions various ceremonies practised during the celebration of the mysteries of this deity. One of the most important was the passing of a golden snake under the clothes of the initiated across their bosom and its withdrawal from below—an old rite of adoption. From Val. Max. i. 3, 2 it has been concluded that Sabazius was identified in ancient times with the Jewish Sabaoth (Zebaoth). Plutarch (*Symp.* iv. 6) maintains that the Jews worshipped Dionysus, and that the day of Sabbath was a festival of Sabazius. Whether he was the same as Sozon, a marine deity of southern Asia Minor, is doubtful. Some explain the name as the "beer god," from an Illyrian word *saboya*, while others suggest a connexion with *Zafō* (god of "health") or *zēfās*. His image and name are often found on "votive hands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (*Sacra Savadia*) gained a firm footing in Rome during the 2nd century A.D., although as early as 130 B.C. the first Jews who settled in the capital were expelled by virtue of a law which proscribed the propagation of the cult of Jupiter Sabazius.

See J. E. Harrison, *Prolegomena to Greek Religion* (1908), p. 414; H. Usener, *Götternamen* (1896), p. 44; F. Cumont, "Hypaistes" in *Revue de l'Instruction publique en Belgique*, xl. (1899); C. S. Blinkenberg, *Archäologische Studien* (1904).

**SABBATAI SEBI** (1626-1676), Jewish mystic, whose Messianic claims produced an unparalleled sensation throughout the world, was born in Smyrna. He was of Spanish descent and was gifted with a personality of rare fascination. As a lad he was attracted by the mysticism of Luria (*q.v.*), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfilment of Messianic hopes, being supported in his vision by the outbreak of English Millenarianism. Christian visionaries fixed the year 1666 for the millennium, and in his appeal to Cromwell on behalf of the return of the Jews to England Menasseh ben Israel (*q.v.*) made strong appeal to this belief. Sabbatai's father (Mordecai) was the Smyrna agent for an English house, and often heard of the expectations of the English Fifth Monarchy men. Dazzled by this confirmation of his nascent confidence, Sabbatai for a time found himself the object of suspicion and even persecution. This treatment, so far from extinguishing the flame, eventually converted it into a conflagration. It was in 1648 (the year which Kabbalists had calculated as the year of salvation) that Sabbatai proclaimed himself Messiah, and in Constantinople came across an able but somewhat unscrupulous man, who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited Redeemer. Others believed in him, but at first his adherents were a small circle of devotees who kept their faith a secret. He charmed men by his sweet singing of Psalms, and children were always fascinated by him. And now the era of his miracles begins. He journeyed to Jerusalem, and there was the instrument for conferring unexpected services on the community. An oppressive exaction was imposed by a local pasha, and in order to win the succour of Raphael Halebi, Sabbatai repaired to Cairo, being on his route at Hebron hailed as Messiah. His mission was completely successful. At Cairo Sabbatai married. As a boy he had been married and divorced twice—but these were merely nominal unions. Now, however, the romantic story of a beautiful girl (Sarah) was on people's lips; she was firm in her assertion that she was the destined bride of the Messiah. Sabbatai had, at the same time, announced that in a dream a spiritual bride had been promised to him. At the house of Halebi bride and bridegroom met. The adhesion of Halebi produced many imitators, and with a retinue of believers, a charming wife and considerable funds, Sabbatai returned in triumph to the Holy Land. Nathan of Gaza assumed the rôle of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai "riding on a lion with a seven-headed dragon in his jaws" (Graetz). Again 1666 was given as the apocalyptic year. Threatened with excommunication by the Rabbis of Jerusalem, Sabbatai returned to Smyrna (autumn of 1665). Here he was received with wild enthusiasm, and the masses were carried beyond all bounds. With delirious joy the Jews of Smyrna—men, women and children—fell down and worshipped. They prepared for the return. Men left their work to make ready for the start. They fasted, they rejoiced; one hour they chilled themselves in the cemeteries, the next they rushed frantically through the streets singing Psalmic refrains. Nor did Sabbatai's adherents all belong to the ignorant classes. The Rabbi Hayim Benveniste and other men of repute and learning shared the general delusion. It is unnecessary to tell the rest of the story in detail. Many letters are extant, written home to English and Dutch business-houses, in which the marvels of Sabbatai are reported, sometimes with apparent belief in them. From the Levant the Sabbataean movement spread to Venice, Amsterdam, Hamburg and London. Sabbatai was no longer able to doubt the reality of his mission. Day by day he was hailed from all the world as king of the Jews. But his character was too weak to sustain the part. Though he was almost deified by many of his brethren, who at his word agreed to modify their religious observances, yet he was unable to turn the enthusiasm of thousands to any account. Had he boldly led the way to Jerusalem, he would probably have carried everything before him. At the beginning of the fateful year 1666 Sabbatai went (or was summoned) to Constantinople. Here

he was arrested, but reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos, amidst the almost tragic consternation of his deluded followers. In September Sabbatai was brought before the Sultan, and he had not the courage to refuse to accept Islam. And so the Messianic imposture ended in the apostasy of Sabbatai. The reaction among the Jews was terrible, and a sense of shame was joined to feelings of despair. But the sober-minded among the Jews—these had throughout been the vast majority—seized their opportunity to reclaim those who had been the victims of a terrible wrong. Yet many continued to believe in him, as he from time to time attempted to resume his rôle. In 1676 he died in obscurity in Albania. A sect of Sabbataeans—the Dormeh of Salonica—survived him, and for many a long year the controversy for and against his claims left an echo in Jewish life.

The literature on the life and career of this remarkable man is very extensive. Sabbatai Sebi figures largely in English books of the period. A valuable account is given in particular by Graetz, *History of the Jews*, vol. v. ch. iv. 1. Langwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto*. (I. A.)

**SABBATH**, the day of cessation from work,<sup>1</sup> which among the Hebrews followed six days of labour and closed the week.

1. *Observance*.—The later Jewish Sabbath, observed in accordance with the rules of the Scribes, was a very peculiar institution, and formed one of the most marked distinctions between the Hebrews and other nations, as appears in a striking way from the fact that on this account alone the Romans found themselves compelled to exempt the Jews from all military service. The rules of the Scribes enumerated thirty-nine main kinds of work forbidden on the Sabbath, and each of these prohibitions gave rise to new subtleties. Jesus's disciples, for example, who plucked ears of corn in passing through a field on the holy day, had, according to Rabbinical views, violated the third of the thirty-nine rules,<sup>2</sup> which forbade harvesting; and in healing the sick Jesus Himself broke the rule that a sick man should not receive medical aid on the Sabbath unless his life was in danger. In fact, as our Lord puts it, the Rabbinical theory seemed to be that the Sabbath was not made for man but man for the Sabbath, the observance of which was so much an end in itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribes because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh's grace. The ideal of the Sabbath which all these rules aimed at realizing was absolute rest from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatharians regard as a service to God, and therefore as specially appropriate to His day, was looked on as work. To save life was allowed, but only because danger to life "superseded the Sabbath." In like manner the special ritual at the temple prescribed for the Sabbath by the Pentateuchal law was not regarded as any part of the hallowing of the sacred day; on the contrary, the rule was that, in this regard, "Sabbath was not kept in the sanctuary." Strictly speaking, therefore, the Sabbath was neither a day of relief to toiling humanity nor a day appointed for public worship; the positive duties of its observance were to wear one's best clothes, eat, drink and be glad (justified from Isa. lviii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service; but it is to be

<sup>1</sup> The grammatical inflexions of the word "Sabbath" would show that it is a feminine form, properly *shabbat-4* for *shabbat-4*. The root has nothing to do with resting in the sense of enjoying repose; in transitive forms and applications it means to "sever," to "put an end to," and intransitively it means to "desist," to "come to an end." The grammatical form of *shabbat* suggests a transitive sense, "the divider," and apparently indicates the Sabbath as dividing the month. It may mean the day which puts a stop to the week's work, but this is less likely. It certainly cannot be translated "the day of rest."

<sup>2</sup> From the Thirty-ninth was deduced the familiar "Sabbath day's journey" (Acts i. 12), based primarily, it would seem, upon the command in Ex. xvi. 29. It was a distance of 2000 cubits.

remembered that this service was primarily regarded not as an act of worship but as a meeting for instruction in the law.

2. *Attitude of Jesus.*—So far, therefore, as the Sabbath existed for any end outside itself it was an institution to help every Jew to learn the law, and from this point of view it is regarded by Philo and Josephus, who are accustomed to seek a philosophical justification for the peculiar institutions of their religion. But this certainly was not the leading point of view with the mass of the Rabbins;<sup>1</sup> and at any rate it is quite certain that the synagogue is a post-exilic institution, and therefore that the Sabbath in old Israel must have been entirely different from the Sabbath of the Scribes. But that it was destitute of any properly religious observance or meaning is inconceivable, for, though many of the religious ideas of the old Hebrews were crude, their institutions were never arbitrary and meaningless, and when they spoke of consecrating the Sabbath they must have had in view some religious exercise of an intelligible kind by which they paid worship to Yahweh. Indeed, that the old Hebrew Sabbath was quite different from the Rabbinical Sabbath is demonstrated in the trenchant criticism which Jesus directed against the latter (Matt. xii. 1-14; Mark ii. 27). The general position which He takes up, that "the Sabbath is made for man and not man for the Sabbath,"<sup>2</sup> is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. And in this connexion He introduces two of the main methods to which historical criticism of the Old Testament has recurred in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matt. xii. 3 seq.), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (v. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the schoolmen made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done nothing more than follow out these arguments in detail, and show that the result is in agreement with what is known as to the dates of the several component parts of the Pentateuch.

3. *Old Usage.*—Of the legal passages that speak of the Sabbath all those which show affinity with the doctrine of the Scribes—regarding the Sabbath as an arbitrary sign between Yahweh and Israel, entering into details as to particular acts that are forbidden, and enforcing the observance by severe penalties, so that it no longer has any religious value, but appears as a mere legal constraint—are post-exilic (Exod. xvi. 23-30, xxxi. 12-17, xxv. 1-3; Num. xv. 32-36); while the older laws only demand such cessation from daily toil, and especially from agricultural labour, as among all ancient peoples naturally accompanied a day set apart as a religious festival, and in particular lay weight on the fact that the Sabbath is a humane institution, a holiday for the labouring classes (Exod. xxiii. 12; Deut. v. 13-15). As it stands in these ancient laws, the Sabbath is not at all the unique thing which it was made to be by the Scribes. "The Greeks and the barbarians," says Strabo (x. 3, 9), "have this in common, that they accompany their sacred rites by a festal remission of labour." So it was in old Israel: the Sabbath was one of the stated religious feasts, like the new moon and the three great agricultural sacrificial celebrations (Hosea ii. 11); the new moons and the Sabbaths alike called men to the sanctuary to do sacrifice (Isa. i. 14); the remission of ordinary business belonged to both

alike (Amos viii. 5), and for precisely the same reason. Hosea even takes it for granted that in captivity the Sabbath will be suspended, like all the other feasts, because in his day a feast implied a sanctuary. This conception of the Sabbath, however, necessarily underwent an important modification when the local sanctuaries were abolished under the "Deuteronomic" reform, and those sacrificial rites and feasts which in Hosea's time formed the essence of every act of religion were limited to the central altar, which most men could visit only at rare intervals. From this time forward the new moons, which till then had been at least as important as the Sabbath and were celebrated by sacrificial feasts as occasions of religious gladness, fall into insignificance, except in the conservative temple ritual. The Sabbath did not share the same fate, but with the abolition of local sacrifices it became for most Israelites an institution of humanity divorced from ritual. So it appears in the Deuteronomic decalogue, and presumably also in Jer. xvii. 19 seq. In this form the seventh day's rest was one of the few outward ordinances by which the Israelite could still show his fidelity to Yahweh and mark his separation from the heathen. Hence we understand the importance attached to it in the exilic literature (Isa. lvi. 2 seq., lviii. 13), and the character of a sign between Yahweh and Israel ascribed to it in the post-exilic law. This attachment to the Sabbath, beautiful and touching so long as it was a spontaneous expression of continual devotion to Yahweh, acquired a less pleasing character when, after the exile, it came to be enforced by the civil arm (Neh. xiii.), and when the later law even declared Sabbath-breaking a capital offence. This increasing strictness is exemplified by the attitude of the Book of Jubilees (ii. 17-32, l. 6-13). But it is just to remember that without the stern discipline of the law the community of the second temple could hardly have escaped dissolution, and that Judaism alone preserved for Christianity the hard-won achievements of the prophets.<sup>4</sup>

4. *Early Christian Church.*—The Sabbath exercised a twofold influence on the early Christian church. On the one hand, the weekly celebration of the resurrection on the Lord's day could not have arisen except in a circle that already knew the week as a sacred division of time; and, moreover, the manner in which the Lord's day was observed was directly influenced by the synagogue service. On the other hand, the Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius (*H.E.* iii. 27) remarks that the Ebionites observed both the Sabbath and the Lord's day; and this practice obtained to some extent in much wider circles, for the *Apostolical Constitutions* recommend that the Sabbath shall be kept as a memorial feast of the creation as well as the Lord's day as a memorial of the resurrection. The festal character of the Sabbath was long recognized in a modified form in the Eastern church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law (comp. Judith viii. 6). On the other hand, Paul had quite distinctly laid down from the first days of Gentile Christianity that the Jewish Sabbath was not binding on Christians (Rom. xiv. 5 seq.; Gal. iv. 10; Col. ii. 16), and controversy with Judaizers led in process of time to direct condemnation of those who still kept the Jewish day (e.g. Co. of Laodicea, A.D. 365). Nay, in the Roman church a practice of fasting on Saturday as well as on Friday was current before the time of Tertullian. The steps by which the practice of resting from labour on the Lord's day instead of on the Sabbath was established in Christendom and received civil as well as ecclesiastical sanction are dealt with under *SUNDAY*; it is enough to observe here that this practice is naturally and even necessarily connected with the religious observance of the Lord's day as a day of worship and religious gladness, and is in full accordance with the principles laid down by Jesus in His criticism of the Sabbath of the Scribes. But of course the

<sup>1</sup> See the Mishnah, tract. "Shabbath" and the alleviation permitted in the tract. "Erlibin"; and compare Schürer, *Gesch. d. jud. Volkes*<sup>11</sup>, pp. 393 seq., where the Rabbinical Sabbath is well explained and illustrated in detail.

<sup>2</sup> Cp. the discussion in Talmud *Yoma*, fol. 85b: "The sabbath is delivered into your hands, not you into the hands of the Sabbath" (cited by S. R. Driver, *Hastings' Dict. Bible*, art. "Sabbath," iv. p. 322). See also art. *Midrash*, § 4, end.

<sup>3</sup> In actual life the Sabbath was often far from being the burden which the Rabbinical enactments would have led us to expect. It "is celebrated by the very people who did observe it, in hundreds of hymns, which would fill volumes, as a day of rest and joy of presentiment of the pure bliss and happiness which are stored up for the righteous in the world to come" (S. Schechter, *Jewish Quart. Review*, iii. p. 763; cp. id., *Studies in Judaism*, pp. 296 seq.).

complete observance of Sunday rest was not generally possible to the early Christians before Christendom obtained civil recognition.<sup>1</sup>

5. *Origin.*—As the Sabbath was originally a religious feast, the question of the origin of the Sabbath resolves itself into an inquiry why and in what circle a festal cycle of seven days was first established. In Gen. ii. 1-3 and in Exod. xx. 11 the Sabbath is declared to be a memorial of the completion of the work of creation in six days. But it appears certain that the decalogue as it lay before the Deuteronomist did not contain any allusion to the creation (see *DECALOGUE*), and it is generally believed that this reference was added by the same post-exilic hand that wrote Gen. i. 1-ii. 4a. The older account of the creation in Gen. ii. 4b seq. does not recognize the hexameron, and it is even doubtful whether the original sketch of Gen. i. distributed creation over six days. The connexion, therefore, between the seven days' week and the work of creation is now generally recognized as secondary.<sup>2</sup> But, if the week as a religious cycle is older than the idea of the week of creation, we cannot hope to find more than probable evidence of the origin of the Sabbath. Unless the Sabbath was already an institution peculiarly Jewish, it could not have served as a mark of distinction from heathenism. This, however, does not necessarily imply that in its origin it was specifically Hebrew, but only that it had acquired distinguishing features of a marked kind. What is certain is that the origin of the Sabbath must be sought within a circle that used the week as a division of time. Here again we must distinguish between the week as such and the astrological week, i.e. the week in which the seven days are named each after the planet which is held to preside over its first hour.<sup>3</sup> It is plain, however, that there is a long step between the astrological assignation of each hour of the week to a planet and the recognition of the week as an ordinary division of time by people at large. Astrology is in its nature an occult science, and there is no trace of a day of twenty-four hours among the ancient Hebrews. Moreover, it is doubtful from extant remains of Assyrian calendars whether the astrological week prevailed in civil life even among the Babylonians and Assyrians. They did not dedicate each day in turn to its astrological planet; and it is therefore precarious to assume that the Sabbath was in its origin what it is in the astrological week, the day sacred to Saturn, and that its observance is to be derived from an ancient Hebrew worship of that planet.<sup>4</sup>

The week, however, is found in various parts of the world in a form that has nothing to do with astrology or the seven planets, and with such a distribution as to make it pretty certain that it had no artificial origin, but suggested itself independently, and for natural reasons, to different races. In fact, the four quarters of the moon supply an obvious division of the month; and, wherever new moon and full moon are religious occasions, we get in the most natural way a sacred cycle of fourteen or

<sup>1</sup> See, further, E. Schürer in *Zeit. f. New-Test. Wissens.* (1905), pp. 1-66. For the theological discussions whether and in what sense the fourth commandment is binding on Christians, see *DECALOGUE*.

<sup>2</sup> "The week ended by the Sabbath, determined the 'days' of creation, not the 'days' of creation of the week" (S. R. Driver, *Genesis* (1909), p. 35). At the same time, there was a peculiar appropriateness in associating the Sabbath with the doctrine that Yahweh is the Creator of all things; for we see from Isa. xl-lvii. that this doctrine was a mainstay of Jewish faith in those very days of exile which gave the Sabbath a new importance for the faithful.

<sup>3</sup> If the day is divided into twenty-four hours and the planets preside in turn over each hour of the week in the order of their periodic times (Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon), we get the order of days of the week with which we are familiar. For, if the Sun presides over the first hour of Sunday, and therefore also over the eighth, the fifteenth and the twenty-second, Venus will have the twenty-third hour, Mercury the twenty-fourth, and the Moon, as the third in order from the Sun, will preside over the first hour of Monday. Mars, again, as third from the Moon, will preside over Tuesday (*Dies Martis*, *Mardi*), and so forth. This astrological week became very current in the Roman empire, but was still a novelty in the time of Dio Cassius (xxvii. 18).

<sup>4</sup> The evidence of the worship of Saturn among the oldest Hebrews is doubtful. Amos v. 26 (where Chiun is taken to represent Kawān-Saturn) is of uncertain interpretation, see W. R. Harper's discussion, *Essays*, pp. 139-141 (*International Crit. Comm.*, 1905).

fifteen days, of which the week of seven or eight days (determined by half moon) is the half. Thus the old Hindus chose the new and the full moon as days of sacrifice; the eve of the sacrifice was called *śrāvatika*, and in Buddhism the same word (*śrāvātha*) has come to denote a Sabbath observed on the full moon, on the day when there is no moon, and on the two days which are eighth from the full and the new moon respectively, with fasting and other religious exercises.<sup>5</sup> From this point of view it is most significant that in the older parts of the Hebrew Scriptures the new moon and the Sabbath are almost invariably mentioned together.<sup>6</sup>

Nor are other traces wanting of the connexion of sacrificial occasions—i.e. religious feasts—with the phases of the moon among the Semites. Thus the Harrarians had four sacrificial days in every month, and of these two at least were determined by the conjunction and opposition of the moon.<sup>7</sup> That full moon as well as new moon had a religious significance among the ancient Hebrews seems to follow from the fact that, when the great agricultural feasts were fixed to set days, the full moon was chosen. In older times these feast-days appear to have been Sabbaths (Lev. xxiii. 11; comp. the article *FASSOVS*). A week determined by the phases of the moon has an average length of 29½-4-7½ days, i.e. three weeks out of eight would have eight days. But this seems to be in 1 Sam. xx. 27, compared with verses 18, 24, an indication that in old times the feast of the new moon lasted two days.<sup>8</sup> In that case a week of seven working days would occur only once in two months. We cannot tell when the Sabbath became dissociated from the month; but the change seems to have been made before the Book of the Covenant, which already regards the Sabbath simply as an institution of humanity and ignores the new moon. In both points it is followed by Deuteronomy.<sup>9</sup> (W. R. S.; S. A. C.)

[6. *The Babylonian and Assyrian Sabbath.*—The Babylonian calendars contain explicit directions for the observance of abstinence from certain secular acts on certain days which forms a close parallel to the Jewish Sabbatical rules. Thus for the 7th, 14th, 21st, 28th and also the 19th days of the intercalary Elul it is prescribed that "the shepherd of many nations is not to eat meat roast with fire nor any food cooked by fire, he is not to change the clothes on his body nor put on gala dress, he may not bring sacrifices nor may the king ride in his chariot, he is not to hold court nor may the priest seek an oracle for him in the sanctuary, no physician may attend the sick woman, the day is not favourable for invoking curses, but at night the king may bring his gift into the presence of Marduk and Ishtar. Then he may offer sacrifice so that his prayers be accepted." Clearly, then, it was a day of suspended activity, but it will be noted that no religious observances are prescribed in place of the forbidden secular matters. So far no evidence is forthcoming that the same days of each month were observed as these of this special rarely occurring month. Calendars exist for other months which make no such regulations for any days. These abstentions are prescribed for the king and a few other persons; there is no evidence that they were observed by all the people. The 19th day is supposed to have had its sacred nature as the 49th day from the commencement of the preceding month, assuming that to have had 30 days. The months often had only 29 days, when the same character ought to have applied to the 20th day of the following month. There is no evidence that these days were called *shabātū*, a word which is rendered by *šūm šāb libbi*, "day of rest of the heart," and has been thought to be the origin of Sabbath. This name *shabātū* was certainly applied to the 15th day of the month, and *šūm šāb libbi* could mean "day of rest in the middle," referring to the moon's pause at the full. The frequent Old Testament association of "new moons and Sabbaths" may point to an original observance of the 1st and 15th days of the month. Many days are indicated in the calendar as *šubātū*, a term which signifies rest, pause, and especially a god's connubial rest with his consort goddess. The observance of such days was a bar to attending even to important diplomatic business or setting out on a journey. Such *šubātū* days fell on the 3rd, 7th and 16th of the intercalary month of Elul, and were noted as the *šubātū* of Marduk and his consort. It would be precarious to assume that the same days in each month were *šubātū*, for the *šubātū* fell on the 4th of Iyar on one occasion.

<sup>5</sup> Childers, *Pāli Dict.* p. 335; Kern, *Manual of Buddhism*, p. 99. *Mahāvagga*, ii. 1. 1 (Eng. trans. i. 239, 291).

<sup>6</sup> Both were days of cessation from business (Amos viii. 5), and were fitting occasions to visit a prophet (2 Kings iv. 23). They naturally take their rise among an agricultural folk. On abstinence from work on the New Moon by Jewish women of the present time, see M. Friedmann, *Jew. Quart. Rev.* iii. (1891), p. 712. See also I. Benzinger, *Encyc. Biblica*, cols. 3401 sqq.

<sup>7</sup> The others—according to the *Fihrist*, 319, 14—are the 17th and the 28th; see Chwolson, *Szabier*, ii. 8, 94 seq.

<sup>8</sup> It appears from Judith viii. 6 that even in later times there were two days at the new moon on which it was not proper to fast.

<sup>9</sup> See further J. M. Meinhold, *Sabbat und Woche im Alten Test.* (Göttingen, 1905); *Zeit. f. Alttest. Wissens.* 1909, pp. 81-112.

Possibly the intercalary month was abnormal, the incidence of observances depending not on the day of the month in ordinary months but on the day of the week reckoned consecutively through the year. For it is obvious that if each 7th day during the year was observed as above, it would, like our Sunday or a Jewish Sabbath, fall on a different day of the month in different months. It is quite possible that *sabbatum* and *subbatum* are from the same root and originally denoted much the same thing—a pause, abstinence, from whatever cause or for ceremonial purposes. The intercalary month being purely arbitrary may exhibit a normal arrangement, supposing that the month and the week begin together.

There are traces of what may be called a "five-day week," but also some traces of a period of seven days. The former would be an exact submultiple of the 30-day month, but the exact relation of seven days to the month is not very clear. If the 15th always was full moon day, the 7th would coincide well with half moon, but the 21st and 28th would fall away considerably from the moon's phases. The significance of seven throughout Babylonian literature is very marked, and most of the material has been collected by J. Hehn, *Siebentzahl und Sabbat* (1907). It is quite consistent with the evidence to suppose that a seven-day week was in use in Babylonia, but each item may be explained differently, and a definite proof does not exist. The enormous number of dated documents has induced some scholars to attempt a statistical research into the observance of the 7th, 14th, 21st, 28th and 19th days of the months as Sabbaths. This has not been carried out with sufficient caution. If the Sabbath involved abstinence from all such business as recorded in dated documents and always fell on these days, then the 7th, &c., should show a marked falling off in the number of dated documents. This appears actually to be the case in the period of the First Dynasty of Babylon and also in the 7th century in Assyria, where early Babylonian customs were kept up conservatively. In other cases the inclusion of documents relating to the temple business, payments of tithes and other dues, salaries to temple officials, and such ceremonies as marriages, &c., which may have demanded the presence of the congregation and were at least partly religious in nature, have been allowed to complicate the matter. Such business as did not profane the Sabbath according to Babylonian ideas cannot be quoted against their observance of their Sabbath. Further, if the Sabbaths fell on each 7th day through the year, any indication by dated documents of a falling off in the number of transactions on the 7th day of the month must obviously be completely disguised. As most of the records appealed to are from temple archives, it may be expected that the Sabbath days would show an increased number of records.

For reasons above indicated the whole subject is in its infancy. Even if it could be shown that the Pentateuchal regulations were universally observed in Israel from Mosaic times, it would not preclude a certain indebtedness to Babylonia for at least the germ of the institution. On the other hand, complete identity of regulations and observance in Babylonia and Israel at one period need not show more than development on the same lines. The evidence of Babylonian observance has not yet been exhaustively considered. Its most suggestive likenesses are indicated above, but further evidence may render the similarity less striking when the meaning of it is more fully understood. (C. H. W. J.)

7. *Sabbatical Year*.—The Jews under the second temple observed every seventh year as a Sabbath according to the (post-exilic) law of Lev. xxv. 1-7. It was a year in which agriculture was remitted, in which the fields lay unown and the vines grew unpruned, only the spontaneous yield of the land might be gathered. That this law was not observed before the captivity we learn from Lev. xxvi. 34 seq. (cp. 2 Chron. xxxvi. 21); indeed, so long as the Hebrews were an agricultural people, in a land often ravaged by severe famines, the law of the Sabbatical year could not have been observed. Even in later times it was accidentally productive of great distress (1 Mac. vi. 49, 53; Jos. Ant. xiv. 16, 2). In the older legislation, however, we already meet with a seven years' period in more than one connexion. The release of a Hebrew servant after six years' labour (Exod. xxi. 2 seq.; Deut. xv. 12 seq.) has only a remote analogy to the Sabbatical year. But in Exod. xxiii. 10 seq. it is prescribed that the crop of every seventh year shall be left for the poor, and after them for the beasts. The difference between this and the later law is that the seventh year is not called a Sabbath, and that there is no indication that all land was to lie fallow on the same year. In this form a law prescribing one year's fallow in seven may have been anciently observed, but it scarcely originated from the analogy of a seventh day of rest. It is extended in v. 11 to the vineyard and the olive oil, but here the culture necessary to keep the vines and olive trees in order is not forbidden; the precept is only that the produce is to be left to the poor. In Deuteronomy this law is not repeated,

but a fixed seven years' period is ordained for the benefit of poor debtors, apparently in the sense that in the seventh year no interest is to be exacted by the creditor from a Hebrew, or that no proceedings are to be taken against the debtor in that year (Deut. xv. 1 seq.). See the discussion by Driver, *Internat. Crit. Comm.*, ad. loc., and the commentaries on Neh. v. 11.

LITERATURE.—In addition to the references already made, see the articles in *Ency. Bib. and Hastings' Dict. Bible* (with references); Fr. Bohn, *Sabbat sm Allen Testament a. alijudisch relig. Aberglauben* (Gütersloh, 1903); an interesting list of unlucky days from an old Egyptian calendar on p. 57 seq.; and for post-Biblical literature, F. Weber's *Jüdische Theologie* (Index), by Franz Deitzsch and Schneidermann (1897). (W. R. S.; S. A. C.)

SABBATION, or SAMBATYON, a river (real or imaginary) in Media—named in some old authorities (Palestinian Talmud, and Midrash Gen. Rabba, lxiii.)—the site of the exile of the Ten Tribes. But Josephus (*War*, vii. v. 1) has this curious passage, from which, no doubt, many of the subsequent legends were derived:—

"Now Titus Caesar tarried some time at Berytus (Beirut) and then removed thence and gave magnificent shows in all the cities of Syria through which he went, and exhibited the captive Jews as proof of the destruction of that nation. He saw on his march a river (identified by Sir C. W. Wilson with the stream running from the intermittent spring *Fawwar ed-Deir* in the Lebanon) of such a nature as deserves to be recorded in history. It runs between Arcaea (Arka), which is part of Agrippa's kingdom, and Rapharza (Rafanlyeh, at north end of the Lebanon), and has something very wonderful and peculiar in it. For when it runs, its current is strong, and has plenty of water; after which its springs fall for six days together, and leave its channel dry, as any one may see. After this it runs on the seventh day as it did before, and as though it had undergone no change at all, and it has been observed to keep this order perpetually and exactly: whence they call it the *Sabbatic river*, so naming it from the sacred Sabbath of the Jews."

Whiston, in his notes to Josephus, already points out that Pliny describes the same river (*Hist. Nat.* xxxi. 11), but according to his account the river ran for six days and rested on the seventh. This is the favourite form of the legend, for though there are intermittent streams in various parts of Asia, none has yet been found to correspond to the fixed regularity posited in the tradition. Various medieval travellers reported such rivers, e.g. Petahiah of Regensburg, who states that such a stream may be found near Jabneh, but his assertion is unfounded. Mahomedans still assert that Josephus's statement is true of the *Nahr-al-Arus* in the neighbourhood in which he locates his Sabbatic river, but modern travellers report that this stream runs every third day. Such facts would, however, be sufficient to explain the origin of the legend. The accounts of Josephus and Pliny do not assert that the intermittence of the current had any connexion with Saturday. Aqba (q.v.) in the early part of the 2nd century A.D., however, assumes this connexion (*Sanhedrin* 65 b), and a confusion between the Sambatyon of the Lost Tribes and the Sabbatical river of Syria begins to manifest itself. It is owing to the narrative of Eldad the Danite (q.v.) that the Sambatyon river rose into wide fame in the 9th century. His diary became the *Arabian Nights* not only of the Jews but also of many medieval Christians and Moslems. Eldad describes the *Children of Moses*, a powerful and Utopian race, whose territory is surrounded by a wonderful river. He describes it in these terms:—

"The river Sambatyon is 200 yds. broad, about as far as a bow-shot. It is full of sand and stones, but without water; the stones make a great noise like the waves of the sea and a stormy wind, so that in the night the noise is heard at a distance of half a day's journey. There are sources of water which collect themselves in one pool, out of which they water the fields. There are fish in it, and all kinds of clean birds fly round it. And this river of stone and sand rolls during the six working days and rests on the Sabbath day. As soon as the Sabbath begins, fire surrounds the river, and the flames remain until the next evening, when the Sabbath ends."

Nöldeke (*Beiträge zur Geschichte des Alexanderromans*, 48) has shown that the Sambatyon appears in one version of the Alexander Legend. Kaswini, the author of the Arab *Cosmography*, also refers to the Sambatyon. So does Prester John in his letter addressed to the emperor Frederick; in his account it is the violence of the current of sand and stone that prevents the Lost Tribes from reuniting. It is unnecessary to summarise

the various embellishments of the legend; in one version the river attains a width of 17 m. and throws stones as high as a house. But there are no stones on Saturday; it then resembles a lake of snow-white sand. Menasseh ben Israel (*q.v.*), who gave vogue to this latter story in his *Hope of Israel*, adds the detail that if sand from Sambatyon be kept in a bottle it agitates itself during six days but remains still on the Saturday.

The site of the Sambatyon varies considerably in the different narratives. Media, Ethiopia, Persia, India, the Caspian district,—all these are suggested. Reggio identified the river with the Euphrates, Fünß with the Zeb in Adiabene. But as Neubauer remarks: "It would be lost time to trouble ourselves about the identification of this stream."

See Neubauer, "Where are the Ten Tribes?" in *Jewish Quarterly Review*, vol. 1. *passim*; M. Seligsohn in *Jewish Encyclopedia*, x. 681. (I. A.)

**SABBIONETA**, a town of Lombardy, Italy, in the province of Mantua, from which it is 20 m. S.W. by steam tramway, not far from the N. bank of the Po, 59 ft. above sea-level. Pop. (1901) 1835 (town); 7016 (commune). Its period of prosperity was under Vespasiano Gonzaga (d. 1591), who was its duke; by him it was transformed into a small "Residenzstadt." It was well fortified and built, and from this period date the ducal palace (now the Municipio), the theatre designed by Scamozzi, &c. The church and the summer palace contain frescoes by the Campi di Cremona. Here in 1567 a Hebrew printing-press was set up.

**SABELLIC**, the name originally given by Mommsen in his *Unterschiedliche Dialekte* to the pre-Roman dialects of Central Italy which was neither Oscan nor Umbrian. The progress of study has, however, grouped them under more specific names, such as the "North Oscan" group (see **PAELIGNI**) and the "Latinian" group (see **LATIN LANGUAGE**), and the only content now left for the term Sabellic consists of a group of 8 or 9 inscriptions to which it certainly cannot be applied with truth. They are probably, if not certainly, the most ancient inscriptions in existence on Italian soil. Since they were all found on a strip of the eastern coast running from the mouth of the Aternus on the south to Pesaro on the north, it is probably best to call them simply "East Italic" or "Adriatic."

Not even the transcription of their alphabet has reached the stage of certainty, for even in this small number of inscriptions the alphabet seems to vary. The chief doubt is about the value of **V** and **Y** (or **A** and **Λ**) which appear beside the symbol **Α** on the same inscriptions; and of the dots in the middle of the line which are certainly not interpuncts. They may conceivably have some connexion with the dots in Venetic inscriptions, which R. S. Conway has endeavoured to explain (see **VENETI**). The most striking characteristic of the group of inscriptions is that the direction of the writing in alternate lines is not merely reversed but inverted ("serpentine boustrophedon" as on the Etruscan stele of Capua of the 5th century B.C.) (see **ETRURIA: LANGUAGE**). Thus if the first line consisted of the letters ABC. in that order, the next would be **ΞΩΓ**, i.e. with each letter turned so as to face the left, and with its head downwards. This arrangement appears in some of the Venetic inscriptions also. The longest of the inscriptions is that from Grecchio, now preserved in the Naples Museum. The probability is that this and all the rest were epitaphs, but a translation is as yet out of the question. The stone from Castrignano gives us certain forms which seem to be recognizable as Indo-European, namely *paterefo*, *materefo*, though it is far from certain that the symbol **Ϟ**, which is here represented by *f*, really has that value.

Pauli's conjecture that these inscriptions probably represented the language of some settlers from Illyria has little support except that of some coincidences in tribal and local names on the two sides of the Adriatic (e.g. "Truentum, quod solum Liburnorum in Italia relicum est" (Plin. *Nat. Hist.* iii. 110), *-entum* being a frequent Illyrian ending, and *Liburni* an Illyrian tribe), though it is a priori likely enough.

For the authorities for the alphabets and the text of the inscriptions as known down to 1897, see R. S. Conway's *Italic Dialects*

<sup>1</sup> For the Sabellian tribes, see **SABINE**.

(Cambridge, 1897), ii. 328; and nothing has yet (1908) been added to what was written about the alphabets by Karl Pauli (*Italica Stud.* iii., "Die Veneter," Leipzig, 1891, pp. 220 seq. and p. 423). Some plausible (but wholly uncertain) conjectures by W. Deecke as to the meaning of some of the inscriptions may be sought in the appendix to *Zvetiaeff's Inscrip. Italica inferioris dialecticæ*; and since 1897 a further inscription of this class has been found at Belmonte Piceno, which is preserved in the museum at Bologna and reported by Brizio in *Notiz. degli scavi*, 1903, p. 104.

It is to be noticed that a much longer and far more legible inscription from Novilara (now in the museum at Pesaro—a cast of it is at Bologna) sometimes spoken of as Sabellie, whose first two words are *mimnis erâi*, is perhaps more probably to be regarded as containing some variety of Etruscan, though its character is far from certain. Its alphabet closely resembles Etruscan of the 4th century B.C. It is a very interesting monument both for its own sake, since it is sculptured as well as inscribed (there is one—or more—hunting or pastoral scene on the back), and because the archaeological stratum (late Bronze period) of the cemetery from which it is believed to have come is clearly marked.

With a companion fragment it is fully described by Brizio in *Monumenti antichi*, v. (1895), and it has also been discussed by Ella Latte in *Hermes* (xxxi. 465 and xliii. 32). (R. S. C.)

**SABELLIUS** (fl. 230), early Christian presbyter and theologian, was of Libyan origin, and came from the Pentapolis to Rome early in the 3rd century. To understand his position a brief review of the Christian thought of the time is necessary. Even after the elimination of Gnosticism the church remained without any uniform Christology; the Trinitarians and the Unitarians continued to confront each other, the latter at the beginning of the 3rd century still forming the large majority. These in turn split into two principal groups—the Adoptianists and the Modalists—the former holding Christ to be the man chosen of God, on whom the Holy Spirit rested in a quite unique sense, and who after toil and suffering, through His oneness of will with God, became divine, the latter maintaining Christ to be a manifestation of God Himself. Both groups had their scientific theologians who sought to vindicate their characteristic doctrines, the Adoptianist divines holding by the Aristotelian philosophy, and the Modalists by that of the Stoics; while the Trinitarians (Tertullian, Hippolytus, Origen, Novatian), on the other hand, appealed to Plato.

In Rome Modalism was the doctrine which prevailed from Victor to Calixtus or Callistus (c. 190–210). The bishops just named protected within the city the schools of Epigonus and Cleomenes, where it was taught that the Son is identical with the Father. But the presbyter Hippolytus was successful in convincing the leaders of that church that the Modalistic doctrine taken in its strictness was contrary to Scripture. Calixtus saw himself under the necessity of abandoning his friends and setting up a mediating formula designed to harmonize the Trinitarian and the Modalistic positions. But, while excommunicating the strict Unitarians (Monarchians), he also took the same course with Hippolytus and his followers, declaring their teaching to be ditheism. The mediation formula, however, proposed by Calixtus became the bridge by which, in the course of the decades immediately following, the doctrine of the Trinity made its way into the Roman Church. In the year 250, when the Roman presbyter Novatian wrote his book *De Trinitate*, the doctrine of Hippolytus, once discredited as ditheism, had already become official there. At the same time Rome and most of the other churches of the West still retained a certain leaning towards Modalistic monarchianism. This appears, on the one hand, in the use of expressions having a Modalistic ring about them—see especially the poems of Commodian, written about the time of Valerian—and, on the other hand, in the rejection of the doctrine that the Son is subordinate to the Father and is a creature (witness the controversy between Dionysius of Alexandria and Dionysius of Rome), as well as in the readiness of the West to accept the formula of Athanasius, that the Father and the Son are one and the same in substance (*ὁμοούσιος*).

The strict Modalists, whom Calixtus had excommunicated along with their most zealous opponent Hippolytus, were led

by Sabellius. His party continued to subsist in Rome for a considerable time afterwards,<sup>1</sup> and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3rd century his doctrine found much acceptance, first in the Pentapolis and afterwards in other provinces.<sup>2</sup> It was violently controverted by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 260 to 320) was very powerfully influenced by the opposition to Sabellianism. Thus, for example, at the great synod held in Antioch in 268 the word *ὁμοούσιος* was rejected, as seeming to favour Unitarianism. The Sabellian doctrine itself, however, during the decades above mentioned underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form. Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged. The teaching of Sabellius himself was very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was to the effect that Father, Son and Holy Spirit are the same person, three names thus being attached to one and the same being. What weighed most with Sabellius was the monotheistic interest. The One Being was also named by him *ἡνωτός*—an expression purposely chosen to obviate ambiguity. To explain how one and the same being could have various forms of manifestation, he pointed to the tripartite nature of man (body, soul, spirit), and to the sun, which manifests itself as a heavenly body, as a source of light and also as a source of warmth. He further maintained that God is not at one and the same time Father, Son and Spirit, but, on the contrary, has been active in three apparently consecutive manifestations or energies—first in the *πρόσωπον* of the Father as Creator and Lawgiver, then in the *πρόσωπον* of the Son as Redeemer, and lastly in the *πρόσωπον* of the Spirit as the Giver of Life. It is by this doctrine of the succession of the *πρόσωπα* that Sabellius is distinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have made use of Stoical formulas (*παρίσχεσθαι, συντέλεισθαι*), but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4; Exod. xx. 3; Isa. xlv. 6; John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (*Philos. bk. ix.*), Epiphanius (*Haer. lxxi.*) and Dionys. Alex. (*Epp.*); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject see Schlieiermacher (*Theol. Ztschr. 1822, Hft. 2*); Lange (*Ztschr. f. hist. Theol. 1832, ii. 2*); Döllinger (*Hippolyt u. Kallist. 1863*); Zahn (*Monatsh. v. Ancyra, 1867*); R. L. Outley, *The Doctrine of the Incarnation (1866)*; various histories of Dogma, and Harnack (*s.s.* "Monarchianismus" in *Herzog-Hauck, Realencycl. für prot. Theol. und Kirche*, xiii. 303). (A. H.)

**ŠABIANS.** The Šabians (*al-Sābī'ān*) who are first mentioned in the Koran (ii. 59, v. 73, xxii. 17) were a semi-Christian sect of Babylonia, the Elkesaites, closely resembling the Mandaeans or so-called "Christians of St John the Baptist," but not identical with them. Their name is probably derived from the Aramaic *šab*, a dialectical form of *šabā*, and signifies "those who wash themselves"; the term *al-mughāsilā*, which is sometimes applied to them by Arab writers, has the same meaning, and they were also known as *ἡμεροβαπτιστῶν*. How Mahomet understood the

term "Šabians" is uncertain, but he mentions them together with the Jews and Christians. The older Mahomedan theologians were agreed that they possessed a written revelation and were entitled accordingly to enjoy a toleration not granted to mere heathen. Curiously enough, the name "Šabian" was used by the Meccan idolaters to denote Mahomet himself and his Moslem converts, apparently on account of the frequent ceremonial ablutions which formed a striking feature of the new religion.

From these true Šabians the pseudo-Šabians of Ḥarrān (*Carrhae*) in Mesopotamia must be carefully distinguished. In A.D. 830 the Caliph Ma'mūn, while marching against the Byzantines, received a deputation of the inhabitants of Ḥarrān. Astonished by the sight of their long hair and extraordinary costume, he inquired what religion they professed, and getting no satisfactory answer threatened to exterminate them, unless by the time of his return from the war they should have embraced either Islam or one of the creeds tolerated in the Koran. Consequently, acting on the advice of a Mahomedan jurist, the Ḥarrānians declared themselves to be "Šabians," a name which shielded them from persecution in virtue of its Koranic authority and was so vague that it enabled them to maintain their ancient beliefs undisturbed. There is no doubt as to the general nature of the religious beliefs and practices which they sought to mask. Since the epoch of Alexander the Great Ḥarrān had been a famous centre of pagan and Hellenistic culture; its people were Syrian heathens, star-worshippers versed in astrology and magic. In their temples the planetary powers were propitiated by blood-offerings, and it is probable that human victims were occasionally sacrificed even as late as the 9th century of our era. The more enlightened Ḥarrānians, however, adopted a religious philosophy strongly tinged with Neoplatonic and Christian elements. They produced a brilliant succession of eminent scholars and scientists who transmitted to the Moslems the results of Babylonian civilization and Greek learning, and their influence at the court of Baghdad secured more or less toleration for Šabianism, although in the reign of Harūn al-Rashid the Ḥarrānians had already found it necessary to establish a fund by means of which the conscientious scruples of Moslem officials might be overcome. Accounts of these false Šabians reached the West through Maimonides, and then through Arabic sources, long before it was understood that the name in this application was only a disguise. Hence the utmost confusion prevailed in all European accounts of them till Chwolson published in 1856 his *Sabier und der Sabismus*, in which the authorities for the history and belief of the Ḥarrānians in the middle ages are collected and discussed.

See also "Nouveaux documents pour l'étude de la religion des Harraniens," by Dozy and De Goeje, in the *Actes of the sixth Oriental congress*, ii. 281 f. (Leiden, 1885). (R. A. N.)

**SABICU WOOD** is the produce of a large leguminous tree, *Lysiloma Sabicu*, a native of Cuba. The wood has a rich mahogany colour; it is exceedingly heavy, hard and durable, and therefore most valuable for shipbuilding. Sabicu, on account of its durability, was selected for the stairs of the Great Exhibition (London) of 1851, and, notwithstanding the enormous traffic which passed over them, the wood at the end was found to be little affected by wear.

**SABINE, SIR EDWARD** (1788–1883), English astronomer and geodesist, was born in Dublin on the 14th of October 1788, a scion of a family said to be of Italian origin. He was educated at the Royal Military Academy, Woolwich, and obtained a commission in the royal artillery at the age of fifteen, attaining the rank of major-general in 1859. His only experience of warfare seems to have been at the siege of Fort Erie (Canada) in 1814. In early life he devoted himself to astronomy and physical geography, and in consequence he was appointed astronomer to various expeditions, among others that of Sir J. Ross (1818) in search of the North-West Passage, and that of Sir E. Parry soon afterwards. Later, he spent long periods on the inter-tropical coasts of Africa and America, and again among the snows of Spitzbergen. He was associated with Henry Williams Chisholm and others as a member of the Royal Commission of

<sup>1</sup> In the 18th century there was discovered in one of the catacombs of Rome an inscription containing the words "qui et Filium dicentis et Pater invenit." This can only have come from a Sabellian.

<sup>2</sup> Whether Sabellius himself ever visited the East is unknown.

1868-1869 for standardizing weights and measures. Sabine was for ten years (1861-1871) president of the Royal Society, and was made K.C.B. in 1869. He died at East Sheen, Surrey, on the 26th of May 1883.

Of Sabine's scientific work two branches in particular deserve very high credit—his determination of the length of the second's pendulum, and his extensive researches connected with terrestrial magnetism. The establishment of a system of magnetic observatories in various parts of British territory all over the globe was accomplished mainly on his representations; and a great part of his life was devoted to their direction, and to the reduction and discussion of the observations. While the majority of his researches bear on one or other of the subjects just mentioned, others deal with such widely different topics as the birds of Greenland, ocean temperatures, the Gulf Stream, barometric measurement of heights, arcs of meridian, glacier transport of rocks, the volcanoes of the Hawaiian Islands, and various points of meteorology.

**SABINI**, an ancient tribe of Italy, which was more closely in touch with the Romans from the earliest recorded period than any other Italic people. They dwelt in the mountainous country east of the Tiber, and north of the districts inhabited by the Latins and the Aequians in the heart of the Central Apennines. Their boundary, between the southern portion of the Umbrians on the north-west, and of the Picentines on the north-east, was probably not very closely determined. The traditions connect them closely with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars and Quirinus, and the patrician form of marriage (*confarreatio*).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) *ircus*, Lat. *hircus*; (2) *ausum*, Lat. *aurum*; (3) *nousensiles*, Lat. *nousensides* ("gods of the nine seats"); (4) the river name *Farfarius*, beside pure Lat. *Fobaris* (Servius, *ad Aen.* vii. 715); and (5) the traditional name of the Sabine king, *Numa Pompilius* (contrasted with Lat. *Quincilius*), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate *ǵh* by *f* instead of Lat. *k*; (2) the retention of *s* between vowels; (3) the change of medial and initial *d* to *f*; (4) the retention of medial *f* which became in Latin *b* or *d*; and (5) the change of Ind.-Eur. *ǵ* to *p*. Not less clear is the well attested tradition (e.g. *Paul ex Fest.* 327 M.) that the Sabines were the parent stock of the Samnites, and this is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be *Safnsi* (see SAMNITES and the other articles there cited, dealing with the minor Samnite tribes).

It is one of the most important problems in ancient history to determine what was the ethnological relation of these tribes, whom we may call "Sabine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other. Much light has been thrown on this group of questions in recent years both from linguistic and from archaeological sources. For the historical and archaeological evidence which connects the Sabines with the patricians of Rome, see *ROME, Ancient History*. The linguistic side of the matter may be conveniently dealt with here. From this point of view the question to be asked is what language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian?

A single monument of 5th- or 4th-century Sabine would be of unique value; but in the absence of any such direct evidence we are thrown back on a few cardinal facts: (1) Festus, though he continually cites the *Lingua Oscan* never spoke of *Lingua Sabina*, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been.

(2) The language of the Samnites was that which we now call Oscan (see *OSCA LINGUA*). (3) The evidence of the glosses and place-names already referred to confirms tradition by the resemblance which they show to the phonological characteristics of Oscan. On the other hand there are two or three forms called Sabine by Latin writers which do appear to show the sound *ǵ* unchanged, especially the name of the Sabine god *Quirinus*, which seems to be at least indirectly connected with the name of the Sabine town *Cures*. We do not, however, know that the initial sound of this word was originally a Velar *ǵ*, and Professor Ridgeway ("Who were the Romans," London, 1908, in *Proceedings of the British Academy*, iii. 109) rightly lays some stress on the fact that the name in Greek form is simply *κυρίνος* (not *κυρίνος*: whereas Lat. *Quirinus* is regularly transcribed *κυρίνος*), and suggests that the initial sound may have been slightly modified so as to correspond with the pure Latin word *quiries* (spearmen). In one or two other examples of an apparent *ǵ* in Sabine names or glosses it is not difficult to show that the sound was originally a pure palatal followed by a suffixal *w* (e.g. *tesqua*, "desert places," probably for *\*ters-c-wa*, cf. *pas-c-wa*, and Greek *τερορα-λαρ*, Lat. *terra*, "dry land," from *tersa*), so that they would in fact offer no difficulty.

There is further an important piece of evidence which connects together all the Sabine tribes and distinguishes them sharply, at least in the 5th and following centuries B.C., from the earlier strata of population in Italy. As this point arises in connexion with so many tribes it is desirable to offer the evidence for it here once for all. It rests upon the different character of the suffixes used by particular tribes and communities to form their ethnic name.

There are only six suffixes so used among the names of ancient Italy.<sup>1</sup> These suffixes are: -ulo-, -io-, -co-, -no-, -ti- (or -ati-), -ensi-.

1. The suffix -ulo- appears only in a few old names, *Siculus*, *Rutulus*, *Appulus*, *Poediculus* and *Vitulus*, which would have been the pure Latin form instead of *Itali*, which was taken over from the Grecized form *\*Italol*.

2. Excluding this small group, the frequency of the occurrence of these suffixes in ancient Italy is shown by the following table:

Table of Ethnic Suffixes in Ancient Italy.

Dialectic Area.	-IO-	-CO-	-NO-	-TI-	-ENSI-	Totals.
Messapii . . .	2	..	16	..	2	20

Totals . . .	27	7 (7)	354	106	107	601

The figures in brackets refer to the forms in -CINO-; see below.

3. The names in -io- seem to have been evenly distributed over the Italian area and not to mark any particular tribe or epoch.

4. The suffix -ensi- can be shown to have borne a political significance.

<sup>1</sup> This statement with those which follow is based upon the collections of the place-names of ancient Italy, arranged according to their locality, by R. S. Conway in *The Italic Dialects* (Cambridge, 1897).

that is to say, it was used by the Romans to form the names of the inhabitants of municipal towns, as for instance *Foro-sabinienses*, the inhabitants of Forum Julii. There remain, therefore, the three suffixes *-co-*, *-no-*, and *-si-*, and it will be seen from the table that the relative frequency of these suffixes in different dialect-areas varies very greatly. The suffix *-no-*, for example, has almost driven out any other in the district of the Hirpini, and it is greatly preponderant among the Campani, in the district of the Lucani, and among the Latini and Sabini themselves.

5. On the other hand, the *-co-* suffix, which is nowhere frequent, is practically confined to the central area.

6. The *-si-* suffix is comparatively frequent in the Volscian district and very frequent in the Umbrian; it is also fairly well represented in Latium and Etruria.

7. In the article VOLSCI it is shown that the addition of the *-no-* suffix is often a mark of the conquest of an original *-co-* folk by a Sabine tribe. It is also fairly frequently added to names formed with the *-si-* suffix: *Ardes* gave first *Ardeales* and then *Ardeatini*; the *Picentes* became *Picentini*, the *Comertes* *Comertini*; of such forms there are no fewer than 54.

8. The addition of the *-si-* suffix to the *-no-* ethnicon, as in *Iguvinales*, is comparatively rare, and no doubt denotes the opposite process, namely, the absorption of a *-no-* tribe by a population to whom it was natural to use the suffix *-si-*. The two opposite processes confirm the inference that both are due to some change of race, not merely to a change of custom in the same population in a later age; for in that case the change would have been in one direction only.

The assumption of the Sabine origin of the *-no-* suffix is further confirmed by the practice of the Romans themselves. The folk of Latium after the Sabine conquest were no longer *Latienses* but *Latini*; and over against the old name *Quirites* was the new *Populus Romanus*. Just the same rough and ready nomenclature was applied to communities conquered on foreign soil; the *Syracūras* became *Spartani*, the *Sypontinos* *Syracusani*, and the *Aesuvii Asiatici*, and so on.

The assumption that Latin was properly the language of the Latian plain and of the Plebs at Rome, which the conquering patrician nobles learnt from their subjects, and substituted for their own kindred but different Sabine idiom, renders easier to understand the borrowing of a number of words into Latin from some dialect (presumably Sabine) where the velars had been labialized; for example, the very common word *bos*, which in pure Latin should have been *\*uos*. And in general it may be stated that the hypothesis of such an intermixture of forms from neighbouring dialects has been rendered in recent years far more credible by the striking evidence of such continual intermixture going on within quite modern periods of time afforded by the *Atlas linguistique de la France*, even in the portion which has already been published.

The conclusion, therefore, to which the evidence appears to lead us is that in, say, the 7th century, B.C., the Sabines spoke a language not differing in any important particulars from that of the Samnites, generally known as Oscan; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as *Lingua Latina*, just as the Normans adopted the language of the conquered English.

The glosses and place-names of the ancient Sabine district are collected by R. S. Conway, the *Italic Dialects* (Cambridge, 1897), p. 351. For the history of the Sabine district see Mommsen, *C.I.L.* ix. p. 396; and Beloch, "Der italische Bund unter römischer Hegemonie" (Leipzig, 1880) and "La Conquista Romana della regione Sabina," in the *Rivista di storia antica* (1905), ix. p. 269. (R. S. C.)

**SABINIANUS**, pope from 604 to 606, successor of St Gregory the Great. He incurred unpopularity by his unseasonable economies. The erudite Italian Augustinian Onofrio Panvino (1529-1568) in his *Eptome pontificum Romanorum* (Venice, 1557) attributes to this pope the introduction of the custom of ringing bells at the canonical hours and for the celebration of the eucharist.

**SABLE**, the name of a small quadruped, closely akin to the martens, and known by the zoological name of *Mustela sibiriana*. It is a native of Siberia and famous for its fur. The name

appears to be Slavonic in origin, cf. Russian *sabel*, whence it has been adapted into various languages, cf. Ger. *Zobel*, Dutch *Sabel*; the Mod. Fr. *sibelline* and Med. Lat. *sibellina* derive from the Ital. form. The Eng. and Mod. Lat. *sabellum* are from the O. Fr. *sable* or *saible* (see MARTEN and FUR). "Sable" in English is a rhetorical or poetical synonym for "black." This comes from the usage in heraldry (first in French) for the colour equivalent to black, represented conventionally by a cross-hatching of vertical and horizontal lines. It has usually been assumed that this is an extension of the name of the fur, but sable fur is brown.

**SABLÉ, MADEMOISELLE DE SOUVRÉ, MARQUISE DE** (1599-1678) French writer, was born in 1599, the daughter of Gilles de Souvré, marquis de Courtenvaux, tutor of Louis XIII., and marshal of France. In 1614 she married Philippe Emmanuel de Laval, marquis de Sablé, who died in 1640, leaving her in somewhat straitened circumstances. With her friend the comtesse de St Maur she took rooms in the Place Royale, Paris, and established a literary salon. Here originated that class of literature of which the *Maximes* of La Rochefoucauld are the best-known example. The *Maximes* of the marquise de Sablé were in fact composed before those of La Rochefoucauld, though not published till after her death. In 1655 she retired, with the comtesse de St Maur, to the Convent of Port Royal des Champs, near Marly, removing in 1661, when that establishment was closed, to Auteuil. In 1669 she took up her residence in the Port Royal convent in Paris, where she died on the 14th of January 1678.

**SABLÉ**, a town of western France, in the department of Sarthe, on the river Sarthe, 30 m. W.S.W. of Le Mans by rail. Pop. (1906) 4952. Sablé has a château of the 18th century, a fortified gateway, relic of a medieval stronghold, and a modern church with fine stained glass of the early 15th century. Its importance, however, is chiefly due to the marble quarries of the vicinity, the products of which are worked in the town, where flour-milling, the manufacture of farm-implements and trade in cattle are also carried on. A communal college is among the public institutions. From the 11th century Sablé was the seat of a powerful barony, which in 1602 was made a duchy-peerage in favour of Urbain de Laval, marshal of France. The place afterwards came into the possession of Colbert de Torcy, nephew of the great Colbert who built the château. In 1488 a treaty which resulted in the union of France and Brittany was concluded at Sablé, between Charles VIII. and Duke Francis II.

**SABLE ANTELOPE**, the English name for a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oryxes, with which they form a group or sub-family. In all these antelopes long cylindrical horns are present in both sexes; the muzzle is hairy; there is no gland below the eye; the tail is long and tufted; and in the breadth of their tall crowns the upper molar-teeth resemble those of the oxen. The sable and roan antelopes are distinguished from Oryx by the stout and thickly ringed horns rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then sweeping backwards in a bold curve. Sable antelope are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from ten to twenty individuals, but on rare occasions as many as fifty have been seen together. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, whose general colour in both sexes is strawberry-roan. It is typically a South African species, but is represented by a local race in the eastern Sudan (*H. equinus bakeri*) distinguished by its redder colour and different face-makings.

**SABLE ISLAND**, an island of Nova Scotia, Canada, 110 m. S.E. of Cape Canso, in 43° 56' N. and 60° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 ft. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out

about 17 m. into the ocean. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and storms; irregular ocean currents of great strength sweep round it, and its colour makes it indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. The island is constantly changing in shape, owing to the action on the sand of wind and wave, and tends to diminish in size. Since 1763, when taken over by Britain, it has shrunk from 40 m. in length to 20, from 2½ in breadth to 1, and from 200 ft. in height to 85; since 1873 the western lighthouse has thrice been removed eastward. As this makes navigation still more dangerous, the Canadian government has planted thousands of trees and quantities of root-binding grass, and the work of destruction has been somewhat stayed. Wild fruits grow plentifully during the summer, and cranberries are exported. Wild ducks, gulls, and other birds nest in large numbers, and a native breed of ponies has long flourished.

Sable Island, estimated as being then over 100 m. in length, was known to the early navigators under the name of Santa Cruz. Early in the 16th century horses were left on its shores by the Portuguese, and the native ponies, supposed to be their descendants, are still exported. In 1598 a band of convicts were left by the marquis de la Roche, but in 1603 the survivors were restored to France.

See Rev. Geo Patterson in *Transactions of Royal Society of Canada* (1894 and 1897).

**SABRE-FENCING**, the art of attack and defence with the sabre, or broad-sword. Besides the heavy German basket-sabre and the *Schläger* (see below) there are two varieties of sabre used for fencing, the military sword and the so-called light sabre. These are nearly identical in shape, being composed of a slightly curved blade about 34 in. in length and a handle furnished with a guard to protect the hand; but the military sword, or broad-sword proper, the blade of which is about ½ in. wide near the guard, tapering to ¼ in. near the point, is considerably heavier than the light sabre and is generally preferred by military instructors, being almost identical with the regulation army sabre in size and weight. Until 1900 it was the common fencing sabre in Great Britain, the United States, and most European countries, although its use was practically confined to military circles. About 1900 the light Italian sabre was introduced and became the recognized cut-and-thrust weapon among fencers throughout the world. In Austria-Hungary it became popular as early as 1885, while in Italy, the country of its origin, it has been in use since the middle of the 19th century. Its blade is about ⅞ in. wide a little below the guard, tapering to ⅜ in. just under the point. For practice this is truncated and the edge blunt, but in scoring both edge and point are assumed to be sharp, while in countries on the continent of Europe (though not in Great Britain or the United States) the back-edge (false-edge) is also supposed to be sharpened for some 8 in. from the point. In Italy when used for duelling the point and both edges are actually sharpened.

The modern sabre is a descendant of the curved light cavalry sword of the late 18th century, which was introduced into Europe from the Orient by the Hungarians.

The old-time European swords used for cutting were nearly all straight, like the Ital. *schiaivona* and *spadroon*, the English and German two-handers and the Scotch *claymore* (see **WORD**). There was indeed a heavy curved fencing weapon called *dussack*, very popular in the German fencing schools of the 16th and 17th centuries, which was of wood, very broad and as long as the fencer's arm, with an elliptical hole for the hand in place of a guard. But the *dussack* was introduced from Bohemia, where, as in Hungary, swords were oriental in shape, and as it completely disappeared in the last half of the 17th century it can hardly be considered in any way as the ancestor of the modern

sabre. The old English *back-sword*, the traditional English weapon, though the curved form was not quite unknown, was almost invariably straight. The ancient English sword-and-buckler play (see **FENCING**) was, to the disgust of its devotees, driven out as a method of serious combat by the introduction at the beginning of the Elizabethan era of the Italian thrusting rapier. Nevertheless it survived as a sport up to the first half of the 18th century, being practised, together with the back-sword or broad-sword play, cudgelling or single-stick fencing, foiling and boxing, by the fencing masters of that period, whose exhibitions, given for the most part in the popular bear-gardens, were described by Pepys, Steele and others. The masters who figured in these "stage-fights" were called "prize-fighters"; and at that period they regarded boxing only as an unimportant part of their art. The most famous of them was Figg, the "Atlas of the Sword" (see **FENCING**). The back-sword of Figg's time was essentially the military sword then in use, having a single straight edge. The blows were aimed at the head, body or leg. Towards the close of the 18th century sticks began to be used for back-swording, the play at first being aimed at any part of the person; but the head soon came to be the sole object of attack, blows on the body and arms being used only to gain an opening. The usual defence was from a high hanging guard. No lunging was allowed. Fencing with the broad-sword did not, however, at any period entirely disappear in England, and was taught by all the regular masters, especially by the celebrated Angelo. The earlier play, of the time of Figg and later, was simple and safe. The prevailing defensive position was the hanging guard, high or medium, with the arm extended and the point downwards. There were also high inside and outside, tierce, quarte, low prime, seconde; and the head or "St George," parries; the last, a guard with the blade nearly horizontal above the head, being the supposed position of England's patron saint from which he dealt his fatal blow at the dragon. Owing to the great weight of the old back-sword wristplay was almost impossible, the cuts being delivered with a chopping stroke. Later in the 18th century a nimbler style, called the Austrian, came into fashion, owing to the introduction of a lighter, curved sabre, the principal guards being the medium, with extended hand and sword held perpendicularly with the point up; the hanging, with the point down, both outside and inside; the half-circle; the "St George"; and the spadron, with horizontal arm and sword pointing downwards. The spadron (Ital. *spadrono*), a light, straight, flat-bladed and two-edged sword, was also a popular 18th-century weapon, and was used both for cutting and thrusting. The thrusting attacks and parries were generally similar to those of the small-sword (see **FOIL-FENCING**), but few or no circular parries were used. The cuts were like those of the broad-sword. The Germans, like the British, were once masters of the edge in fencing, but the art declined with the introduction of the point, and sabre-playing survived only in the army and in academic circles with the heavy basket-sabre (see below).

The school of sabre still taught in most armies, and up to the end of the 19th century by fencing-masters of all countries except Italy and Austria-Hungary, shows little advance from that in vogue in Angelo's time. Two fundamental guards are usual, one (taught at the French army school at Joinville-le-Pont) corresponding to the guard of tierce in foil-fencing, except that the left forearm rests in the small of the back; and the other a high hanging guard, with crooked arm and the point of the sabre directed slightly forwards. The methods of coming on guard differ considerably, but have nothing to do with fencing proper. In 1896 the Florentine (Radaelli) system of sabre was introduced into the British army, the cavaliere F. Masiello spending some time at Aldershot for the purpose of training the army sword-masters; but since the year 1901 regular instruction in swordsmanship has practically been abandoned.

Fencing on horseback for cavalry is simple in comparison with light sabre-play. The cavalry sword is of two patterns, one the heavy, straight cuirassier's sword, and the other somewhat lighter with a slightly curved blade. On the attack straight

point thrusts, and wide sweeping cuts are used. The three principal parries are the "head" (or "high prime") with horizontally held blade; the "tierce," on the right, parrying cuts at the left side of the head and body; and the "quarte," on the opposite side.

The modern style of fencing with the light sabre was perfected in Italy during the last quarter of the 19th century, the most important pioneer in its development having been G. Radaelli, a Milanese master, who became chief instructor of the sabre in the Royal Italian Military Fencing Academy in 1874, when it was transferred to Milan from Parma. Radaelli's system was described by F. Masiello, an army officer whose works remain the chief authority on the light sabre. An old-time rivalry between the Neapolitan and the northern Italian fencing methods came to a crisis when M. Parise, an expert of the southern school, secured first place for foil-fencing in a tournament instituted by the military authorities, the result being the transfer of the Military Fencing Academy to Rome under the title of *Scuola Magistrale di Roma*. There was, however, less difference between the two schools in sabre than in foil play, and the Radaelli system for the former was so generally esteemed that a master of that method was established at the Roman Academy.

The light fencing-sabre is made up of two principal parts, the blade and the handle. The blade, from 33 to 34 in. long and slightly and gradually curved from hilt to point (which is truncated), has the tongue, or tang, which runs through the handle; the heel, or thick uppermost part of the blade fitting on to the guard; the edge, running from heel to point; the back-edge or false-edge (sometimes not allowed), running from the point along the back for about 8 in.; and the back, running from point to heel (unless there is a back-edge). The blade is fluted on both sides from the heel where the back-edge begins. The handle consists of the guard, of thin metal, extending from the pommel to the heel of the blade, to protect the hand; the grip (of wood, fish-skin, or leather, often backed with metal), shaped to fit the hand, through which the tongue of the blade passes; and the pommel, or knob, a button which finishes off the handle and holds the tongue in place.

The recognition of the light fencing-sabre as a practice weapon only, related to the heavier military sword as the foil is to the duelling-sword, at once makes apparent the difference between the play of the two cut- and thrust-weapons. As a light cut with the military sabre will be of little advantage in battle, however prettily delivered, it is evident that in order to produce a shock of impact sufficient to put an adversary out of action, a wide sweeping movement with the sword (*moulinet*; Ital. *molinelli*) is necessary. With the fencing-sabre a hit is a hit if properly delivered with the edge or point, however light it may be. For hits of this kind less force is necessary, and wide moulinets are not only useless but dangerous, since in making them the point must for a moment be directed away from the opponent, and momentary openings are thus left of which the opponent may take advantage by attacks on the preparation. For this reason the cuts of the Radaelli school are delivered with moulinets of very narrow radius, made as much as possible by a movement of the elbow only, keeping the point directed menacingly towards the opponent. Again, whereas in battle a wound on any part of the person may be effective and the school of the heavy sabre has to reckon with this fact, in fencing with the light sabre no hit lower than the hips counts, although hits upon any part of the person above the hips are good; in England cuts on the outside of the thigh are allowed. This somewhat narrows the scope of the fencing-sabre, just as the scope of the foil is narrower than that of the duelling-sword.

The military sword is, on account of its weight, usually held firmly in the hand with the thumb overlapping the fingers; but in holding the light sabre the thumb is placed on the flat of the grip, giving a perfect command over the movements of the blade, called by the Italians *passaggio*. Both attacks and parries are executed as narrowly as possible, avoiding the wide movements common in heavy sabre-play, and the moulinets (which are ellipses described by the point as it is drawn back for a cut)

are made, not by swinging the sword round the head, but by drawing back the hand held in front of the body, and with the point directed forward. The thrusts with the light sabre are made with the thumb to the left; whereas in the French school it is turned down, so that the blade curves upward. The modern school allows no such parries as the "St George," in executing which the blade is held at right angles to the body, but teaches that the point should always be directed towards the adversary as much as possible. The attacks are either "simple," "complex" or "secondary," and bear a general resemblance to those in foil-fencing (*q.v.*); simple attacks being such as are not preceded by other movements, as feints; complex attacks those preceded by feints, advances, or some other preliminary manoeuvre; and secondary attacks those carried out while the adversary is himself attacking or preparing to attack. The parries also correspond in nomenclature, and generally in nature, to those used in foil-play, but no circular or counter-parries are taught, though sometimes employed.

**Terms used in Sabre-Fencing.**— "Absence of the blade": a guard so wide as apparently to leave the body uncovered, so as to entice the adversary to attack. "Appuntata" (Fr. *remise*): a supplementary cut or thrust after the failure of an attack, when the adversary replies slowly or with a feint. "Assault" (Ital. *assalto*), a regular bout. "Attacks on the blade" (see below under "beat," "disarmament," "graze" and "press"). "Beat" (Ital. *battuta*): a hard dry stroke on the adversary's blade, in order to drive it aside and push home an attack; a "re-beat" is made by beating lightly on one side, then dropping the point quickly under the adversary's blade and beating violently on the other side. *Cassione* (see below under "disengage"). "Completion" (see below under *riposte*). "Controtempo": to parry an attack in such a manner that the adversary is hit at the same time. "Deceive the blade": when the adversary attempts an "attack on the blade" to avoid contact by a narrow circular movement of the point and hand; this is generally followed by a straight thrust or cut, as the force of his blow will carry his blade wide and leave an opening. "Development" (attacks on the): attacks made while the adversary is making a complex attack, *i.e.* one consisting of at least two movements (feint and real attack). *Devanteno* (see below under "press"). "Disarmament" (Ital. *sforzo*): striking the adversary's weapon from his hand by means of a sweeping stroke along his blade from the point downwards. "Disengage" (Ital. *cassione*): being on guard (engaged) in one line, to draw one's point under the adversary's sword and lunge on the other side: to avoid a cut by retiring the right foot behind the left; a time-cut at the adversary's arm is usually made at the same time. "Graze" (Ital. *filo*): to run one's blade along that of the adversary and push home the attack suddenly. "Invitation guard": a guard in any line with the blade intentionally so wide that the adversary lunges into the apparent opening, only to meet a prepared counter. *Incontro* (Ital. for double-hit): both fencers attacking at the same instant. "Lines" (of engagement): the four quarters into which the trunk is divided, attacks and parries opposite them being called after them. These are, with the hand held in "supination" (thumb on top of sabre-grip): upper right, "sixte"; upper left hand, "quarte"; lower right "octave" (not used in sabre); lower left "half-circle" (not used in sabre). (When the hand is held in pronation (thumb down) the lines are: upper right, "tierce"; upper left, "prime"; lower right, "seconde"; lower left, "low prime" ("seconde" generally used). *Quinte* and *septime* are also lines of the Italian school. "Lunge": the advance of the body by stepping forward with the right foot in order to deliver a cut or thrust. "Opposition": pressing the hand and blade in attack towards the side the adversary's blade is on; the object being to occupy his blade and cover one's person from a "riposte." "Press": forcing the adversary's blade aside by a sudden push in order to create an opening for an attack, either directly or on the same side after he has recovered his blade and parried too wide on his supposed threatened side. "Preparation" (attacks on the): mostly made by "deceiving" when the adversary attempts a beat, graze or press. "Re-beat" (see "beat"). "Remise" (see "appuntata"). "Riposte": a quick cut or thrust made after parrying an attack, without lunging. When the riposte in its turn is parried and replied to with another riposte, the French call this second riposte the *lac-au-lac*. *Sforzo* (see "disarmament"). *Scandaglio*: studying an opponent's style at the beginning of a bout. "Stop-thrust": a direct thrust made as the adversary begins a complex attack, *i.e.* one of more than one movement. The stop-thrust must get home palpably before the adversary's attack or the attack alone is counted, the rule of scoring being that he who is attacked must take the parry. "Time-cut": a quick slash at the adversary's arm as he begins a complex attack. *Toccata*: Ital. for "hit" *Touché*: French for "hit"

*Manchette-Fencing* (Fr. *manchette*, a cuff) is a variety of sabre-play popular in Germany, in which the fencers stand at such a

distance from each other that only hand and fore-arm can be reached with the last few inches of the sword nearest the point, both edges being supposed to be sharp. No thrusts are allowed, and both feet must remain stationary where they are planted when the bout begins. Narrow parries are necessary, though many cuts are avoided by withdrawing the hand. *Manchette-fencing* is not considered good practice for the light sabre and is therefore losing ground.

The German Basket-Sabre (*Krummer Säbel*, or *Krummsäbel*) is a descendant of the heavy cavalry sabre once in use in some branches of the German horse. It is now used almost exclusively by students. It has a strongly curved blade about 32 in. long and 1 in. broad, tapering slightly towards the end, which is truncated, no thrusts being allowed. The hand is protected by a large guard of heavy steel basket-work, and the handle is shaped to fit the hand, the forefinger being run through a leathern loop. On account of the great weight of the weapon (about 2½ lb, more than half of which is in the guard) blows delivered with a full swing are impracticable, and all cuts are made from the elbow and wrist, the hand being generally kept as high as possible. The *Mensur* is the distance at which the combatants stand from one another. There are three recognized distances, that in general use being the middle, from which two sabres can be crossed at about 15 in. from the points. Neither combatant may move his left foot (the right in the case of a left-handed fencer) from the position in which it is placed at the beginning of the bout, all advances and retreats being made by the movements of the right foot and the body. The position of the engagement is in high tierce, the arm being held straight out towards the adversary. The feet are planted about 24 in. apart, the right in advance. The right shoulder is bent forward and the stomach drawn back, imparting a slight stoop to the fencer. There are eight cuts and as many parries. The basket-sabre is used in the more serious students' duels; the neck, wrist, armpits and body below the nipples being heavily bandaged.

Rapier-fencing among the students of the German universities and technical high-schools of Germany, Austria, Switzerland and Russia may be considered under the sabre, as the rapier, although originally used for thrusting as well as cutting, is now employed by students only to cut. According to the association of German fencing-masters the modern weapon when blunt and used only for practice is called *Rapier* or *Hawrapier*, but when sharpened for duelling, *Schläger* (striker). It is derived from the long straight sword of the German *Reiters*, or light cavalry, who were famous in the 16th century and later. Its use, however, was only occasional before the middle of the 19th century, when it gradually took the place of the dangerous *Pariser*, or long French small-sword, for the semi-serious duels (*Mensuren*) of the students. There are two varieties of rapier, each having a thin flat blade about 33½ in. long and ¼ in. wide and truncated at the point, but distinguished by the shape of the handle. The bell-rapier (*Glockenrapier*), used only at the north German universities of Leipzig, Berlin, Halle, Breslau, Königsberg and Greifswald, is furnished with a guard consisting of a cup or bell of iron about 4½ in. in diameter and 2 in. deep, joined to the pommel by a steel shaft protecting the hand. Its total weight is about 1½ lb. The basket-rapier (*Korbapier*), used at all universities except those named above, has a handle protected by a sort of basket of heavy steel wire. Its total weight is 2 lb. The balance is just below the guard. The blade of the rapier is divided conventionally into the *forte*, the half next the hilt, and the *foible*. These are again divided into full and half forte and full and half foible, the half foible being the weakest quarter of the blade, nearest the point. Every bout, whether with sharp or blunt weapons, is preceded by the command *Auf die Mensur!* (on the mark, literally distance). The two fencers take position with feet apart and the right slightly in advance just far enough from one another to allow their heads to be reached by the sword without moving the feet, which remain firm during the entire bout. During the first half of the 19th century the objective points of the rapier included the upper arm and breast, but later the head, including the face, became

the sole target. In practice a heavy mask of wire with felt top, a glove with padded arm-piece (*Stulpe*) and a padded apron to protect body and legs are worn. There is one defensive position, which is with the arm stretched upward bringing the hand and hilt about 6 in. in front of and above the forehead, and the point of the rapier directed diagonally downward across the body and to the outside of the adversary's knees. The fencers having at the command *Bindet die Klingent!* (Join blades!) placed their hilts together with the points of the rapiers directed upwards, attack simultaneously at the command *Los!* (Go!), All blows are delivered from the wrist, slightly helped by the forearm, the hand never being dropped below the level of the eyes. No movement of the head or body is allowed except such as is unavoidably connected with that of the sword-arm.

C. Roux (Paris, 1885), a French exposition of the German student fencing. (E. B.)

**SABZAWAR**, a town of Afghanistan, situated at an elevation of 3550 ft. on the left bank of the river Harud, 93 m. S. of Herat. Sabzawar was once a city of considerable size, and still possesses a fortress with sides of about 200 or 250 yds. This fortress has been abandoned, and the town, which is the centre of a group of villages, is now fairly prosperous, with a bazaar of about 800 shops and a busy traffic with Seistan. The plains about Sabzawar are highly cultivated by the Nurzai Duranis, and each village boasts its own little mud fort.

**SABZEVAR**, a district of the province of Khorasan in Persia, formerly called Baihak. It is situated between Nishapur on the east and Shahrud-Bostam on the west, and has a length of about 80 m. and a breadth of 50; its population is about 60,000, and it pays to the government a yearly revenue of £8000. The district has many flourishing villages and much cultivation; it produces much wool, excellent cotton, some silk, partly exported to Russia, partly manufactured into various stuffs in the district, and fruits, exported dried in large quantities. The export trade is chiefly done by a few Russian Armenians who reside in Sabzevar town.

**SABZEVAR**, the capital of the district, is situated 150 m. E. of Shahrud and 65 m. W. of Nishapur, in 36° 12' N., 57° 39' E., at an elevation of 3100 ft. The population, which was 30,000 before the famine in 1871, is now about 15,000. There are some good caravanserais, a well-supplied bazaar, three colleges, two large and thirty small mosques, and post and telegraph offices.

**SACCHARIC ACID**,  $C_6H_{10}O_6$  or  $HO_2C[CH(OH)]_2CO_2H$ , in chemistry, a tetraoxydicarboxylic acid which exists in three stereoisomeric forms. The ordinary or dextro (*d*)-saccharic acid is formed in the oxidation of cane sugar, grape sugar, *d*-gluconic acid and many other carbohydrates with nitric acid. It forms a deliquescent mass. On standing, the syrupy acid gives the crystalline lactonic acid,  $C_6H_8O_7$ . Sodium amalgam reduces it to gluconic acid,  $C_6H_{12}O_7$ , or  $SOH[CH(OH)]_2CO_2H$ , whilst hydriodic acid reduces it to adipic acid,  $HO_2C(CH_2)_4CO_2H$ . Nitric acid oxidizes it to dextro-tartaric acid and oxalic acid. Laevo (*l*)-saccharic acid is formed by oxidizing *l*-gluconic acid with nitric acid, whilst the inactive (*d*-*l*)-acid is obtained similarly from inactive gluconic acid. These acids closely resemble the *d* acid except in their action on polarized light. For their relations

to the glucoses see SUGAR. Mucic acid (q.v.) is isomeric with these acids.

**SACCHARIN**, the name given to several distinct chemical substances. The saccharin of commerce, so named from its extensively sweet taste, is a coal-tar product, being the imide of ortho-sulphobenzonic acid,  $C_6H_4\langle\begin{smallmatrix} CO \\ SO \end{smallmatrix}\rangle NH$ . It may be prepared by the oxidation of ortho-toluenesulphonamide  $CH_3\cdot C_6H_4\cdot SO_2NH_2$ , with potassium permanganate (C. Fahlberg and I. Remsen, *Ber.*, 1879, 12, p. 469); by the electrolytic oxidation of the above sulphonamide (German patent 35211); by the action of concentrated sulphuric acid on ortho-sulphamidobenzonic acid,  $NH_2\cdot SO_2\cdot C_6H_4\cdot CO_2H$  (German patent 113720); by warming the chloride of ortho-sulphobenzonic acid phenyl ester ( $SO_2Cl\cdot C_6H_4\cdot CO_2C_6H_5$ ) with excess of aqueous ammonia (R. List and M. Stein, *Ber.*, 1898, 31, p. 1662); and from benzaldehyde ortho-sulphonic acid by conversion into its acid chloride, which with ammonia yields the corresponding acid-amide, which gives saccharin on oxidation with atmospheric oxygen (German patent 94948). It is a crystalline powder which melts at  $220^\circ C$ . with partial decomposition. It is soluble with difficulty in cold water, but is moderately soluble in hot water and readily soluble in alcohol. By the action of concentrated hydrochloric acid at  $150^\circ C$ . it is decomposed into ammonia and ortho-sulphobenzonic acid. With phosphorus pentachloride above  $200^\circ C$ . it yields ortho-chloronitrobenzene. Sodium saccharin,  $C_6H_4(CO)\cdot(SO_2)\cdot N\cdot Na$ ,  $2H_2O$ , is used under the name of "soluble saccharin" or "crystallose," and is readily soluble in hot water. The ammonium salt is named "sucramine." Saccharin is largely used for sweetening purposes, pure saccharin being 500 times sweeter than sugar. Until 1891 the commercial product contained about 40% of the tasteless para compound and was only 300 times as sweet as sugar; the mixture, however, is now separated by dissolving out the saccharin with xylene, in which solvent the para compound is insoluble. Saccharin is used as a sugar substitute for diabetic patients. It is interesting to note that o-sulphobenzonic acid has an acid taste, and the sulphamide is tasteless; the sweetness of saccharin therefore appears to be connected with the formation of a cyclic anhydride. In the United Kingdom there is an import duty of 1s. 3d. per oz. on saccharin and similar products, and manufacturers have to take out a licence. In the United States the import duty is \$1.50+10% *ad valorem* per lb. Austria-Hungary, France, Belgium and Germany prohibit the importation. On the estimation of saccharin in commercial samples and for its detection in foods and beverages see J. H. Kastle, *Jour. Chem. Soc.*, 1905, 87, p. 503; E. M'K. Chace, *Jour. Amer. Chem. Soc.*, 1904, 39, p. 1627.

The lactones of the saccharic acids are also known as "saccharins." By boiling dextrin or laevulose with milk of lime the so-called "saccharin," a lactone of the formula,

is obtained (E. Péligot, *Ber.*, 1880, 13, p. 196; H. Kiliani, *Ber.*, 1882, 15, p. 2954). It crystallizes in large prisms, has a bitter taste, and is easily soluble in hot water. Potassium permanganate oxidizes it to carbonic and acetic acids. Heating with caustic potash to  $200^\circ C$ . gives formic and lactic acids, and when reduced by hydriodic acid and phosphorus it is converted into  $\alpha$ -dimethylbutyrolactone. "Iso-saccharin" and "meta-saccharin" are formed by the action of lime on milk sugar (H. Kiliani, *Ber.*, 1885, 18, p. 631). The former melts at  $95^\circ C$ . and on reduction by hydriodic acid and phosphorus is converted into  $\alpha$ -dimethylvalerolactone. Meta-saccharin melts at  $141\text{--}142^\circ C$ . and is easily soluble in water.

**SACCHETTI**, FRANCO (c. 1335-c. 1400), Italian poet and novelist, was the son of Benci di Uguccone, surnamed "Buono," of the noble and ancient Florentine family of the Sacchetti (comp. Dante, *Par.* c. xvi.), and was born at Florence about the year 1335. While still a young man he achieved repute as a poet, and he appears to have travelled on affairs of more or less importance as far as to Genoa, Milan and "Ischiavonia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380 it appears that Franco was expressly exempted, "per esser tanto uomo buono," and in 1383 he was one of the "eight," discharging the office of "prior" for the months of March and April. In 1385

he was chosen ambassador to Genoa, but preferred to go as podestà to Bibbiena in Casentino. In 1392 he was podestà of San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow-citizens the post of captain of their then province of Romagna, having his residence at Portico. The date of his death is unknown; most probably it occurred about 1400, though some writers place it as late as 1410.

Sacchetti left a considerable number of *sonnetti*, *canzoni*, *ballate*, *madrigali*, &c., which have never been printed, but which are still extant in at least one MS. in the Laurentian library of Florence. His *Noelle* were first printed in 1724, from the MS. in the same collection, which, however, is far from complete. They were originally 300 in number, but only 258 in whole or in part now survive. They are written in pure and elegant Tuscan, and, based as they are for the most part on real incidents in the public and domestic life of Florence, they are valuable for the light they throw on the manners of that age, and occasionally also for the biographical facts preserved in them.

**SACCHI**, ANDREA (c. 1600-1661), Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter of undistinguished position, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil, and under Albani he made his reputation early. The painter of Sacchi's predilection was Raphael; he was the jealous opponent of Pietro da Cortona, and more especially of Bernini. In process of time he became one of the most learned designers and one of the soundest colourists of the Roman school. He went to Venice and to Parma to study Venetian colour and the style of Correggio; but he found the last-named master unadaptable for his own proper methods in art, and he returned to Rome. Sacchi was strong in artistic theory, and in practice slow and fastidious; it was his axiom that the merit of a painter consists in producing, not many middling pictures, but a few and perfect ones. His works have dignity, repose, elevated yet natural forms, severe but not the less pleasing colour, a learned treatment of architecture and perspective; he is thus a painter of the correct and laudable academic order, admired by connoisseurs rather than by ambitious students or the large public. His principal painting, often spoken of as the fourth best easel-picture in Rome—in the Vatican Gallery—is "St Romuald relating his Vision to Five Monks of his Order." The pictorial *crux* of dealing with these figures, who are all in the white garb of their order, has often been remarked upon; and as often the ingenuity and judgment of Sacchi have been praised in varying the tints of these habits according to the light and shade cast by a neighbouring tree. The Vatican Gallery contains also an early painting of the master—the "Miracle of St Gregory," executed in 1624; a mosaic of it was made in 1771 and placed in St Peter's. Other leading examples are the "Death of St Anna," in S. Carlo at Catania; "St Andrew," in the Quirinal; "St Joseph," at Capo alle Case; also, in fresco, a ceiling in the Palazzo Barberini—"Divine Wisdom"—reckoned superior in expression and selection to the rival work of Pietro da Cortona. There are likewise altarpieces in Perugia, Foligno and Camerino. Sacchi, who worked almost always in Rome, left few pictures visible in private galleries; one, of "St Bruno," is in Grosvenor House. He had a flourishing school: Nicholas Poussin and Carlo Maratta were his most eminent scholars; Luigi Garzi and Francesco Lauri were others, and Sacchi's own son Giuseppe, who died young, after giving very high hopes. This must have been an illegitimate son, for Andrea was unmarried when he died at Nettuno in 1661.

**SACCHINI**, ANTONIO MARIA GASPARE (1734-1786), Italian musical composer, was born at Pozzuoli, on the 23rd of July 1734. He was the son of a poor fisherman and was heard singing on the sands by Durante, who undertook his education at the Conservatorio di Sant' Onofrio at Naples. Durante and Piccini taught him composition, and Nicola Fiorenza the violin. The intermezzo *Fra Donato* was written for the theatre of the Conservatorio in 1756, but his first serious opera was produced at Rome in 1762, and was followed by many others, nearly all of which were successful. In 1769 he went to Venice, and in consequence of the great success achieved there by the

production of his opera *Alessandro nell' India* he was appointed director of the Conservatorio dell' Ospedaletto, where he trained some admirable female singers and wrote church music. In 1772 he visited London, where, notwithstanding a cruel cabal formed against him, he achieved a brilliant success, especially in his four new operas, *Tamerlano*, *Lucio Vero*, *Nilditi e Perseo* and *Il Gran Cid*. Later he met with an equally enthusiastic reception in Paris, where in 1783 his *Rinaldo* was produced under the immediate patronage of Queen Marie Antoinette, to whom he had been recommended by the emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. He seems everywhere to have been the victim of bitter jealousy. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; and by her command, given with the utmost reluctance, his last opera and undoubted masterpiece, *Ceclipe e Colone*, was set aside in 1786 to make room for Lemoine's *Phedre*—a circumstance which so preyed upon his mind that he died of chagrin on the 7th (or 8th) of October 1786.

Sacchini's style was rather graceful than elevated, and he was deficient both in creative power and originality. But the dramatic truth of his operas, more especially the later ones, is above all praise, and he never fails to write with the care and finish of a thorough and accomplished musician. *Ceclipe* was extremely successful after his death, and was performed at the Académie nearly six hundred times.

**SACERDOTALISM** (from Lat. *sacerdos*, priest, literally one who presents sacred offerings, *sacer*, sacred, and *dare*, to give), a term applied, usually in a hostile sense, to the system, method and spirit of a priestly order or class, under which the functions, dignity and influence of the members of the priesthood are exalted in the ministry of religion, and in the church at the expense of the laity. This exalting of the priesthood in the Christian church is based on the claim that the priest exercises sacrificial and supernatural powers in the celebration of the Eucharist.

**SACHEVERELL, HENRY** (1674-1724), English ecclesiastic and politician, was the son of Joshua Sacheverell, rector of St Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife, and was sent to Magdalen College, Oxford, in 1689, was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Addison, another Wiltshire lad, entered at the same college two years earlier, but was also elected a demy in 1689; he inscribed to Sacheverell in 1694 his account of the greatest English poets. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1695 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; but he leapt into notice when holding a preachingship at St Saviour's, Southwark. His famous sermons on the church in danger from the neglect of the Whig ministry to keep guard over its interests were preached, the one at Derby on the 15th of August, the other at St Paul's Cathedral on the 5th of November 1709. They were immediately reprinted, the latter being dedicated to the lord mayor and the former to the author's kinsman, George Sacheverell, high sheriff of Derby for the year; and, as the passions of the whole British population were at this period keenly exercised between the rival factions of Whig and Tory, the vehement invectives of this furious divine on behalf of an ecclesiastical institution which supplied the bulk of the adherents of the Tories made him their idol. The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting this zealous parson. Somers was against such a measure; but Godolphin, who was believed to be personally alluded to in one of these harangues under the nickname of "Volpone," urged the necessity of a prosecution, and gained the day. The trial lasted from 27th February to 23rd March 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. This was the decree of the state, and it had the effect of making him a martyr in the eyes of the populace and of bringing about the downfall of the ministry. Immediately on the expiration of his sentence (13th April 1713) he was instituted to the valuable

rectory of St Andrew's, Holborn, by the new Tory ministry, who despised the author of the sermons, although they dreaded his influence over the mob. He died at the Grove, Highgate, on the 5th of June 1724.

See Hearne's *Diaries*, Bloxam's *Register of Magdalen* and Hill Burton's *Queen Anne*, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

**SACHEVERELL, WILLIAM** (1638-1691), English statesman, son of Henry Sacheverell, a country gentleman, was born in 1638. His family had held a good position in Derbyshire and Nottinghamshire since the 12th century, the name appearing as Sent Cheveroll in the roll of Battle Abbey, and William inherited large estates from his father. He was admitted at Gray's Inn in 1667, and in 1670 he was elected member of parliament for Derbyshire. He immediately gained a prominent position in the party hostile to the Court, and before he had been six months in the House of Commons he proposed a resolution that all "popish recusants" should be removed from military commands; the motion, enlarged so as to include civil employment, was carried without a division on the 28th of February 1672-1673. This resolution was the forerunner of the Test Act, in the preparation of which Sacheverell took an active part, and which caused the break up of the cabal. He now took part in nearly every debate in the House of Commons, being recognized as one of the most able of the leaders of the opposition or country party. He strongly opposed the king's policy of alliance with France, advocating a league with the Dutch instead, and the refusal of supplies until the demands of the Commons should be complied with. Sacheverell took especial interest in the state of the navy and spoke in many debates on this question. In 1677 he carried an address to the king calling upon him to conclude an alliance with the United Provinces against Louis XIV., and when the Speaker adjourned the House by Charles's order Sacheverell made an eloquent protest, asserting the right of the House itself to decide the question of its adjournment. When parliament met early in 1678 assurances were received from Charles II. that he had arranged the treaties demanded by the Commons; but Sacheverell boldly questioned the king's good faith, and warned the Commons that they were being deceived. When the secret treaty with France became known, thus confirming Sacheverell's insight, the latter called for the disbandment of the forces and advocated the refusal of further supplies for military purposes; and in June 1678 he resolutely opposed Lord Danby's proposal to grant £300,000 per annum to Charles II. for life. Barillon mentions Sacheverell among the Whig leaders who accepted bribes from Louis XIV., but the evidence against him is not conclusive.

When Titus Oates began his pretended revelations in 1678 Sacheverell was among those who most firmly believed in the existence of a Popish plot. He was one of the most active investigators of the affair, and one of the managers of the impeachment of the five Catholic peers. He also acted for a time as chairman of the secret committee of the Commons, and drew up the report on the examination of the Jesuit Coleman, secretary to the duchess of York. He was a member of the committee for drafting the articles of impeachment against Danby in 1678, and was appointed one of the managers of the Commons; and in 1679, when the impeachment, interrupted by the dissolution of parliament, was resumed in the new parliament, he spoke strongly against the validity of Danby's plea of pardon by the king. The allegations made in Sacheverell's report on the examination of Coleman prompted the country party to demand the exclusion of James, duke of York, from the succession to the throne, the first suggestion of the famous Exclusion Bill being made by Sacheverell on the 4th of November 1678 in a debate—"the greatest that ever was in Parliament," as it was pronounced by contemporaries—raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass. When Charles offered an alternative scheme (1679) for limiting the powers of a Catholic sovereign, Sacheverell made a great speech in which he pointed out the

insufficiency of the king's terms for securing the object desired by the Whigs. In the conflict between the Petitioners and the Abhorers he supported the former, and on the 27th of October 1680 brought forward a motion asserting the right of petitioning the king to summon parliament, and proposed the impeachment of Chief Justice North as the author of the proclamation against tumultuous petitioning. Sacheverell was one of the managers on behalf of the Commons at the trial of Lord Stafford in Westminster Hall; but took no further part in public affairs till after the elections of March 1681, when he was returned unopposed for Derbyshire. He was prosecuted for riot in connexion with the surrender of the charter of Nottingham in 1682, being tried before Chief Justice Jeffreys, who fined him 500 marks.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, and for the next four years he lived in retirement on his estates. In the convention parliament summoned by the prince of Orange, in which he sat for Heytesbury, he spoke in favour of a radical resettlement of the constitution, and served on a committee, of which Somers was chairman, for drawing up a new constitution in the form of the Declaration of Right; and he was one of the representatives of the Commons in their conference with the peers on the question of declaring the throne vacant. William III. appointed Sacheverell a lord of the admiralty, but he resigned the office after a few months. He procured the omission of Lord Jeffreys's name from the Act of Indemnity. In 1690 he moved a famous amendment to the Corporation Bill, proposing the addition of a clause—the purport of which was misrepresented by Macaulay—for disqualifying for office for seven years municipal functionaries who in defiance of the majority of their colleagues had surrendered their charters to the Crown. A celebrated debate on this question took place in the House of Commons in January 1690; but the evident intention of the Whigs to perpetuate their own ascendancy by tampering with the franchise contributed largely to the Tory reaction which resulted in the defeat of the Whigs in the elections of that year. Sacheverell was elected member for Nottinghamshire; but he died on the 9th of October 1691, before taking his seat. In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney." Though his fame has become dimmed in comparison with that of Shaftesbury, Russell and Sidney, he was not less conspicuous in the parliamentary proceedings of Charles II.'s reign, and he left a more permanent mark than any of them on the constitutional changes of the period.

Sacheverell was twice married. His first wife was Mary, daughter of William Staunton of Staunton; and his second was Jane, daughter of Sir John Newton. His eldest son Robert represented the borough of Nottingham in six parliaments and died in 1714. The family became extinct in 1724.

**BIBLIOGRAPHY.**—Many of Sacheverell's speeches are reported in Anchitell Grey's *Debates of the House of Commons, 1667-1694* (10 vols., London, 1766). **SACHS, HANS** (1404-1576), German poet and dramatist, was born at Nuremberg on the 5th of November 1404. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg, which left behind it a lasting interest in the stories of antiquity. In the spring of 1500 he began his apprenticeship, and was at the same time initiated into the art of the Meistersingers by a weaver, Leonhard Nunnenpeck. In 1511 he set out on his *Wanderjahre*, and worked

at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Osnabrück, Lübeck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handiwork and devoting his leisure time to literature. In 1517 he became master of his gild and in 1519 married. The great event of his intellectual life was the coming of the Reformation; he became an ardent adherent of Luther, and in 1523 wrote in Luther's honour the poem beginning *Die wüthenbergisch Nachtigall, Die man jetzt hört überall*, and four remarkable dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. In spite of this, his advocacy of the new faith brought upon him a reproof from the town council of Nuremberg, and he was forbidden to publish any more *Büchlein oder Reimen*. It was not long, however, before the council itself openly threw in its lot with the Reformation. After the death of Hans Sachs's first wife in 1560 he married again. His death took place on the 10th of January 1576.

Hans Sachs was an extraordinarily fertile poet. By the year 1567 he had composed, according to his own account, 4275 *Meisterlieder*, 1700 tales and fables in verse, and 208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The *Meisterlieder* were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the *Spruchgedichte*, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a varying number of acts; of the essentials of dramatic construction or the nature of dramatic action Sachs has little idea. The subjects are drawn from the most varied sources, the Bible, the classics and the Italian novelists being especially laid under contribution. He succeeds best in the short anecdotal *Fastnachtsspiel* or Shrovetide play, where characterization and humorous situation are of more importance than dramatic form or construction. Farces like *Der fahrende Schüler im Paradies* (1550), *Das Wildbad* (1550), *Das heisse Eisen* (1551), *Der Bauer im Fegfeuer* (1552) are inimitable in their way, and have even been played with success on the modern stage.

Hans Sachs himself made a beginning to an edition of his collected writings by publishing three large folio volumes (1558-1561); after his death two other volumes appeared (1578, 1579). A critical edition has been published by the Stuttgart *Literarischer Verein*, edited by A. von Keller and E. Goetze (23 vols., 1870-1896); *Seitliche Fastnachtsspiele*, ed. by E. Goetze (7 vols., 1880-1887); *Seitliche Fabeln und Schwänke*, by the same (3 vols., 1893). There are also editions of selected writings by J. Tittmann (3 vols., 1870-1871; new ed., 1883-1885) and B. Arnold (2 vols., 1885). See E. K. J. Lützelberger, *Hans Sachs* (1876); C. Schweitzer, *Étude sur la vie et les œuvres de Hans Sachs* (1887); K. Drescher, *Hans Sachs-Studien* (1890, 1891); E. Goetze, *Hans Sachs* (1891); A. L. Stiel, *Hans Sachs-Forschungen* (1894); R. Gené, *Hans Sachs und seine Zeit* (1894; and ed., 1902); E. Geiger, *Hans Sachs als Dichter in seinen Fastnachtsspielen* (1904).

**SACHS, JULIUS VON** (1832-1897), German botanist, was born at Breslau on the 2nd of October 1832. At an early age he showed a taste for natural history, and on leaving school he became, in 1851, private assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and then adopted a botanical career, establishing himself as *Privatdozent* for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he was called to be director of the Polytechnic at Chemnitz, but was almost immediately transferred to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1867, when he was nominated professor of botany in the university of Freiburg-im-Breisgau. In 1868 he accepted the chair of botany in the university of Würzburg, which he continued to occupy (in spite of calls to all the important German universities) until his death on the 29th of May 1897.

Sachs achieved distinction as an investigator, a writer and a teacher; his name will ever be especially associated with its great development of plant physiology which marked the latter half of the 19th century, though there is scarcely a branch of

botany to which he did not materially contribute. His earlier papers, scattered through the volumes of botanical journals and of the publications of learned societies (a collected edition was published in 1892-93), are of great and varied interest. Prominent among them is the series of "Keimungsgeschichten," which laid the foundation of our knowledge of microchemical methods, as also of the morphological and physiological details of germination. Then there is his resuscitation of the method of "water-culture," and the application of it to the investigation of the problems of nutrition; and further, his discovery that the starch-grains to be found in chloroplasts are the first visible product of their assimilatory activity. His later papers were almost exclusively published in the three volumes of the *Arbeiten des botanischen Instituts in Würzburg* (1871-88). Among these are his investigation of the periodicity of growth in length, in connexion with which he devised the self-registering auxanometer, by which he established the retarding influence of the highly refrangible rays of the spectrum on the rate of growth; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and the arrangement of cells in growing-points; the elaborate experimental evidence upon which he based his "imbibition-theory" of the transpiration-current; his exhaustive study of the assimilatory activity of the green leaf; and other papers of interest. Sachs' first published volume was the *Handbuch der Experimentalphysiologie der Pflanzen* (1865; French edition, 1868), which gives an admirable account of the state of knowledge in certain departments of the subject, and includes a great deal of original information. This was followed in 1868 by the first edition of his famous *Lehrbuch der Botanik*, by far the best book of its kind. It is a comprehensive work, giving an able summary of the botanical science of the period, enriched with the results of many original investigations. The fourth and last German edition was published in 1874, and two English editions were issued by the Oxford Press in 1875 and 1882 respectively. The *Lehrbuch* was eventually superseded by the *Vorlesungen über Pflanzenphysiologie* (1st ed., 1882; 2nd ed., 1887; Eng. ed., Oxford, 1887), a work more limited in scope, but yet covering more ground than its title would imply; though it is a remarkable book, it has not gained the general recognition accorded to the *Lehrbuch*. Finally, there is the *Geschichte der Botanik* (1875), a brilliant and learned account of the development of the various branches of botanical science from the middle of the 16th century up to 1860, of which an English edition was published in 1890 by the Oxford Press. As a teacher Sachs exerted great influence, for his vigorous personality and his ready and lucid utterance enabled him not only to instruct, but to fire his students with something of his own enthusiasm.

A full account of Sachs' life and work was given by Professor Goebel, formerly his assistant, in *Flora* (1897), of which an English translation appeared in *Science Progress* for 1898. There is also an obituary notice of him in the *Proc. Roy. Soc.* vol. lxxi. (S. H. V\*.)

**SACHS, MICHAEL** (1808-1864), German Rabbi. He was one of the first of Jewish graduates of the modern universities, taking his Ph.D. degree in 1836. He was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took the conservative side against the Reform agitation, and so strongly opposed the introduction of the organ into the Synagogue that he retired from the Rabbinate rather than acquiesce. Sachs was one of the greatest preachers of his age, and published two volumes of Sermons (*Predigten*, 1866-1891). He co-operated with Zuntz (q.v.) in a new translation of the Bible. Sachs is best remembered for his work on Hebrew poetry, *Religiöse Poesie der Juden in Spanien* (1845); his more ambitious critical work (*Beiträge zur Sprach- und Alterthumsforschung*, 2 vols., 1852-1854) is of less lasting value. His poetical gifts he turned to admirable account in his translation of the Festival Prayers (*Maškor*, 9 vols., 1855), a new feature of which was the metrical rendering of the medieval Hebrew hymns. Another very popular work by Sachs contains poetical paraphrases of Rabbinic legends (*Stimmen vom Jordan und Euphrat*, 1853).

**SACK**, a large bag made of a coarse material such as is described under SACKING below. The word occurs with very little variation in all European languages, cf. Gr. *σάκος*, Lat. *saccus*, Fr. *sac*, Span. *saco*, Du. *sak*, &c. All are borrowed from the Hebrew *sag*, properly a coarse stuff made of hair, hence a bag made of this material. Most etymologists attribute the widespread occurrence of the word to the story of Joseph and his brethren in Gen. xlii. The Hebrew word itself is probably Egyptian, as is evidenced by the Coptic *sok*. Apart from its ordinary meaning, the word is used as a unit of dry measure, which has varied considerably at different times and places and for different goods; it is the customary British measure for coals, potatoes, apples and some other goods, and is equivalent to three bushels. From the end of the 17th to the middle of the 18th century the sack or "sacque" was a fashionable type of gown for women, having a long flowing loose back—hanging in pleats from the neck. It is still used as a tailor's or dressmaker's term for a loose straight-back coat. The Fr. *sac* meant also pillage, plunder, whence *saccager*, to plunder a town, especially after it had been taken by assault or after a siege. There is no doubt that it is an extension of "sack," a bag, with a reference to the most obvious receptacle for booty. The slang expression "to give the sack," "to get the sack," of a person who has been turned out of a situation or been given notice to leave is an old French proverbial expression. Cotgrave gives *On luy a donné sa sac et ses quilles*, "he hath his passport given him, he is turned out to grazing, said of a servant whom his master hath put away." The *New English Dictionary* finds the expression also in 15th-century Dutch.

It remains to distinguish the name, familiar from English literature of the 16th and 17th centuries, of a Spanish wine, which was of a strong, rough, dry kind (in Fr. *vin sac*, whence the name), and therefore usually sweetened and mixed with spice and mulled or "burnt." It became a common name for all the stronger white wines of the South.

**SACKBUT, SHAKBUSSE, SAGBUT, DRAW OR DRAWING TRUMPET** (Scotland, *draucht trumpet*) or FLAT TRUMPET (Fr. *saquebute, saqueboute, cacbouc, trompette harmonique*; Ger. *Posaune, Busaun, Pusin, Zug-Trommel*; Ital. *tromba da tirarsi or tromba spessata*; Span. *sacabuche*; Dutch *basuin Schuiftrompetje*), the earliest form of slide trumpet, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been fully realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. It is not known exactly in what country the principle of the slide was first discovered and applied to musical instruments; if it be not an Oriental device, then the credit is probably due to the Netherlands or to South Germany before or during the 13th century.

The early history of the sackbut is among the most interesting of all instruments. Various attempts have been made to fix the etymology of the word as derived from Span. *sacabuche* through French. The Rev. F. W. Galpin<sup>1</sup> suggests a derivation from *sacar*, to draw out, and *buche*, identical with *bucca* (Lat. *buxus*), used in the sense of a tube or pipe originally of boxwood. To accept this etymology would be to lose sight of the fact that all the technical names applied to the sackbut in various languages directly acknowledge its descent from the buccina (q.v.), with the exception of Italian, in which the recognition is indirectly made through the synonym *tromba*. A clue to the etymology of *sacabuche* is afforded by the well-known fact that not only did the Arabs after the conquest introduce oriental musical instruments by way of Spain to western Europe, but the Arabic names also clung to the instruments in many cases. The Arabs had a military trumpet they called *Buk* or *Baque*, a word they had borrowed from the Christians,<sup>2</sup> and it is mentioned in a musical treatise of the 14th century (Escorial MS. 69) among the musical instruments then in use in Spain. It has been claimed on philological grounds that England derived her knowledge of the sackbut from France, but the oldest known form of the word in English is *shakbusse*, which occurs in the accounts of Henry VII.

<sup>1</sup> "The Sackbut, its Evolution and History," in *Proc. Mus. Assoc. London* (1906-1907).

<sup>2</sup> See Edw. W. Lane, *Arabic-English Lexicon* (London, 1863), bk. i. pt. i. p. 276.

for the 3rd of May 1495,<sup>1</sup> and is obviously of Spanish origin. Sackbut appears early in the 16th century.

The word *sacabuche* was at some time applied in Spain to the ship's pump; and the questions naturally arise, Which came first, and Was the musical instrument named after the pump from the great resemblance in their respective actions as well as in outward form? It is certainly significant that the Ital. *tromba*, from which sprang "trumpet" and "trombone," means a pump as well as a trumpet and the trunk of an elephant. Even if it could be proved beyond doubt that the slide had been applied to the trumpet before the word *tromba* was used for it, there would still remain several difficulties to be disposed of. (1) The word *tromba*, *trombus*, *trompe*, already general in the romances of the 12th and 13th centuries, was at first applied to the tubas and curved horns, probably from the similar curve of the elephant's trunk. (2) If *tromba* referred to the pump, it must have been applied to the slide trumpet, and *tromba da tirarsi* for "sackbut" is senseless tautology. (3) The etymology given above from *buk* or *buque*, trumpet, supported by similarly compounded words in English, Scotch, Dutch, Italian, would have to be regarded as a strange but not unparalleled philological coincidence. The earliest instance yet discovered of the use of *sacabuche* as a musical instrument seems to be in the 14th century.<sup>2</sup>

The transformation of the busine (*buccina*) into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages. It was applied first to the straight busine made in three or four sections having rings or knobs at the joints. The sliding portions or joints here doubtless served much as in our modern wood wind instruments for tuning purposes or for changing the key. The long slide, added for the purpose of obtaining a diatonic compass, denoted a further step in the evolution. When applied to the straight busine it differed materially from the slide of the sackbut or trombone, for the normal position of the instrument was with the slide fully drawn out, so that the knobs were equidistant; on the slide being gradually closed the pitch was proportionally raised in order to fill in the gaps of the first fifth by new fundamentals, upon each of which the harmonic series would be obtainable. An example of this early use of the slide is to be found in a miniature from a psalterium executed in the south of France during the 13th century, now preserved in the library of the university of Munich (MS. 24, 4to fol. 96b). Here (fig. 1) the performer is represented

FIG. 1.

The folding of the busine marks the advent of the new double slide, like a U, made to draw out and lower the pitch. This radical change did not come all at once, the intermediate step being the folding of the busine, with the old single slide, the whole S being drawn up and down, as the slide closed and opened again. This interesting development is shown (fig. 2) in a miniature by Taddeo Crivelli in the Borso Bible<sup>3</sup> (1450-1471). The two upper joints defined by rings are clearly drawn of larger calibre than the lower folded portion, which has been drawn out to what would approximately correspond to the third position on the trombone lowering the pitch one tone. A single slide would require to be extended about twice the distance of the double or folded tube on the trombone to produce any given effect. This drawing of the sackbut must not be taken as showing the instrument in use in Crivelli's day; it is clearly retrospective, for sackbuts in a more advanced stage are not uncommon in works of art of the same century. In a MS.<sup>4</sup> preserved in the library of the Arsenal in Paris, executed for the dukes of Burgundy in the middle of the 15th century, is seen a trumpet of

the cavalry type with a single straight slide drawn out so far that the bell rests on the performer's foot (fig. 3).

The last transition immediately preceding the change into the trombone consisted in folding the tube to form two U-shaped

FIG. 2.

FIG. 3.

bends, one of which pointed downwards and the other over the shoulder, reaching to the level of the back of the head; the third branch was bent over between the other two, but in a plane almost at right angles above them, the bell extending downwards beyond the first bend. Sackbuts of this type are to be seen in Dürer's picture in the Nuremberg town hall, and in others by artists of the 15th century, as, for instance, in Gentile Bellini's *Processione in piazza S. Marco* among the band to the right of the picture.

The further history and development of the sackbut are given under TROMBONE. See also TRUMPET and BUCCINA. (K. S.)

**SACKETT'S HARBOR**, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River Bay, about 1 m. from its mouth, and about 10 m. W. by S. of Watertown. Pop. (1890) 787; (1900) 1266; (1905) 903; (1910) 868. Sackett's Harbor is served by the New York Central & Hudson River railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about  $\frac{1}{2}$  m. nearly due eastward from the mainland. About 1 m. to the W. by S. is Horse Island, approximately  $\frac{1}{2}$  m. long (east and west), and nearly as broad, only a few feet above the lake level and separated from the mainland by a narrow strait, always fordable, and sometimes almost dry; at its eastern end is Sackett's Harbor Lighthouse. The harbour is deep enough for the largest lake vessels. The village is a summer resort. At Sackett's Harbor are Madison Barracks, a United States military post, established in 1813 and including a reservation of 90 acres; and a United States Naval Station. In the post cemetery is the grave of General Zebulon M. Pike, who was killed at York (now Toronto) on the 27th of April 1813.

The first settlement was made in 1801 by Augustus Sackett, and the village was incorporated in 1821. In the War of 1812 Sackett's Harbor was an important strategic point for the Americans, who had here a naval station, Fort Tompkins, at the base of Navy Point, and Fort Volunteer, on the eastern side of the harbour. In July 1812 a British squadron unsuccessfully attempted to capture a brig and schooner in the harbour. From Sackett's Harbor American expeditions against York (now Toronto) and Fort George respectively set out in April and May 1813; though scantily garrisoned it was successfully defended by General Jacob Brown (who had just taken command) against an attack, on the 29th of May, of Sir George Prevost with a squadron under Sir James Lucas Yeo. The British losses were 259; the American 157, including Lieut.-Colonel Electus Backus, commander of the garrison before General Brown's arrival. Almost all the American stores at the naval station were destroyed to save them from the enemy. The blockade of the harbour by Yeo was abandoned in June 1814 after the defeat of a force from the squadron sent out to capture guns which were being brought from Oswego to Sackett's Harbor to equip the "Superior," an American vessel launched on the 1st of May, and a smaller vessel nearly completed. Sackett's Harbor was the starting-point of a force of 700 men under a Pole named von Schultz, who in November 1838, during the uprising in Upper Canada (Ontario) attempted to invade Canada, was taken prisoner near Prescott, was tried at Kingston, being defended by Sir John Macdonald, and with nine of his followers was executed in Kingston in December.

See A. T. Mahan, *Sea-Power in its Relation to the War of 1812* (2 vols., Boston, 1905); and William Kingsford, *The History of Canada*, vol. viii. (Toronto, 1895).

**SACKING AND SACK MANUFACTURE.** Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cops and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp sacking.

All three-leaf twill sackings are double in the warp, but four-leaf sackings are single. They are usually 27 in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is reproduced in the cloth by two warp threads. The weft is single, but each one is usually about four times the weight of the warp for the same length (about 8 lb warp and 32 lb weft). Large quantities of cotton sacks are made for flour, sugar and similar produce: these sacks are usually plain cloth, some woven circular in the loom, others made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave, *i.e.* the cloth, although circular except at the end, is perfectly plain on both sides. Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the cloth for these kinds, and in most cases for all other types, in the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first cut up into definite lengths by special machinery, which may be perfectly automatic, or semi-automatic—usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines of the Lating or Union make (of which there are seven or eight different kinds for different types of bags), and the ends hemmed. It will thus be seen that the length required is twice the length of the sack plus the amount for hemming the mouth.

The sack is now ready for delivery, unless the name of the owner, some trade mark, or other particulars are required to appear on it. These particulars are printed on in one or more colours by the Kinmond and Kidd patent multicolour sack-printing machine.

The chief centres for these goods are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city. (T. Wo.)

**SACKVILLE, GEORGE, 1ST VISCOUNT (1716–1785)**, generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on the 26th of January 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in the 7th Cathcart's Horse (now 6th Dragoon Guards) in 1737, and three years later was transferred to Bragg's regiment of foot (Gloucestershire Regiment) as lieutenant-colonel; immediately afterwards the regiment sailed for active service on the Rhine, and although it was not present at the battle of Dettingen, its lieutenant-colonel was made brevet colonel and aide-de-camp to the king. It was not until two years later that Sackville took part in his first battle, Fontenoy. Wounded in the charge of

Cumberland's infantry column, he was taken to the tent of King Louis XV. to have his wound dressed. Released, by what means does not appear, he was sent home to serve against the Pretender in Scotland. He was given the colonelcy of the 20th (Lancashire Fusiliers), but was too late to take part in the battle of Culloden. In 1747–1748 he was again with the duke of Cumberland in the Low Countries, and in 1749 was transferred to the cavalry, receiving the colonelcy of the 7th (3rd) Irish Horse (Carabiniers). With this office he combined those of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and a seat in each of the two Houses of Commons at Westminster and Dublin, winning at the same time the repute of being "the gayest man in Ireland except his father." In 1755 he was promoted major-general, took an English command, and vacated his Irish offices. In 1757 he was made lieutenant-general of the ordnance, and transferred to a fourth colonelcy. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Cancale Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. But no sooner had he taken over the command than his haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. Popular indignation was unbounded, and Sackville was dismissed from his offices. But his courage, though impugned, was sufficient to make him press for a court-martial, and a court at last assembled in 1760. This pronounced him guilty of disobedience, and adjudged him "unfit to serve his Majesty in any military capacity whatsoever." The sentence was executed with gratuitous harshness. It was read out on parade to every regiment in the service, with a homily attached, and placed on record in every regimental order book. Further, it was announced in the Gazette that his Majesty had expunged Sackville's name from the roll of the Privy Council. This, and Sackville's own dogged perseverance, turned the scale in his favour. No reverses to the British arms occurred to keep alive the memory of his lost opportunity, and in 1763 his name was restored to the list of the Privy Council. Hitherto without party ties in parliament, in 1766 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In the same year his coolness and courage in a duel with Captain George Johnstone, M.P., assisted to rehabilitate him, and in 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet. Thus, though still standing condemned as unfit for any military employment, he exercised a powerful and unfortunate influence on the military affairs of the nation. Some of the business of the war department in those days fell to the colonial office, and Germain was practically the director of the war for the suppression of the revolt in the American colonies. What hopes of success there were in such a struggle Germain and the North cabinet dissipated by their misunderstanding of the situation and their friction with the generals and the army in the theatre of war. But this failure was not on the same footing as that of Minden, and in spite of virulent party attacks, King George III., on the resignation of the North ministry, offered him a peerage. Sackville, in characteristic fashion, stipulated for a viscountcy, as otherwise he would be junior to his secretary, his lawyer and to Amherst, who had been page to his father. There was some opposition to his taking his seat in the House of Lords. But his health was failing and he withdrew from politics, spending his last years as a benevolent and autocratic country magnate. He died at

Stoneland Lodge (Buckhurst Park), Sussex, on the 26th of August 1785.

**SACKVILLE, MORTIMER SACKVILLE-WEST, 1ST BARON** (1820-1888), was descended from Sir Richard Sackville, a Kentish gentleman, and a cousin of Ann Boleyn. A member of parliament and courtier under Henry VIII., Richard Sackville became chancellor of the court of augmentations in 1548 and was knighted in 1549. He amassed a great deal of wealth, and Sir Robert Naunton said his name should be "fill-sack," rather than "Sack-ville." He was on friendly terms with Roger Ascham, whom he advised to write his *Scholemaster*. In 1604 his son Thomas was created earl of Dorset, and from him the earls and dukes of Dorset (q.v.) of the Sackville family were descended.

Mortimer Sackville-West was a younger son of George John Sackville-West, 5th Earl de la Warr (See DE LA WARR): his mother, Elizabeth, Baroness Buckhurst, being a daughter of John Frederick Sackville, 3rd duke of Dorset. When in 1873 his elder brother, Reginald Windsor, became 7th Earl de la Warr, Mortimer succeeded by arrangement to the extensive estates of the Sackvilles, including Knole Park, their beautiful Kentish residence, which had come to his family through his mother. In 1876 he was created Baron Sackville of Knole, and died on the 1st of October 1888.

His brother, **LIONEL SACKVILLE-WEST** (1827-1908), succeeded as 2nd baron. He had a long career in the diplomatic service. From 1874 to 1878 he was ambassador to the Argentine Republic; from 1878 to 1881 he represented his country at Madrid, and from 1881 to 1888 at Washington. His retirement was due to an unfortunate interference in American domestic politics, or what was taken as such, which caused some stir. He died in September 1908 and was succeeded by his nephew Lionel Edward (b. 1867) as 3rd baron. By a Spanish dancer, Josefa Duran de Ortega, known also as Pepita de Oliva, Mr Sackville-West, as the 2nd baron then was, had several children, and soon after his death one of these, calling himself Ernest Henri Jean Baptiste Sackville-West, claimed to be a lawful son and his father's heir. He asserted that between 1865 and 1867 Sackville-West had married his mother. The case came before the English courts of law in 1909-1910, and it was decided that the children of this union were all illegitimate, as Pepita's husband, Jean Antonio Gabriel de Oliva, was alive during the whole period of his wife's connexion with Sackville-West.

**SACO**, a city of York county, Maine, U.S.A., on the Saco river, and the Atlantic Ocean, opposite Biddeford, with which it is connected by bridges, and 14 m. S.W. of Portland. Pop. (1890), 6075; (1900) 6122 (903 foreign-born); (1910) 6583. It is served by the Boston & Maine railway, and is connected with Portland by an electric line. The actual municipal limits include an area of about 40 sq. m., but much of this is sparsely settled, and the centre of settlement, or city proper, is about 5 m. above the mouth of the Saco. The city has a public park (Pepperell Park) of 30 acres, the Dyer Library (1790), containing in 1908 16,000 volumes, and York Institute (established in 1866 and incorporated in 1867), with a library of 5000 volumes in 1908; and is the seat of Thornton Academy (co-educational), incorporated in 1811, opened in 1813, but closed during 1848-1889 after the burning of the old building. Old Orchard Beach, in the vicinity, extending along the shore front of the township of Old Orchard (pop. in 1900, 964) and part of the shore fronts of Saco and Scarborough, is a popular summer resort; in August 1907 nearly all the hotels were burnt, but others have since been built. At Saco the river falls about 55 ft. and provides excellent water-power. The city's principal manufactures are cotton goods and cotton-mill machinery. Saco was settled as early as 1631, and was the seat of the Gorges government from 1636 to 1653, when it passed under the jurisdiction of Massachusetts. Until 1762 Saco and Biddeford formed one town or plantation—until 1718 under the name of Saco, and from 1718 to 1762 under the name of Biddeford. In 1716 Sir William Pepperell acquired title to the principal part of what is now Saco, in 1752 this was made a separate parish, and ten years later

it was incorporated as a separate township under the name of Pepperellboro. In 1779 the Pepperell property was confiscated as that of a loyalist, and in 1805 the name of the township was changed to Saco. In 1867 Saco was chartered as a city.

**SACRAMENT**, in religion, a property or rite defined in the Anglican catechism as "an outward and visible sign of an inward and spiritual grace"; if the grace be allowed to be inherent in the external symbolic thing or act as well as in the faithful who receive or do it, this definition holds good not only for the Latin Church, but for more primitive religions as well. In the Greek Church the equivalent word is *μυστήριον*, a mystery, a usage which is explained below.

The Latin word *sacramentum* originally meant any bodily or sensible thing, or an action, or a form of words solemnly endowed with a meaning and purpose which in itself it has not. Thus the money deposited by each of two litigants in a sacred precinct or with a priest, was called a sacrament. The winner of the suit got back his deposit, but the loser forfeited his to the god or to the winning party. In Livy it signifies the oath (q.v.) which soldiers took among themselves not to run away or desert. Pliny uses it similarly of the oath by which the Christians of Bithynia bound themselves at their solemn meetings not to commit any act of wickedness. Tertullian (c. 160-240) uses it in both senses, of an oath, as in the passage of his treatise *Adversus Spectacles*, where he says that no Christian "passes over to the enemy's camp without throwing away his arms, without abandoning the standards and sacraments of his chief." In the treatise *To the Nations*, i. 16, he speaks of "the sacraments of our religion," intending, it would appear, the love-feast and Eucharist. So in the *Apology*, ch. vii., he speaks of "the sacrament of infanticide and of the eating of a murdered child and of incest following the banquet," the crimes of which the Christians were commonly accused. In the work *Against Marcion*, iv. 34, he speaks of the sacrament of baptism and Eucharist. In the work against the Jews, ch. xi., he speaks of the letter *Tau* set in ink on the foreheads of the men of Jerusalem (Ezek. ix. 4), as "the sacrament of the sign," i.e. of the cross; and in chap. xiii. of the same work he dwells on the sacrament of the wood prefigured in 2 Kings vi. 6. The stick with which Elisha made the iron to swim in that passage, and the wood which Isaac carried up the mountain for his own pyre "were sacraments reserved for fulfilment in the time of Christ." In other words they were types, things which had a prophetic significance. In the same work, chap. x., he speaks of "the Sacrament of the Passion foreshadowed in prophecies." In his work *On the Soul*, chap. xviii., the aeons and genealogies of the Gnostics are "the sacraments of heretical ideas." In the work *About the Crown*, chap. iii., he describes how the faithful "take the sacrament of the Eucharist also in their meetings held before dawn." Elsewhere he speaks of "the sacraments of water, oil, bread." In the work *Against Valentinians*, chap. xxxix., he speaks of the "great sacrament of the name," here rendering the Greek word *μυστήριον*, mystery. In the tract *On Monogamy*, chap. xi., he speaks of "the sacrament of monogamy." Elsewhere he talks of the "sacrament of faith," and "of the Resurrection," and "of human salvation," and "of the Pascha," and "of unction," and "of the body of Christ." Later Latin fathers use the word with similar vagueness, e.g. Augustine speaks of the salt administered to catechumens before baptism and of their exorcism as sacraments; and as late as 1129 Godfried so calls the salt and water, oil and chrism, the ring and pastoral staff used in ordinations. But by this time the tendency was in the West to restrict the sense of the word. Thus Isidore Hispalensis, c. 630, in his book of *Origins*, vi. 19, recognized as sacraments baptism and the chrism, and the Body and Blood, and he writes thus: "Under the screen of corporeal objects a divine virtue of the sacraments in question secretly brings about salvation; wherefore they are called sacraments from their secret or sacred virtues." Bernard (*In coen. Dom.* § 4, op. ii. 88) calls the rite of washing feet a sacrament, because without it we have no portion with Christ (John xiii. 8), and therefore it is necessary to salvation. Hugo de St Victor, c. 1120, in his work *On the*

*Sacraments*, distinguishes six, but of different grades of importance. The two principal ones necessary to salvation are baptism and the Eucharist; then come the water of aspersion and the wearing of cinders, and so forth; these advance a man in sanctity. Lastly come those needful to the hallowing and instituting of other sacraments, those which concern the conferring of orders or of monkish habit. In his *Summa* he declares that as there are seven chief sins, either original or of act, so there must be seven sacraments to remedy them; but he only enumerates six, namely baptism and the sacraments of confirmation, of the altar, of penance, last unction and matrimony. Peter Lombard (c. 1150) added as a seventh that of ordination, and to this number the Latin Church adhered at the councils of Florence and Trent. This enumeration was also adopted in 1575 as against the Augustan confession of the year 1540 by Jeremiah Patriarch of Constantinople, and again in a council held in the same city in 1639 to anathematize Cyril Lucar, who with the Anglicans recognized two only, baptism and the Eucharist. It is hardly fair on the strength of these two pronouncements to attribute the doctrine of seven sacraments to the Eastern churches in general; except under a sporadic Latin influence, they have not troubled themselves so to define their number.

In this article it is impossible to attempt a history of the sacraments and of the controversies which in every age have arisen about them. It is enough to formulate a few general considerations of a kind to orientate and guide inquirers. To begin with, it is obvious that the number of sacraments must vary according to the criterions we use of what constitutes a sacrament. The Anglicans recognize baptism and the Eucharist alone, under the impression that Christ ordained these and none other. The Latin doctors by arguments as good as those usually put forth in such controversies have no difficulty in proving that Christ instituted all seven. How, they argue, could Paul (1 Cor. iv. 1) call himself and others "*ministers* of Christ and *stewards* of the mysteries of God" unless the mysteries in question had been directly instituted by Christ. They contend even that extreme unction was so instituted, and that St James in his Epistle did but promulgate it. So Christ instituted confirmation *non exhibendo sed promittendo*, not by undergoing it and so setting it forth in His own person, but by promising to send the Paraclete. The sacrament of confession and penance He equally instituted when He assigned the power of the keys to the Apostles.

The Latin Church, following Gulielmus Antissiodorensis (c. 1215), distinguishes in each sacrament the matter from the form. The matter is the sensible thing which in accordance with Christ's institution can be raised to a sacramental plane. It is, e.g. water with immersion in the case of baptism; bread and wine in the Eucharist; anointing and laying on of hands in confirmation; contrition in the sacrament of penance. The form consists of the words used in the rite, e.g. in penance, of the formula "I absolve thee"; in the Eucharist, of the words "This is my body" and "This is the cup of my blood" or "This is my blood"; in confirmation, of the words "I sign thee with sign of the cross and confirm thee with chrism of salvation in name of Father and Son and Holy Spirit"; in baptism, of the words "I baptize thee in the name of Father, Son and Holy Spirit (or among the Greeks "N. or M. is baptized in the name," &c.). Merely verbal change in these formulae made without prejudicing the sense does not invalidate the sacrament. On the part of the minister or priest officiating must be present also an inward intention or will to do what the Church does. Thus a drunkard's or a madman's sacraments would only be mockery, even though the recipients received them in good faith and devoutly. On the other hand, sanctity of life on the part of the minister is not necessary in order to the validity of the sacraments which he confers, although this was held to be the case by the Donatists in the 4th century, and following them by the Waldensians and Albigenes in the 12th, and by the followers of Hus and Wycliffe in the 14th. The latter enunciated the following rule: "If a bishop or priest be

living in mortal sin, then he neither ordains, nor consecrates, nor baptizes." The Cathars even held it necessary, in case a bishop fell into mortal sin, to repeat his baptisms and ordinations, for they had been vitiated by his sins. On such points the Catholics followed the more sensible course.

Certain of the sacraments can obviously only be once conferred, e.g. baptism, confirmation and orders; but can be conditionally repeated, if there is a doubt of their having been validly conferred. In conditional baptism the Latins, since about the year 1227, use the formula, "If thou art not baptized, then do I baptize thee," &c. The Latins further insist on a strict observance of the traditional matter and form. Thus baptism is not valid if wine or ice be used instead of water, nor the Eucharist if water be consecrated in place of wine, nor confirmation unless the chrism has been blessed by a bishop; also olive oil must be used. The distinction, be it noted, of form and matter seems more appropriate to the sacraments of baptism, Eucharist, confirmation and last unction, than to those of orders, penance and matrimony. The recognition by the Church of the last-named as a sacrament was, in spite of the commendation uttered by Jesus (Mark x. 9), slow and arduous, owing to the encratic enthusiasms of the first generations of believers. In many regions baptism involved renunciation of married life, and for at least the first two hundred years marriage was a civil rite preceding baptism, which was deferred until the age of thirty or even later. Liturgical forms for consecrating marriage are of late development, and the Church took the institution under its protection through outside social pressure rather than of its own will and wish.

In any Latin pontifical or Greek euchologion we find numerous prayers for the consecration, not only of men, but of things. Here is an example of such a petition from the 9th century codex of Heribert, archbishop of Milan:<sup>1</sup> "Be thou graciously pleased by the infusion of the Holy Spirit to strengthen and enhance the substance, of old approved by thee, of this oil here before thee; to the end that whatsoever in the human kind hath been touched therewith may speedily pass to a higher nature, and that the ancient Enemy may not, after anointing with the same, claim aught for himself, but that he may grieve for that he is exposed to the shafts of this blessed engine of defence, and groan because by the oil of peace the swellings of his antique fury are kept down and repressed: through our Lord Jesus Christ," &c.

Or again the following prayer for baptism over the water from the Ethiopic Statutes of the Apostles as translated by the Rev. G. Horner (London, 1904, p. 165): "God, my Lord almighty, who madest heaven and earth . . . who mingledst and unitedst the immortal with the mortal, who madest living man a combination of the two, and gavest to that which was made body a soul also, which thou causest to dwell within: stir this water and fill it up with thy Holy Spirit, that it may become water and Spirit for regeneration to those who are to be baptized: work a holy work and make them to become sons and daughters of thy holy name."

Such petitions as the above are common in the more ancient of the Christian cults, and are all alike inspired by the idea that a spirit or divine virtue can be confined in material objects which are to be brought into contact with or swallowed by men and animals. The same idea pervades old medical treatises; for a drug was not a chemical substance taking effect naturally on the human system, but something into which a supernatural virtue had been magically introduced, in order the more easily and efficaciously to be brought to bear upon the patient. The spirits which take possession of man or animal can equally take possession of a material substance, and even replace the substance, leaving the outward accidents of colour, shape and size unchanged. This primitive belief, termed "animism" by E. B. Tylor, asserts itself everywhere in Christianity; and objects thus invested with spiritual or curative powers are called by the Latin doctors sacramentals. Thus in the *Theologia dogmatica*

<sup>1</sup> *Monumenta veteris liturgiae Ambrosianae*, by M. Magistretti and A. Ceriani (Milan, 1897), p. 99.

of *moralis* of P. M. Belmont, bishop of Claremont (8th ed., Paris, 1899, vol. iii. p. 119) the following definition is given of *sacramentalis*: "Sacramentals are certain things or actions instituted or consecrated by the Church for the production of certain spiritual effects, and sometimes for the obtaining of a temporal effect."

Some of the older authorities, like Caietanus and Soto, taught that sacramentals as above defined have power to produce their effects *ex opere operato*, i. e. by their own inherent virtue; others that they produce them *ex opere operantis*, i. e. through the merit and disposition of the user. But in the latter case, argues M. Belmont, what is the use of the prayers offered up over the substances; and how account for the differences of effects which by the testimony of the faithful are respectively caused by water duly blessed and by water falsely blessed? If the mere state of mind of the person using the water determines the effect, then in the case of both kinds of benediction, the true and the false alike, it would be one and the same. He therefore inclines to the opinion that there is no inherent virtue in sacramentals, but that God is moved by the prayers uttered in their consecration to produce salutary effects in those who use them. Thus he avoids on the one side the *opus operatum* view, and on the other a merely receptionist position.

The consecration of material objects and in general their use in religion and cult was consistently avoided by the Manicheans; not because they failed to share the universal belief of earlier ages that spirits can be inducted by means of fitting prayers and incantations into inanimate things, but because the external material world was held to be the creation of an evil demiurge and so incapable of harbouring a pure spirit. The sacramentals of the great Church were denounced by them as vehicles of the evil one; and this class of prejudice was carried to such a length that some of them eschewed even baptism with water and the sacrament of bread and wine. That they retained the laying on of hands in their spiritual baptism was an inconsistency which their orthodox opponents did not fail to note; the human hand, argued the latter, is, like the rest of the body, no less the work of the evil creator than water, oil, bread and wine, or than the wood, metal and stone out of which altars, images and churches are made. Relics for the same reason were abhorred by the Manicheans; the Catholics defending them on the ground that the bodies of saints participate in a divine virtue and have a power of making men whole and working miracles in the same manner as had the cloak of Elijah (2 Kings ii. 14), or the corpse of Elisha (*ibid.* xiii. 21), the hem of Christ's garment (Matt. ix. 20), Peter's shadow (Acts v. 15), the handkerchiefs or aprons off Paul's body (*ibid.* xix. 12). The Manicheans' answer to such arguments was that miracles worked by Christ and the Apostles in the material world were only apparitional and not real, while those of the Old Testament were satanic.

It has been argued that the sacramental rites of the Christians were largely imitated from the pagan mysteries; but for the first two hundred years this is hardly true, except perhaps in the case of certain Gnostic sects whose leaders intentionally amalgamated the new faith with old pagan ideas and rites. It is true that Gentile converts carried over into the new religion many ideas and habits of cult contracted under the old; this was inevitable, for no one lightly changes his religious habits and categories. For long generations the doctors of the Church fought bravely against such an infusion of heathen customs; thus in Latin countries we find the rule to keep New Year's day as a fast, just because the pagans feasted on it, giving one another gifts (*strenas*, Fr. *strennes*) and taking omens for the coming year. But in the 4th century this puritanic zeal gave way; and this and other pagan feasts were taken over by the Church; a century earlier in Asia Minor Gregory the Thaumaturge was actively transforming into shrines and cult of martyrs the temples and idolatrous rites of heroes and demigods. In proportion as such conversion was facile and rapid, it was probably imperfect.

That baptism is called the Seal (*σφραγίς*), and Illumination (*φωτισμός*) in the 3rd century has been set down to the influence

of the pagan mysteries; but as a matter of fact the former term is a metaphor from military discipline, and the idea conveyed in the latter that *gnosis* or imparting of divine love is an illumining of the soul is found both in the Old and New Testaments. Nor because the pagans regarded the close meetings of the Christians usually held in private houses as mysteries in which incest and cannibalism were rife, does it follow that the Christians themselves accepted the comparison. On the contrary, as a thousand passages in the earlier apologists attest, they viewed the pagan mysteries with horror and detestation. Nor were they so solicitous, as it is pretended, to conceal from the authorities what they did and said in their liturgical meetings. The Christians<sup>1</sup> of Bithynia were evidently quite frank about them to Pliny (c. 112), and Justin in his Apology reveals everything to a pagan emperor (c. 150). That catechumens could not participate in the *agapé* or love-feast (of which in this epoch the Eucharist was merely an episode) does not give to those feasts the character of a Greek mystery. The uncircumcized proselyte was similarly excluded from the Paschal meal on which the Eucharist was largely modelled, even though it may not have been in any way a continuation of the same. Baptism and the *agapé* took their rise in Palestine, and in their origin certainly owed little or nothing to outside influences. For both there can be found Jewish models, if necessary. The sacred feasts of the Essenes and Therapeutae in particular, as described by Josephus and Philo, closely resembled the Eucharistic *agapé*.

Undeniably Clement of Alexandria and Origen apply the language of the Greek mysteries to Christian *gnosis* and life. "These are," says Clement, "divine mysteries, hidden from most and revealed to the few who can receive them." And Origen compares them to the sacred vessels, and would have them "guarded secretly behind the veil of the conscience and not lightly produced before the public." He who so produces them "dances out the word of the true philosophy,"—a technical description of the profanation of the mysteries. It is not even safe, according to these two fathers, to commit too much to writing; and Clement undertakes not to reveal in writing many secrets known to the initiated among his readers; otherwise the indiscreet eye of the heathen may rest on them, and he will have cast his pearls before swine. But we may discount most such talk in these writers as belletristic pedantry, copied as a rule from Philo of Alexandria, their literary model. In the latter's description of the *Therapeutae* (ed. Mangey, ii. 475) we read how each ascetic had "in his house a room in which in solitude they celebrated the mysteries of the holy life, introducing nothing therein, either to drink or to eat, nor anything else necessary for the uses of the flesh." And in scores of other passages Philo dwells on "the ineffable mysteries" of Jewish faith and allegory. He even writes thus: "O ye initiated ones, with purified sense of hearing, shall ye accept in your souls these truly sacred mysteries, nor divulge them to any of the uninitiated. . . . I have been initiated by Moses the friend of God in the great mysteries." But because he uses the language of the Greek mysteries, Philo never imitated the thing itself; and he is ever ready to denounce it in the bitterest terms. Clement and Origen really meant no more than he. At a later period, however, the difficulty of screening the rites of baptism and Eucharist from the eyes of catechumens and from their ears the creeds and liturgies—a difficulty which had ever been formidable and which after the overthrow of paganism must have become insurmountable—seems to have provoked not only a great outpouring on the part of the Christian rhetors, like Basil, Chrysostom, the Gregories and the Cyrils, of phrases borrowed from the Greek mysteries, but perhaps an actual use of precautions. Thus the bishop of Rome, Julius (c. 340), complained (Athanasius, *Apol. cont. Arian.* 31, Migne 25, 300) that a court of law had not been cleared of catechumens, Jews and pagans, in a case where the legal discussion introduced the topic of the table of Christ; and the preachers of the 4th and

<sup>1</sup> Perhaps, however, Pliny refers only to the renegades among them.

5th centuries in their discourses often make a point of not citing the creed or describing the Eucharist; they stop short and ejaculate such remarks as *ισαωσ εννοω, νορωσι fideles* ("the faithful know it"). Such was the *Disciplina arcani*. All will admit who study the post-Nicene Church, that the Christian sacraments have stolen the clothes of the pagan mysteries, dethroned and forbidden by the Christian emperors. The catechumenate, an old institution, older in most regions than the mysteries themselves, suggested and rendered feasible such wholesale theft, especially in an age in which the sacerdotal class wished to be pre-eminent, and left nothing undone to enhance in the eyes of the multitude the importance and solemnity of rites which it was their prerogative to administer. The disappearance, too, of the pagan mysteries must have left a void in many hearts, and the clerics tried to fill it up by themselves masquerading as hierophants.

In the age of the Council of Nice the custom arose of baptizing children of three, because at that age they can already talk and utter the baptismal vows and responses. Not a few homilies of that age survive, denouncing the deferring of baptism, and urging on parents the duty of initiating their young children. Thus there is much evidence to show that long before A.D. 500 child baptism was in vogue. But in that case how can the creed and ritual of baptism, the Lord's Prayer and the Eucharistic formulae, have been kept secret? How can they have been the "awful mysteries," the "dread and terrible canons," the "mystic teachings," the "ineffable sentences," the "oracles too sacred to be committed to writing" which the homilists of that age pretend them to have been? Could our modern freemasons continue to hide their watchwords and ritual, or even make a pretence of doing so, if they were constrained by public opinion to initiate every child three years of age? The thing is absurd. When, therefore, we find such phrases in Greek and Latin homilies of the period of 350 to 550 we must regard them as elaborate make-believe. Because catechumens as well as the faithful were present at the sermons, the preachers thought it becoming to throw them in; but the audience must have been aware that their secrets were open ones.

Duchesne, *Origines du culte chrétien* (Paris, 1898); Joseph Bingham, *Origines ecclesiasticæ* (London, 1834); Adolf Harnack, *Dogmengeschichte* (Freiburg, 1897). (F. C. C.)

**SACRAMENTALS** (*Sacramentalia*), in the Roman Catholic Church certain acts or ordinances instituted not by Christ, but by the Catholic Church with divine authority. They are believed, in their application to persons and things, to communicate *quasi ex opere operato* through ordained priests the grace of God, consisting in purification, supernatural revivification and sanctification. The term is thus used to cover the rites of dedication, consecration and benediction, and, closely connected with the last-named, exorcism.

**SACRAMENTARIANS**, the name given to those who during the Reformation controversies not only denied the Roman Catholic "transubstantiation," but also the Lutheran "consubstantiation." They comprised two parties: (1) the followers of Capito, Carlstadt and Bucer, who at the diet of Augsburg presented the *Confessio Tetrapolitana* from Strassburg, Constance, Lindau and Memmingen; (2) the followers of the Swiss reformer Zwingli, who to the same diet presented his private confession of faith. The doctrinal standpoint was the same—an admission of a spiritual presence of Christ which the devout soul can receive and enjoy, but a total rejection of any physical or corporeal presence. After holding their own view for some years the four cities accepted the Confession of Augsburg, and were merged in the general body of Lutherans; but Zwingli's position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or extreme view of the efficacy of the sacraments.

**SACRAMENTO**, the capital of California, U.S.A., and the county-seat of Sacramento county, 91 m. (by rail) N.E. of San

Francisco, on the eastern bank of the Sacramento river, about 61 m. above its mouth, at the point where it is joined by the American. Pop. (1850) 6820, (1890) 26,386, (1900) 29,282, of whom 6723 were foreign-born (1377 Germans, 1293 Irish, 964 Chinese, 655 English, 446 English Canadian and 337 Japanese) and 402 were negroes, (1910, census) 44,666. Land area (1906) 4,49 sq. m. Sacramento is on the direct eastward line to Ogden, Utah, of the Southern (once the Central) Pacific railway (which has its main shops here), the starting point of the Southern Pacific line to Portland, Oregon, the terminus of several shorter branches of the Southern Pacific and on the Western Pacific, which has repair shops here, and it is served by interurban electric railways connecting with places in the Sacramento and San Joaquin valleys. The city is about 200 m. below Red Bluff, the head of river navigation for boats drawing 2 or 2½ ft. of water; for boats drawing 4 to 5 ft. Colusa, 91 m. above Sacramento, is the head of navigation; at low water, vessels drawing 7 ft. of water go up the river to Sacramento. There are two daily steamer lines to San Francisco, besides freight lines.

The city site is level (formerly in many parts 5 ft. below flood-level of the river) and is about 30 ft. above sea-level, and the street plan is rectangular. The business quarter has been filled in, and levees have been built along the Sacramento and American rivers. The climate is mild: the average annual temperature is 60.5° F.; average for winter months, 48.3°; for spring, 59.5°; for summer, 71.7°; for autumn, 61.5°; average rainfall, 19.94 in.; average number of clear days *per annum*, 244. The principal buildings are: a very fine state capitol (cornerstone laid, 1860; completed, 1874) in a wooded park of 35 acres, in which is an Insectary where parasites of injurious insects are propagated; Roman Catholic and Protestant Episcopal cathedrals; the county court-house; the city hall; the public library (in 1908, 41,400 volumes); and the Crocker Art Gallery, which was presented to the city by the widow of Judge E. B. Crocker, one of the founders of the Central Pacific, with an art school and an exhibit of the minerals of the state. There is a state library of 140,000 volumes in the capitol; connected with it are travelling libraries sent out through the rural districts of the state. In Sacramento are the large state printing establishment, in which, in addition to other books and documents, text-books for the entire state school system are printed; the College of the Christian Brothers, Howe's Academy, Atkinson's Business College, St Joseph's Academy, the Stanford-Lathrop Memorial Home for Friendless Girls (1900), under the Sisters of Mercy, two other orphanages, the Southern Pacific Railway Hospital (1868), the Mater Misericordiae Hospital (1895, Sisters of Mercy), Wentworth Hospital, a City Receiving Hospital (1884), the Marguerite Home (for old ladies), the Mater Misericordiae Home (1895, Sisters of Mercy) and the Peniel Rescue Home (1890). Just outside the city limits is the State Agricultural Pavilion, with race track and live-stock exhibition grounds (where the State Agricultural Society holds its annual "State Exposition" in September).

The city has a large wholesale trade. Its prosperity rests upon that of the splendid Sacramento Valley, a country of grain and fruit farms, along whose eastern side lie the gold-producing counties of the state. It is the centre of the greatest deciduous fruit region of California, and shipped about 17,000 car-loads east of the Rocky Mountains in 1909. Sacramento derives electric power from Folsom, on the American river, 22 m. away, and from Colgate, on the Yuba river, 119 m. distant. The manufacturing interests of the city are large and varied: the city's manufactures include flour (1905, value \$1,172,747), lumber, distilled liquors, canned and preserved vegetables and fruits, packed meats, cigars and harness. In 1905 the total value of the factory product was \$10,319,416. In 1909 the assessed valuation of the city was about \$30,400,000, and the bonded indebtedness about \$1,100,000. The city owns its own water system, which has a capacity of 22 million gallons daily, and is a financial success.

In 1839 John Augustus Sutter (1803-1880), a Swiss military

officer, was allowed to erect a fort on the then frontier of California, on the present site of Sacramento. He became a Mexican official (1840), and in 1841 obtained from the Mexican government a grant of 11 square leagues of land. Sutter's fort, or "New Helvetia" (a reproduction of which, with a historical museum, in Fort Sutter Park, is one of the objects of interest in the city), was on the direct line of overland immigration from the East, and its position—purposely selected by Sutter with a view to freedom of interference from Mexican officials—made Sutter a man of great importance in the last years of the Mexican régime. After the discovery of gold in 1848, made on Sutter's land, near the present Coloma, about 45 m. E.N.E. of Sacramento, several rival towns were started on Sutter's property near the fort. Of these fortune finally favoured Sacramento—a name already frequently applied to the fort, and adopted for the name of the settlement about its embarcadero or river landing in 1848. The first sale of town lots was in January 1849. Here began the determined movement for the organization of a state government. The extraordinary richness of the placer mines of '49 caused the city to grow with wonderful rapidity. In October 1849 its population was probably 2000, in December 4000 and a year later 10,000. Trouble with land "squatters" almost led to local war in 1850. In 1849 the city offered \$1,000,000 for the honour of being the state capital, which it finally secured in February 1854 (the legislature having already met here once in 1851). Between November 1849 and January 1853 the city was thrice devastated by fearful floods, and it was two-thirds destroyed by fire in November 1852; but though these misfortunes caused a collapse of inflated realty values they did not seriously cripple the city in its development. A city government was organized in August 1849, and in February 1850 this government was incorporated, and in 1863 reincorporated; the city and county governments were consolidated from 1858 to 1863; and a new city charter was received in 1893, coming into effect in 1894. The first local steam railway of California was opened from Sacramento in 1855, and here in 1863 was begun the building of the Central Pacific railway across the Sierras, the first train from the Atlantic coast reaching Sacramento in May 1869. In 1862 there was another flood, the most destructive in the history of the city; since then the measures taken for protection have secured safety from the river. The government of the city in the 'fifties was excessively corrupt and expensive. Progress since the end of the flush mining days has been steady and conservative.

**SACRARIUM**, the term in classic architecture given to the cells of a temple, and to the apartment in a dwelling-house which was sacred to a deity. In medieval architecture the term is applied on the European continent to that portion of a chancel, which, enclosed with a railing or balustrade in front of the altar, is devoted to the celebration of the Holy Eucharist; this in England is generally known as the presbytery.

**SACRED HEART.** Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. The secondary and partial object is that Heart which was the seat or organ of His love, and which forms the natural symbol thereof. Heart and love are viewed, not physiologically, but in their moral connexion. The chief liturgical expressions of this cult are the institution of a feast of the Sacred Heart and public representations of it by statues and pictures.

Private worship of Christ's heart in particular is of great antiquity in the Church, and is prominent in St Gertrude and other mystics. It was greatly stimulated in the 17th century by St Francis of Sales (q.v.) who gave this symbol to his Order (the Visitation) as its badge. The Venerable Fr. Eudes must also be mentioned as a great propagator of the devotion, in the same century, and he was the first to obtain a certain public, though only local, authorization of the new pious practices. Blessed Margaret Mary Alacoque (1647-1690), a Visitation nun of Paray-le-Monial, assisted by her director, the Venerable Claude de la Colombière, S.J. (1641-1682), was the instrument of the introduction of the specific worship of the Sacred Heart

into the Church by a decision of the supreme authority, although their work only took effect long after their death. Mary of Modena, the exiled queen of James II., at the instance of the Visitation, petitioned in 1697 for a proper Feast of the Sacred Heart. Neither then, however, nor on the presentation of new petitions in 1726, was an affirmative answer obtained. Meanwhile the chief objection, that of "novelty," was gradually removed by the multiplication of local manifestations, the genuineness of which was proved to the satisfaction of the Roman Congregation of Rights, and in 1765 it was allowed for houses of the Visitation and certain countries. It must be added that this devotion was strongly opposed, not only by the Jansenists, but by others within the Church, under the mistaken idea that the Heart of Christ was viewed in it as separate from the rest of His Being. The formulation of this objection by the synod of Pistoia,<sup>1</sup> in 1786, however, only provoked a clearer explanation of the doctrine, which contributed to confirm the cult. In 1856 Pius IX. introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the cause of which she had been the apostle.

See Nic. Nilles, S.J., *De rationibus festorum SS. Cordis Jesu, &c.* (3rd ed. Innsbruck, 1873); E. Letricier, S.J., *Études sur le Sacré Cœur et la Visitation* (Paris, 1890). These two works contain bibliographical lists. Dalgairna, *The Devotion to the Heart of Jesus* (1853); H. E. Manning, *The Glories of the Sacred Heart* (1876); Jos. Nix, *Cultus SS. Cordis Jesu . . . cum addimento de cultu purissimis cordis B.V. Mariæ* (2nd ed. Freiburg-i.-B., 1891). (H. B. M.)

**SACRIFICE** (from Lat. *sacrificium*; *sacer*, holy, and *facere*, to make), the ritual destruction of an object, or, more commonly, the slaughter of a victim by effusion of blood, suffocation, fire or other means. While the Hebrew for sacrifice, *qan*, makes the killing of the victim the central feature of the ceremony, the Latin word brings out the fact that an act of sacralization (see TABOO) is an essential element in many cases. The sacrifice of desacralization is, however, also found; hence M.M. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view," i.e. it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony." By this definition the term sacrifice is extended to cover the inanimate offering which is consumed by fire, broken or otherwise rendered useless for the purpose of human life.

*Theories of Sacrifice.*—Explanations of sacrifice, as of other rites, are naturally not wanting among the peoples who have practised or still practise it; but they are often of the nature of aetiological myths and give no clue to the original meaning. Scientific theories date from the second half of the last century, and were originated in the first instance by the English anthropological school.

(a) According to the view put forward by Dr Taylor, the sacrifice is originally a gift, offered to supernatural beings by man for the purpose of securing their favour or minimizing their hostility. By a natural series of transitions the gift theory became transformed, in the minds of the sacrificers, into the homage theory, which again passed by an easy transition into the renunciation theory. These were, in fact, simply the popular theories of sacrifice put on an evidential basis by facts drawn from various stages of culture.

(b) With W. Robertson Smith, on the other hand, a new era was reached, in which the recently recognized existence of Totemism (q.v.) was made the basis of an attempt to give a

<sup>1</sup> Scipione de Ricci, bishop of Pistoia from 1780 to 1791, on the ex-Jesuit requesting him to consecrate a bell dedicated to this object, issued a pastoral letter (3rd June 1784) in which he pointed out that the spirit of true religion was "far removed from fetishism," and warned his flock against "cardiolatry." This pastoral was subsequently in 1786 annexed to the resolutions passed by the reforming synod of Pistoia (q.v.), and was condemned with eighty-four other propositions by papal bull in 1794.—Ed.

theory of origins. The first form of his theory distinguishes (i.) honorific, (ii.) piacular and (iii.) mystical or sacramental sacrifices; but the latter type is traced back to the same cycle of ideas as that in which the piacular sacrifice originated. (i.) The essential feature of this type was that the god and his worshippers shared the sacrifice and might thus be regarded as commensals, or table companions. The human commensals were the totem-kin, whom Robertson Smith conceived to have been in the habit of sharing a common meal in daily life, or at least of not mixing with other kins. The object of sharing the meal with the god was to renew the blood bond. The victim was the animal of a hostile totem-kin or an animal commonly offered to the god. The god was originally a stranger, taken into the kin by a rite of blood brotherhood, and this constitutes the dark point of the theory; for Robertson Smith regards the blood bond as relatively late; hence we do not see how the god became associated with the kin. (ii.) The piacular sacrifice arose from the need of atoning for bloodshed within the kinship group; properly speaking, the culprit himself should suffer: should he be unknown or beyond the reach of vengeance, a substitute had to be found. This was naturally found in the non-human member of the totem-kin—the totem animal; in a sense, therefore, the god died for his people. (iii.) In the mystical sacrifice the god is himself slain and eaten by his worshippers. In the *Religion of the Semites* (2nd ed., 1894) the theory was remodelled so as to overcome the difficulty pointed out above. The god, the victim and the human group are regarded as of the same kin; the animal (totem) is the earlier form of the god; the deity was originally female, for under matrilineal rules the mother alone is of kin to her children, but, with the rise of descent in the male line, the god was transformed into a male. The sacrifice is in its origin a communion; god and worshippers have a bond of kinship between them; but it is liable to be interrupted or its strength diminished. Ceremonies of initiation are the means by which the alliance is established between the deity and the young man, when the latter enters upon the rights of manhood; and the supposed bond of kinship is thus regarded as an artificial union from the outset, so far as the individual is concerned, although Robertson Smith still maintains the theory of the fatherhood of the god, where it is a question of the origin of the totem-kin. From the communion sacrifice sprang the *piaculum*, which here becomes a subsidiary form and finds its full explanation in the ideas connected with the mystic union of god and worshippers. For the object of the *piaculum* is the re-establishment of the broken alliance, which was precisely that of the communion sacrifice. With the decline of totemism arose the need for human sacrifice—the only means of re-establishing the broken tie of kinship when the animal species was no longer akin to man.

This theory of Robertson Smith's has been attacked from two sides. In the first place, L. Marillier (*Rev. de l'hist. des religions*, xxxvi. 243) argues that if there was an original bond of kinship between the god and the kin, there is no need to maintain it by sacrificial rites, and cites against Smith's view the practice of totemic groups. To this it might be replied that the real significance of initiation ceremonies is still obscure; it is a plausible argument that the child does not form part of the kin till after initiation, but this argument seems inconclusive, for in West Australia there is solidarity, according to Grey (*Journals*, ii. 239), between the whole of the kinship group, whether adult or not; and, moreover, nowhere are rites found which are intended to strengthen the union between a man and his totem by means of the blood bond, unless we include the aberrant totemism of the Arunta (Spencer and Gillen, *Native Tribes of Central Australia*, 167), who eat their totems in order to gain magical powers of increasing the stock of the totem animal. Marillier further argues that if, on the other hand, there was no bond between god and people but that of the common meal, it does not appear that the god is a totem god; there is no reason why the animal should have been a totem; and in any case this idea of sacrifice can hardly have been anything but a slow growth and consequently not the origin of the practice. In the second place,

M.M. Hubert and Mauss point out that Robertson Smith is far from having established either the historical or the logical connexion between the common meal and the other types of sacrifice; the simplest Semitic forms known to us are the most recently recorded; further their simplicity may mean no more than documentary insufficiency, and in any case does not imply any priority; the *piaculum* is found side by side with the communion at all times. Moreover, under *piaculum* are confused purification, propitiations and expiations; Smith's contention that purifications, whose magical character he recognizes but interprets as late, are not sacrificial, is far from conclusive.

(c) Building in part on the foundation laid by Robertson Smith, Dr J. G. Frazer has put forward the view that while the sacrifice of the god may have been piacular, it was also intended to preserve his divine life against the inroads of old age. This theory he exemplifies by two orders of cases, (i.) the putting to death of the man-god, who is often also the king, on whose health is held to depend the safety of his people, of the world, or even of the universe; and (ii.) the annual killing of the representative of the spirit of vegetation or of the Corn-spirit (see *DEMONOLOGY*).

(d) For L. Marillier sacrifice was, at its origin, essentially a magical rite—the liberation by the effusion of a victim's blood of a magical force which was to bend the gods to the will of man; from this arose, under the influence of cult of the dead, the gift theory of sacrifice. Adopting the theory of W. R. Smith, Marillier also maintained, but without clearly explaining the relation of this part of his theory to the preceding, that a human kinship group conceived the idea of allying itself with one god in particular. This they did by sacrificing a victim and effecting communion with the god by the application of its blood to the altar; or, more directly, by the sacrifice of the animal-god and the contact of the sacrificer with its blood.

(e) Dr Westermarck takes the view that human sacrifice is as a rule an act of substitution, in that men offer a victim in the hope of saving themselves; but he also recognizes funeral sacrifices of various kinds. Certain sacrifices of animals he explains as intended to transfer a conditional curse.

(f) The preceding theories are attempts, in the main, to derive from one source all the forms of sacrifice. M.M. Hubert and Mauss, while admitting that in all sacrifices is found some idea of purchase or substitution, decline to admit that all have issued from one primitive form. In their view, based on an analysis of Hebrew and Hindu forms of sacrifice, the unity of sacrifice consists in the immediate aim of the ritual, not in the ultimate end to be attained; for we rarely find a rite other than complex and by the same sacrifice more than one result may be sought or attained. The unity of procedure consists in the fact that every sacrifice involves putting the divine in communication with the profane by an intermediary—the victim—which may be piacular or honorific, a messenger or a means of divination, a means of alighting the eternal life of the species or a source of magical energy which the rite diffuses over objects in its neighbourhood.

(g) Our knowledge of primitive forms of sacrifice is meagre; even were it more extensive, it would probably be impossible to determine the origin or origins of sacrifice; for no ritual has necessarily survived unchanged in form and meaning since its inception, and even permanence of form cannot be taken to imply a corresponding permanence of meaning for the worshippers. If, however, we turn to Australia, where sacrifice is unknown, we find more than one class of rites in which we can trace an idea akin to some forms of sacrifice. Just as the German reaper leaves the last ears of corn as an offering to Wodan, so the Australian black offers a portion of a find of honey; in New South Wales a pebble is said to have been offered or a number of spears, in Queensland the skin removed in forming the body-scars. Thus it appears that the gift theory may after all be primitive; the worship of, or care for, the dead may have supplied in other areas the motive for the transition from offering to sacrifice or the evolution may have been due to the spiritualisation of the gods. In Australia, among the Hottentots,

in the Malay Peninsula and elsewhere, blood ceremonies are in use which are unconnected with the slaughter of a victim; in this blood ritual we may see another possible source of sacrifice. The Arunta hold that the spirits of kangaroos are expelled by human blood from certain rocks. By parity of reasoning a blood ritual may have been adopted by peoples who practise the expulsion of evils, conceiving them either animistically or as powers; catharsis, in the sense of removal of uncleanness, is not necessarily primitive.

*Principles of Classification.*—It is possible to classify sacrifices according to (a) the occasion of the rite, (b) the end to be achieved, (c) the material object to be affected or (d) the form of the rite. (a) The division into periodical and occasional is important in Hindu and other higher religions, and the *sutras* constantly draw the distinction; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and these are held to be in like manner obligatory. (b) The end to be achieved is, as has been shown by Hubert and Mauss, sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (c) Sacrifices may be classified into (i.) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (ii.) objective, where the current of *mana* (see TABOO) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself. (d) The form of the sacrifice is discussed in the next section.

*Ritual.*—For Hinduism and later Judaism we possess a wealth of material on which to base a comparative study of the forms of sacrifice; a form of this—animal sacrifice in the Vedas—has been analysed by MM. Hubert and Mauss. For Greece and Rome, where the instructions as to ritual were not embodied in the elaborate codes handed down in Hinduism or Judaism, our material is far less complete. For other areas we have often no description of the procedure at all, but merely the briefest outline of the actual process of slaughter, and we are ignorant whether the form of the rite is in reality simple (either from a loss of primitive elements or from never having advanced beyond the stage at which we find it), or whether the absence of detail is due to the inattention or lack of interest of the observer. It must therefore be understood that the following analysis of ritual, based on the most elaborate codes known to us, is by no means conclusive as to the primitive form or forms of sacrifice. The necessary elements of a Hindu sacrifice are: (1) the sacrificer, who provides the victim, and is affected, directly or indirectly, by the sacrifice; he may or may not be identical with (2) the officiant, who performs the rite; we have further (3) the place, (4) the instruments of sacrifice and (5) the victim; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed towards (6) the object; finally, we may distinguish (7) three moments of the rite—(a) the entry, (b) the slaughter, (c) the exit.

The sacrifices of sacralization and desacralization mentioned above find their analogues in the Hindu scheme of the rite; sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, are the essential elements of the preparation for sacrifice and the subsequent lustration. In the most developed forms, such as the offering of *soma*, they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relieved

him of the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice.

(3) Where there was an appointed place of sacrifice—the Temple at Jerusalem, according to later Jewish prescription—there was no need of preparation of a place of sacrifice; but the Hindu chose, each for himself, the site of his altar. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling it, (b) the tracing on the ground of the *vedi*, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or (b) the whole species might be allied to the god; in the latter case the victim had to be without blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It was first cleansed; then plied with laudatory epithets; and, thirdly, soothed, so that it might be more acceptable to the gods and less likely to do an injury after its death, when its spirit was set free. It had now reached a degree of sanctity and only the priest might touch it; it was sprinkled with water, and anointed with butter; finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The object of the sacrifice being to bridge the gulf between the sacred and profane worlds, the sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. But this did not conclude the ceremony, even as far as the victim was concerned; it remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim, the *agda*, was removed, held over the fire and finally cast into it. The remainder, divided into eighteen portions, was cooked; seven fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desacralization, including burning of certain of the instruments, lustration of the post, destruction of the butter, &c. Finally the priest, the sacrificer and his wife performed a lustration, found in an exaggerated form in the "bath" which concluded the *soma* sacrifice, and the ceremonies were at an end.

How far this scheme of sacrifice holds good for other areas, and in particular for more primitive peoples, is an open question. Our data are nowhere so full as for India; where they are comparatively abundant they refer either to a civilized or semi-civilized people, or to an area, like West Africa, where the influence of Islam has introduced a disturbing element. Though the moralization of gods has only proceeded *pari passu* with the moralization of mankind, the deities of the more advanced nations are perhaps felt by them to be more terrible and more difficult of access than the divinities of lower races; herein lies one explanation of the power of the priesthood. Even if the conception of the relative sanctity of gods and men remained unaltered, it by no means follows that in primitive times the same precautions were necessary in approaching the former as were demanded by the consciousness of later generations. With our present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble.

No general survey of sacrificial ritual is possible here, but a few details as to the mode of slaying the victim and disposing of the body may be given. The head of the animal or man may be cut off (and custom often requires that a single blow shall suffice), its spine broken or its heart torn out; it may be

stoned, beaten to death or shot, torn in pieces, drowned or buried, burned to death or hung, thrown down a precipice, strangled or squeezed to death. The sacrificer may aim at causing a speedy death or a slow one. The corpse may be burnt, in part or as a whole; portions may be assigned to the priest, the sacrificer and the gods; the skull, bones, &c., may receive special treatment; the fat or blood may be set aside, and they or the ashes may be singled out as the share of the god, to be offered upon the altar; the skin of the victim may be employed as a covering for the idol or material representative of the god, either permanently or till the next annual sacrifice. The blood of the victim may be drunk by the priest as a means of inducing inspiration, its entrails may be employed in divination, its flesh consumed in a common meal, exposed to the birds and beasts of prey or buried in the earth.

It is equally impossible to give a general survey of the purposes of sacrifice; not only are they too numerous but it is rare to find any but mixed forms; the scapegoat, for example, is also a messenger to the dead, and its flesh is eaten by the sacrificers. Certain main types may, however, be enumerated.

**Cathartic Sacrifice.**—In primitive cults the distinction between sacred and unclean is far from complete or well defined (see TABOO); consequently we find two types of cathartic sacrifice—(i.) one to cleanse of impurity and make fit for common use, (ii.) the other to rid of sanctity and in like manner render suitable for human use or intercourse.

(i.) The most conspicuous example of the first class is the scapegoat. Two goats were provided by the ancient Hebrews on the Day of Atonement; the high priest sent one into the desert, after confessing on it the sins of Israel; it was not permitted to run free but was probably cast over a precipice; the other was sacrificed as a sin-offering. In like manner in the purification of lepers two birds were used; the throat of one was cut, the living bird dipped in the blood mingled with water and the leper sprinkled; then the bird was set free to carry away the leprosy. In both these rites we seem to have a duplication of ritual, and the parallelism of sacrifice and liberation is clear.

(ii.) As an example of the second class may be taken the sacrifice of the bull to Rudra. MM. Hubert and Mauss interpret this to mean that the sanctity of the remainder of the herd was concentrated on a single animal; the god, incarnate in the herd, was eliminated by the sacrifice, and the cattle saved from the dangers to which their association with the god exposed them. In the Feast of Firstfruits we have another example of the same sort; comparable with this concentration of holiness is the respect or veneration shown to a single animal as representative of its species (see ANIMAL WORSHIP). In both these cases the object of the rite is the elimination of impurity or of a source of danger. But the Nazarite was equally bound to lay aside his holiness before mixing with common folk and returning to ordinary life; this he did by a sacrifice, which, with the offering of his hair upon the altar, freed him from his vow and reduced him to the same level of sanctity as ordinary men.

With regard to the scapegoat, it must be noted that we also meet with a more concrete idea of expulsion of evil (see DEMONOLOGY, EXORCISM), which is present among the most primitive peoples, such as the Australians. This raises the problem of how far the catharsis dealt with above is in its original form an elimination of impurity, and how far something more definite—a spirit or other principle of evil—is held to be expelled by scapegoat and allied ceremonies.

**Communal Sacrifice.**—In spite of the importance attached to the idea of the common meal by Robertson Smith, it is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see COUVADE), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely

in these cases there is no custom of giving a portion of the victim to the god.

**Deificatory Sacrifice.**—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In Burma, as in many other countries, those who die a violent death are held to haunt the place where they met their fate; consequently when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the *magual* or *manisú* animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god cited by Dr Frazer, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in theriomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see FETTERISM) on the Congo resembles deificatory sacrifice; but here there is no actual slaughter of a human being; magical means are alone relied upon.

**Honorific Sacrifices.**—Whatever their origin, sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, by intimidation, by deceit, by bribery; and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is believed to take pleasure in eating; the germ of this idea may have been identical with that of some funerary sacrifices—to nourish the divine life. At a later period, *pari passim* with the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. This latter idea was the more likely to arise, as the gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation; it must be distinguished from the *piaculum* (see below), to which in some aspects it is allied.

**Mortuary Sacrifice.**—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

**Piacular Sacrifices.**—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. This, according to Westermarck, is the central idea of human sacrifice: the victim is substituted for the sacrificer, to deliver him from perils by disease, famine or, more indefinitely, from the wrath of the god in general. The essential feature of the *piaculum* is that it is an expiation for wrong-doing, and the victim is often human.

**Human Sacrifice.**—Many theories of the relation of human to animal sacrifice have been put forward, most of them on an insufficient basis of facts. It has been held that animal sacrifice is the primitive form and that the decay of totemism or lack of domestic animals has brought about the substitution of a human victim; but it has also been urged that in many cases animal victims are treated like human beings and must consequently have replaced them, that human beings are smeared with the blood of sacrifice, and must therefore have themselves been sacrificed before a milder régime allowed an animal to replace them. If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till two hundred years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples. On the whole, human sacrifice is far commoner

among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connexion with the initiation of a magician; it is therefore by no means axiomatic that animals were offered before human beings; the problem of priority is one to be solved for each area separately, but probably no solution is possible; in the absence of Aztec traditions it would hardly have seemed probable that two centuries had seen so great a transformation.

Among the forms of human sacrifice must be reckoned religious suicide. This is perhaps mainly found in India but is not unknown in Africa and other parts of the world. Human sacrifices were known in ancient India and survived till late in the 19th century (see below); both Greeks and Romans practised them, no less than the wilder races of ancient Europe. Semites and Egyptians, Peruvians and Aztecs, slew human victims; Africa, especially the West Coast, till recently saw thousands of human victims perish annually; in Polynesia, Tahiti and Fiji were great centres of the rite—in fact, it is not easy to name an area where it has not been known.

No general survey of sacrifice on geographical lines is possible, but some of the more important features in each area may be noticed.

*Sacrifice in Greece and Rome.*—Both the mainland of Greece and the Greek colonies practised human sacrifice, usually as a means towards expulsion of evil. Thus, the Athenians maintained a number of outcasts, from whom in times of national calamity two were selected, one for the men, one for the women, and stoned to death outside the city; at the Thargelia two victims were annually put to death in the same way. Many animal sacrifices were known; of especial importance is the annual sacrifice of a goat on the Acropolis, though at other times the animal was not permitted to enter the temple.

Important features of Greek sacrifice, though not necessarily found in every rite, were the putting of wreaths and pieces of wool on the victim, the gilding of its horns, the lustration of the officiant and the sprinkling of those present with holy water. It was held inauspicious if the animal were unwilling; if it nodded all was well. Barley meal<sup>1</sup> was strewn on its neck, and a lock of hair cut from its forehead and burned. The animal was then clubbed, its throat cut and the altar sprinkled with its blood. Finally the body was skinned and cut up and the god's share burned on the altar.

The important Attic sacrifice of the Dipolia, known as *τὰ βοῦφονία*, demands some notice. Cakes were laid on the altar of Zeus Polieus and oxen driven round; the one which touched the cakes was the victim. An officiant at once struck it with his axe and another cut its throat; then all save the one who struck the first blow partook of its flesh. Then the hide was stuffed with grass and yoked to a plough; the participants were charged with ox murder and each laid the blame on the other; finally the axe was thrown into the sea. The interpretation of the rite is uncertain; it may perhaps be connected with agrarian rites.

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found; the generalized account given above for Greece is true also for the Romans.

*Sacrifice in Egypt.*—Of Egyptian ritual little is known; our knowledge rests mainly on the evidence of pictures. At Deir el Bahri we see that the animal had its throat cut in Mahommedan fashion; it lay on its side, the legs tied together; the heart was taken out, then the liver; the burnt sacrifice was hardly known.

*Sacrifice in India.*—An account of animal sacrifice has been given above. Among human sacrifices may be mentioned the *suttee*, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sacrifice of the Meriah, who was either purchased or the son of a victim father. Some days before

<sup>1</sup> This sprinkling of the victims with sacrificial meal (Lat. *mola*) is the origin of the word *immolare*, to sacrifice, slaughter; Eng. "immolate," "immolation."

the sacrifice, the victim, who was often kept in captivity for long periods, was devoted by the cutting of his hair, previously unshorn, and his sanctity was increased later by various ceremonies of anointing. Finally he was taken in procession, stupefied or otherwise rendered incapable of resistance, and put to death by strangulation or pressure. The remains were dismembered and carried to the fields, excepting the portion offered to the earth goddess, which was buried.

*Sacrifice in Africa.*—Especially in West Africa many forms of sacrifice are found. In the annual "customs" of Dahomey, now abolished, hundreds of human victims were offered. Three main forms of human sacrifice existed in this area: (1) the scapegoat; (2) the messenger; and (3) the expiation, but combinations were not infrequent. The victim was often kept in captivity and well fed; to transfer their sins people laid their hands upon him as he was led in procession, his head covered with ashes; on the way to the place of sacrifice were three enclosures, the second open to chiefs and priest only, the third to the officiant and his helper alone; the blood of the victim was offered to the gods. At the present day the animal victim may be burned or drowned, buried in the earth or simply exposed. Sometimes the sacrificer's hands are laid on the victim before it is slain, or he may be smeared with its blood; in other cases the blood is smeared on the door posts, or the sacrificer is touched on every part of the body with the victim's body. On the Congo, if a man commits a murder, the community votes whether he shall die or be expelled; if the latter, a victim is killed, of which all must partake; but this is not, as might be imagined, a case of Robertson Smith's *piaculum* for the re-establishment of the tribal bond; for the criminal is driven out of the community.

*Sacrifice in America.*—Sacrifice was relatively infrequent and undeveloped among the Red Indians. The Pawnees, however, had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bore in later times the character of a scapegoat festival; but it is doubtful how far this was an original feature. The animals were decorated with wampum and strangled, and then the sins of the people were transferred to them; then the remains were burned and the ashes gathered up, taken through the village and sprinkled before every house. In Mexico human sacrifices were very common; the lowest estimate is 20,000 annually. The victims were often fêted for a whole year and treated as divine; the heart was an offering to the god, the body was eaten by the priests and nobles and the head was preserved with those of previous victims.

#### *The Idea of Sacrifice in the Christian Church.*

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this

protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and among them both was the idea that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable. The best instances of these ideas in the Old Testament are in Psalms I and II., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. *Dem. ev.* 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. *Trypho*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. *Strom.* vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb. xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (*Tosephta Berachoth*, c. 4), and hence St. Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cp. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day. A precedent for making such oblations elsewhere than in the temple had been afforded by the Essenes, who had endeavoured in that way to avoid the contact with unclean persons and things which a resort to the temple might have involved (Jos. *Antiq.* xviii. 1. 5), and a justification for it was found in the prophecy of Malachi, "In every place incense is offered unto my name and a pure offering; for my name is great among the Gentiles, saith the Lord of hosts" (Mal. i. 11, repeatedly quoted in early Christian writings, e.g. *Teaching of the Twelve Apostles*, c. 14; Just. Mart. *Trypho*, c. 28, 41, 116; Irenaeus iv. 17. 5).

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these. (1) It was regarded as a true offering or sacrifice; for in the *Teaching of the Twelve Apostles*, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used

to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (e.g. in the *Teaching of the Twelve Apostles*; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual LXX. word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (i.e. on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.* I. 65, 67), and implied by Clement of Rome (*Ep.* i. 44. 4).

Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ. This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal; nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has been at the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these

ideas rather confirm than disprove the persistence of those primitive conceptions themselves.

All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead. The main points in which the pre-medieval formularies of both the Eastern and the Western Churches agree in relation to the Christian sacrifice are the following. (1) It was an offering of the fruits of the earth to the Creator, in the belief that a special blessing would descend upon the offerers, and sometimes also in the belief that God would be propitiated by the offerings. The bread and wine are designated by all the names by which sacrifices are designated (*sacrificia, hostiae, libamina*, and at least once *sacrificium placationis*), and the act of offering them by the ordinary term for offering a sacrifice (*immolatio*). (2) The offering of bread and wine was originally brought to the altar by the person who offered it, and placed by him in the hands of the presiding officer. In course of time there were two important changes in this respect: (a) the offerings of bread and wine were computed for money, with which bread and wine were purchased by the church-officers; (b) the offerings were sometimes handed to the deacons and by them taken to the bishop at the altar, and sometimes, as at Rome, the bishop and deacons went round the church to collect them.<sup>1</sup> (3) In offering the bread and wine the offerer offered, as in the ancient sacrifices, primarily for himself, but inasmuch as the offering was regarded as having a general propitiatory value he mentioned also the names of others in whom he was interested, and especially the departed, that they might rest in peace. Hence, after all the offerings had been collected, and before they were solemnly offered to God, it became a custom to recite the names both of the offerers and of those for whom they offered, the names being arranged in two lists, which were known as diptychs. Almost all the old rituals have prayers to be said "before the names," "after the names." It was a further and perhaps much later development of the same idea that the good works of those who had previously enjoyed the favour of God were invoked to give additional weight to the prayer of the offerer. In the later series of Western rituals, beginning with that which is known as the *Leonine Sacramentary*, this practice is almost universal. (4) The placing of the bread and wine upon the altar was followed by the kiss of peace. (5) Then followed the actual offering of the gifts to God (*immolatio missae*). It was an act of adoration or thanksgiving, much longer in Eastern than in Western rituals, but in both classes of rituals beginning with the form "Lift up your hearts," and ending with the *Ter Sanctus* or *Trisagion*.<sup>2</sup> The early MSS. of Western rituals indicate the importance which was attached to this part of the liturgy by the fact of its being written in a much more ornate way than the other parts, e.g. in gold uncial letters upon a purple ground, as distinguished from the vermilion cursive letters of the rest of the MS. With this the sacrifice proper was concluded. (6) But, since the divine injunction had been "Do this in remembrance of me," the sacrifice was immediately followed by a commemoration of the passion of Christ, and that again by an invocation of the Holy Spirit (*epiclesis*) that He would make the bread and wine to become the body and blood of Christ. Of this invocation, which is constant in all Eastern rituals, there are few, though sufficient, surviving traces in Western rituals.<sup>3</sup> Then after a prayer for sanctification, or for worthy reception, followed the Lord's Prayer, and after the Lord's Prayer the communion.

In the course of the 8th and 9th centuries, by the operation of this proceeding an elaborate account exists in the very interesting document printed by Mabillon in his *Museum Italicum* as "Ordo Romanus I.," the small phials of wine which were brought were emptied into a large bowl, and the loaves of bread were collected in a bag.

<sup>1</sup> The elements of the form are preserved exactly in the liturgy of the Church of England.

<sup>2</sup> It is found, e.g., in the second of More's masses from the Reichenau palimpsest, and in Mabillon's *Missale Gothicum*, No. 12; it is expressly mentioned by Isidore of Seville as the sixth element in the Eucharistic service, *De offic. eccles.* i. 15.

of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connexion with the former offering, are repeated in the course of the same service in connexion with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the medieval theory of the nature of the latter. The reaction against the medieval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion. (E. H.A.)

**SACRILEGE**, the violation or profanation of sacred things, a crime of varying scope in different religions. It is naturally much more general and accounted more dreadful in those primitive religions in which cultual objects play so great a part, than in more highly spiritualized religions where they tend to disappear. But wherever the idea of sacred exists, sacrilege is possible. The word itself comes from the Lat. *sacrilegium*, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

The history of sacrilege reflects a large phase of the evolution of religion. In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation. This brings us at once into the whole field of taboo (*q.v.*). From it we pass without a break, merely narrowing the application as the conception of sacredness grew clearer and less associated with magic, into early criminal law with its physical sanctions. The Levitical code exacted of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (*Lev. v. 15, 16*). Even the gold and silver ornaments of the images of false gods were not to be coveted nor appropriated for fear of being contaminated with the curse which they could impart (*cf. Deut. vii. 25*). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most

graphic details of Old Testament history (cf. Joshua vii. 20-25).

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action. The whole wide field of Jewish taboo naturally involves sacrilege as its reverse side. Such violations of holy things as making mock of the Scriptures, or even reciting them as one would ordinary literature, was sacrilege in the eyes of the rabbi. Even imitation of the style of the Talmud has also been accounted sacrilege.

While the Roman cults were amply protected by taboos, there was no comprehensive term in Roman law for religious violations and profanations in general. *Sacrilegium* was narrowly construed as the theft of sacred things from a sacred place. Sacred things, according to Gaius, were those things that had been definitely consecrated to the gods—and so had come to partake of their holiness. Sacred places did not include private shrines. According to Ulpian the punishment for *sacrilegium* varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of *sacrilegium*, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., *sacrilegium* means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that *sacrilegium* had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacred made the crime of sacrilege in the sense of *violatio sacri* a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, &c. and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, &c. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide. The church had found in the imperial law a strong protector.

The penitentials (*q.v.*), or early collections of disciplinary canons, gave much attention to sacrilege. In the earliest of them, sacrilege in the narrower sense is not a separate class of crime, but the wider usage goes with variations through the different collections. There is also the greatest difference in the penalties assigned, reaching from little more than restitution of property to penance of one to five or even fifteen years. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. In the Pseudo-Isidore the attempt was made to include even property on which the church had merely a legal claim. The murder or injury of the clergy is also sacrilege in both penitentials and capitularies. The practice of magic, superstition, &c., are also frequently referred to as sacrilege, especially during the long struggle with German heathenism. With the definite triumph of the church, the profanation of its sanctuaries became

less frequent, and once robbery or seizure of ecclesiastical possessions or violation of its privileges tended to absorb the attention of synods and popes. Gratian's Decretum mirrors two tendencies, the church legislation with its growingly less extended application, and the wide meaning as in Justinian's Code, owing to the revival of Roman law in the 11th century. It thus was once more declared to include all violations of the divine law. A somewhat distorted, but well-substantiated use of the word *sacrilegium* in mediæval Latin was its application to the fine paid by one guilty of sacrilege to the bishop.

The penalties in the canon law included, in addition to restitution, penance, fines and excommunication; and right of asylum was denied to the culprit. The jurisdiction was something jointly shared with the temporal power in case corporal punishment were involved. The numerous enactments of councils to ensure the proper care of church property, prohibiting the use of churches for secular purposes, for the storing of grain or valuables, for dances and merry-making, do not technically come under the head of legislation against sacrilege. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX. it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the women to be branded with the letter V and imprisoned for life, or for a term. When one takes into account that the next article of the declaration decreed death for domestic theft, the legislation is not relatively cruel. Yet even in the enlightened 18th century popular fanaticism made of sacrilege the most heinous offence. The trial of La Barre in 1766 at Abbeville (see VOLTAIRE) is the most famous in modern times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for civic festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In the penal code the penalty for interfering with and molesting worshippers is slight, a fine of from 16 to 300 francs and prison from six days to three months, while damage or insult to the objects of worship brought only 16 francs to 500 francs fine, and prison from fifteen days to six months. In 1825 the reactionary parlement once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This was a crime not recognized in the penal code, which was therefore to be modified by this law. No attenuating circumstances were to be recognized, as in the general scheme of the penal code. This ferocious legislation was expressly and summarily abrogated in 1830. (J. T. S.\*)

*English Law.*—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building. Thus breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house

of Almighty God. The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship is a misdemeanour punishable by imprisonment for six months, and in the case of a male under the age of sixteen years with whipping.

(T. A. I.)

**SACRISTY** (through Fr. *sacristie*, from med. Lat. *sacristia* or *sacristina*), the term in ecclesiastical architecture given to the room or hall in a large church wherein are kept the vestments and utensils (*sacra*) used in the services and celebrations. Like the *diaconicon* in the Greek Church, it was usually situated on the north side of the chancel, but its position varies according to that of the chapter-house, as it is generally placed between the latter and the church.

**SACRO BOSCO, JOHANNES DE** [JOHN HOLYWOOD] (d. 1244 or 1256), astronomical author, studied at Oxford and was afterwards professor of mathematics at the university of Paris. He wrote a treatise on spherical astronomy, *Tractatus de sphaera*, first printed at Ferrara in 1472. This was the second astronomical work to be printed. Although recording no advance on the Arabian commentaries on Ptolemy, it gained a great reputation; twenty-four editions appeared before 1500, and at least forty between 1500 and 1647, in which year the last edition was published at Leiden. About the year 1232 he wrote *De anni ratione* or *De computo ecclesiastico* (printed editions at Paris in 1538 (?), 1550, 1572 and at Antwerp in 1547 and 1566), in which he points out the increasing error of the Julian calendar, and suggests a remedy which is nearly the same as that actually used under Gregory XIII. three hundred and fifty years later.

He also wrote *Algorismus* or *De arte numerandi*, printed in 1490 (?), in 1517 (Vienna), 1521 (Cracow), 1523 (Venice); *De astrolabio* and *Breviarum juris*.

**SADDLE** (a word common to Teutonic languages, cf. Ger. *Sattel*, Dut. *sadel*, also in Russ. *siedlo* and Lat. *sella*, for *sedla*; it is not derived directly from Lat. *sedile*, which means a chair, but all the words are to be referred to the root *sad-*, which gives Lat. *sedere*, Eng. "sit," "settle," "seat," &c.), a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins (see **SADDLERY**). The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship, or in machinery to support a rod, or in masonry (*q.v.*) the top or "apex stone" of the gable of a roof, &c.

**Saddle bars**, in architecture (Fr. *traverses*), are narrow horizontal iron bars passing from mullion to mullion, and often through the whole window from side to side, to steady the stone work, and to form stays, to which the lead work is secured. When the bays of the windows are wide, the lead lights are further strengthened by upright bars, passing through eyes forged on the saddle bars, and called stanchions. When saddle bars pass right through the mullions in one piece, and are secured to the jambs, they have sometimes been called "stay bars."

**SADDLERY and HARNESS**, two terms which embrace the whole equipment for the horse when used for riding or driving. "Harness" (O. Fr. *harnais*, mod. *harnais*, Ger. *Harnisch*, of unknown origin) was originally a general term for equipment, e.g. the body armour of a soldier. It is now usually confined to the draught horse's equipment, "saddle and bridle" being used of that of the riding horse.

Saddlery is principally a leather trade, and the craft has been established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham; the principal seat of the cheaper saddlery trade is now at Walsall. Saddler's ironmongery embraces the making of buckles, chains, stirrups, spurs, bits, hames, &c.

The "bridle" (O.E. *bridel* for *bridgel*, from *bregdan*, to pull) is the combination of straps and buckles which fits on the horse's head, the headstall, together with the bit and reins which it keeps in position. The headstall consists of the headpiece passing behind the ears and joining the head-band over the forehead, the cheek-straps run down

the head to the bit to which they are fastened; in the driving bridle the "blinkers," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-band passes round the head above the nostrils and the throat-lash from the top of the cheek-straps underneath the head. The "martingale" passes between the horse's legs with one end fastened to the girth and the other to the bridle or nose-band. It prevents the horse throwing up his head. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be divided into the "snaffle" (Du. *snael*, horse's muzzle), the "curb" and combinations of the two. The "snaffle" for the riding horse has a smooth jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and cheek-pieces of the headstall being fixed in the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse pulling the bit through the mouth. The snaffle without bars is generally termed a "bridoon." The commonest form of bit used in driving is the double-ring snaffle, in which the rings work one within the other, the headstall straps fastening to one and the reins to the other, or, if the horse is driven on the double ring, the reins are buckled to both rings. The curb-bit (Fr. *courbe*, Lat. *curvus*, bent, crooked) is one to which a curb-chain or strap is attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the cheek-bars, the leverage thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and has in the centre a "port," i.e. a raised curve allowing liberty for the tongue and bringing the pressure on the base of the horse's jaw. The curb-bit and the bridoon can be used together with separate headstalls and reins, but there are many combination bits, such as the Pelham. In this the mouthpiece, without port, is that of the snaffle bit (it may be unjointed), with the rings fixed at the junction of the mouthpiece and cheek-bars; the lower ends have rein rings as in the plain curb-bit.

FIG. 2.—Some Types of Driving Bits. (From Messrs. Champion and Wilton.)

The riding saddle is composed of the "tree," the framework or skeleton, the parts of which are the pommel or head, the projection which fits over the withers, and the side bars which curve round into the cantle or hind-bow. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, and iron or steel plates then riveted on the head and on the cantle. Linen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree should be of pig-skin; cheap saddles are made of sheep-skin stamped to imitate pig-skin. The various parts of the man's saddle are the seat, the skirt, i.e. the fold or pad of leather on either side of the head, and the hanging flaps; knee-rolls are not used as much as they were, except where roughly broken-in horses are ridden. The saddle is cut straight over the withers with a square-ended cantle, as in the hunting saddle, or cut back over the withers with a round-ended cantle, as in the polo saddle. The saddles in use on the continent of Europe still retain the high pommel and cantle and heavy knee-rolls discarded by riders trained in the British school and the hunting-field. The saddles of the East and of the Arabs keep their primitive shape, and they are really seats on which rather than on which the rider sits. The Mexican saddle, with its silver adornments and embossed leather, is a characteristic type. It has a very high padded pommel and a round-headed projecting cantle.

The lady's side-saddle when first fully developed had two heads or pommels, between which the right leg was supported, the support for the left being the stirrup. The third pommel or "leaping head," against which the left leg rests, was, it is said, invented as the result of a match between two gentlemen riders to ride a steepchase on side-saddles; the winner had provided himself this support for his left leg. At first the "leaping head" was only used in the

hunting-field and the double cow-horn was still retained; as its usefulness became apparent the second pommel practically disappeared.

Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse coach, the farm wagon, &c., or the different kinds of ornamentation that are or have been lavished upon it. The leather collar, heavily padded, passes over the head and

FIG. 3.—a, Side-saddle; b, hunting saddle; c, officer's regulation saddle (British Army). (From models made by Messrs Champion and Wilton.)

rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top by the hame-strap; they bear the traces, or straps which pass along the horse's sides and the shafts and are attached by loops slipped over hooks in the body of the carriage. Where the collar is dispensed with, the traces are attached to a breast-strap against which the horse works. This breast harness is much used for the lightly harnessed American trotting horses, and for military draught horses. The saddle pad is a narrow leather cushion girted under the belly and held in position by the crupper-dock and the crupper, a loop strap passing under the tail. The saddle supports the shafts by the back-band and its tugs and by the belly-band. The reins pass from the bit through "terrets" or rings on the hames and pad. The harness on the horse's hind-quarters consists of the breaching, passing round behind the horse and helping in backing and stopping the vehicle, the hip-strap fastened to the breeching and passing over the hind-quarters, and the kicking-strap falling across the loins and fastened to the shafts. The bearing rein, when used merely as a support to the head, or as an aid to the improvement of the paces, consists of a separate bridoon-bit with the reins passing through rings on the throat-band and thence slipped over a hook on the pad. The severer form, which brings the rein over the head-stall, keeps the horse's head up in a cramped attitude and the mouth continually working on the bit. A recent modification of the severer form is not attached to the bit.

*Historical Sketch.*—Questions as to the epoch in the history of mankind when the horse was first trained for draught and riding are for archaeologists and anthropologists to discuss (see HORSE, § History). With the domestication of the horse came the development of the bit; first a halter of hide bound the muzzle, then a stone slipped into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Robenhäuser, near Zürich which may have been bits; one is slightly curved and two knobs grooved at either end for the reins. Bits from the bronze age and the iron age can be seen in most museums showing that the forms have changed little. The Scandinavian museums are particularly rich in early remains of harness and horse-trappings. An early bronze age bit of bone with horn cheek-pieces and with holes on the upper ends for the head-stall, and on the lower ends for the reins, was found at the Corcelletes lake dwelling, and a twisted bronze bit jointed by interlocking rings with straight cheek-pieces and rings and loops for headstall and reins is in the National Museum at Zürich. In the late iron age burial of a Gaulish chief with his chariot at Somme-Bionne were found two horse's bits of the ordinary jointed snaffle type (see ARCHAEOLOGY, plate VI). A heavy snaffle unjointed bit with red and blue enamel ornamentation is illustrated in the British Museum *Guide to the Late Iron Age*. Assyrian and Babylonian monuments show the harness of the chariot horses and the bridling of the riding horse, cf. BABYLONIA AND ASSYRIA, Plate II, fig. 2.

In ancient Greece and Rome the bit and bridle were used during historic times, and allusions to riding without them refer to exhibitions of horsemanship. On Trajan's column the Numidians ride without bridles or bits, and various North African tribes trained their horses to obey their voice alone (cf. Claudian, *Epig.* i. 10, of the Gaulish *esedaris*, driving without bridle and reins). The *locus classicus* for the bridling and saddling of the Greek horse is Xenophon, *Hippias* i. 10. The Greek name for the bridle bit and reins collectively is *χάλυβας* (Lat. *frenum*), the bit proper is *ὄριον*; in Lat. *frenum* is also used of the bit itself. The headstall (*κορυβάλα*) and cheek-straps (*σφαίρια*) were richly decorated. In Homer (*Il.* iv. 142) the latter are ornamented with ivory plates stained with purple, and such have been found on the site of Troy (Schliemann, *Ilios*, 476, 631). The head-band also bore a crest (*κορυβή, crista*), and in front the *ἀμυγὴ (frontale)* might be extended down the face to serve as a defence, as in the medieval *chaufreins*. This frontal was a special subject of decoration. Of the two principal types of ancient bits, the un-

jointed and the jointed mouthpiece, the latter is the most common form. There are also other forms of bits; those with sharp points were called *lupala* (Virg. *Georg.* iii. 208). There is a Greek bit in the British Museum with revolving disks, a device which occurs in medieval bits, to give the horse something to keep turning in his mouth. The curb was also used: Xenophon distinguishes between the snaffle (*ἀσφάλας*) and the curb. The curb-strap or chain was termed *ἰσοχάλαβις* or *ψάλλων*, which, however, may mean a muzzle. A bronze bit found at Pompeii has a twisted and jointed metal mouthpiece and a plain curved bar acting as a curb-strap. The cheek-bars of the bit take a variety of forms: straight bars, circles with rays, square or oblong plaques, triangles and the swan-necked or S-shaped type are all found. In medieval times complicated and severe bits were used, and heavy bits with cruel mouth-pieces and long elaborately curved cheek-bars are still used by Arabs and the riders of Central and South America. The bit of the armed war-horse in the middle ages was sometimes provided with very long cheek-bars covered with sharp spikes to prevent the foot-soldier catching hold of the bridle (see R. Tachille and R. Forrer, *Die Pferdezeuge in ihrer Formen-Entwicklung*, 1903, for illustrations of bits from prehistoric times to the 16th century).

The saddle was not used in Egypt; the Assyrian monuments (cf. the illustration noticed above) chiefly show decorated saddle-cloths rather than any form of the saddle proper. The harness of the chariots of Egypt and Assyria are also illustrated on the monuments (see especially Sir J. G. Wilkinson, *Manners and Customs of the Ancient Egyptians*). The ancient Greeks rode bare-backed as in the Panathenaic frieze of the Parthenon or used a saddle-cloth (*ἰστίριον*, Lat. *ephippium*; *sella* as applied to a saddle is quite late). Even the saddle-cloth does not appear to have been in use till the 5th century. A 6th-century vase, found at Daphne, Lower Egypt (Flinders-Petrie and Murray, *Tenis*, 1888, ii. pl. xxix.), shows a woman riding astride on a cloth, with fully developed headstall and powerful bit. A black-figured sarcophagus, now in the British Museum, from Clazomenae, shows a long pointed *ephippium* with a chest-strap. These indicate Asiatic influence, for Daphne was an Ionian and Carian settlement of the 7th century B.C. In Xenophon (*Lc.*) we find that the saddle-cloth had been adopted by the Athenian cavalry, and from his advice as to the seat to be adopted pads or rolls seem to have been added. There were no stirrups till the time of the emperor Maurice, A.D. 602, and the rider mounted at a vault or by blocks; mounting by the spear used as a vaulting pole was also practised as an athletic feat. On a funeral monument of the time of Nero in the museum at Mainz is the figure of a horseman on a saddle-cloth with something resembling the pommel and cantle of a saddle, but the first saddle proper is found in the so-called column of Theodosius at Constantinople (usually ascribed to the end of the 4th century A.D., though it may be more than 100 years earlier), where two figures are riding on high-peaked saddles resting on embroidered saddle-cloths. In medieval times the saddle was much like that of the Oriental saddle of to-day with high peaks before and behind. In the military saddle of the 14th and 15th century the high front parts of the saddle were armoured and extended to protect the legs of the rider. The jousting saddle (cf. the example in the Tower of London) becomes almost a box into which the rider is fixed; the high cantle fits round the rider's loins and when charging he lifted himself into practically a standing position in the stirrups. The saddle for use on the road or hunting was much like the Arab saddle of to-day, and similar forms are in use in Europe and elsewhere where the British saddle has not been adopted. Women rode astride or on a pillion behind a male rider. The side-saddle is said to date from the end of the 12th century. For the harness of the ancient draught horse see CHARIOT. BIBLIOGRAPHY.—J. C. Ginzert, *Wagen u. Fahrwerke d. Griechen u. Römer*, etc. 1877; Daremberg and Saglio's *Dict. des antiquités grecques et rom.*, s. v. "Ephippium," "Frenum," &c.; Viollet-le-Duc's *Dict. rais. du mobilier français*, and the works referred to in the text. See also DRIVING, RIDING and HORSE. (C. W.)

**SADDLEWORTH**, an urban district in the Colne Valley parliamentary division of the West Riding of Yorkshire, England, 14 m. N.E. of Manchester, on the London & North Western railway. Pop. (1901) 12,320. It lies on the western side of the elevation of Stanedge, which here forms the watershed between streams flowing westward to the Irish Sea and eastward to the North Sea. Early earthworks and tumuli are numerous in the locality. The Huddersfield canal follows the valley, and, like the railway, is carried under Stanedge by a long tunnel.

**SADDUCEES**, a sect or party of the Jews mentioned in the historical books of the New Testament (with the exception of the fourth Gospel), by Josephus, and in the Talmud. According to all the authorities, the essential qualification for the title is the denial of certain beliefs which the Pharisees held to be implicitly contained in Scripture, and therefore necessarily part of Judaism as soon as they were formulated. From their own point of view they were orthodox conservatives, so far as they really cared to remain—for whatever reason—within the pale of Jewry and

to justify their presence there. From the standpoint of the Pharisees who championed the hope of everlasting life and believed in the existence of angels, through whom God could communicate with men, they were infidels. As the Pharisees accumulated the oral tradition which was afterwards codified and elaborated or preserved by fragments, which served some useful purpose, in the Talmud and other Rabbinic writings, the Sadducees acquired concrete regulations to oppose so long as they dared. The Pharisees even improved upon the Temple ritual, and their popularity enabled them to force the Sadducees into adopting the improvements.

But though some of those who bore the title may be reckoned at their best as orthodox conservatives, their position was, as far as our mainly Pharisaic authorities permit us to learn, merely negative; and all the information we possess, whether it rests on facts or on prejudice, points to their close affinity with the Jews who renounced their faith altogether and advertised the fact—say by habitual and unwarranted breach of the Sabbath, for example. In fact, broadly speaking, the Sadducees for the period during which they are reported to exist, represent and embody the tendency to conformity with neighbouring Gentiles, which is deplored and denounced by Jewish writers from Moses to Philo. And there is this to be said that idolatry may be an outward symbol of a real indebtedness to idolaters which is not necessarily wiped out when the tangible idols are smashed. Idolatry is plainly incompatible with the law of Moses: so were Greek caps; but the Jews who conformed to Hellenism in the time of Antiochus Epiphanes acquired much that was conserved and utilized in that great attempt to convert the Greek world to Judaism, whose best monument is the works of Philo. The process is normal: first, there is an unqualified adoption of a foreign culture by the Sadducees of the time being; then, after unqualified opposition, the Pharisees of the time admit whatever is admissible within the four corners of the Law and are confronted by other Sadducees who have not followed the first into temporary or permanent separation from the existing Jewish way of life and absorption in the immediate foreign environment, and who, therefore, will have none of the current innovations which the Pharisees have in course of time selected as capable of assimilation and reconciliation with the existing body of growing doctrine and practice. The Jews spoiled the Egyptians: some made a golden calf and worshipped it: others destroyed it and turned the spoils into vessels for the sanctuary: some again sighed for the fleshpots of Egypt, if they did not actually return thither.

The controversies of the Pharisees and Sadducees afford a typical example of this process. With the approval of Antiochus Epiphanes, the Sadducean section embraced the outward forms of Hellenism, and out of the persecution of the orthodox which followed was born the hope of a future life which was in the circumstances the necessary corollary of God's righteousness and was discovered to be latent in Scripture. Later Sadducees, who actually bore the name, resisted this and all the characteristics of the Pharisees and continued to flatter the predominant foreigner—Greek or Roman—by imitating him with less reckless bravado than the first Hellenizers and with growing assurance. They were men of the world, and men of *this* world, and, so far as they still professed and practised Judaism, they preferred to repudiate the additions for which they felt no need, but which had entered into the faith of their fathers. The Pharisees, who pruned and fed the tree of Judaism so that it might bear fruit for the healing of the Nation—and the nations in the latter days—gave them the opportunity of posing as the champions of the primitive standards. But, though the reformers thus played into the hands of the Sadducees, the people were not deceived by the badge which Sadducean priests adopted and paraded to save their faces: they loved the Pharisees and were ready to go to death at their bidding. The Sadducees were the hypocrites of the Jewish world, just as the Epicureans were the hypocrites of the Greek world. The rest of the Jews rated the Sadducees as atheists, just as the rest of the Greeks rated the Epicureans as atheists and discerned, as Plutarch said, the sardonic grin

behind the mask of their obsequious devotion to the ceremonies at which the force of public opinion compelled their attendance. The Sadducee was a Jew outwardly so long as he so retained place, power and profit. The destruction of Jerusalem, long before it was consummated in A.D. 70, robbed them of the place and nation which alone compensated them for the inconveniences of their nominal allegiance. They knew well enough the power of invincible Rome; and her advance warned them to take themselves and their talents to the market of the wide world, to which in heart and mind they had always belonged.

Josephus (*Ant.* xiii. 5. 9, §§ 171-173, Niese) introduces the Sadducees along with the Pharisees and Essenes in his account of Jonathan's reign (161-143 B.C.) as the third of the sects of the Jews, and defines their tenets thus: "They deny the existence of God (Josephus says 'Fate,' as he is speaking to pagans) and the Divine government of human affairs; and they assert that everything lies in our power; so that we are responsible for our good or bad fortune." Similarly, in the earlier history of the Jewish War (ii. 8. 14, §§ 164-166, Niese) to which he refers, he says: "The Sadducees do away with Destiny altogether and set God beyond the possibility of punishing or supervising men. They assert that man is free to choose good or evil since both are set before him, and that he receives good or evil according to his choice. They deny the immortality of the soul and the punishments and rewards of Hades. In contrast with the mutual friendliness and loyalty of the Pharisees, their behaviour towards one another is lacking in courtesy, and when they mix with their fellow-countrymen, they are as offhanded as if their fellows were aliens." Josephus might have added that they were disposed to treat aliens as they should have treated their friends.

In the New Testament there is already a tendency to ignore the Sadducees and to transfer to the surviving and active sect of the Pharisees denunciations addressed to hypocrites. The feud which set Pharisee and Sadducee against one another is ignored, and generally the condign oblivion which overtook this sect of the Jews is already beginning. The Christian Fathers seem to confound them with the Samaritans, and the confusion is natural enough. The Sadducees were as little loyal to the Judaism of Jerusalem as the Samaritans—and they were less sincere and less interested in religion.

The Talmud reports ancient controversies on points of law; and gives the Sadducees a founder, Zadok the disciple of Antigonus the man of Socco who prohibited the hope of reward for service done to God. But this explanation of the name is as worthless as the rest of the Talmudic accounts of the Sadducees who were already dead and gone. For the present the explanation put forward by A. E. Cowley (*Ency. Bib.* 4236) holds the field: a Persian word *Zandik* meaning *Zoroastrian*, and therefore infidel in the mouths of those who did not hold with Zoroaster, was applied to them by their opponents, and gradually altered so as to mean something in Hebrew—*i.e.* *Zadokite* or *Righteous*. Its acquired significance could be varied by the inflexion of the voice or the suggestion of inverted commas.

Schürer (*Geschichte des jüdischen Volkes*, ii., 4th ed., pp. 447-456, 475-489) gives the evidence of the ancient authorities and references to modern studies of the subject. See also Jews. (J. H. A. H.)

**SADE, DONATIEU ALPHONSE FRANÇOIS, Count** [usually called the **MARQUIS DE SADE**] (1740-1814), French licentious writer, was born in Paris on the 2nd of June 1740. He entered the light-horse at fourteen and saw considerable military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be recommitted as incurable in 1803. He died there on the 2nd of December 1814. Among his works, all of the type indicated, were *Justine* (1791), *Juliette* (1792), *Philosophie dans le boudoir* (1793) and *Les Crimes de l'amour* (1800). The word *Sadism*, meaning a form of sexual perversion, is derived from his name.

**SÁ DE MIRANDA, FRANCISCO DE** (1485-1558), Portuguese poet, was the son of a canon of Coimbra belonging to the ancient and noble family of Sá, and passed his early years by the banks of the river Mondego, the source of inspiration to poets in every age. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon University, beginning at the same time to frequent

the court. Verse-making and gallantry occupied much of his time there, and by virtue of his talents and name he became one of a group comprising the greatest nobles and most celebrated poets of the age, including Bernardim Ribeiro and Christovão Falcão, who surrounded the beautiful and gifted D. Leonor de Mascarenhas. He seems to have resided for the most part in the capital down to 1521, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516. Honoured by the friendship of Prince John (afterwards John III.), he accompanied the court as it moved from place to place during the reign of King Manoel, and witnessed the triumphs of the Fortunato Monarch; and at a time when the flag of Portugal floated victorious in every sea and her ships encircled the globe, it was not surprising that the youthful poet should aspire to be the Virgil of a new Augustus ruling a universal monarchy. His studious and reflective mind and sound sense did not allow him, however, to nourish these illusions for long, and we find him pointing out in tones of prophetic melancholy the signs of decadence and future disaster. He had come out of the university so good a lawyer that he was able to act as *ad interim* professor of his faculty, and he was offered a judicial post, but his independent spirit and punctilious conscience led him to refuse it. He had only embarked on a legal career to please his father, and on the latter's death he abandoned law for moral and stoic philosophy and poetry, and resolved to travel. He had observed with regret the modest intellectual position of his country, for all her wealth and epic achievements, the latter of which had found no echo in poetry; and if he were to learn and be able to introduce new forms of art fed by fresh ideals, as he desired, he felt he must go abroad. The *Cancioneiro de Resende*, which represented the poetical efforts of courtiers for almost a century and contained Miranda's early verses, showed the extent of the national poverty by its artificiality, and lack of ideas, of sincerity and of good taste. These defects are not surprising, seeing that during most of that long period the literary movement had been confined to court circles and had remained essentially imitative of Spanish models, with hardly a vestige of national or popular inspiration about it. Portugal had been too busy building up a world-empire to imbibe much of the mental culture of the Renaissance, and even the classics were for the most part only known through Spanish translations. Direct intercourse between Portugal and Italy partook of a commercial rather than a literary or artistic character, and, previously to Miranda's journey, Italian poetry was practically unknown.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily "with leisure and curiosity." He enjoyed intimacy with Giovanni Rucellai, Lattanzio Tolomei and Sanazarro; he saluted the illustrious Vittoria Colonna, a distant connexion of his family, and in her house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He assisted at the rebirth of the Italian drama and saw the performance of classical prose comedies, a form of art which he was to transplant to Portugal. Lastly he heard the echoes of the Protestant revolt, and witnessed with horror the dissolution of morals which prepared the way for the Reformation.

Returning home in 1525, he brought with him the sonnet and canzone of Petrarch, the tercet of Dante, the *ottava rima* of Ariosto, the eclogue in the manner of Sanazarro, and Italian endecasyllabic verse. He did not, however, like his disciple Antonio Ferreira (*q.v.*), abandon the national *redondilha*, but rather continued to employ it and carried it to perfection in his *Cartas*. Settling down in Coimbra or its environs, he lived there from 1526-1527 until 1532. The visit of King John III. and his court to the city enabled him to resume his old relations with the reigning house and the cultivated members of the nobility, who received him affably and listened with interest to the story of his Italian tour. Gil Vicente, the court dramatist, was then at the height of his fame, but his *autos* appeared poor things to Sá de Miranda as compared with the comedies he had seen in Italy; and urged by his friends to present an example of the new style, he wrote the *Estrangeiros*. Produced in 1527-1528, it was

the first Portuguese prose comedy, and was composed on the lines of the classical Roman drama as modified by contemporary Italian authors like Ariosto; it had a great and immediate success, notwithstanding the opposition of the partisans of the popular auto, who saw themselves attacked in the prologue. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzone entitled *Fábula do Mondego*, and in 1530-1532 he followed it up with the eclogue *Aleixo*, which among its *redondilhas* has some endecasyllables—the earliest attempt at *ottava rima* in Portuguese. Various sonnets dedicated to friends also belong to this period. The foundations of the Italian school were now laid, and henceforth Miranda's reputation as a poet grew visibly, while he was also one of the most esteemed of courtiers; but the opposition of his literary foes increased with his very success. Moreover, in the sphere of politics pessimism had taken firm hold of him. From being a land of promise, India had become for him, as for Camoens, "the mother of villains, the stepmother of men of honour"; and though the wealth of the East poured into Lisbon, Portugal remained poor because agriculture was neglected and corn had to be imported from abroad. Miranda protested in vigorous terms against the fever of adventure and lust of gold, but few gave ear to his moralizings or had leisure to read poetry, and in 1534 he left the court.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue *Basto*, in the form of a pastoral dialogue written in *redondilhas*, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The shepherds Gil and Bento represent, the one city sociability, the other rustic aloofness, or the contrast between life at court and in the country, and serve as a vehicle for the poet's ideas. The same epoch saw the composition of his *Cartas* or sententious letters in *quintilhas*, which, with *Basto* and his satires, make up the most original, if not the most valuable, portion of his legacy, and served as models for two centuries. His allusion in *Aleixo* to the exile of Bernardim Ribeiro, and his defence of his friend, seem to have offended that powerful grandee, the count of Castanheira, and probably hastened his retirement from court, and the royal gift of a Commenda of the Order of Christ, situate by the river Neiva on the borders of Galicia, came opportunely, because the rents Sá de Miranda drew from it and a small private fortune enabled him to live in modest comfort at the neighbouring Quinta da Tapada. Poetry with him was never a mere pastime, and, after a short period of repose, the gift of a MS. of the verses of Garcilasso and Boscan, founders of the Italian school in Castile, encouraged him to resume the work of reform commenced at Coimbra; between 1535 and 1538 he composed five eclogues in endecasyllables, four in Spanish and one in Portuguese, which show evident traces of their influence.

Before long he heard echoes of his new song, first from the province, then from the court. In 1536 he married D. Brioljanja de Azevedo, a lady of rare qualities and education, belonging to an illustrious Minho family. He spent the rest of his life in retirement at the Quinta da Tapada, which became a centre from which the reform of Portuguese poetry spread; for he developed great poetical activity in his retreat, and while he read and annotated Homer in the original Greek, he did not disdain domestic pleasures and country sports. His evenings were occupied by music and the performance of comedies and mimes, and by readings of Bembo and Ariosto with cultivated neighbours; and he extended hospitality to savants like Nicholas Cleynarts and Francisco de Hollanda, and launched on the career of letters such men as Diogo Bernardes, the author of the *Lima*.

In 1538 he wrote his second classical prose comedy, the *Vilhalpandos*, which was played before the Cardinal Infant Henry, afterwards king, at his request, and on the poet's death that prince saw to the printing of this and the earlier comedy. During the years 1543 to 1553, except for a few occasional poems Sá de Miranda kept silence, and the cause is not far to seek; the Inquisition had got to work, and the Jesuits had acquired control of the university and displaced the humanists. When

the king and court lent their presence to *entos da fé* and organized public penances, initiating a reign of fanaticisms and sadness, there was no place for poetry. Sá de Miranda could only deplore in private the misfortunes of his country and devote himself to polishing his verses and educating his children. His life's work was done, for the year 1550 saw Camoens writing his admirable sonnets, cançons and elegies, and the Italian school had definitely triumphed. The last eight years of Sá de Miranda's life produced a cycle of beautiful poems evoked by the personality of Prince John, the heir-apparent, who loved letters and especially poetry, and whose precocity of talent made him the hope of all patriots. In 1550 and 1551, after the prince's visit to the university of Coimbra, he honoured the master by asking for a collection of his poems, and on three occasions we find the latter despatching portions of his song-book to Lisbon accompanied by dedicatory sonnets. Moreover, he had the further gratification of receiving verses from Antonio Ferreira, Jorge de Montemayor, Diogo Bernardes, and André Falcão de Resende, which were so many proofs of the vitality of his school. Three misfortunes, however, came on him in quick succession. He lost his eldest son in 1553, Prince John died in 1554, and in 1555 his wife died. His friend King John III. passed away in 1557, and on the 15th of March 1558 Sá de Miranda followed him to the grave.

He was not a great writer and never entered into the hearts of his countrymen, remaining the poet of the cultured, who could understand him and pardon his metrical imperfections. He led the way, however, in a revolution in literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He is obviously not at ease in the new forms which he had introduced, and his verse is, as a rule, austere, unharmonious and often difficult of understanding, but these remarks do not, of course, apply to his *redondilhas*. Some of his sonnets are, however, admirable, and display a grave tenderness of feeling, a refinement of thought, and a simplicity of expression which give them a high value. As examples it is only necessary to mention the one beginning "O sol he grande . . .," and the lines he composed on the death of his wife. Sá de Miranda wrote much and successfully in Castilian, several of his best eclogues being in that language. The charm of these compositions lies in their convincing descriptions of natural scenery and country life, which he loved and comprehended to perfection.

Sá de Miranda's works were first published in 1595, but the admirable critical edition of Madame Michélis de Vasconcellos (Halle, 1885), containing life, notes and glossary, supersedes all others so far as the poems are concerned. His plays can best be read in the 1784 edition of the collected works. No modern or critical edition is available. See also Oswald Crawford, *Portugal Old and New* (London, 1880); Dr Sousa Viterbo, *Estudos sobre Sá de Miranda* (3 parts, Coimbra, 1895-1896); Decio Carneiro, *Sá de Miranda e a sua obra* (Lisbon, 1895); and Dr Theophilus Braga, *Sá de Miranda* (Oporto, 1896).

**SADHU**, a Hindu ascetic, corresponding to the Mohammedan fakir (q.v.). The Sadhus, who are known also as Sanyasis, Gosains and Bairagis, are of various sects, hold peculiar opinions, indulge in strange practices, and subject themselves in many cases to cruel hardships and fantastic disciplines. They range in moral standing from the peripatetic philosopher to the idle vagabond. Some lead the life of contemplation, which Hindus consider especially holy; others pose as alchemists, physicians, fortune-tellers, palmists or acrobats; while others yet again practise voluntary tortures, such as holding one arm upright until it withers, or lying continually upon a bed of spikes. Some go about almost naked, or smeared all over with ashes; but the usual garment of an ascetic is stained an orange red with ochre. Hence was derived the colour of the Mahratta flag. Alone among Hindus their dead are buried instead of being burned, usually in a sitting posture, and often in salt. During the disturbed period of Indian history, before British rule was firmly established, armed bodies of Sanyasis or Gosains attached themselves to the Mahratta armies, and also ravaged Northern Bengal in the time of Warren Hastings.

**SA'DI** (c. 1184-1292). MUŞLIH-UDDİN, or more correctly MUŞARRIF-UDDİN b. MUŞLIH-UDDİN, the greatest didactic poet and the most popular writer of Persia, was born about

1184 (A.H. 580) in Shiraz. After the premature death of his father he was taken under the protection of Sa'd b. Zengi, the atâbeg of Fars, who sent him to pursue his studies in the famous medreseh of Baghdâd, the Nizâmiyya, where he remained about thirty years (1196-1224). About 1220 (A.H. 606) his literary fame had spread as far as Kashgar in Turkistan, which the young poet (who in honour of his patron had assumed the name of Sa'di) visited in his twenty-sixth or twenty-seventh year. After mastering all the dogmatic disciplines of the Islamic faith he turned his attention first to practical philosophy, and later on to the more ideal tenets of Sufic pantheism, under the spiritual guidance of the famous sheikh Shihâb-uddin Umar Suhrawardî (died 1234; A.H. 632). Between 1220 and 1225 he paid a visit to a friend in Isfahan, went from there to Damascus, and returned to Isfahan just at the time of the inroads of the Mongols, when the atâbeg Sa'd had been deposed by the victorious Khwarizm ruler of Ghiyâs-uddin (1226). Sadly grieved by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa'di quitted Shiraz and entered upon the second period of his life—that of his wanderings (1226-1256). He proceeded via Balkh, Ghazni and the Punjab to Gujârât, on the western coast of which he visited the famous shrine of Siva in Somnath. After a prolonged stay in Delhi, where he learnt Hindûstâni, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. Thence he directed his steps towards Syria and lived as a renowned sheikh for a considerable time in Damascus, which he had once already visited. There and in Baalbek he added to his literary renown that of a first-rate pulpit orator. Specimens of his spiritual addresses are preserved in the five homilies (on the fugitiveness of human life, on faith and fear of God, on love towards God, on rest in God and on the search for God). At last, weary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa'di, unable to live with his quarrelsome wife, set out on fresh travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his seventieth year did he return to Shiraz (about 1256; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abûbâkr b. Sa'd, the son of his old patron (1226-1260; A.H. 623-658), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Şûfic contemplation and poetical composition. He died at Shiraz in 1292 (A.H. 691) according to Hamdallah Mustaufi (who wrote only forty years later), or in December 1291 (A.H. 690), at the age of 110 lunar years.

The experience of the world gained during his travels, his intimate acquaintance with the various countries he had visited, his insight into human character, together with an inborn loftiness of thought and the purest moral standard, made it easy for Sa'di to compose in the short space of three years his two masterpieces, which have immortalized his name, the *Bûstân* or "Fruit-garden" (1257) and the *Gulistân* or "Rose-garden" (1258), both dedicated to the reigning atâbeg Abû Bekr. The former, also called *Sa'di-nâme*, is a kind of didactic epopee in ten chapters and double-rhymed verses, which passes in review the highest philosophical and religious questions, not seldom in the very spirit of Christianity, and abounds with sound ethical maxims and matchless gems of transcendental speculation. The latter is a prose work of a similar tendency in eight chapters, interspersed with numerous verses and illustrated, like the *Bûstân*, by a rich store of clever tales and charming anecdotes; it discusses more or less the same topics as the larger work, but has acquired a much greater popularity in both the East and the West, owing to its easier and more varied style, its attractive

lessons of practical wisdom, and its numerous *bons mots*. But Sa'di's *Diwān*, or collection of lyrical poetry, far surpasses the *Būstān* and *Gulistān*, at any rate in quantity, whether in quality also is a matter of taste. Other minor works are the Arabic *qaṣidas*, the first of which laments the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 656); the Persian *qaṣidas*, partly panegyric, partly didactical; the *marthi*, or elegies, beginning with one on the death of Abū Bekr and ending with one on the defeat and demise of the last caliph, Mostā'sim; the *mulaṃmā'āt*, or poems with alternate Persian and Arabic verses of a rather artificial character; the *tarjī'āt*, or refrain-poems; the *ghazals*, or odes; the *ṣāhibiyyah* and *muḃalla'āt*, or moral aphorisms and epigrams; the *rubā'iyyāt*, or quatrains; and the *mufradāt*, or distichs. Sa'di's lyrical poems possess neither the easy grace and melodious charm of Ḥāfiẓ's songs nor the overpowering grandeur of Jelālud-din Rūmī's divine hymns, but they are nevertheless full of deep pathos and show such a fearless love of truth as is seldom met with in Eastern poetry. Even his panegyrics, although addressed in turn to almost all the rulers who in those days of continually changing dynasties presided over the fate of Persia, are free from that cringing servility so common in the effusions of Oriental encomiasts.

The first who collected and arranged his works was 'Alī b. Ahmad b. Bisutūn (1326-1334; A.H. 726-734). The most exact information about Sa'di's life and works is found in the introduction to Dr W. Bacher's *Sa'di's Aphorismen und Sinngedichte (Ṣāhibiyyah)* (Strasbourg, 1879; a complete metrical translation of the epigrammatic poems), and in the same author's "Sa'di Studien," in *Zeitschrift der morgenländischen Gesellschaft*, xxx. pp. 81-106; see also H. Ethé in *W. Geiger's Grundriss der iranischen Philologie*, ii. pp. 292-296, with full bibliography; and E. G. Browne, *Literary History of Persia*, pp. 525-539. Sa'di's *Kulshyāt* or complete works have been edited by Harrington (Calcutta, 1791-1795) (with an English translation of some of the prose treatises and of Daulat Shah's notice on the poet, of which a German version is found in Graf's *Rosengarten* (Leipzig, 1840 p. 229 sq.)); for the numerous lithographed editions, see *Rieu's Pers. Cat. of the Brit. Mus.* ii. p. 596. The *Būstān* has been printed in Calcutta (1810 and 1828), as well as in Lahore, Cawnpore, Tabriz, &c.; a critical edition with Persian commentary was published by K. H. Graf at Vienna in 1850 (German metrical translations by the same, Jena 1850, and by Schlechta-Wesserd, Vienna, 1852); English prose translations by H. W. Clarke (London, 1879), and Ziauddin Gulam Moheiddin (Bombay, 1889); verse by G. S. Davie (1882); French translation by Barbier de Meynard (Paris, 1880). The best editions of the *Gulistān* are by A. Sprenger (Calcutta, 1851) and by Platts (London, 1874); the best translations into English by Eastwick (1852) and by Platts (1873); the first four *bābs* in prose and verse by Sir Edwin Arnold (1899); into French by Delémery (1858); into German by Graf (1846); see also S. Robinson's *Persian Poetry for English Readers* (1883), pp. 245-366. The *Pandnāmāh*, or book of wisdom (of doubtful genuineness) has been translated by A. N. Wollaston (1908), with Persian text. Select *qaṣidas*, *ghazals*, elegies, quatrains and distichs have been edited, with a German metrical translation, by Graf, in the *Z.D.M.G.* ix. p. 92 sq., xii. p. 82 sq., xiii. p. 445 sq., xv. p. 541 sq. and xviii. p. 570 sq. On the Sūfic character of Sa'di in contrast to Ḥāfiẓ and Rūmī, comp. Ethé, "Der Sūfismus und seine drei Hauptvertreter," in *Morgenländische Studien* (Leipzig, 1870), pp. 95-124. (H. E.)

**SADIYA**, the extreme north-east frontier station of British India, in the Lakhimpur district of Eastern Bengal and Assam. It stands high on a grassy plain, nearly surrounded by forest-clad mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. On the opposite bank a railway has recently been opened which connects with the Assam-Bengal line. Sadiya is garrisoned by detachments of native infantry and military police, and is the base of a chain of outposts. There is a bazaar, to which the hill-men beyond the frontier—Mishmis, Abors and Khamtis—bring down rubber, wax, ivory and musk, to barter for cotton-cloth, salt, metal goods, &c.

**SADLER, MICHAEL THOMAS** (1780-1835), English social reformer and economist, was born at Nelsdon, Derbyshire, on the 3rd of January 1780. Settling down in business in Leeds in 1800, he early took an active part in political life, devoting himself particularly to the administration of the poor law. In 1828 he wrote *Ireland: its Evils and their Remedies*, in which he advocated a poor-law, and a tax on absenteeism. He also took a share in the Malthusian controversy, writing *The Law of Population: a Treatise in Disproof of the Super-secundity of*

*Human Beings and developing the Real Principle of their Increase* (1830). He entered parliament in 1829 as member for Newark, and devoted his efforts to questions of social reform. He took a leading part in the agitation for the prevention of child labour in factories—he was chairman of the committee appointed to inquire into the subject. He contested Leeds after the Reform Bill of 1832 (Aldborough, for which he had sat after Newark, being deprived of its member), but was defeated by Macaulay. In 1834 he was unsuccessful at Huddersfield, and failing health prevented any further attempts to re-enter parliament. He settled down in Belfast, where his firm had business interests, and died at New Lodge on the 29th of July 1835.

See R. B. Seeley, *Memoirs of M. T. Sadler* (1842).

**SADLER** (or **SADLER**), **SIR RALPH** (1507-1587), English statesman, the son of Henry Sadler, steward of the manor of Cilney, near Great Hadham, Hertfordshire, was born at Hackney, Middlesex, in 1507. While a child he was placed in the family of Thomas Cromwell, afterwards earl of Essex, whose secretary he eventually became. Between 1525 and 1529 his patron's letters are full of Sadler's name in connexion with Cardinal Wolsey's suppression of the monasteries; this probably brought him under the king's notice, for in 1536 he was made gentleman of the privy chamber, and from that time was continually employed by Henry VIII. In 1537 Sadler went first to Scotland to try to reconcile Margaret to her son King James V., and then to France on the same mission to James himself. He seems to have been successful, and was again in Scotland in 1540 trying to induce the king to follow his uncle's ecclesiastical policy. In or about January 1540, he was made secretary of state along with Sir Thomas Wriothesley, and was knighted, probably about the same time. On James V.'s death Sadler again went to Scotland (March 1543) to negotiate a marriage between prince Edward and his cousin Mary; he was unsuccessful, but still retained Henry's confidence. On Henry's death in 1547, Sadler was by his will made one of the councillors to the sixteen noblemen entrusted with the young king's guardianship. In the same year he was appointed treasurer to the army sent to Scotland, and for his services in rallying the repulsed cavalry at the battle of Musselburgh or Pinkie, he was created a knight-banneret. He also received many grants of land, including the manor of Standon in Hertfordshire, where he built a magnificent house in 1546. When Mary ascended the throne he retired, living quietly till Elizabeth's accession. He issued the writs for the privy council meeting at Hatfield on the 20th of November 1558, and during the first year of the queen's reign he once more became a privy councillor. He sat in the parliament of January 1558-1559 as member for Hertford, which he had already represented in 1541, 1542 and 1553. Not long afterwards his strong Protestant sympathies and his acquaintance with Scotch affairs induced Elizabeth to send him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he was largely instrumental in bringing about the treaty of Leith, July 6th, 1560. In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English Commissioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connexion with Mary's captivity, and was frequently sent with messages to her. On the 25th of August 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury was allowed to resign his guardianship of the Queen, Sadler was appointed to succeed him. In September Mary was removed from Sheffield to Wingfield and thence early in 1585 to Tutbury. In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. He is said by some to have been sent to Scotland to announce to James VI. his mother's death, but this is not corroborated by the state papers. On the 30th of March 1587 Sadler died at Standon, and was buried in the church there. He had married about 1534 Elizabeth Mitchell,

whose first husband Matthew Barre had deserted her and was believed to be dead. Barre, however, re-appeared a few years later, and Sadler then obtained an act of parliament legitimizing his children. Sadler was not a brilliant statesman, but a most faithful and intelligent servant. His letters, particularly those on Scottish affairs, are most interesting.

Arthur Clifford, with a memoir by Sir Walter Scott (Edinburgh, 1809, 3 vols.); article by N. H. N. in *Gentleman's Magazine* for March 1835; J.-M. Cussans, *Hist. of Hertfordshire* (1870-1873, 3 vols.); *Memoir of the Life and Times of Sir R. Sadler*, by F. Sadleir Stoney (1877); *Life and Letters of Thomas Cromwell*, by R. B. Merriman (Oxford, 1902, 2 vols.).

**SADO**, an island belonging to Japan, lying 32 m. W. of Niigata, on 38° N., 138° 30' E. It has a circumference of 130 m., an area of 336 sq. m. and a population of 113,000. The port is Ebisa, on the east coast; and at a distance of 164 m., near the west coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous. They have been worked from very early times. Sado consists of two parallel hill ranges separated by a lower isthmus; the loftiest peak is that of Kimpokuzan (3815 ft.), to the north of Aikawa.

**SADOLETO, JACOPO** (1477-1547), Italian humanist and churchman, was born at Modena in 1477, and, being the son of a noted jurist, was designed for the same profession. He gave himself, therefore, to humanistic studies and acquired reputation as a Latin poet, his best-known piece being one on the group of Laocoon. Passing to Rome, he obtained the patronage of Cardinal Carafa and adopted the ecclesiastical career. Leo X. chose him as his secretary along with Pietro Bembo, and in 1517 made him bishop of Carpentras. Sadoleto had a remarkable talent for affairs and approved himself a faithful servant of the papacy in many difficult negotiations under successive popes, especially as a peacemaker; but he was no bigoted advocate of papal authority, and the great aim of his life was to win back the Protestants by peaceful persuasion—he would never countenance persecution—and by putting Catholic doctrine in a conciliatory form. Indeed his chief work, a *Commentary on Romans*, though meant as a prophylactic against the new doctrines, gave great offence at Rome and Paris. Sadoleto was a diligent and devoted bishop and left his diocese with reluctance even after he was made cardinal (1536). His piety and tolerant spirit, combined with his reputation for scholarship and eloquence and his diplomatic abilities, give him a unique place among the churchmen of his time. He died in 1547.

His collected works appeared at Mainz in 1607, and include, besides his theologico-irenic pieces, a collection of *Epistles*, a treatise on education (first published in 1533), and the *Phaedrus*, a defence of philosophy, written in 1538. The best collection is that published at Verona (1737-1738); it includes the life by Fiordibello. See also Péricaud, *Fragments biographiques sur Jacob Sadoleto* (Lyons, 1849); Joty, *Étude sur Sadoleto* (Caen, 1857); Balan, *Monumenta*, vol. i. (Innsbruck, 1885); Rochini's edition of the letters (Modena, 1872).

**SADOLIN, JÜRGEN** (c. 1499-1559) Danish reformer, the son of Jens Christensen, a curate and subsequently a canon of Viborg cathedral, and consequently, in all probability, born (c. 1499) out of wedlock, as his Catholic opponents frequently took care to remind him. He himself never used the name Sadolinus, which seems to have been invented subsequently by his son Hans, and points to the fact that the family were originally saddle-makers. We first hear of him on the 1st of December 1525, when Frederick I. permitted him to settle at Viborg to teach young persons of the poorer classes "whatever might be profitable." On this occasion he is described as "magister" and no doubt got his degree abroad, where he seems to have been won for the Reformation. He sided with Hans Tausen when the latter first began to preach the gospel at Viborg, and Tausen, though himself only in priest's orders, shortly before he left the place, ordained Sadolin (1529). Amongst "the free priests" who attended the *herredag* of Copenhagen in 1530 Sadolin occupied a prominent place. Frederick subsequently transferred him to Funen, where he acted, according to his own expression, as "adjutor in verbo" to Knud

Gyldenstjerne, bishop of Odense. At the diocesan council held on the 27th of May 1532, during the absence of the bishop, he presented to the assembled priests a translation of Luther's catechism, with Luther's name omitted, preceded by an earnest plea in favour of a better system of education and a more practical application of the Christian life, which occupies a conspicuous place in the literature of the Danish Reformation. In the following year Sadolin published the first Danish translation of the Confession of Augsburg. He disappears during the troublous times of "C-revens Fejde" (1533-1536), though we get a glimpse of him at the end of 1536 as one of the preachers at *Vor Frue Kirke*, the principal church of Copenhagen. On the 2nd of September 1537 he was consecrated by the German reformer, Johann Bugenhagen, who himself only had priest's orders, superintendent, or first evangelical bishop, of Funen. As bishop he was remarkable for the success with which he provided the necessary means for the support of churches, schools and hospitals in his widespread diocese, which had been deprived of its usual sources of income by the wholesale confiscation of church property. Towards the Catholics he adopted a firm, but moderate and reasonable, tone, and his indulgence towards the monks in St Knud's cloister drew down upon him a fierce attack from the Puritan clergyman of Odense, who absurdly accused him of being a crypto-Catholic. He gave the funeral oration over Christian III. in St John's Church at Odense in February 1559, though now very infirm and blind, and died at the end of the same year.

See Bricks, *Dansk Biografisk Lx. Art. Sadolin* (Copenhagen, 1887).

**SADOWA** (Czech, *Sádová*), a village of Bohemia, Austria, 4 m. N.W. of Königgrätz. Pop. (1900) 183, exclusively Czech. Sadowa, with the small adjoining wood, was one of the principal and most hotly contested Prussian positions in the decisive battle now usually called by the name of *Königgrätz* (see SEVEN WEEKS' WAR).

**SAEPINUM** (mod. Altilia, near Sepino), a Samnite town 9 m. S. of the modern Campobasso, on the ancient road from Beneventum to Corfinium. It was captured by the Romans in 293 B.C. The position of the original town is on the mountain far above the Roman town, and remains of its walls in Cyclopean masonry still exist. The city walls (in *opus reticulatum*) of the Roman town were erected by Tiberius before he became emperor, the date (between 2 B.C. and A.D. 4) being given by an inscription. Within them are remains of a theatre and other buildings, including temples of Jupiter and Apollo, and there still exists, by the gate leading to Bovianum, an important inscription of about A.D. 168, relating to the *tractura* (see APULIA) in Roman days, forbidding the natives to harm the shepherds who passed along them (*Corp. inscr. Lat. ix. 2438*).

See L. Fulvio in *Not. degli scav.* (1878), 374.

**SAETERSDAL**, a district in the south of Norway, comprising the valleys of the Otter river and its tributaries. The river rises in the fields above the Bukken Fjord, and flows south to Christiansund. The natives preserve old customs and an individual costume. A railway follows the valley to Byglands Fjord (48 m.), on the lake of that name, fostering the local agricultural and timber trade, and a driving road continues to Viken i Valle from which bridle-paths lead to Daen in Telemarken, and over the Enden and Malen fjelds to Lake Suldal on the Bratlandsdal route.

**SAFED KOH** ("white mountain"), in many respects the most remarkable range of mountains on the north-west frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the south-east to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual conformation of frontier ridge and valley. The highest peak, Sikaram, is 15,620 ft. above sea-level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it

with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river, which cuts a deep waterway across where it makes its way from Dacca into the Peshawar plains. Strategically it is an important topographical feature, for it divides the basin of the Kabul river and the Khyber route from the valley of Kurram, leaving no practicable pass across its rugged crest to connect the two. Its western slopes, where it abuts on the mountain masses which dominate the Kabul plain, are forest-covered and picturesque, with deep glens intersecting them, and bold craggy ridges; the same may be said of the northern spurs which reach downward through the Shinwari country towards Gandamak and Jalalabad. Here the snow lies late and moisture is abundant—but on the southern sun-scorched cliffs but little vegetation is to be seen. Approaching the Peshawar plains the Safed Koh throws off long spurs eastward, and amongst the foothills of these eastern spurs the Afridi Tirah long remained hidden from European eyes.

**SAFES, STRONG-ROOMS AND VAULTS.** The term "safe," whilst really including any receptacle for the secure custody of valuables provided with a lock or other device intended to prevent any person except the owner or some person authorized by him gaining access thereto, has gradually come to be confined to such receptacles when fitted with a vertical door, as distinguished from a lid, and of such a size that they can be moved into position, by the use of proper appliances, in one piece. Such receptacles, when so large as to require that their parts should be assembled *in situ*, fall under the term "strong-rooms," or in the case of safe-deposits "vaults," and when constructed with hinged lids, as distinct from doors, under the terms "cash-box," "deed-box" and "coffer." The term "coffer" is probably the most ancient, and in earlier days included, as it still does in France, what are now known as safes.

Although it is practically certain that boxes provided with locks or coffers must have followed closely on the development of locks (*q.v.*) and been in use in ancient Egypt, yet no examples remain to us of earlier date than the middle ages. The earliest examples extant were constructed of hard wood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron. On the continent of Europe the iron box was developed to a very high standard of artistic beauty and craftsmanship, but with no real increase of security. Several specimens of these coffers supposed to be of 17th-century workmanship are preserved in the museum at Marlborough House. Cast-iron chests seem to have been made in various parts of Great Britain in the early part of the 19th century, but the use of wrought iron was probably confined to London until 1820, or thereabouts, when the trade spread to Wolverhampton.

Up to this time no attempt had been made to make coffers fireproof, for though a patent for fireproofing had been taken out in 1801 by Richard Scott, it does not appear to have been used. In 1834, however, a patent was obtained by William Marr for the application of non-conducting linings, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1830, works at Liverpool for the manufacture of tinplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846. To him is due the modern system of fireproofing, which owes its merit to the use not of non-conductors but of an absorbent material which in the case of fire will be permeated with moisture present in it, either in the form of liquid contained in tubes which burst or otherwise discharge their contents when subjected to heat, or mixed with it as water of crystallization in combination with an inorganic salt. The patent he obtained in 1840 contains the following claim: "Constructing, forming, or manufacturing boxes, safes, or other depositories of an outer case of iron or other metal or material, enclosing one, two, or more inner cases, with spaces or chambers between them, containing an absorbent material or composition, such as porous wood, dust of wood, dust of bones, or similar

substances, in which are distributed vessels, pipes or tubes filled with an alkaline solution or any other liquid or matter evolving steam or moisture, the tubes or vessels bursting or otherwise discharging themselves on the exposure of the box or other depository to heat or fire, into the surrounding absorbent matter, which thus pervaded with moisture and rendered difficult of destruction, protects the inner cases or boxes and their contents." In 1843, Edward Tann, Edward Tann, Junr., and John Tann took out a patent for securing the presence of moisture by means of a chemical salt. In their patent they give preference to alum in combination with Austin's cement or gypsum, but they also claim "any non-conductors of heat may be used, and for alum may be substituted sulphate of potash, muriate of ammonia, borax, impure potash, nitrate of soda, soda in cake, pearlsh, or any of the known alkalis." Milner considered this an infringement of his patent of 1840, and in an action before Lord Campbell and a special jury in the Queen's Bench, on the 3rd of June 1851, a verdict was given upholding his contention.

For some years no marked improvements in safes were made, although the manufacture had been taken up in various places by different firms. Safes had, however, been constructed of thicker materials, and some attention had been paid to the more secure attachment of the various parts; also, with the advent

FIG. 1.

of the wrought-iron safe, as distinct from the coffer, the practice had developed of securing the door by a number of bolts operated by a handle and fastening them in the locked position by the lock proper, in order that a small key might be used (Charles Chubb's patent, 1845).

Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1865 called general attention to the question. In 1860 a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferro-manganese or speigeleisen in a molten state, the total thickness being 2 in. (fig. 2). The drilling of conical holes in the inner surface of the outer plate as shown in the figure renders the use of drills of any materials at present known quite inoperative; as the drill, even if it could be made sufficiently hard to pierce the speigeleisen, would on meeting it be bedded in the soft steel and unable to free itself. The construction of such a safe was an expensive matter, and it was not till after the robbery above referred to that he was enabled to sell a single example; it is, however, still in demand for the preservation of diamonds, as probably the only

absolutely drill-proof receptacle. This patent is noteworthy as being the only one connected with the lock and safe industry which has been extended by the privy council.

It is about this period (1860-1870), perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack. These devices may be placed in three classes: (1) the fixing to the door of studs or projections which, when the door closed, passed into holes or recesses in the frame of the body; (2) the use of bolts hooking into the side framing or entering the bolt holes at an angle; (3) the strengthening of the side framing and of the attachment of the bolts to the outer door-plate. The third of these methods (fig. 2) was patented by Samuel Chatwood in 1862, and is still very commonly employed. The second method was used by Chubb and Chatwood, but is not to-day in general use. The first method was used by all makers of repute, but has now been abandoned, as the increased structural strength of the better class of safes renders such devices unnecessary.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the

FIG. 2.

manufacture of high carbon steel, and even in what is to-day called the "fire-proof" safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

For many years little advance was made except such as consisted in substituting steel for iron and in general gaining increased strength by the utilization of better materials, although many safes are made and sold to-day which offer little if any more resistance to fire and thieves than those of 1860-1870. About 1888 the "solid" safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate (fig. 3). This construction, with solid corners, also illustrated in figs. 1 and 2, only became practicable in consequence of the great improvements which had been made in the quality of steel plates; the credit of its invention formed the subject of litigation, which, however, was not carried to an issue. The abolition of corner joints, which up to 1888 had been made by dovetailing and by the use of angle irons, had been previously attempted by welding, but the process was abandoned as commercially impracticable.

In the early days of the safe industry in America the conditions as far as protection from fire was concerned were entirely different from those obtaining in Great Britain. The timber construction employed in American buildings rendered fires much more fierce, but at the same time of very short duration, not more than an

FIG. 3.

hour or two. To meet this condition of affairs thick sides of non-conducting materials were more efficacious than the chambers of steam-generating materials employed in British construction, but the gradual abandonment of timber and the increasing size of buildings have called for changes in the methods of fire-proofing.

The American "burglar proof" safe (fig. 4) seems to have developed from the fire-proof (fig. 5) simply by the addition of extra thicknesses of metal, usually alternately hard and soft, without any serious increase of structural strength; this construction, known as the "laminated" or "built up," offers little resistance to burglars, as the various layers can be separated from one another by the use either of explosives, especially nitroglycerine, or of wedges. In 1890 a commission was appointed by the U.S.A. government to report upon the strong-rooms or vaults of the treasury at Washington; and their report<sup>1</sup> was presented in September 1893. This commission based their conclusions on experiments conducted in their presence, as well as on well-authenticated experiments performed by safe-makers on their own and other makers' productions, and they found

FIG. 4.—American Burglar-proof Construction.

FIG. 5.—American Fire-proof Safe.

that, with the single exception of the Cortiss safe, all the safes which came under their notice—and these comprised all the best-known American makes—could be opened by burglars by

<sup>1</sup> Report of Special Commission of Experts as to Means of improving Vault Facilities of the Treasury Department (Washington, 1894).

beautifully decorated courts in fair repair, built by Mohammed XVII., is a prominent object above the town, and there are many interesting buildings and ruins.

**SAFFLOWER** (ultimately from the Arabic *safra*, yellow) or **BASTARD SAFFRON** (*Carthamus tinctorius*), a plant of the natural order Compositae; its flowers form the basis of the safflower dye of commerce. The plant is a native of the East Indies, but is cultivated in Egypt and to some extent in Southern Europe. To obtain the dyeing principle—carthamin,  $C_{44}H_{70}O_7$ —the flowers are first washed to free them from a soluble yellow colouring matter they contain; they are then dried and powdered, and digested in an alkaline solution in which pieces of clean white cotton are immersed. The alkaline solution having been neutralized with weak acetic acid, the cotton is removed and washed in another alkaline solution. When this second solution is neutralized with acid, carthamin in a pure condition is precipitated as a dark red powder. It forms a brilliant but fugitive scarlet dye for silk, but is principally used for preparing toilet rouge.

**SAFFRON** (Arab. *sa'farán*), a product manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of *Crocus sativus*; some of the wild forms (var. *Thomasi*, *Cartwrightianus*) are also employed for the manufacture. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which are protruded from the perianth, are of a characteristic orange-red colour. The fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower, do not seem to have possessed saffron; but it is named in Canticles iv. 14 among other sweet-smelling herbs. It is also repeatedly mentioned (*κρόκος*) by Homer, Hippocrates and other Greek writers; and the word "crocodile" was long supposed to have been derived from *κρόκος* and *δαίλος*, whence we have such stories as that "the crocodile's tears are never true save when he is forced where saffron groweth" (Fuller's *Worthies*). It has long been cultivated in Persia and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (*Pun Isonis*, 1552-1578). The chief seat of cultivation in early times, however, was the town of Corycus (modern Korghoz) in Cilicia, and from this central point of distribution it may not improbably have spread east and west. According to Hehn, the town derived its name from the crocus; Raymond, on the other hand, with more probability, holds that the name of the drug arose from that of the town. It was cultivated by the Arabs in Spain about 961, and is mentioned in an English leechbook of the 10th century, but seems to have disappeared from western Europe till reintroduced by the crusaders. According to Hakluyt, it was brought into England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Hinton in Cambridgeshire and in Essex at Saffron Walden, its cultivators being called "crokers."

Saffron was used as an ingredient in many of the complicated medicines of early times. That it was very largely used in cookery is evidenced by many writers; thus Laurentbergius (*Apparatus plantarum*, 1632) makes the large assertion "In *fc* familiari vix ullus est telluris habitatus angulus ubi non sit croci quotidiana usurpatione aspersi vel incocti cibis." The Chinese used also to employ it largely, and the Persians and Spaniards still mix it with their rice. As a perfume it was strewn in Greek halls, courts and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city.

It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterwards, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetairae. In ancient Ireland a king's mantle was dyed with saffron, and even down to the 17th century the "fein-croich," or saffron-dyed shirt, was worn by persons of rank in the Hebrides. In medieval illumination it furnished, as a glaze upon burnished tinfoil, a cheap and effective substitute for gold. The sacred spot on the forehead of a Hindu pundit is also partly composed of it. Its main use in England

was to colour pastry and confectionery, and it is still used for this purpose in some parts of the country (notably Cornwall).

One grain of saffron rubbed to powder with sugar and a little water imparts a distinctly yellow tint to ten gallons of water. This colouring power is due to the presence of polychlorite, a substance whose chemical formula appears to be  $C_{24}H_{12}O_{12}$ , and which may be obtained by treating saffron with ether, and afterwards exhausting with water. Under acids it yields the following reaction—

Crocin, according to Watts, *Dict. of Chem.*, has a composition of  $C_{22}H_{10}O_{11}$  or  $C_{24}H_{12}O_{12}$ . This crocin is a red colouring matter, and it is surmised that the red colour of the stigmas is due to this reaction taking place in nature.

Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines and in Persia and Kashmir. The ground has to be thoroughly cleared of stones, manured and trenched, and the corms are planted in ridges. The flowers are gathered at the end of October, in the early morning, just when they are beginning to open after the night. The stigmas and a part of the style are carefully picked out, and the wet saffron is then scattered on sheets of paper to a depth of 2 or 3 in.; over this a cloth is laid, and next a board with a heavy weight. A strong heat is applied for about two hours so as to make the saffron "sweet," and a gentler temperature for a further period of twenty-four hours, the cake being turned every hour so that every part is thoroughly dried. This is known as *cake saffron* to distinguish it from *hay saffron*, which consists merely of the dried stigmas.

The drug has naturally always been liable to great adulteration in spite of penalties, the severity of which suggests the surviving tradition of its sacred character. Thus in Nuremberg a regular saffron inspection was held, and in the 15th century we read of men being burned in the market-place along with their adulterated saffron, while on another occasion three persons convicted of the same crime were buried alive. Grease and butter are still very frequently mixed with the cake, and shreds of beef dipped in saffron water are also used. Good saffron has a deep orange-red colour; if it is light yellow or blackish, it is bad or too old.

**SAFFRON WALDEN**, a market-town and municipal borough in the Saffron Walden parliamentary division of Essex, England, beautifully situated near the Cam in a valley surrounded by hills, on a branch of the Great Eastern railway, 43½ m. N.N.E. from London. Pop. (1901) 5896. It has a somewhat ancient appearance and possesses a spacious market-place. Of the old castle, dating probably from the 12th century, but in part protected by much earlier earthworks, the keep and a few other portions still remain. Near it are a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; there was a large Saxon burial-ground here. The church of St Mary the Virgin, a beautiful specimen of the Perpendicular style, dating from the reign of Henry VII., but frequently repaired and restored, contains the tomb of Lord Audley, chancellor to Henry VIII. There is an Edward VI. grammar school, occupying modern buildings. The town possesses a museum with good archaeological and natural history collections, a literary institute and a horticultural society. The benevolent institutions include the hospital and the Edward VI. almshouses. There is a British and Foreign School Society's training college for mistresses. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136. Brewing, malting and iron-founding are carried on. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 7502 acres.

Saffron Walden (*Waldana*) was almost certainly fortified by the Britons, and probably by some earlier race. The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII., the lord of the town, in 1514. It was dissolved under Edward VI., and a charter was obtained for Walden, appointing a treasurer and chamberlain and twenty-four assistants, all elective, who, with the commonalty, formed the corporation. In 1604 William and Mary made Walden a free borough, with a mayor, 4 aldermen and 12 town councillors. The corporation became a local board of health under the act of 1858, and a municipal borough in 1875. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III. until its gradual extinction about 1768.

**SAFRANINE**, in chemistry, the azonium compounds of symmetrical diamino-phenazine and containing the ring system annexed:—

They are obtained by the joint oxidation of one molecule of a paradiamine with two molecules of a primary amine; by the condensation of para-aminoazo compounds with primary amines (O. Witt, *Ber.*, 1877, 10, p. 874), and by the action of para-nitrosodialkylanilines with secondary bases such as diphenylmetaphenylenediamine. They are crystalline solids showing a characteristic green metallic lustre; they are readily soluble in water and dye red or violet. They are strong bases and form stable monacid salts. Their alcoholic solution shows a yellow-red fluorescence.

Phenosafranin is not very stable in the free state; its chloride forms green plates. It can be readily diazotized, and the diazonium salt when boiled with alcohol yields aposafranin or benzene induline,  $C_{14}H_{11}N_3$ . F. Kehrman showed that aposafranin could be diazotized in the presence of cold concentrated sulphuric acid, and the diazonium salt on boiling with alcohol yielded phenylphenazonium salts. Aposafranone,  $C_{14}H_{11}N_3O$ , is formed by heating aposafranin with concentrated hydrochloric acid. These three compounds are perhaps to be represented as ortho- or as paraquinones (see papers by F. Kehrman, O. Fischer and E. Hepp; R. Nietski and others, *Ber.*, 1895 et seq.). The "safranin" of commerce is a tolosafranin. The first aniline dye-stuff to be prepared on a manufacturing scale was *mauveine*,  $C_{18}H_{15}N_3Cl$ , which was obtained by Sir W. H. Perkin by heating crude aniline with potassium bichromate and sulphuric acid. It is a *N*-phenylsafranin (see *INDULINES*).

**SAGA** (literally a story committed to writing), a word derived from Icel. *segja*, to say. The term is common to most of the Teutonic languages, where we find Eng. *say*, Ger. *sagen*, the O. Eng. *seggan*, Dan. *sige* and Swed. *segja*, all identical in meaning. A saga, therefore, was originally something reported, *segin saga*, a tale told, in English a *saw*. But the earliest literature of Scandinavia goes back to an age before writing was invented, and when the legends were first put down they were called sagas because they were things which had been told or repeated from mouth to mouth. The early books speak of sagas which, apparently, had never been written down and were in consequence lost; but, as soon as the art of writing was understood, the word *saga* began for the future to be used exclusively for written historical books. A volume made up of such histories was known as a *sögubók* or book of sagas. They were not rigidly historical; any story which was written down, and repeated according to the literary formula, was called a saga. The telling of tales was a recognized form of entertainment at Icelandic banquets, and in *Haraldssaga Harðráða* there are very interesting details regarding these public saga-tellings; the person who repeated or read the tale being known as the *sögumaðr* or sagaman, and being held in high honour at the feast.

The saga was properly a creation of the peculiar conditions under which Icelandic society was constituted in the earliest medieval times. The aristocratic Icelander had no diversions, except games of strength and skill out of doors and the listening to professional story-tellers indoors. As has been often pointed out, the saga is a prose epic, and in its various kinds it follows strict laws of composition. The lesser epic, in its original form, was the biography of some heroic Icelander who had lived in the 10th or 11th century. It was composed with great regularity, so as to proceed uniformly from the birth of the hero to his death, and indeed from before the one date until after the other. The style is brief, clear and conversational; the hero was often a distinguished poet, and in that case some of the best of his verses are interwoven into the narrative, being put in his mouth on striking occasions. Alliteration takes a great part in the ornament of the style. The skill with which the story is told, the high romantic sense of honour and courage which is displayed, the quick turns of the dialogue, the brilliant evolution of the plot, all these give enduring charm to the more successful and ample of the sagas, and in the earlier examples

these qualities are very rarely missing. It is to be remembered, however, that the saga was intended to be listened to, not read, by an audience which was mainly interested in three subjects, namely fighting, litigation and pedigree. It was illegitimate for the saga-man, in the preparation of his epic, to allow himself to stray for any length of time from one of those three themes; since even love must be considered in the light of an episode.

The period of the saga-age, as it was called, the *sögu-öld* or epoch celebrated in the sagas, is now confined between the years 890 and 1030, and opens with the original colonization of Iceland. The deaths in 1030 of two great statesmen, Snorri and Skapti the Lawman, mark its close; almost immediately afterwards, before the end of the 11th century, the actual age of saga-composition is in full action; and lastly comes the *rit-öld*, or age of writing when the sagas were preserved in their present literary form, the blossoming time of which was the 13th century. According to the definite statement of the great historian, Sturla, the first man who wrote down in the Norse tongue, in Iceland, "histories relating to times ancient and modern," was Ari Fróði (1067-1148), who was therefore the earliest of the saga-writers. He, as we know, was the author of three works of vast importance in the history of Icelandic literature. These were *Konunga-bók* or the Book of King, *Landnámabók* or the Book of Settlements and *Islendinga-bók* or the Book of Icelanders. The second of these, in which Ari was assisted by Kolsegg Asbjörnsson, survives and is of priceless value. Of the first and third, we possess abbreviations and summaries. It is believed that the admirable style in which the sagas are composed was the invention of Ari, to whose individual genius the form of classic prose tradition is attributed. He has no rival in this respect, and is the true father of the Icelandic saga. The works of Sæmund Vigfusson (1056-1133), who succeeded Ari as a writer of the lives of kings, are unfortunately lost.

We now pass to what are called the Greater or *Islendinga sagas*, which are of a more intense and romantic character than the historical biographies. Among these the greatest is *Njalssaga* (or *Njala*), which few critics will question to be the most eminent masterpiece of Icelandic literature. There is no clue to the name of the author, who was evidently a lawyer; extensive as is the work, it is evidently written by one hand, for peculiarities and felicitous originalities of style recur throughout the whole saga. It must have been composed between 1230 and 1280. Vigfusson has described *Njala* as being, *par excellence*, the saga of law, and adds, "the very spirit indeed of Early Law seems to breathe through its pages." The scene in which *Njal*, the Lawman of judgment and peace, is burned in his homestead by his enemies is perhaps the most magnificent passage which has been preserved in the whole ancient literature of the North. The story of *Njala* is placed at the close of the 10th and the first years of the 11th century. *Eybyggissaga* deals with politics as *Njalssaga* deals with law; it is a precious compendium of history and tradition handed down from heathen times. It has been suggested that it may be, at all events in part, the work of Sturla the Lawman, who died in 1284. Extremely beautiful in its relation to external nature, a matter often ignored in the sagas, is *Laxdoelasaga*, which is also the most romantic in sentiment. It was probably written about 1235, but by whom is unknown. The aristocratic spirit of the great Icelandic families finds its most characteristic exposition in *Egilsaga*, a very vigorous tale of adventure, the central figure of which, Egil, is depicted with more psychological subtlety than is usual in the sagas; it probably belongs to about 1230. Into *Grettissaga* there enter biographical and mythical elements, curiously mingled; it is also confused in form, and is probably a recension, made about 1310, of two or more earlier sagas now lost, the finest parts of which it is thought that Sturla may have written. These are the five famous groups of anonymous narrative which are known as the Greater Sagas.

The Minor Sagas must be treated more briefly. *Heiðskopissaga*, belonging to the south-west of Iceland, deserves attention because of its extreme antiquity; it has been dated 903. *Gunnlaugssaga Ormsstungu* (The story of Gunnlaug Worm-

Tongue) is a love-story of great sentimental charm. In *Gislasaga* the gloom of the Icelandic outlaw-life is strikingly depicted in the adventures of Gisli, who is under a ban and is hunted from place to place. A very unusual specimen of the minor saga is *Bandalmannasaga*, a comic story of manners in the north of Iceland in the 11th century, in which an intrigue of the old families banded against the pretensions of a wealthy *parsonu*, is told in a spirit of broad humour. The most archaic of the minor sagas is *Kormakssaga*, the story of the loves of the dark-eyed Kormak and Steingerda; this is, according to Vigfusson, the most primitive piece of Icelandic prose writing that has come down to us. Another very ancient and very simple saga is *Vatnadalasaga*. Among sagas which deal with the earliest history of America in the chronicles of Greenland and Vinland, a foremost place is taken by *Floamannasaga*, which possesses peculiar interest from its description of the shipwreck of colonists on the coast of Greenland; this belongs to the close of the 10th century. We possess a late (13th century) recension of what must have been equally important as a record of the Greenland colony in the 11th century, *Fostbraedrasaga*. Vigfusson formed a class of still shorter sagas than these, *thaettir* or "morsels" of narrative. At the close of the great period of the composition of all these anonymous sagas, of which few can have been written later than 1260, a work of enormous length and value was composed or compiled by a poet and historian of great eminence, Sturla Thordsson (1215-1284). About the year 1270 he began to compile the mass of sagas which is now known by his name as *Sturlungasaga*. The theory that Sturla was the author of the whole of this bulky literature is now abandoned; it is certain that *Hrofn Sveinbjornssaga*, for instance, belongs to an earlier generation, and the same is true of *Gudmundar Saga Góða*. Vigfusson distinguished these and other sagas, which Sturla evidently only edited, from those which it is certain that he composed, and gathered the latter together under the title of *Isendingasaga*. It is certain that it is to Sturla that we owe almost all our knowledge of Icelandic history from 1200 to 1260. *Isendinga* is divided into two main sections, the former closing in a general massacre of the characters of the story in about 1240, the latter dealing much more minutely with new persons and subsequent events. To Sturla also are attributed two saga-biographies, the *Hakonssaga* and the *Magnussaga*. It is a remarkable fact that while Icelandic saga-literature begins and ends with a definite figure of a writer, all that lies between is wholly anonymous. Ari was the earliest and Sturla the latest of the saga-writers of the classical period, but in the authors of *Njala* and *Laxdaela* we have nameless writers whose genius was still greater than that of the pioneer and of the rear-guard of Icelandic literature. These unknown men deserve a place of honour among the best narrative-writers who have ever lived. The elder brother of Sturla was called Olaf Hvitaskald, or the White Poet (1209?-1259); he was a learned man, who worked at the arrangement and compilation of the sagas which form the mass of *Sturlunga*. In another class are the stories of bishops, *Biskupasögur*, which are not sagas in the true sense, but have considerable value as biographical material for reconstructing Icelandic social life in the 12th century. The admirable saga of Bishop Laurence (1266-1331) was composed by his private secretary, Einar Hafidason (1304-1393), who also wrote *Annals*, and is the latest Icelandic biographer. After his time a long silence fell on the literature of the country, a silence not broken until the revival of Icelandic learning in the 17th century.

It is evident that a vast number of sagas must be lost; when we consider how many are preserved, we can only express amazement at the fecundity of the art of saga-telling in the classic age. The MSS., on which what we have were preserved, were all on vellum, and there were no sagas written on paper until the time of Bishop Odd, who died in 1630; there was an enormous destruction of vellum during the dark age. After 1640 it became the practice to make transcripts on paper from the perishing vellum MSS. The best authority on the history of the sagas is the copious *prolegomena* to Dr. Gudbrand Vigfusson's edition of the text of *Sturlungasaga*, published in 2 vols. by the Clarendon Press at Oxford in 1878. See also the edition of *Biskupasögur*, issued by the same author, at

Copenhagen, in 1858. Möbius and Vigfusson published the *Forn-sögur* or archaic sagas in 1860, and all the work of Vigfusson calls for the closest attention from those interested in this subject. In connexion with the descents of Northmen on the shores of Britain particular interest attaches to the four volumes of sagas edited for the "Rolls" series (1887-1894). William Morris, who had done much to interpret the spirit of the sagas to English readers, and who published a translation of *Grœttisaga* in 1869, started in 1891 the "Saga Library," in conjunction with Mr. E. Magnússon, of this a sixth volume appeared in 1906. Mr. Sephton has published versions of several of the purely historical sagas. No account has been given above of the famous *Heimskringla* or "Round of the World," of Snorri Sturlason, because this great work, although it contains stories of the kings of Norway, hardly belongs to the same class as the biographical sagas of Iceland. The *Heimskringla* is purely a storehouse of primitive Norwegian history.

See also Jónsson, *Der oldnordiske og oldlandske Literaturhistorie* (Copenhagen, 1893-1902); F. W. Horn, *Geschichte der Literatur des skandinavischen Nordens* (Leipzig, 1879). (E. G.)

**SAGAING**, a district and division of Upper Burma, lying to the south and west of Mandalay. The district has an area of 1862 sq. m.; pop. (1901) 282,658, showing an increase of 15% in the decade. It occupies both banks of the Irrawaddy, at its confluence with the river Chindwin. The chief crops are sesamum, millet, rice, peas, wheat and cotton. The total rainfall in 1905 was 34.76 in., taken at Sagaing. In the hot season the maximum shade temperature rises to a little over 100° F. The lowest readings in the cold season average about 56° F.

Sagaing, the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1901) 9643. It was formerly a capital of Burma. It is the terminus of the railway to Myitkya. A steam ferry connects with the Rangoon-Mandalay line, and the steamers of the Irrawaddy Flotilla Company call daily.

The Sagaing division includes the four districts of Upper and Lower Chindwin, Shwebo and Sagaing; area, 29,566 sq. m.; pop. (1901) 1,000,483.

**SAGALLO**, a small settlement on the north shore of the Gulf of Tajura, French Somaliland. A dismantled fort built by the Egyptians (who occupied the place between 1875 and 1884) is the most prominent object. In January 1889 Sagallo was occupied by a Cossack chief named Achinov, who was accompanied by the archimandrite Paisi and some 200 people, including priests, women and children. Paisi had been entrusted by the metropolitan of Novgorod with an evangelistic mission to the Abyssinian Church; while Achinov stated that he had a commission from the Negus for the purchase of arms and ammunition. The presence of Achinov at Sagallo (where he occupied the fort, which he found deserted) was regarded by the French government as an invasion of French territorial rights. The Russian foreign office having disavowed (7th of February) any connexion with Achinov, instructions were sent from Paris to secure the removal of the Cossacks. On the 17th of February French warships appeared off the port, and an ultimatum was sent to Achinov calling on him to surrender, but without effect. The fort was bombarded, and seven persons killed, two being women and four children. The Cossacks then surrendered, not having fired a shot. They were subsequently deported to Suez, whence they returned to Russia. Achinov was interned by the Russian government for some months (until October 1889). In 1891 he returned to Abyssinia. Paisi was promoted by his ecclesiastical superiors. In Paris the incident caused great excitement amongst the Russophiles, and the consequent demonstrations led to the suppression of the League of Patriots and the prosecution of M. Paul Déroulède.

See *L'Archimandrite Paisi et l'Ataman Achinov*, by vicomte de Constantin (Paris, 1891).

**SAGAN**, a town of Germany, in the Prussian province of Silesia, situated on the Bober, a tributary of the Oder, 60 m. S.S.E. of Frankfort-on-Oder and 102 m. S.E. of Berlin by the direct main line of railway to Breslau. Pop. (1905) 14,208. It is still partly surrounded by its old fortifications and has numerous mediæval houses. It contains the handsome palace of the dukes of Sagan. Among other buildings are an Evangelical church with a conspicuous steeple and containing the burial vaults of the ducal family, and Augustine and a Jesuit

monasterial church, a medieval town-hall with old cloisters attached, a Roman Catholic gymnasium and a large hospital, named after its founder, the duchess Dorothea (1703-1862), wife of Edmund, duke of Talleyrand-Périgord-Dino. The leading industry of the town is cloth-weaving, with wool and flax spinning, there is also some trade in wool and grain.

The mediate principality of Sagan, now forming a portion of the Prussian governmental district of Liegnitz, and formed in 1397 out of a portion of the duchy of Glogau, has several times changed hands by purchase as well as by inheritance. One of its most famous possessors was Wallenstein, who held it for seven years before his death in 1634. Bought by Prince Lobkowitz in 1646, the principality remained in his family until 1787, when it was sold to Peter, duke of Courland, whose descendant, Prince Bozon (b. 1832), son of Napoleon Louis (1811-1898), duke of Talleyrand-Périgord, owned it in 1910. The principality has an area of nearly 500 sq. m. and a population of 65,000.

**SAGAR** or **SAUGOR ISLAND**, an island at the mouth of the Hugli river, in the Twenty-four Parganas district of Bengal. The word means "sea"; and, as being the place where the sacred stream of the Ganges is believed to mingle with the ocean, the island is one of the most frequented places of Hindu pilgrimage in all India, the time for the greatest annual gathering being in January. On the seaward face is a lighthouse, and farther out are the Sandheads, the cruising-ground of the Calcutta pilots.

**SAGASTA, PRAXEDES MATEO** (1827-1903), Spanish statesman, was born on the 21st of July 1827 at Torrecilla de Cameros, in the province of Logroño. He began life as an engineer, and from his college days he displayed very advanced Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. After the *coup d'état* of Don Leopold O'Donnell in 1856, Sagasta had to go into exile in France, but promptly returned, to become the manager of the Progressist paper *La Iberia*, and to sit in the Cortes from 1859 to 1863. He seconded the Progressist and revolutionary campaign of Prim and the Progressists against the throne of Queen Isabella, conspiring and going into exile with them. He returned, via Gibraltar, with Prim, Serrano and others, to take part in the rising at Cadix, which culminated in the revolution of September 1868, and Sagasta was in succession a minister several times under Serrano and then under King Amadeo of Savoy, 1868-1872. Sagasta ultimately headed the most Conservative groups of the revolutionary politicians against Ruiz Zorrilla and the Radicals, and against the Federal Republic in 1873. He took office under Marshal Serrano during 1874, after the *pronunciamiento* of General Pavia had done away with the Cortes and the Federal Republic. He vainly attempted to crush the Carlists in 1874, and to check the Alphonist military conspiracy that overthrew the government of Marshal Serrano at the end of December 1874. Barely eight months after the restoration of the Bourbons in the autumn of 1875, Sagasta accepted the new state of things, and organized the Liberal dynastic party that confronted Canovas and the Conservatives for five years in the Cortes, until the Liberal leader used the influence of his military allies, Jovellar, Campos and others, to induce the king to ask him to form a Cabinet in 1881. The Liberals only retained the confidence of the king by postponing the realization of almost all their democratic and reforming programme, and limiting their efforts to financial reorganization and treaties of commerce. A military and republican rising hastened Sagasta's fall, and he was not readmitted into the councils of Alphonso XII. On the death of that king in 1885, Sagasta became premier with the assent of Canovas, who suspended party hostility in the early days of the regency of Queen Christina. Sagasta remained in office until 1890, long enough to carry out all his reform programme, including universal suffrage and the establishment of trial by jury. A coalition of generals and Conservatives turned Sagasta out in July 1890, and he only returned to the councils of the regency in December 1892, when the Conservative party split into two groups under Canovas and Silvea. He was still in office when the final rising of the Cubans began in February

1895, and he had to resign in March because he could not find superior officers in the army willing to help him to put down the turbulent and disgraceful demonstrations of the subalterns of Madrid garrison against newspapers which had given offence to the military. Sagasta kept quiet until nearly the end of the struggle with the colonies, when the queen-regent had to dismiss the Conservative party, much shorn of its prestige by the failure of its efforts to pacify the colonies, and by the assassination of its chief, Canovas delCastillo. Sagasta's attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of General Weyler, and other concessions, did not avert the disastrous war with the United States and its catastrophe. The Liberal party and Sagasta paid the penalty of their lack of success, and directly the Cortes met in March 1899, after the peace treaty of the 10th of December 1898 with the United States, they were defeated in the senate. He pursued his policy of playing into the hands of the sovereign whilst keeping up the appearances of a Liberal, almost democratic, leader, skilful in debate, a trimmer *par excellence*, and abler in opposition than in office. He returned with the Liberals to power in March 1901. His task, however, was beyond his years. The economic situation was of the gravest. Strikes and discontent were rife. Still, Sagasta held on long enough to witness the surrender of the regency by Queen Christina into the hands of her son, Alfonso XIII., in May 1902. In the following December Sagasta was defeated on a vote of censure and resigned office. Shortly afterwards he fell into ill-health, and died at Madrid on the 15th of January 1903.

**SAGE, RUSSELL** (1816-1906), American financier, was born in Verona township, Oneida county, New York, on the 4th of August 1816. He worked as a farm-hand until he was 15, when he became an errand boy in a grocery conducted by his brother, Henry R. Sage, in Troy, New York. He had a part interest in 1837-1839 in a retail grocery in Troy, and in a wholesale store there in 1839-1857. He served as an alderman of Troy in 1841-1848, and as treasurer of Rensselaer county in 1845-1849. In 1853-1857 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railways; and in 1863 removed to New York City, where, besides speculating in railway stocks, he became a money-lender and a dealer in "puts" and "calls" and "privileges," and in 1874 bought a seat in the New York Stock Exchange. He gradually accumulated a fortune, which at his death was variously estimated as from \$60,000,000 to \$80,000,000. On the 4th of December 1891 an attempt was made to assassinate him in his office by one Henry Norcross, who demanded a large sum of money, and upon being refused exploded a dynamite bomb, and was himself killed.<sup>1</sup> Sage died in New York on the 22nd of July 1906. In 1869 he had married Miss Margaret Olivia Slocum (b. 1828), a graduate (1847) of the Troy Female Seminary (now the Emma Willard School). She inherited nearly all of his great fortune, and out of it she gave away a long series of liberal benefactions to various institutions.

**SAGINAW**, a city and the county-seat of Saginaw county, Michigan, U.S.A., situated on both banks of the Saginaw river, about 16 m. from its entrance into Saginaw Bay and about 96 m. N.W. of Detroit. Pop. (1890) 46,322, (1900) 42,345, of whom 11,435 were foreign-born, (1910) 50,510. Saginaw is served by the Grand Trunk, seven divisions of the Père Marquette (which has repair shops here) and four divisions of the Michigan Central railways, by interurban electric railways to Detroit and Bay City, and by steamboat lines to several of the lake ports. The city is built on level ground covering an area of about 13 sq. m. and somewhat more elevated than the surrounding country. In the city are St Vincent's Orphan Home (1875) and St Mary's Hospital (1874) under the Sisters of Charity, a Woman's Hospital (1888) and the Saginaw General Hospital

<sup>1</sup> Mr Sage's secretary was also killed, and one of his clerks, W. R. Laidlaw, jr., was badly injured. Laidlaw afterward repeatedly sued Sage for damages, claiming that Sage had used him as a shield at the moment of the explosion, but his suits were unsuccessful.

(1887); the Hoyt Library and the Public Library; a large auditorium, belonging to the city; an armoury; the Germania Institute, with a kindergarten, a gymnastic school and a German library; and a free bathhouse and manual training school (1903), a part of the public school system. There is an annual music festival in May. The city has parks, including Hoyt Park (27 acres), used for athletic sports, Rust Park (150 acres), occupying an island in the river, and Riverside Park, a pleasure resort. Saginaw is situated in a good farming region with a fertile soil, especially adapted to the culture of sugar beets; other important crops are beans, cabbages, tomatoes, cucumbers, hay, apples and grains. In the vicinity of the city there are salt wells, and Saginaw county is the most productive coalfield in the state—in 1907 its output was 1,047,927 tons, more than half the total for the state. The city is an important distributing centre, has a large wholesale trade (especially in groceries, hardware, boots and shoes, and dry goods), and in 1904 in the value of its factory products (\$10,403,508, 20-2% more than in 1900) it ranked fifth among the cities of the state. The municipality owns and operates the water-works. The first settlement was made on the west bank of the river in 1815 and was called Saginaw City; the settlement on the east side of the river made in 1849 was called East Saginaw and was financed by Eastern capitalists. East Saginaw in 1855 was incorporated as a village. East Saginaw and Saginaw City each received a city charter in 1850, but in 1890 the two were consolidated as the city of Saginaw, and in 1897 the charter was revised.

**SAGITTA** ("the arrow" or "dart"), in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, Tycho Brahe and Hevelius, who each described 5 stars. The fable was that this constellation was one of the arrows with which Hercules killed the vulture which gnawed the liver of Prometheus. *S. Sagittae* is a short period variable, period 8-38 days, range in magnitude 5.6 to 6.4.

**SAGITTARIUS** ("the archer"), in astronomy, the 9th sign of the zodiac (*q.s.*) denoted by the symbol  $\mathcal{A}$ , an arrow or dart. It is also a constellation, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, Tycho Brahe and Hevelius 22. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotes, son of Eupheme, the nurse of the Muses. Several short period variables occur in the constellation, e.g. X3 *Sagittarii*, Wγ, *Sagittarii* and Y *Sagittarii*, having periods of 7.01, 7.59, 5.77 days respectively. *Nova Sagittarii* is a "new" star, which was discovered by Mrs Fleming in 1890; the nebula M. 17 *Sagittarii* is an omega or horse-shoe nebula, while the nebula and cluster M. 8 *Sagittarii* is a splendid irregular nebula associated with a great number of faint stars.

**SAGO**, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palm (*Metroxylon Sagu*) (see fig.), a native of the East Indian Archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity as starch-yielding plants at the age of about fifteen years, when the stem is gorged with an enormous mass of spongy medullary matter, around which is an outer rind consisting of a hard dense woody wall about 2 in. thick. When the fruit is allowed to form and ripen, the whole of this starchy core disappears, leaving the stem a mere hollow shell; and the tree immediately after ripening its fruit dies. When ripe the palms are cut down, the stems divided into sections and split up, and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for their cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet

sago, &c. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting along the marshy river-banks of Sarawak.

Sago is also obtained from *Metroxylon Rumphii* as well as from various other East Indian palms such as the Gomuti palm (*Arenga saccharifera*), the Kittul palm (*Caryota urens*), the

Sago Palm (*Metroxylon Sagu*), much reduced.

1. Portion of leaf.
2. Portion of female inflorescence in fruiting stage.
3. Branch of male inflorescence.
4. Spike of male flowers.
5. Same cut lengthwise.
6. Fruit.
7. Section of fruit and seed, s, embryo.

cabbage palm (*Corypha umbraculifera*), besides *Corypha Gebagan*, *Raphia flabelliformis* and *Phoenix farinifera*, also from *Mauritia flexuosa* and *Guilielma speciosa*, two South American species. It is also obtained from the pith of species of *Cycas*.

**SAGUENAY**, a river of Quebec province, Canada, flowing into the St Lawrence 120 m. N.E. of Quebec. It drains Lake St John, from which it issues by two impassable rapids, La Grande and La Petite Décharge. Thence for 40 m. it flows E.S.E. in a series of rapids, navigable only by skilled boatmen in canoes, to Chicoutimi, the seat of a Roman Catholic bishop, a prosperous little town exporting great quantities of lumber. Six miles farther down is Ha Ha Bay, a favourite summer resort. From Chicoutimi the river is navigable by small steamers, and from Ha Ha Bay to the mouth by vessels of the largest size. It is indeed rather a loch or bay than a river, containing neither rock nor shoal, and having at its mouth a depth of some 600 ft. greater than that of the St Lawrence. Its width varies from three-quarters of a mile to two miles, and the waters are blackened by the shadow of treeless cliffs, over 1000 ft. in height, separated here and there by narrow wooded valleys, and culminating in Capes Trinity and Eternity, 1600 and 1800 ft. in height. Above Chicoutimi it runs through hills of about 400 ft. in height, densely wooded with spruce, maple and birch. Tadoussac, at its mouth, is the oldest European trading post in Canada.

Lake St John is a shallow basin, 26 m. by 20, with an area of 365 sq. m. It receives the waters of the Ashuapmucuan, often spoken of as the upper course of the Saguenay, the Mistassini, the Peribonka and various other important streams. A numerous farming population live near its shores. It is well known to anglers as containing the celebrated *ounaniche*, or land-locked salmon, which attains a weight of about 6 lb.

**SAGUNTUM**, now Sagunto or Murviedro, an ancient town in a fertile district of eastern Spain (Castellon de la Plana) 20 m. N. of Valencia, close to the coast. Its history comprises one brief flash of tragic glory and a long obscure happiness. At the outbreak of the Second Punic War (219 B.C.) it was a large and commercially prosperous town of native—not Greek—origin. It sided with Rome against Carthage, and drew Hannibal's first assault. Its long and noble resistance, told by the Roman historian Livy in no less noble language, ranks with the Spanish defence of Saragossa in the Peninsular War. Finally in 218 Hannibal took it and passed on into Italy. Then we hear little more of it till at the opening of the Christian era it appears as a flourishing Romano-Spanish town with a Latin-speaking population and the rank of *municipium*. This later prosperity lasted most of the empire through, and is attested by inscriptions and ruins (notably a theatre, demolished by Suchet).

**SAHARA**, the great desert of northern Africa. The Sahara has an area, according to Dr A. Bludau's calculation of the areas of African river basins, of 3,459,500 sq. m., made up as follows:—

Drainage or slope to Atlantic	131,000
Drainage or slope to Mediterranean	502,000
Drainage inland	2,602,500
Slope to Niger basin	224,000
<b>Total</b>	<b>3,459,500</b>

This includes Tripoli and Fezzan, which practically belong to the desert zone, but does not include arid portions of the basins of the Nile and Niger, in which the drainage is at most intermittent, and which might with reason be included in the Sahara. The area would thus be brought up to at least 3½ million sq. m., about the area of Europe minus the Scandinavian peninsula.

The physical limits of this region are in some directions marked with great precision, as in parts of Morocco and Algeria, where the southern edge of the Atlas range looks out on what has almost the appearance of a boundless sea, and forms, as it were, a bold coast-line, whose sheltered bays and commanding promontories are occupied by a series of towns and villages—Tizgi, Figuig, El Aghuat, &c. In other directions the boundaries are vague, conventional and disputed. This is especially the case towards the south, where the desert sometimes comes to a close as suddenly as if it had been cut off with a knife, but at other times merges gradually and irregularly into the well-watered and fertile lands of the Sudan. While towards the east the valley of the Nile at first sight seems to afford a natural frontier, the characteristics of what is usually called the Nubian desert are so identical in most respects with those of the Sahara proper that some authorities extend this designation to the shores of the Red Sea. The desert, indeed, does not end with Africa, but is prolonged eastwards through Arabia towards the desert of Sind. As the Nubian region is described under **SUDAN**: § *Anglo-Egyptian*, the present article is confined to the country west of the Nile Valley, the Libyan desert inclusive. Its greatest length, along the 20th parallel of north latitude, is some 3200 m.; its breadth north to south varies from 800 to 1400 m.

The sea-like aspect of certain portions of the Sahara has given rise to much popular misconception, and has even affected the ideas and phraseology of scientific writers. Instead of being a boundless plain broken only by wave-like mounds of sand hardly more stable than the waves of ocean, the Sahara is a region of the most varied surface and irregular relief, ranging from 100 ft. below to 5000 and 6000 and even in isolated instances to 8000 ft. above the sea-level, and, besides sand-dunes and oases, containing rocky plateaus, vast tracts of loose stones and pebbles, ranges of the most dissimilar types, and valleys through which abundant watercourses must once have flowed.

In the centre of the Sahara is a vast mountain region known as the Ahaggar (Hoggar) Tassili or plateau. The culminating peaks of this plateau, Mounts Watellen and Hikena, are about 900 m. in a straight line almost due S. of the city of Algiers and about 1200 m. due N. of the mouth of the Niger. They also occupy, speaking roughly, a central position between the Atlantic and the Nile.

The Ahaggar plateau is not inferior to the Alps in area, but its highest peaks do not greatly exceed 8000 ft. They are believed to be volcanic like those of Auvergne. Upon their summits snow is reputed to lie from December to March. South-east of the main plateau, and partly filling the valley between the Ahaggar plateau and the Tassili of the Asjer (see *asjer*), are the Anaf mountains. To the north the valley is again contracted by the Irawen mountains.

Besides this central group of mountains, sometimes spoken of as the Atakor-n-Ahaggar (Summits of the Ahaggar), there are various other massifs in the Sahara. On the north-west of the Ahaggar, and separated from it by a wide plain, is the Muidir plateau, which extends nearly east and west 200 m. North-east of the Ahaggar (in the direction of Tripoli) is the Tassili of the Asjer (4000-5000 ft.), which runs for 300 m. in a N.E. to S.E. direction. South-east of the Tassili of the Asjer is a range of hills known as the Tummo (or War) mountains. Still farther south is the mountainous region of Tibesti (or Tu), with an average height of some 7000 ft., the volcanic cone of Tussid rising to an estimated height of 8800 ft. Towards the south and east the Tibesti highlands are connected with the lower ranges of Borku and Eneadi, which merge into the plains of Wadai and Darfur. The slopes are bare and rocky. By some authorities the Tassili of the Asjer, the Tummo, Tibesti and Borku ranges are considered "the orographic backbone" of the Sahara.

In addition to the plateaus and ranges named, there are several disconnected mountain masses. Midway between the Atakor-n-Ahaggar and Nigeria are the Air or Asben hills in which Dr Erwin von Bary discovered (1877) the distinct volcanic crater of Teginjir with a vast lava-bed down its eastern side. By some writers Air (*g.s.*) is not included in the Sahara, as it lies within the limit of the tropical rains; but the districts farther south have all the characteristics of the desert. West of Air, and north-east of the bend of the Niger, lies the hilly region sometimes known as Adrar of the Iforas or of the Awellimiden (the southern confederacy of the Tuareg). To the N.E., in FEZZAN (*g.s.*), are the dark mountains of Jebel-es-Soda, which are continued S.E. towards Kufra by the similar range of the Haruj; and in the extreme S.W., at no great distance from the Atlantic, is the hilly country of the western Adrar (*g.s.*).

Nearly all the rest of the Sahara consists in the main of undulating surfaces of rock (distinguished as *hammada*), vast tracts of water-worn pebbles (*serir*) and regions of sandy dunes (variously called *maghler*, *erg* or *areg*, *igidi*, and in the east *rhar*), which occupy about one-ninth or one-tenth of the total area. The following is the general distribution of the dunes:—

From a point on the Atlantic coast south of Cape Blanco a broad belt extends N.E. for about 1300 m., with a breadth varying from 50 to 300 m. This is usually called the Igidi or Gidi from the Berber word for dunes. In part it runs parallel with the Atlas mountains. Eastward it is continued, south of Algeria and Tunisia, by the Western Erg and Eastern Erg, separated by a narrow valley at Golea. South of the Eastern Erg (which extends as far north as the neighbourhood of the Gulf of Gabes) the continuity of the sandy tract is completely broken by the Hammada al-Homra (or Red Rock Plateau), but to the south of this region lie the dunes of Edeyen, which, with slight interruptions, extend to Murzuk in Fezzan. South of the hammada of Murzuk the dunes of Murzuk stretch south-east. This series of tracts may be called the northern zone of the Sahara; it forms a kind of bow, with its extremities respectively at the Atlantic and the Libyan desert and its apex in the south of Tunisia. In the south are the Juf (depressions), covering a vast area to the south-east of the middle portion of the Igidi, another area between the Adghach plateau and the Ahaggar, and a third between Air and Tibesti. The Juf or depressions are not, except in rare instances, below sea-level. In the Libyan desert is a vast region of dunes of unascertained limits; the characteristics of the Libyan desert being thought typical of the whole of the Sahara originated the idea of "a sea of shifting sand" as descriptive of the entire desert. Here a region of over 500,000 sq. m. extending east from the Tibesti mountains to the valley of the Nile, bounded south by Wadai and Darfur and north by Fezzan and the Cyrenaica, appears to be almost entirely stone and increasingly covered by dunes. There is only one known route through this dreadful wilderness—one running north and south to the oases of Kufra, which lie in its centre. The dunes in the Libyan desert, so far as is known, run N.N.W. and S.S.E. In the Eastern Erg the dunes also lie in long lines in a N.N.W. and S.S.E. direction, presenting a gradual slope to windward and an abrupt descent to leeward. There they are generally about 60 or 70 ft. high, but in other parts of the Sahara they are said to attain a height of upwards of 300 ft.

Under the influence of the wind the surface of the dunes is subject to continual change, but in the mass they have attained such a state of comparative equilibrium that their topographic distribution can be considered as permanent, and some of them, such as Gern (Peal al-Shuf and Gern Abd-al-Kader, to the south of Golea), have names of their own. The popular stories about caravans and armies being engulfed in the moving sands are regarded as apocryphal (and perhaps in some instances in the Libyan desert), but there is abundant

evidence against the theory of M. Vatonne as to the dunes having been formed *in situ*.

Although now mainly waterless, the Sahara possesses the skeleton of a regular river-system. From the north side of the Atakor-n-Abaggar, through which runs the "water-parting" *Staliois river-system*, between the basins of the Mediterranean and Atlantic, begins Wadi Igharghar, which, running northwards between the Tassili plateau and the Irawen mountains, appears to lose itself in the sands of the Eastern Erg, but can be traced northwards for hundreds of miles. Its bed contains rolled fragments of lava and freshwater shells (*Cyrena* and *Planorbis*). In a line almost parallel to Wadi Igharghar, Wadi Mya descends from the plateau of Tademaït, and shows the importance of its ancient current by deep erosion of the Cretaceous rocks, in which a large number of left-hand tributaries have also left their mark. The streams flowing south from the Atlas, which seem to be absorbed in the sands of the desert, evidently find a series of underground reservoirs or basins capable of being tapped by artesian wells over very extensive areas. As Olympiodorus (quoted by Photius) mentions that the inhabitants of the Sahara used to make excavations from 100 to 120 ft. deep, out of which jets of pure water rose in columns, it is clear that this state of matters is (historically) of ancient date. Since 1856 French engineers have carried on a series of borings which have resulted in the fertilizing of extensive tracts. In Wadi Righ (otherwise Rhir), which runs for 80 m. towards the south-west of the Sbat Melir (department of Constantine, Algeria), the water-bearing stratum is among permeable sands, which are covered to a depth of 200 ft. by impermeable marls, by which the water is kept under pressure. In this valley many artesian wells have been sunk by the French. Connections probably exist with subterranean water-supplies in the mountains to the north. That the water in the artesian reservoirs is kept aerated is shown by the existence below ground of fishes, crabs and freshwater molluscs, all of which were ejected by the well called Mezer in Wadi Righ. Further west the Wadis Zulfana and Ghir unite to form the Saura, known in Tuat as the Messaud. These rivers still carry water as far as the northern part of Tuat; thence the course of the Messaud was, apparently, S.W. to the eastern Juf. There are also well-marked river-beds in the central Sahara. The Wadi Telemis, rising in Adrar, of the Iforas, apparently joined the Niger near Gao, while the Wadi Tafassassent, which rose in the Ahaggar mountains, is believed to have been the ancient upper course of the lower Niger. The cases are also proofs of the presence of a steady supply of underground moisture, for vegetation under the Saharan climate (beyond the few plants specially adapted to desert conditions) is exceptionally thirsty.

The existence of these wadis or river-beds is a factor in the consideration of the cause of the desert nature of the country. In all parts of the Sahara there is evidence of denudation carried out on a scale of unusual magnitude. The present surface of the desert has been exposed to the protracted wear and tear of the elements. But to determine the exact method by which the elements have done their work has hitherto proved beyond the power of science. The theory of *submarine* denudation was accepted by many scientists of the mid-Victorian era. The sand-dunes, the salt efflorescence and deposits, and the local occurrence of certain modern marine molluscs all go to help the hypothesis of a diluvial sea. Nor is evidence lacking that in cretaceous times portions of the Sahara were covered by the sea. Colonel P. L. Montell brought home (1892) a fossil sea-urchin from Bilma. In 1902 at Tamaské, some 250 m. W. of Zinder, and a little north of Sokoto, a nautilus and four sea-urchins (fossils) were found by Captain Gaden in a limestone bed. Similar fossils occur in the region between Zinder and Air, and others of the same age have been found near Dikar. Basing his conclusions on these and other facts, de Lapparent held that an arm of the sea extended inland from the Atlantic to the eastern Sahara. This sea was bounded on the north and east by the mountains of Air, Ahaggar, the Asjer Tassili, &c. An extensive acquaintance with Saharan characteristics shows, however, that a sea for the Sahara as a whole is impossible. Henri Schirmer, who in 1893 published an admirable summary of Saharan geography up to that date, argued that the desert nature of the Sahara is due to forces which have been at work for ages, although, as in all deserts, the dryness is probably progressively increasing. The primary cause is to be sought in the existing distribution of land and sea, the great land mass of North Africa causing an outflow of air in all directions (and consequent absence of rain) in winter, and an indraught in summer, when the surface is intensely heated and the relative humidity of the atmosphere becomes so small that condensation is all but impossible. The vicinity of the comparatively cool Mediterranean in the north accentuates the force of the winds from that direction, which, blowing towards a lower latitude, are in their very nature dry winds. The influence of mountain ranges, such as the Atlas, round the border of the desert, is thus but a subordinate cause of the latter's dryness, which would probably be little diminished did the Atlas not exist. This dryness reacts again on the temperature conditions of the Sahara, accentuating both the daily and annual variations. The intense heat of the day is compensated by the cold of the nights, so that the mean annual temperature is not excessive. The difference between the mean temperature of

the hottest and coldest month has been found to be as high as 45° F., and the extreme range at least 90° F., maxima of 115° and over having been frequently observed. As a result of the extreme dryness of the air, evaporation is excessive, and, being greater than the precipitation, involves a progressive desiccation of the Sahara. The surface of the rocks, heated by the sun and suddenly chilled by rapid radiation at night, gets fractured and crumbled; elsewhere the cliffs have been scored and the sand thus formed is at once turned by the wind into an active instrument of abrasion. In many places it has planned the flat rocks of the hammada as smooth as ice. Elsewhere it has scored the vertical faces of the cliffs with curious imitations of glacial striation, and helped to undercut the pillar or table-like eminences—remains of former more extensive plateaus—which, under the name *gw*, are among the most familiar products of Saharan erosion. The softer quartz rocks of the Quaternary and Cretaceous series have been made to yield the sand which, drifted and sifted by the winds, has taken on the form of dunes. The slightest breeze is enough to make the surface "smoke" with dust; and at times the weird singing of the sands, waxing louder and louder, tells the scientific traveller that the motion is not confined to the superficial particles. The dry wind of the Sahara is known in southern Europe as the *Sirocco*. It brings with it clouds of fine red dust, as noted long since by Idrisi, the Arabian geographer. Dr Theobald Fischer and Dr Oscar Fraas agree in believing that the desiccation has markedly increased in historic times. Evidence derived from ancient monuments combined with the statements of Herodotus and Pliny are held to prove that the elephant, the rhinoceros, and the crocodile existed in North African regions where the environment is now utterly alien, and on the other hand that the camel is a late introduction.

Any attempt to improve the climatic conditions of the Sahara as a whole can hardly meet with success when the causes of its desiccation are considered. Much may, however, be done to modify local conditions, and fairly satisfactory results have been obtained in the direction of fixing the dunes and covering them with a growth of vegetation. Experiments carried out by the French at Ain Sefra, on the northern border of the desert, have shown that by protecting the sand from the action of the wind by a litter of alfalfa grass, time is given for the establishment of suitable trees, which include the tamarisk, acacia, eucalyptus, prickly pear, peach and aspen poplar, the last-named having proved the most capable of all of resisting the desert conditions. Such planting operations can only be carried out in favourable localities, such as valleys in which a certain amount of water is available. Wide areas like the arid stony plateaus (hammada) must be abandoned as hopeless.

As already stated, the popular conception of the Sahara as a sand desert is erroneous. It is really a stony, wind-wrest waste with much bare rock visible, the actual area of pure sand forming a relatively small portion. A broad belt of *Geological* Archaeozoic rocks extends throughout the desert, appearing at intervals in the form of hills and plateaus from beneath the superficial sands and Quaternary deposits. Examples are the granite of Air and the gneiss and mica-schists of this massif and of the Ahaggar plateau. Flanking this zone are immense tracts occupied by rocks of Devonian and Carboniferous ages, from which characteristic marine fossils have been obtained at the springs of El Hasei and between Wad Draa and the dunes of Igidi. *Productus africanus* is a common fossil of the Carboniferous rocks. At the close of the Carboniferous period it has been generally considered that the southern and central Sahara became dry land and has remained so up to the present day. Marine fossils of Cretaceous age have, however, been found within recent years in the central regions; while Eocene echinoids have been obtained near Sokoto (*Geol. Mag.* 1904). During the lower Cretaceous times the Mediterranean covered the Algerian and Tripolitan Sahara and the northern portion of the eastern desert; the extensive development of the Cretaceous system being one of the most striking features of Saharan geology. At the close of the Cretaceous period the Tripolitan Sahara completely emerged, but parts of the Tunisian and Algerian Sahara seem to have remained below sea-level until the end of the Lower Eocene. Only on the extreme borders of the desert, however, do tertiary formations play any prominent part. During the Quaternary period the Sahara possessed a moister climate than the present. This is shown by the numerous water-cut valleys, now dry, and by the remains of hippopotamus in the Quaternary deposits.

The idea so long held that the Sahara represented the recently dried-up bed of an extension of the Mediterranean has been disproved by the investigations of French geologists. The sand is mainly derived from the wide expanse of Cretaceous sandstones, which become rapidly disintegrated by the contraction caused by the wide range of temperature between day and night. The loose sands of the Quaternary deposits also furnish abundant material. The true dune sand is remarkable for the uniformity of its composition and the geometrical regularity of its grains, which measure less than  $\frac{1}{320000}$  in. While individually these appear transparent or reddish yellow (from the presence of iron), they have in the mass a rich golden hue. According to Tisserand animal organisms, such as the microscopic shells of Rhizopoda, abundant in sea-sand, are strikingly absent.

Botanically the Sahara is the meeting-ground of representatives

**SAHARANPUR**, a city and district of British India, in the Meerut division of the United Provinces. The city is situated on a stream called the Damaula Nadi, 907 ft. above sea-level, 998 m. by rail from Calcutta. Pop. (1901) 66,254, of whom more than half are Mahomedans. It is an important junction of the North-Western railway with the Oudh and Rohilkhand line. The government botanical gardens were established in 1817. There are railway workshops, and a large industry is pursued in wood-carving.

The DISTRICT OF SAHARANPUR has an area of 2228 sq. m. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The Siwalik hills rise precipitously on its northern frontier; at their base stretches a wild submontane tract, with much forest and jungle. Cultivation generally in this part is backward, the surface of the country being broken by ravines. South of this tract lies the broad alluvial plain of the Doab, with fertile soil and good natural water-supply. This portion of the country is divided into parallel tracts by numerous streams from the Siwaliks, while the Eastern Jumna and Ganges canals cover the district with a network of irrigation channels. The annual rainfall averages about 37 in. The population in 1901 was 1,045,230, showing an increase of 4.4% in the decade. The principal crops are wheat, rice, pulse, millet, and maize, with some sugar-cane and cotton. The district contains the towns of Roorkee and Hardwar.

During the later years of the Mogul empire, Saharanpur suffered much from the perpetual raids of the Sikhs, but in 1785 the district under Ghulam Kadir enjoyed comparative tranquillity. On his death the country fell into the hands of the Mahrattas. It was afterwards again overrun by the Sikhs, remaining practically in their hands until their defeat at Charaon November 1804, when it passed under British rule. Several disturbances subsequently took place among the native chiefs; but from 1824 to 1857 nothing occurred to disturb the peace of the district. The Mutiny in this part was soon quelled.

**SAHEL** (Arabic for "shore"); a common place-name in countries where Arabic is the dominant language. By *sahel* any coast belt may be indicated, but the name has become the definite designation of certain districts, e.g. the Tunisian coast between the gulfs of Hammamet and Gabes. Another region so called is that part of the Sahara washed by the Atlantic. The name is also used to designate the territory under French jurisdiction west of Timbuktu and north of the Senegal. Sahel thus understood comprises regions which form the inter-

mediate zone between the fertile lands of the Sudan and the desert. In its plural form, Swahili, the word has become the tribal name of the natives inhabiting the coast strip opposite Zanzibar.

**SAHIB**, a title of respect in India, specially used to designate Europeans. The word is Arabic, and originally means a companion. It is generally fixed to the titles of men of rank, as Khan Sahib, Nawab Sahib, Raja Sahib, and is equivalent to master. The proper feminine form is *sahiba*; but the hybrid term *memsahib* (from *madam* and *sahib*) is universally used in India for European ladies.

**SAHOS**, or **SHOHOS**, Africans of Hamitic stock living to the W. of Massawa. Some authorities regard them as true Abyssinians, but more probably they are akin to the Gallas and Afars. They are for the most part Mahomedans, but some few are Christians.

**SAHYADRI**, a mountain range of India. The term, which is Sanskrit rather than vernacular, is applied to the entire system of the Western GHATS (*q.v.*) from the Tapti river to Cape Comorin, but more especially to that part of the system in the Bombay Presidency. In this restricted sense the Sahyadri hills begin in Khandesh district, and run S. as far as Gao.

In the territory of the Nizam of Hyderabad, the cross range forming the watershed between the river systems of the Tapti and the Godavari, is locally known as Sahyadri Parbat.

**SAIDAPET**, a town of British India, administrative headquarters of Chingleput district, Madras, on the South Indian railway, 5 m. S.W. of Madras city, from which it is separated by a line of tanks. Pop. (1901) 14,254. The government teachers' college has a hostel or boarding-house for Brahmans, opened in 1897. The agricultural college, originally (1865) a model farm, has been transferred to Coimbatore.

**SAID PASHA** (c. 1830- ), surnamed **KUCUK**, Turkish statesman, was at one time editor of the Turkish newspaper *Jeride-i Havadis*. He became first secretary to Sultan Abd-ul-Hamid II. shortly after his accession, and is said to have contributed to the realizations of his majesty's design of concentrating power in his own hands; later he became successively minister of the interior and Vali of Brussa, reaching the high post of grand vizier in 1879. A Turkish statesman of the old school, he was regarded as somewhat bigoted and opposed to the extension of foreign influence in Turkey. He was grand vizier four more times under Abd-ul-Hamid. In 1896 he took refuge at the British embassy at Constantinople, and, though then assured of his personal liberty and safety, remained practically a prisoner in his own house. He came into temporary prominence again during the revolution of 1908. On the 22nd of July he succeeded Ferid Pasha as grand vizier, but on the 6th of August was replaced by Kiamil Pasha, a man of more liberal views, at the instance of the young Turkish committee.

**SAID PASHA KURD** (1834-1907), Turkish statesman, son of Hussein Pasha, was born at Suleimanié. After holding various administrative posts he became governor-general of the Archipelago (1881), minister for foreign affairs (1882), ambassador at Berlin (1883) and again foreign minister in 1885. He was afterwards president of the Council of State, an office which he held till his death on the 29th of October, 1907.

**SAIGA** (*Saiga tatarica*), the native designation of a desert-dwelling antelope, easily recognized by its extraordinary swollen and puffy nose, in which the apertures of the tubular nostrils are directed downwards. The ringed lyrate horns of the males are amber-coloured, and wide apart on the head. There is a small gland on each side of the face below the eye; and the ears are remarkable for their short and rounded form. The color is whitish in winter and sandy in summer. It is the sole representative of its genus. At the present day the headquarters of this antelope are the Kirghiz Steppes, but a century ago its range extended as far west as Poland. During the latter part of the Tertiary period the saiga was much more widely distributed. fossilized remains having been obtained from many parts of Western Europe, including Britain.

**SAIGO, TAKAMORI** (1832-1877); Japanese patriot, was born in Satsuma in 1832. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of abolishing the Tokugawa administration, he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat to Kagoshima, and fell fighting (September 14) within sight of their homes. Saigo's patriotism and his great services in the cause of the restoration of the administrative power to the throne were so fully recognized that his son was raised to the peerage with the title of marquis, and his own memory was honoured by the erection of a bronze statue in Tokyo.

**SAIGON**, a town of French Indo-China, capital of the colony of Cochin-China, on the right bank of the river Saigon, 34 m. from the sea. Pop. (1905) 54,745; of whom 8749 were French (exclusive of troops), 152 Europeans of other nationalities, about 30,000 Annamese, 14,000 Chinese. The town is enclosed by the river Saigon on the east, the Chinese Arroyo on the south and the Arroyo of the Avalanche on the north, while on the west it extends towards the neighbouring town of Cholon. Double rows of trees give shade in all the streets, the width and uniformity of which, together with the beautiful gardens (including the zoological gardens), make Saigon one of the finest towns of the Far East. It is lighted chiefly by electricity and its water-supply is secured by a filtering reservoir. The chief public buildings are the government house, the palace of the lieutenant-governor of Cochin-China, the law courts, the theatre, the post-office and the cathedral. The commercial port, at the mouth of the Chinese Arroyo, carries on a large rice trade. The naval harbour comprises an arsenal and has a repairing dock.

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochin-China. Its municipal council consists of eight French and four native members elected by universal suffrage. This body elects a mayor and two assistants.

Before the French conquest, Saigon, then known as *Gia-dinh-thanh*, was the capital of Lower Cochin-China, which consisted of the "six southern provinces" of the Annamese empire, and constituted a vice-royalty under the government of a *kinhluoc*. In 1836 it was fortified for the emperor Gia Long by Colonel Ollivier. The French captured it in 1859, and it was part of the territory ceded in 1862.

**SAIL**, the English equivalent of the common Teutonic word for one of the two universal means of propulsion of a vessel through the water, the other being the oar (*g.v.*). For the various types of sail see RIGGING, and for the textile material used see SAILCLOTH below. The origin of the O. Eng. *segl* or *segele* and its cognates, e.g. Dutch *zeil*, Dan. *seil*, Ger. *Segel*, &c., is not known; it is certainly not connected with the Lat. *sagulum*, cloak, mantle. It may be derived from the Indo-European root *sagh-*, seen in Sanskrit *sah*, endure, the idea being that of which bears up against or resists the wind.

**SAILCLOTH**, now more commonly called *canvas* (*g.v.*), usually a double warp, single weft fabric of the same structure as bagging (*g.v.*), although it is sometimes made with single threads of warp. Hemp and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smacks and similar vessels are made entirely of cotton—the fabric sometimes

retaining its natural colour, but more often dyed or stained tan. Since most of the larger vessels are now driven by steam, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers, and for coal bags, sailcloth buckets, &c.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 36 in. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Great care has to be exercised in the manufacture of canvas for the British Admiralty. The yarns must be made wholly from long flax, well and evenly spun, and properly twisted. They must also be free from blacks, and be twice boiled in order to remove all injurious matter. From the grey state to the cleaned state the yarns must lose 10% of weight, and no deleterious substance whatever must be used in any stage. The mill washing and first boiling reduce the weight about 8%, while about 2% is removed during the second boiling. Finally, the yarn is thoroughly washed to remove all traces of alkali. The successive processes which the yarn is subjected to remove all impurities, and leave the yarn in the best condition for weaving. Canvas is made in sixteen different qualities: the heaviest is No. 0000, then follow Nos. 000, 00, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12. Of these sixteen varieties Nos. 1 to 8 are mostly in use. Nos. 1, 2, 4, 6 and 7 are used for royal navy canvas, and Nos. 4 and 6 for the merchant navy. The canvas for the Admiralty is 24 in. wide, and the pieces, termed bolts, should be as nearly as practicable 40 yds. of legal measure in length, and to be completely manufactured—particular attention being given to the weaving; the selvages to be evenly and well manufactured, the thrum to be left on each end of the bolt, and to be made as nearly as possible in the proportion of weights given below.

The breaking tests for red and grey canvas are 5% below those for white canvas.

*Sailmaking* is a very ancient industry, but it is, naturally, much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—after due allowance for stretching—in terms of cloths and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-and-aft sail (triangular), the number of cloths in the foot and the depth in yards of the luff or stay and of leech or after-leech; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot, and the depth of mast or luff and of after-leech. These particulars obtained, there is got out what is technically termed a "casting," which simply means the shape, length, &c., of each individual cloth in the sail. These figures are given to the cutter, who proceeds to cut out the sail cloth by cloth in consecutive order, numbering them 1, 2, 3, 4, &c.; the series of cloths thus cut out are handed over to the workman, who joins them together by carefully made double flat seams, sewn with twine specially prepared for the purpose, with about 120 stitches in a yard. In the heavy

Canvas Number.	Weight of Warp.	Weight of Bolt.	Length of Bolt.	Reed.	No. of Threads.	Breaking Test for Warp.	Breaking Test for Weft.	Dimensions of Testing Strip.
	lb.	lb.	yds.	Score.	Double.	lb.	lb.	in.
1	26	46	39	16½	660	340	480	24×1
2	24	43	39	16½	660	320	460	24×1
3	22	40	39	16½	660	300	440	24×1
4	21	36	39	17	680	280	400	24×1
5	19	33	39	17	680	260	370	24×1

7	15	27	40	20	800 single	330	390	24×1½
8	14	23	40	20	800 "	310	380	24×1½

sails the seam is about 1½ in. in width, and in the British navy stock or stitched in the middle of the seam to give additional strength; the seams in the lighter sails are about 1 in. wide. The whole of the cloths are then brought together, and spread out, and the tabling (or hemming, so to speak) is turned in and finished off with about 72

stitches to a yard. Strengthening pieces or "linings" are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, leech-linings, bunt-linecloths; in top-sails (only) a top-lining or brim; in other and lighter sails such pieces as mast-lining clew and head, tack and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bunt-line, &c., are also made where required, a grommet of line of suitable size being worked in them to prevent their being cut through. The next thing to be done is to secure the edges of the sail. Bolt-rope, a comparatively soft laid rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from 1 in. (increasing in size by quarter inches) up to 8 in. inclusive; it is then neatly sewn on with roping twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roping. Where slack sail has to be taken in, it is the practice to leave it to the judgment of the sail-maker; but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roping the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is 6 in.; sizes above this are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred and served over with spun yarn; the foot of the sail is then secured to it by being marled in. Where two sizes of bolt-rope used in roping a sail have to be connected, it is effected by a tapered splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-rope, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sides or leeches, mast or luff; they are required either for making stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and-aft sails, such as spankers, gaff-sails and storm try-sails, are reduced in size by reef-points made of stout line (4 to 20 lb), crow-footed in the middle, a hole being pierced through every seam; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and the reefs are placed parallel to the foot. The sails—now finished in respect of making—have to be fitted, that is, such ropes have to be attached to each of them as are necessary for proper use; such ropes may be summarily stated as follows: head-earings, robands, reef-earings, reef-lines, spilling and slab lines, reef-tackle pendant, reef-points, bow-line bridles, bunt-line toggles, bunt-becket, leech-line strops and toggles, toggles in clews, sheet ropes, down-haul, lacing, head and stay tack-rope (gaff top-sail), tack lashing, bending strops, matting and gaskets.

The tools and appliances of a sailmaker are not very numerous: a bench about 7 ft. long and 15 in. high, upon which he sits; palms

for seaming and roping to fit the hand, made of hide lined with leather, a plate properly tempered being fixed in it having chambers to catch the head of the needle, thus acting as a thimble; needles of various sizes, that for seaming being the smallest; and fids, splicing, serving and stretching knife, rubber, sail-hook, bobbin for twine, and sundry small articles. (T. Wo.)

**SAINFOIN** (*Onobrychis sativa*) in botany is a low-growing perennial plant with a woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is papilionaceous, pink, with darker stripes of the same colour.

The indehiscent pods or legumes are flattened from side to side, wrinkled, somewhat sickle-shaped and crested, and contain a single olive-brown seed shaped like a small bean. In Great Britain the plant is a native of the calcareous districts of the southern counties, but elsewhere it is considered as an escape from cultivation. It is native throughout the whole of Central Europe and Siberia; but it does not seem to have been cultivated in Great Britain till 1651, when it was introduced from France or French Flanders, its French name being retained. Alphonse de Candolle (*Origin of Cultivated Plants*, p. 104) considers that the cultivation of sainfoin originated in the south of France as late perhaps as the 15th century. It is grown as a forage plant, being especially well adapted for dry limestone soils. It has about the same nutritive value as lucerne, and is esteemed for milch cattle and for sheep in winter. Besides the common form, a second known as giant sainfoin is met with in cultivation, being more rapid in its growth.

**SAINT** (lat. *sanctus*, "holy"), the term originally applied, e.g. in the New Testament and in the most ancient monuments of Christian thought, to all believers. In this sense it is still used by those modern Christian sects which profess to base their polity on the Bible only (e.g. the Mormons or "Latter Day Saints"). In ancient inscriptions it often means those souls who are enjoying eternal happiness, or the martyrs. Thus we find inscriptions in the Catacombs such as *vivas inter sanctes, refrigera cum spiritu sancto*, and people were buried *ad sanctos*. For a long time, too, *sanctus* was an official title, particularly reserved for bishops (v. *Anacleto Bollandiano*, xviii. 410-411). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the *Martyrium Polycarpi* (xviii. 3) in connexion with a meeting to celebrate the anniversary of the martyr's death. Another passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to the illustrious dead; and these honours were officially paid by the community. They consisted in a gathering at the martyr's tomb on the anniversary of his death. St Cyprian, speaking of the confessors who died in prison, wrote to his priests, "Denique et dies eorum, quibus excedunt, adnotate, ut commemoraciones eorum inter memorias martyrum celebrare possimus" (*Epist.* xii. 2). The list of anniversaries of a church formed its Martyrology (q.v.). In the early days each church confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. In the oldest Roman ferial we already find festivals of Carthaginian martyrs, and similarly, in the Carthaginian calendar, Roman festivals, while Wright's *Syriac Martyrology* contains numerous traces of this exchange of festivals. From the 5th century onwards certain celebrated saints were honoured almost universally; St Augustine (*Sermo*, 276, § 4) says that the festival of St Vincent was celebrated throughout the whole of the Christian world. The same was the case of the festivals of St Stephen, St James and St John, and St Peter and St Paul as is shown by the liturgical documents, but these festivals were held in connexion with that of Christmas (26th, 27th and 28th December), and were not strictly speaking anniversaries.

The calendars at first included only martyrs, but their scope was gradually widened. The first to find a place in them were the bishops. Apparently they were at first arranged in a series of anniversaries separate from that of the martyrs, as seems to be shown by the existence at Rome of the *Depositio episcoporum* side by side with the *Depositio martyrum*: the two lists seem to have been combined in the calendar of Carthage, which includes the *dies natalis et depositio martyrum et depositiones episcoporum*. Some of the most famous bishops also ended by passing from one calendar into the other. Finally, the ascetics came to share in the honours paid to the martyrs and we see in the *Historia religiosa* of Theodoret how quickly they

Sainfoin (*Onobrychis sativa*). 1, Fruit, nat. size.

lancheolate calyx-teeth shorter than the corolla, which latter is papilionaceous, pink, with darker stripes of the same colour.

assimilation took place. In times of persecution the martyrs were buried among the rest of the faithful, but one can understand that their tombs, at which gatherings took place at least on the day of their anniversary, were distinguished from the ordinary tombs by some sign. When the peace of the Church permitted it, they were enshrined in chapels and often in sumptuous basilicas. In the West these buildings were raised over the tomb, which was left intact; but in the East there was no hesitation in disturbing the graves of the saints and removing the bodies to a basilica built to receive them. It is in this way that the relics of St Babylas were placed in the sanctuary built by Gallus at Daphne (Socrates, *Hist. eccl.* iii. 18; Sozomen, *Hist. eccl.* v. 19). As a matter of fact, the discipline of the Eastern churches with regard to the relics was, from the very beginning, much less severe than that of Rome and a great number of the Western churches. From the 4th century on are recorded cases of translation of the bodies of saints, and they did not even shrink from dividing the sacred relics. In the West the principle already laid down by St Gregory the Great in his letter to Constantia, namely that of not disturbing the bodies of the saints, was for a long time the rule in all cases, and the portions distributed to the churches were simply *branda*, that is to say, linen which had lain upon the tomb of the saint, or, in other words, representative relics. But as early as the 7th century there is proof of a relaxation of this rule which had so well safeguarded the authenticity of the relics. It was finally disregarded altogether; in the 9th century translations of relics were extremely frequent, and led to inextricable confusion in the future.

As to the belief in the efficacy of the prayers of the saints for those still living on earth, and similarly in the efficacy of the prayers addressed to the saints, St Cyril of Jerusalem indicates in the following words the advantages of the commemoration of the saints: "Then we make mention also of those who have fallen asleep before us, first of patriarchs, prophets, apostles, martyrs, that God would at their prayers and intercessions receive our supplication" (*Cat. Myst.* v. 9). It is difficult to understand a much-discussed passage of Origen (*De oratione*, 14), except as applying to prayer addressed to the saints. The Fathers of the 4th century, and notably the Cappadocian Fathers, provide us with a quantity of evidence on this subject, which leaves no doubt as to the practice of the invocation of saints, nor of the complete approval with which it was viewed. St Basil, for example, says: "I accept also the holy apostles, prophets and martyrs, and I call upon them for their intercession to God, that by them, that is by their mediation, the good God may be propitious to me, and that I may be granted redemption for my offences" (*Epist.* 360).

The cult of the saints early met with opposition, in answer to which the Church Fathers had to defend its lawfulness and explain its nature. The Church of Smyrna had early to explain its position in this matter with regard to St Polycarp: "We worship Christ, as the Son of God; as to the martyrs, we love them as the disciples and imitators of the Lord" (*Martyrium Polycarpi*, xvii. 3). St Cyril of Alexandria defends the worship of the martyrs against Julian; St Asterius and Theodoret against the pagans in general, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone. St Jerome argued against Vigilantius with his accustomed vehemence, and especially meets the objection based on the resemblance between these rites and those of the pagans. But it is above all St Augustine who in his refutation of Faustus, as well as in his sermons and elsewhere, clearly defined the true character of the honours paid to the saints: "Non eis templa, non eis altaria, non sacrificia exhibemus. Non eis sacerdotis offerunt, absit, Deo præstantur. Etiam apud memórias sanctorum martyrum cum offerimus, nonne Deo offerimus? . . . Quando audistis dici apud memórias sancti Theogenis: offero tibi, sancte Theogenis: aut? offero tibi Petre, aut: offero tibi Paule?" (*Sermo*, 273. 7; cf. *Contra Faustum*, xx. 21). The undoubted abuses which grew up, especially during the middle ages, raised up, at the time of the Reformation, fresh adversaries of the cult of the saints. The council of Trent, while reproving all superstitious practices in the invocation of the saints, the veneration of relics and the use of images, expresses as follows the doctrine of the Roman Church: "That the saints who reign with Christ offer to God their prayers for men; that it is good and useful to invoke them by supplication and to have recourse to their aid and assistance in order to obtain from God His benefits through His Son our Saviour Jesus Christ, who alone is our Saviour and Redeemer" (*Sess.* xxv.). At the present day the canonization (q.v.) of saints is reserved in the Roman Church to the sovereign pontiff. The Anglican Church, while still commemorating many of the Catholic saints, has not, since the Reformation, admitted any new names to the authoritative list, with the single exception of that of King Charles I., whose "martyrdom" was celebrated by authority from the Restoration until the year 1859.

Lucius, *Die Anfänge des Heiligenkults* (Tübingen, 1904); H. R. Percival, *The Invocation of Saints* (London, 1896); A. P. Forbes, *An Explanation of the Thirty-nine Articles* (Oxford, 1878). (H. DR.)

**ST AFFRIQUE**, a town of Southern France, capital of an arrondissement in the department of Aveyron, on the Sorgues, 68 m. N.N.W. of Beziers on a branch line of the railway to Clermont Ferrand. Pop. (1906) town, 4473; commune 6571. An old bridge over the Sorgues and some megaliths in the neighbourhood, especially the dolmen at Tiergues, are of antiquarian interest. There is considerable trade in wool and Roquefort cheese.

St Afrique grew up in the 6th century around the tomb of St African, bishop of Comminges. In the 12th century a fortress was built on the neighbouring rock of Caylus. The possession of St Afrique was vigorously contested during the wars of religion. It was eventually occupied by the Huguenots till 1639, when it was seized and dismantled by a royal army.

**ST ALBANS, EARL AND DUKES OF**. The English title of earl of St Albans was first borne by Richard Bourke, or de Burgh, 4th earl of Clanricarde (d. 1635), who was lord president of Connaught from 1604 to 1616 and governor of Galway in 1616. In 1624 he was made Baron Somerhill and Viscount Tunbridge in the English peerage, and in 1628 earl of St Albans, Baron Imanney and Viscount Galway. He became the third husband of Frances, dowager countess of Essex, whose first husband had been Sir Philip Sidney, and his English titles became extinct on the death of his only son, Ulick, and earl of St Albans and marquis of Clanricarde, in 1657.

The second creation of an earl of St Albans was in 1660, when Henry, Baron Jermyn, was made an earl under this title; but again it became extinct on his death in 1684.

The dukedom of St Albans was created in 1684 in favour of CHARLES BEAUCLERK (1670-1726), a natural son of Charles II. by Nell Gwynne. Born in London on the 8th of May 1670, Charles was made Baron Hedington and earl of Burford in December 1676. He became colonel in the 8th regiment of horse in 1687, and took service with the emperor Leopold I., being present at the siege of Belgrade in 1688. After the battle of Landen in 1693, William III. made him captain of the gentlemen pensioners, and four years later gentleman of the bedchamber. His father had given him the reversion of the office of hereditary master falconer and that of hereditary registrar of the Court of Chancery, which fell vacant in 1698. His Whig sentiments prevented his advancement under Anne, but he was restored to favour at the accession of George I. He died at Bath on the 10th of May 1726. His wife Diana, daughter and heiress of Aubrey de Vere, last earl of Oxford, was a well-known beauty, who became lady of the bedchamber to Caroline, princess of Wales, and survived until the 15th of January 1742. Charles was succeeded by his eldest son, CHARLES BEAUCLERK, 2nd duke of St Albans (1696-1751), while his youngest son, Lord Aubrey Beauclerk (c. 1710-1741), became a captain in the royal navy, and perished in a fight in the West Indies on the 2nd of March 1741. The second duke's son and heir, GEORGE BEAUCLERK, 3rd duke (1730-1786), was followed by his second cousin, George Beauclerk (1758-1787), 4th duke, who died unmarried, and was succeeded as 5th duke by his cousin, Aubrey Beauclerk (1740-1802). He was succeeded by his son Aubrey, the 6th duke (1765-1815), whose infant son Aubrey, 7th duke (b. 1815), died within a year of his father. The 8th duke, William (1766-1825), was the second son of the 5th duke. His son William (1801-1849), the 9th duke, married the actress Harriot Mellon, widow of the banker Thomas Coutts. She was celebrated for her beauty, and was painted by Romney. Her fortune derived from her first husband passed to her granddaughter Angela, Baroness Burdett-Coutts in her own right. The 9th duke was succeeded by his son by a second marriage, William Amelius Aubrey de Vere (1840-1898), whose son, Charles Victor Albert Aubrey de Vere, became the 11th holder of the title.

**ST ALBANS, HENRY JERMYN, EARL OF** (c. 1604-1684), was the third son of Sir Thomas Jermyn of Rushbroke, Suffolk. At an early age he won the favour of Queen Henrietta Maria, whose vice-chamberlain he became in 1628, and master of the horse in 1639. He was a consummate courtier, a man of dissolute morals, and much addicted to gambling. He was member for Bury St Edmunds in the Long Parliament and an active and reckless royalist. He took a prominent part in the army plot of 1641, and on its discovery fled to France. Returning to England in 1643, he resumed his personal attendance on the queen, and after being raised to the peerage as Baron Jermyn of St Edmundsbury in that year, he accompanied Henrietta Maria in 1644 to

France, where he continued to act as her secretary. In the same year he was made governor of Jersey, whence he conducted the prince of Wales to Paris. He conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament; and in other respects also he meddled with foreign politics, his great influence with the queen being a continual embarrassment to royalist statesmen, especially after the execution of Charles I. When Charles II. went to Breda, Jermyn remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St Albans in 1660. Gossip which the historian Hallam accepted as authentic, but which is supported by no real evidence, asserted that Jermyn was secretly married to the widow of Charles I. At the Restoration St Albans became lord chamberlain, and received other appointments. He supported the policy of friendship with France, and he contributed largely to the close secret understanding between Charles II. and Louis XIV., being instrumental in arranging the preliminaries of the treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St James's Palace, where Jermyn Street preserves the memory of his name, and where he built the St Albans market on a site afterwards cleared for the construction of Regent Street and Waterloo Place. The earl, who was a friend and patron of Abraham Cowley, died in St James's Square, for the building of which he had provided the plan in January 1684. St Albans being unmarried, the earldom became extinct at his death, while the barony of Jermyn of St Edmundsbury passed by special remainder, together with his property, to his nephew Thomas Jermyn, and after the latter's death to Thomas's brother Henry Baron Dover (q.v.).

**ST ALBANS**, a city, municipal borough, and market town in the St Albans parliamentary division of Hertfordshire, England, on the main line of the Midland railway and on branches of the London & North-Western and the Great Northern lines, 20 m. N.W. of London. Pop. (1891) 12,898; (1901) 16,019. St Albans became the seat of a bishop in 1877; the diocese covering the greater part of Essex and Hertfordshire, with small portions of Cambridgeshire, Bedfordshire and Buckinghamshire. The great cathedral, or abbey church, is finely situated on the steep hill, above the small river Ver, on which the central part of the city is placed.

Shortly after the martyrdom of St Alban, probably in 303, a church was built on the spot where he was slain, and in 793 Cila, king of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became one of the richest and most important houses of that order in the kingdom. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but its erection was delayed till the time of William the Conqueror, when Paul of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The cathedral at Canterbury as built by Lanfranc was almost a reproduction of St Stephen's, Caen; but Paul, while adopting the same model for St Albans, built it on a much larger scale. The church was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristic that, owing to the use of the flat broad Roman tile, the Norman portions are peculiarly bare and stern. The western towers were pulled down in the 13th century. About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work now remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the west front and portions of the north and south aisles. He began the erection of the west front in a new and enriched form, and his work was continued by his successor William de Trumpington in a plainer manner. In 1257 the eastern portion was pulled down, and between the middle of the 13th and the beginning of the 14th century a sanctuary, ante-chapel and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1323 two great columns on the south side suddenly fell, and this necessitated the rebuilding of five bays of the south aisle and the Norman cloisters. Various incongruous additions were made during the Perpendicular period, and much damage was also done during the dissolution of the abbey to the finer work in the interior. Structural dangers gave rise to an extensive restoration and partial rebuilding, begun under the direction of Sir Gilbert Scott, and completed in 1894 by Lord

Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey's extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (292 ft.) is the longest Gothic nave in the world and exceeds that of Winchester by about 20 ft. The length of the transepts is 175 ft. inside. The monastic buildings have all disappeared except the great gateway.

St Michael's church, within the site of Verulamium, was originally constructed in the 10th century. Considerable portions of the Norman building remain. The church contains the tomb of Lord Chancellor Bacon. St Stephen's church, dating from the same period, contains some good examples of Norman architecture. St Peter's church has been in great part rebuilt, but the Early Perpendicular nave remains. The restored clock-house in the market-place was built by one of the abbots in the reign of Henry VIII. There is an Edward VI. grammar school. The principal modern buildings are the corn exchange, the court-house, the prison, the public baths, a technical school and the public library. There are two hospitals (one for infectious diseases), a dispensary and almshouses founded in 1734 by Sarah, duchess of Marlborough. The principal industries are the manufacture of silk, straw-plaiting, brush-making, letterpress and chromo-lithographic printing. There are also breweries and iron-foundries. A public park of 24 acres was opened in 1894, and a recreation ground in 1898. The increase in population is largely due to the growth of a residential district on the outskirts, owing mainly to the convenient proximity to London. The city is governed by a mayor, 4 aldermen, and 12 councillors. Area, 997 acres.

To the south-west of the present city of St Albans stood the ancient Verulamium (q.v.), one of the oldest towns in Britain, on Watling Street. The ruins served as a quarry not only to the builders of the Abbey, but also for the other churches and the monastic buildings of St Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ m. N.E. After being burnt by Boadicea, Verulamium revived, and its church was famous early in the 8th century. The origin of the royal castle of Kingsbury is variously assigned to the 6th and 8th centuries. In the 9th and 10th centuries the abbots enlarged the town, which was confirmed to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the good men of St Albans; but the borough court was, apparently, discontinued for about 300 years after the rebellion of 1381. A charter of 1533, confirmed in 1553 and 1559-1560, incorporated the mayor and burgesses. Charters of 1663, 1664 and 1685, and the Municipal Corporations Act of 1835, altered the form of the corporation; and in 1877 St Albans became a city. Two burgesses were returned to the parliament of 1306-1307, and to others, until, after 1336, such right fell into abeyance until its resumption in 1553. Its abolition, as a result of corrupt electioneering practices, took place in 1852.

During Wat Tyler's insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St Albans the Lancastrians were defeated on the 21st of May 1455, their leader, the duke of Somerset, being killed, and Henry VI. taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on the 17th of February 1461. During the civil wars the town was garrisoned for the parliament. On a printing press, one of the earliest in the kingdom, set up in the abbey the first English translation of the Bible was printed. See *Victoria County History, Herts.*, vol. ii.; Peter Newcome, *The History of the Abbey of St Albans* (London, 1793); and *Chronicles of the Monasteries of St Albans*, edited by H. T. Riley for the "Rolls" series (1863-1876).

**SAINT ALBANS**, a city and the county-seat of Franklin county, Vermont, U.S.A., 57 m. (by rail) N.N.W. of Montpelier. Pop. (1900) 6239, including 1201 foreign-born; (1910) 6382. St Albans is served by the Central Vermont railway, which has general offices and shops here, and by an electric line connecting with Lake Champlain at St Albans Bay and with Swanton, 9 m. N. The city is built on a plain less than 3 m. from Lake Champlain and about 300 ft. above it; surrounding hills (Aldis and Bellevue) rise still higher and command charming views of the Green Mountains, Lake Champlain and the Adirondacks. Among the prominent buildings are a U.S. customs-house, the city hall, the court house, a public library, a hospital (1882), the War-Home for Little Wanderers (1882), two Roman Catholic parochial schools and two convents. There are marble quarries in the vicinity, but the surrounding country is devoted largely to dairying. St Albans has a large creamery, manufactures condensed milk and ships large quantities of butter.

The first permanent settlement here was established in 1786; the township of St Albans (pop. in 1900, 1715) was incorporated in 1859, and the larger part of it was chartered as the city of St Albans in 1897. On the 19th of October 1864 Lieut. Bennett H. Young led from Canada about twenty-five un-uniformed Confederate soldiers in a raid on St Albans. They looted three banks, wounded several citizens, one mortally, and escaped to Canada, where Young and twelve others were arrested and brought to trial. But they were never punished, and even the \$75,000 which had been taken from them on their arrest was returned to them. Later, however, the Canadian government refunded this amount to the banks. In 1866 and again in 1870 the Fenians made St Albans a base for attacks on Canada, and United States troops were sent here to preserve neutrality.

**SAINT ALBIN, ALEXANDER CHARLES OMER ROUSSELIN DE CORBEAU, COMTE DE (1773-1847)**, French politician, was born in Paris, of a noble Dauphinois family, and was educated at the Collège d'Harcourt. He embraced the revolutionary ideas with enthusiasm. As civil commissioner at Troyes he was accused of terrorism by some, and by the revolutionary tribunal of moderation. He was imprisoned for a short time in 1794. On his release the Citizen Rouselin entered the ministry of the interior, and under the Directory he became secretary-general, and then civil commissioner of the Seine. Attached to the party of Bernadotte, he was looked on with suspicion by the imperial police, and during the later years of the empire spent his time in retirement at Provence. During the Hundred Days, however, he served under Carnot at the ministry of the interior. Under the Restoration he defended Liberal principles in the *Constitutionnel*, of which he was the founder. Although Louis Philippe had been his friend since the days of the Revolution, he accepted no office from the monarchy of July. He retired from the *Constitutionnel* in 1838, and died on the 15th of June 1847. His chief works deal with the soldiers of the Revolution. They are: *Vie de Lazare Hoche* (2 vols., 1798); *Notice historique sur le général Marbot* (1800); *M. de Champronnel* (1860); and notices of others posthumously published by his son, Hortensius de Saint Albin, as *Documents relatifs à la Révolution Française* . . . (1873).

**ST ALDEGONDE, PHILIPS VAN MARNIX, HEER VAN (1538-1598)**, Dutch writer and statesman, was born at Brussels, the son of Jacob van Marnix, baron of Pottes. He studied theology under Calvin and Beza at Geneva and, returning to the Netherlands in 1560, threw himself energetically into the cause of the Reformation, taking an active part in the compromise of the nobles in 1565 and the assembly of St Trond. He made himself conspicuous by issuing a pamphlet in justification of the iconoclasts who devastated Flanders in 1566, and on Alva's arrival next year had to fly the country. After spending some time in Friesland and in the Palatinate he was in 1570 taken into the service of William, prince of Orange, and in 1572 was sent as his representative to the first meeting of the States-general assembled at Dordrecht. In 1573 he was taken prisoner by the Spaniards at Maaslandsluys, but was exchanged in the following year. He was sent as the representative of the insurgent provinces to Paris and London, where he in vain attempted to secure the effective assistance of Queen Elizabeth. In 1578 he was at the diet of Worms, where he made an eloquent but fruitless appeal for aid to the German princes. Equally vain were his efforts in the same year to persuade the magistrates of Ghent to cease persecuting the Catholics in the city. He took a conspicuous part in arranging the Union of Utrecht, and in 1583 was chosen burgomaster of Antwerp. In 1585 he surrendered the city, after a 13 months' siege, to the Spaniards. Violently attacked by the English and by his own countrymen for this act, he retired from public affairs and, save for a mission to Paris in 1590, lived henceforth in Leiden or on his estate in Zeeland, where he worked at a translation of the Bible. He died at Leiden on the 15th of December 1598.

St Aldegonde, or Marnix (by which name he is very commonly known), is celebrated for his share in the great development of Dutch literature which followed the classical period represented by such writers as the poet and historian Pieter Hooft. Of his works the best known is the *Roman Bee-hive* (*De roomsche byen-korf*), published in 1569 during his exile in Friesland, a bitter satire on the faith and

practices of the Roman Catholic Church. This was translated or adapted in French, German and English. As a poet, St Aldegonde is mainly known through his admirable metrical translation of the Psalms (1580), and the celebrated *Wilhelmus van Nassauwe*, one of the two officially recognized national anthems of Holland, is also ascribed to him. His complete works, edited by Lacroix and Quinet, were published at Brussels in 7 vols. (1855-1859), and his religious and theological writings, edited by Van Turenbergen, at Paris, in 3 vols. (1871-1891).

See E. Quinet, *Marnix de St Aldegonde* (Paris, 1854); Juste, *Vie de Marnix* (The Hague, 1858); Frédéricq, *Marnix en zijne nederlandse geschriften* (Ghent, 1882); Tjalma, *Philips van Marnix, heer van Sint-Aldegonde* (Amsterdam, 1896).

**ST ALDWIN, MICHAEL EDWARD HICKS BEACH, 1ST VISCOUNTY (1837- )**, English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London in 1837, and was educated at Eton and Christ Church, Oxford, where he graduated with a first class in the school of law and modern history. In 1864 he was returned to parliament as a Conservative for East Gloucestershire, the county in which his estates of Williamstrip Park were situated; and during 1868 he acted both as parliamentary secretary to the Poor Law Board and as under-secretary for the Home Department. In 1874 he was made chief secretary for Ireland, and was included in the Cabinet in 1877. From 1878 to 1880 he was secretary of state for the colonies. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the House of Commons. After Mr Gladstone's brief Home Rule Ministry in 1886 he entered Lord Salisbury's next Cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the House; but troubles with his eyesight compelled him to resign in 1887, and meanwhile Mr Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the Board of Trade, and in 1895—Mr Goschen being transferred to the Admiralty—he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the National Debt from twenty-five to twenty-three millions—a reduction imperatively required, apart from other reasons, by the difficulties found in redeeming Consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income-tax each year, up to 1s. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Mr Lowe. The sale of his Netheravon estates in Wiltshire to the War Office in 1898 occasioned some acrid criticism concerning the valuation, for which, however, Sir Michael himself was not responsible. On Lord Salisbury's retirement in 1902 Sir Michael Hicks Beach also left the government. He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator; and though when the fiscal controversy arose he became a member of the Free-food League, his parliamentary loyalty to Mr Balfour did much to prevent the Unionist free-traders from precipitating a rupture. When Mr Balfour resigned in 1905 he was raised to the peerage as Viscount St Aldwyn.

**ST AMAND-LES-EAUX**, a town of northern France, in the department of Nord, at the junction of the Elnon with the Scarpe, 22 m. S.E. of Lille by rail. Pop. (1906), town, 10,195; commune, 14,454. The town has a communal college and a school of drawing, and carries on iron-founding and the manufacture of porcelain, hosiery, chains and nails, but is better known for its mineral waters and mud baths. There are five springs; the water (67° to 77° F.) contains sulphate of lime and sulphur, and deposits white gelatinous threads without smell or taste. The mud baths are of benefit to patients suffering from rheumatism, gout and certain affections of liver and skin. Though from the discovery of statues and coins in the mud it is evident that these must have been frequented during the Roman period, it was only at the close of the 17th century that they again became of more than local celebrity. Of the abbey there remain

an entrance pavilion serving as town hall and the richly decorated façade of the church, both dating from the 17th century.

St Amand owes its name to St Amand, bishop of Tongres, who founded a monastery here in the 7th century. The abbey was laid waste by the Normans in 882 and by the count of Hainaut in 1340. The town was captured by Mary of Burgundy in 1477, by the count of Ligne, Charles V.'s lieutenant, in 1521, and finally in 1667 by the French. In 1793 St Amand was the headquarters of General Dumouriez in revolt against the Republican government.

**ST-AMAND-MONT-ROND**, a town of central France, capital of an *arrondissement* in the department of Cher, 39 m. S. by E. of Bourges on the railway to Montluçon. Pop. (1906), 7711. The town stands at the foot of the hill of Mont-Rond on the right bank of the Cher, at its confluence with the Marmande and on the canal of Berry. A church of the period of transition from the Romanesque to Gothic style and several old houses are the more interesting buildings. The beautiful château of Meillant, built from 1500 to 1510 by the admiral Charles of Amboise, is 5½ m. from St Amand; and the abbey of Noirlac, a fine type of Cistercian abbey with a 12th-century church, is 2½ m. from the town.

The town grew up round a monastery founded by St Amand, a follower of St Columban, in the 7th century. Its ruined stronghold, on the hill of Mont-Rond, was of importance in the middle ages, and during the Fronde, when it belonged to the great Condé, was a centre of resistance to the royal troops, by whom it was taken after a siege of eleven months in 1652. It was for a time the property of Sully, who retired to it under the regency of Marie de' Medici.

**SAINT-AMANT, MARC ANTOINE DE GÉRARD, SEUR DE** (1594-1661), French poet, was born near Rouen in the year 1594. His father was a merchant who had, according to his son's account, been a sailor and had commanded for 22 years *une escadre de la reine Elisabeth*—a vague statement that lacks confirmation. The son obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d'Harcourt among others. He saw military service and sojourned at different times in Italy, in England—a sojourn which provoked from him a violent poetical attack on the country, *Albion* (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant's later years were spent in France; and he died at Paris on the 29th of December 1661.

Saint-Amant has left a not inconsiderable body of poetry. His *Albion* and *Rome ridicule* set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron. In his later years he devoted himself to serious subjects and produced an epic, *Moïse saisi* (1653). His best work consists of Bacchanalian songs, his *Débauche* being one of the most remarkable convivial poems of its kind.

The standard edition is that in the *Bibliothèque Elzévienne*, by M. C. L. Livet (2 vols. Paris, 1835).

**SAINT ANDRÉ, ANDRÉ JEANBON** (1749-1813), French revolutionist, was born at Montauban (Tarn-et-Garonne) on the 25th of February 1749, the son of a fuller. Although his father was a Protestant, St André was brought up by the Jesuits at Marseilles and took orders. He turned Protestant, however, and became pastor at Castras and afterwards at Montauban. The proclamation of liberty of worship made him a supporter of the Revolution, and he was sent as deputy to the Convention by the department of Lot. He sat on the Mountain, voted for the death of Louis XVI. and opposed the punishment of the authors of the September massacres. In July 1793 he was president of the Convention, entered the Committee of Public Safety the same month and was sent on mission to the Armées of the East. On the 20th of September 1793 he obtained a vote of one hundred million francs for constructing vessels, and from September 1793 to January 1794 reorganized the military harbours of Brest and Cherbourg. In May 1794 he took part with Admiral Villaret de Joyeuse in a fight with the English. Finally, after a mission in the south, which lasted from July 1794 to March 1795 and in which he showed great moderation, he was arrested on the 28th of May 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), was kept prisoner by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three

departments on the left bank of the Rhine. He died at Mainz on the 10th of December 1813.

See Lévy-Schneider, *Le Conventionnel Jeanbon St André* (Paris, 1901).

**SAINT ANDRÉ, JACQUES D'ALBON, SEIGNEUR DE** (c. 1505-1562), French soldier and favourite of Henry II. of France. He was made marshal of France, governor of Lyonnois and ambassador in England. He served with great bravery against the emperor Charles V. in 1552. In 1557 he was taken prisoner at the battle of Saint Quentin, but was released the following year, and took part in negotiating the peace of Cateau-Cambrésis. After the death of Francis II. he formed in 1561 with the constable de Montmorency and Francis, duke of Guise, an alliance known as "the triumvirate" against the Protestants and the queen-mother. He perished at the battle of Dreux by the hand of a private enemy.

**ST ANDREWS**, a city, royal burgh, university town and seaport of Fife-shire, Scotland. Pop. (1901), 7621. It is situated on a bay of the North Sea, 2½ m. S.E. of Dundee by the North British railway, via Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs in which the sea has worn numerous caves. The Eden enters St Andrews Bay to the north-west of the Links; and Kinness Burn, skirting the south side of the town, flows into the harbour. Almost the whole activity of St Andrews is centred in education and golf. There are a few small businesses, however, such as brewing, tanning, shipping and fishing. The harbour, which is somewhat difficult of access, is protected by a pier 630 ft. long. The city has been called the "Mecca of Golf," partly because the Royal and Ancient Golf Club, founded in 1754, is the legislative authority of the game, and partly because its beautiful links—acquired by the town in 1804 and containing three courses—rank amongst the finest in the world. For the sake of the game, the bracing air and the bathing which the sandy beach of its bay affords, visitors are attracted to St Andrews in great numbers. The chief modern buildings include the town hall, the Templars' Hall, the Volunteer Hall, the Gibson Hospital, the Memorial Cottage Hospital, the Marine Biological Station (erected by Dr C. H. Gatty and opened in 1896), the Library and the Golf Club House, erected in 1853. The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs' Memorial, erected to the honour of Patrick Hamilton, George Wishart, and other martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Bishop Robert (1122-1159). At the end of the 17th century some of the priory buildings were still entire and considerable remains of others existed, but nearly all traces have now disappeared, except portions of the priory wall and the archways, known as the Penda. The wall is about three-quarters of a mile long, and bears turrets at intervals. The 3rd marquis of Bute undertook the restoration of the priory, but the work was interrupted by his death in 1900. The cathedral was founded by Bishop Arnold (1159-1162), to supply more ample accommodation than was afforded by the church of St. Regulus. Of this church in the Romanesque style, probably dating from the 10th century, there remain the square tower, 108 ft. in height, and the choir, of very diminutive proportions. On a plan of the town, about 1530, a chancel appears, and on seals affixed to the city and college charters there are representations of other buildings attached. The cathedral was constructed in the form of a Latin cross, the total length inside the walls being 355 ft., the length of the nave 200 ft., of the choir and lateral aisles 62 ft. and of the lady chapel at the eastern extremity 50 ft. The width at the transepts was 166 ft. and of the nave and choir 62 ft. The building was finished in the time of Bishop Lambertson (1297-1328), and was dedicated on the 5th of July 1318, the ceremony being witnessed by Robert Bruce. When entire it had, besides a central tower, six turrets, of which two at the east and one of the two at the west extremity, rising to a height of 100 ft., remain. The building was partly destroyed by fire in 1378, and the restoration and further embellishment were completed in 1440. It was stripped of its altars and images in 1559. It is believed that about the end of the 16th century the central tower gave way, carrying with it the north wall. Afterwards large portions of the ruins were taken away for building purposes, and nothing was done to preserve them until 1826. Since then it has been tended with scrupulous care, an interesting feature being the cutting out of the ground-plan in the turf. The principal portions extant, partly Norman and partly Early English, are the

east and west gables, the greater part of the south wall of the nave and the west wall of the south transept.

The picturesque ruins of the castle are situated on a rocky promontory much worn away by the sea. It is supposed to have been erected by Bishop Roger about the beginning of the 13th century as an episcopal residence, and was strongly fortified. It was frequently taken by the English, and after it had been captured by the Scottish regent, Andrew Murray, in 1336-1337, was destroyed lest it should fall into their hands. Towards the close of the century it was rebuilt by Bishop Trail in the form of a massive fortification with a moat on the south and west sides. James I. spent some of his early years within it under the care of Bishop Wardlaw, and it was the birthplace of James III. (1445). From a window in the castle Cardinal Beaton witnessed the burning of George Wishart in front of the gate (1546), and in the same year he was murdered within it by a party of Reformers. The castle was taken from the conspirators by the French, among the prisoners captured being John Knox. Some years afterwards it was repaired by Archbishop Hamilton, but in less massive and less substantial form. By 1656, however, it had fallen into such disrepair that the town council ordered the materials to be used for repairing the pier. The principal remains are a portion of the south wall enclosing a square tower, the "bottle dungeon"—so named from its shape: it was a cell hewn out of the solid rock—below the north-west tower, the kitchen tower and a curious subterranean passage. The grounds have been laid out as a public garden.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turbot. The early building was a beautiful Norman structure, but at the close of the 18th century the whole, with the exception of little else than the square tower and spire, was re-erected in a plain and ungainly style. In this church John Knox first preached in public (May or June 1547), and in it, on June 4th 1559, he delivered the famous sermon from St. Matthew xxi. 12, 13, which led to the stripping of the cathedral and the destruction of the monastic buildings. The church contains an elaborate monument in white marble to James Sharp, archbishop of St. Andrews (assassinated 1679). In South Street stands the lovely ruin of the north transept of the chapel of the Blackfriars' monastery founded by Bishop Wishart in 1274; but all traces of the Observantine monastery founded about 1450 by Bishop Kennedy have disappeared, except the well.

The great university of St. Andrews owed its origin to a society formed in 1410 by Lawrence of Lindores, abbot of Scone, Richard Cornwall, archdeacon of Lothian, William Stephen, afterwards archbishop of Dunblane, and a few others. A charter was issued in 1411 by Bishop Henry Wardlaw (d. 1440), who attracted the most learned men in Scotland as professors, and six bulls were obtained from Benedict XIII. in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers the use of a building called the Paedagogium, or St. John's. St. Salvador's College was founded and richly endowed by Bishop Kennedy in 1456; seven years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 St. Leonard's College was founded by Prior John Hepburn and Archbishop Alexander Stewart on the site of the buildings which at one time were used as a hospital for pilgrims. In the same year Archbishop Stewart nominally changed the original Paedagogium into a college and annexed to it the parish church of St. Michael of Tarvet; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but its general character has been much altered by various restorations. It forms two sides of a quadrangle, the library and principal's residence being on the north and the lecture rooms and the old dining-hall on the west. The University library, which now includes the older college libraries, was founded about the middle of the 17th century, rebuilt in 1764, and improved in 1820 and 1880-1890. The lower hall in the older part of the building was used at times as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1570 St. Mary's was set apart for theology; and in 1747 the colleges of St. Salvador and St. Leonard were formed into the United College. The buildings of St. Leonard's are now occupied as a school for girls. The college chapel is in ruins. The United College occupies the site of St. Salvador's College, but the old buildings have been removed, with the exception of the college chapel,

now used as the university chapel and the parish church of St. Leonard's, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox's pulpit; the entrance gateway, with a square clock tower (152 ft.); and the janitor's house with some class-rooms above. The modern building, in the Elizabethan style, was erected between 1827 and 1847. University College, Dundee, was in 1890 affiliated to the university of St. Andrews. This arrangement was set aside by the House of Lords in 1895, but a reaffiliation took place in 1897. In 1889-1888 a common dining-hall for the students was established; in 1892 provision was made within the university for the instruction of women; and for the board and residence of women students a permanent building was opened in 1896. To the south of the library medical buildings, erected by the munificence of the 3rd marquis of Bute, were opened in 1899. It was during the principalship of Dr. James Donaldson, who succeeded John Tulloch (1823-1886), that most of the modern improvements were introduced.

Madras College, founded and endowed by Dr. Andrew Bell (1755-1832), a native of the city, is a famous higher-class school.

The town, which is governed by a council, provost and bailies, gives its name to the district group of burghs for returning one member to parliament, the other constituents being the two Anstruthers, Crail, Cupar, Kilrenny and Pittenweem.

Four miles N.W. is Leuchars (pop. 711), the church of which, dating from 1100, contains some beautiful Norman work in the chancel and apse, the nave being modern. It was in this church that Alexander Henderson (1583-1646) heard the sermon that led him to give up Episcopacy. At Guard Bridge (pop. 715), so named from the six-arched bridge erected by Bishop Wardlaw at the mouth of the Eden, are a large paper-mill and brickworks. Mt. Melville, to the S.W. of the city, was the residence of the novelist C. J. Whyte-Melville (1821-1878), and Kinaldie, to the S., was the birthplace of Sir Robert Ayton the poet (1570-1638). On the shore, to the S.E., stands the huge detached rock which, from its shape, bears the name of the Spindle rock.

*History.*—St. Andrews was probably the site of a Pictish stronghold, and tradition declares that Kenneth, the patron saint of Kennoway, established a Culdee monastery here in the 6th century. The foundations of the little church dedicated to the Virgin were discovered on the Kirkheugh in 1860. Another Culdee church of St. Mary on the Rock is supposed to have stood on the Lady's Craig, now covered by the sea. At that period the name of the place was Kilyrmont (Gaelic, "The church of the King's Mount") or Muckcross. Another legend tells how St. Regulus or Rule, the bishop of Patras in Achaea, was guided hither bearing the relics of Saint Andrew. The Pictish king Angus gave him a tract of land called the Boar Chase, no doubt the Boar hills of the present day, and the name of the spot was changed to St. Andrews, the saint soon afterwards (747) becoming the patron-saint of Scotland (but see ANDREW, Sr.). St. Andrews is said to have been made a bishopric in the 9th century, and when the Pictish and Scottish churches were united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alban. It became an archbishopric during the primacy of Patrick Graham (1466-1478). The town was created a royal burgh in 1124. In the 16th century St. Andrews was one of the most important ports north of the Forth and is said to have numbered 14,000 inhabitants, but it fell into decay after the Civil War. Defoe says that when he saw it one-sixth of its houses were ruinous and the sea had so encroached on the harbour that it was never likely to be restored; but the slight improvement in trade and public spirit which Bishop Pococke seemed to detect in 1760 continued throughout the 19th century.

**SAINT ARNAUD, JACQUES LEROY DE** (1801-1854), marshal of France, was born at Paris on the 20th of August 1801. He entered the army in 1817, and after ten years of garrison service, which he varied by gambling and wild courses, he still held only the lowest commissioned grade. He then resigned, led a life of adventure in several lands and returned to the army at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshal) Bugeaud's staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. There he distinguished himself on numerous occasions, and after twelve years had risen to the rank of *maréchal de camp*. In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a *coup d'état*, an expedition was made into Little Kabylia, in which St Arnaud showed his prowess as a commander-in-chief and provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war and superintended the military operations of the *coup d'état* of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on the 20th of September 1854 shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

See *Letres du Maréchal de Saint Arnaud* (Paris, 1855; 2nd édition with memoir by Sainte-Beuve, 1858).

**ST ARNAUD**, a town of Kara-Kara county, Victoria, Australia, 158 m. by rail N.W. of Melbourne. Pop. (1901), 3656. It is a flourishing town with a fine town hall, a school of mines and the court house, in which sittings of the supreme court are held. There are tanneries, chaff and wood yards, and flour- and bone-mills in the town, which lies in a gold-mining, pastoral and agricultural district, the mining being chiefly quartz. To the N.W. is some of the finest agricultural land in the colony.

**ST ASAPH**, a cathedral city and a contributory parliamentary borough of Flintshire, N. Wales, on the Rhyl-Denbigh branch of the London & North-Western railway, about 6 m. from each of these towns. Pop. (1901), 1788. Its Welsh name, Llanelyw, is derived from the Elwy, between which stream and the Cwyd it stands. Asaph, to whom the cathedral (one of the smallest in Great Britain) is dedicated, was bishop here after Kentigern's return hence to Glasgow, and died in 596. The small, irregularly built town has also a parish church (Anglican), remains of a Perpendicular chapel near Ffynnon Fair (St Mary's Well), a bishop's house, a grammar school (1882) and almshouses for eight poor widows, founded in 1678 by Bishop Barrow. The hill on which St Asaph stands is Bryn Paulin, supposed to have been the camping-ground of Suetonius Paulinus, on his way to Anglesey. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the war of Owen Glendower in 1402; Bishop Redman's building (c. 1480) was completed by the erection of the choir about 1770. During the Civil War the Parliamentarians did not spare the building. The choir and chancel were restored, from designs by Sir Gilbert Scott, in 1867-1868, the nave in 1875. The church is plain, cruciform, and in style chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2000 volumes (some rare); memorials to Bishop Dafydd ab Owain (d. 1502), to Bishop Luxmore (d. 1830), to the poetess Felicia Hemans, a resident near St Asaph (d. 1835); and Perpendicular oak choir stalls. In the neighbourhood is the modern mansion of Bodellwyddan, of which the estate was bought by Sir W. Williams, speaker of the House of Commons in Charles II.'s time.

**ST AUGUSTINE**, a city and the county-seat of St John's county, Florida, U.S.A., in the N.E. part of the state, about 36 m. S.E. of Jacksonville. Pop. (1900) 4272, including 1735 negroes; (1910) 5494; many of the native whites are descendants of those Minorcans who were settled at New Smyrna, Florida, by Andrew Turnbull in 1769, and subsequently removed to St Augustine. St Augustine is served by the Florida East Coast railway and by the Florida East Coast Canal, an inland waterway from the St John's river to the Florida Keys.

The city stands on a narrow, sandy peninsula, about 12 ft. above the sea, formed by the Matanzas and San Sebastian rivers, and is separated from the ocean by the northern end of Anastasia Island. St George, the chief street in St Augustine, is only 17 ft. wide, and Treasury Street is, at its east end, an alley across which two people may clasp hands. There are many old houses, some of which have balconies projecting above the streets. At its northern end is the old fort of San Marco (now renamed Fort Marion in honour of General Francis Marion), a well-preserved specimen of Spanish military architecture, begun, it is supposed, about 1656 and finished in 1756. The St Francis barracks (now the state arsenal) occupy the site of the old Franciscan convent, whose walls still remain as the first storey. In the military cemetery are buried a number of soldiers who were massacred by the Seminoles near the Great Wahoo Swamp on the 28th of August 1835. At the end of St George Street and near Fort Marion is the City Gate (two pillars, each 20 ft. high); from this gate a line of earthworks formerly stretched across the northern end of the peninsula. In the centre of the city is the Plaza de la Constitución, in which are an obelisk erected in 1813 to commemorate the Spanish Liberal Constitution of 1812, and a monument (1872) to citizens who died in the Confederate Army. On this square are the market (built in 1840, partially burned in 1887, and afterwards rebuilt), often erroneously spoken of as "the slave market"; a Roman Catholic cathedral (built in 1791, burned in 1887, and rebuilt and enlarged in 1887-1888); Trinity church (Protestant Episcopal); and the post office (once the Spanish government building). In the western part of the city is the beautiful Memorial Presbyterian Church, built in 1889 as a memorial to his daughter, by Henry M. Flagler. Facing King Street (the Alameda) is the magnificent Hotel Ponce de Leon (Spanish Renaissance), of shell-concrete, also by Flagler. The Alcazar (with a large swimming pool fed by a sulphurous artesian well, in the Moorish style, and the Alcazar Annex (with a large sun parlour), formerly the Cordova Hotel, designed and built by Franklin W. Smith, in the Hispano-Moorish style, are also famous hosteries. In an old building (restored) is housed the Wilson Free Public Library. Another old building houses the collections of the St Augustine Institute of Science and Historical Society, organized in 1884. St Augustine is the seat of the state school for the deaf and blind (1885).

At St Augustine are car and machine shops of the Florida East Coast railway. Oyster canning and fishing are engaged in to some extent, and cigars are manufactured, but the city is important chiefly as a winter resort, the number of its visitors approximating 25,000 a year. The climate is delightful, the mean temperature for the winter months being about 58° F., and for the entire year about 70° F.

St Augustine is the oldest permanent settlement of Europeans in the United States. It was founded by Spanish colonists under the leadership of Pedro Menéndez de Avilés, who sighted land here in 1565, on the 28th of August, St Augustine's day, whence the name. On the 6th of September he landed and began his fortifications. St Augustine's colonial history is almost identical with the history of Florida (q.v.) under Spanish dominion. In 1586 it was burned by Sir Francis Drake, who captured the fort, and in 1665 it was pillaged by Captain John Davis, an English freebooter. There were frequent conflicts with the English settlements in South Carolina and Georgia, beginning in 1681 with an attack by the Spanish on Port Royal, South Carolina. In 1702 Governor James Moore of South Carolina captured St Augustine, but not the fort; and there were subsequent expeditions under General James Edward Oglethorpe (see GEORGIA). When Florida was ceded to England in 1763, nearly all the Spanish inhabitants of St Augustine went to Cuba. Under English control the city prospered, but when in 1783 Florida was re-ceded to Spain, nearly all the English inhabitants left for the Carolinas, Georgia or the West Indies, and it became merely a military post. In 1821 St Augustine, with the rest of Florida, passed under American control. The Spanish inhabitants remained. On the 7th of January 1861, three days before Florida passed her Ordinance of Secession, the small United States garrison was compelled by a state force to evacuate; but on the 11th of March 1862 the fort was

recaptured without bloodshed by a Federal force, and was held by the Federals until the close of the Civil War.

See George R. Fairbanks, *The History and Antiquities of the City of St Augustine* (New York, 1858); Charles B. Reynolds, *Old St Augustine* (St Augustine, 1885); and D. Y. Thomas, "Report upon the Historic Buildings, Monuments and Local Archives of St Augustine," in vol. 1. pp. 333-352 of the *Annual Report* (1905) of the American Historical Association.

**ST AUSTELL**, a market town in the St Austell parliamentary division of Cornwall, England, 14 m. N.E. of Truro, on the Great Western railway. Pop. of urban district (1901) 3340. It is pleasantly situated on a steep slope 2 m. inland from St Austell bay on the south coast. To the north the high ground culminates at 1034 ft. above the sea in Hensbarrow Downs, so called from a barrow standing at the loftiest point. The church of the Holy Trinity is perpendicular, with decorated chancel, richly ornamented in a manner unusual in the county. The town is the centre of a district productive of china clay (kaolin), about 400,000 tons being annually exported by sea to the potteries of Staffordshire and to Lancashire, when it is used in the calcosworks for sizing. The deposits of clay became important about 1763, and Josiah Wedgwood acquired mines in the neighbourhood. Mines were previously worked for tin and copper, and in some cases after being exhausted of ore continued to be worked for clay. The Carclaze mine to the north-east is notably rich; it is a shallow excavation of great superficial extent, which appears to have been worked for very early times. Close to St Austell is a good example of an ancient baptistery, called Menacuddle Well, the little chapel being Early English.

**ST BARTHOLOMEW**, or **ST BARTHELEMY**, an island in the French West Indies. It lies in 17° 55' N. and 63° 60' W., about 130 m. N.W. of Guadeloupe, of which it is a dependency. It is shaped like an irregular crescent, the horns enclosing the bay of St Jean, pointing to the N., its surface is hilly, culminating near the centre in a limestone hill 1003 ft. high. It is 8 sq. m. in area, and devoid of forests, and water has often to be imported from the neighbouring island of St Kitts. The surrounding rocks and shallows make the island difficult of access. Despite the lack of water, sugar, cotton, cocoa, manioc and tobacco are grown. The capital, Gustavia, on the S.W. coast, possesses a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and negro descent, are English-speaking, and number about 3000. St Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

**ST BARTHOLOMEW, MASSACRE OF**, the name given to the massacre of the Huguenots, which began in Paris on St Bartholomew's day, the 24th of August 1572. The initiative for the crime rests with Catherine de' Medici. Irritated and disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX. into a war with Spain, she resolved at first to have him assassinated. The blow failed, and the admiral was only wounded. The attempt, however, infuriated the Huguenots, who had flocked to Paris for the wedding of Henry of Navarre and Marguerite de Valois. Charles IX. declared that the assassin should receive condign punishment. Catherine then conceived the idea of killing at a blow all the Huguenot leaders, and of definitely ruining the Protestant party. After holding a council with the Catholic leaders, including the duke of Anjou, Henry of Guise, the marshal de Tavannes, the duke of Nevers, and René de Birague, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of the 23rd of August succeeded in wringing his authorization from him. The king himself arranged the manner of its execution, but it is scarcely probable that he fired upon the Huguenots from a window of the Louvre. The massacre began on Sunday at daybreak, and continued in Paris till the 17th of September. Once let loose, it was impossible to restrain the Catholic populace. From Paris the massacre spread to the provinces till the 3rd of October. The duc de Longueville in Picardy, Chabot-Charny (son of Admiral Chabot) at Dijon, the comte de Matignon (1525-1597) in Normandy, and other provincial governors, refused to authorize the massacres.

François Hotman estimates the number killed in the whole of France at 50,000. There were many illustrious victims, among them being Admiral Coligny, his son-in-law Charles de Téliigny and the logician Peter Ramus. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

See H. Bordier, *La St Barthélemy et la critique moderne* (Paris, 1879); H. Baumgarten, *Vor der Bartholomäusnacht* (Strassburg, 1882); and H. Maréchal, "La Réforme et la Ligue" (Paris, 1904), in vol. vi. of the *Histoire de France*, by E. Lavisse, which contains a more complete bibliography of the subject.

**ST BENOÎT-SUB-LOIRE**, a village of north-central France, in the department of Loiret, on the right bank of the Loire, 22 m. E.S.E. of Orléans by road. St Benoît (Lat. *Floriacum*) possesses a huge basilica, the only survival of a famous monastery founded in the 7th century to which the relics of St Benedict were brought from Monte Cassino. Of great importance during the middle ages, owing partly to its school, the establishment began to decline in the 16th century. In 1562 it was pillaged by the Protestants and, though the buildings were restored by Richelieu, the abbey did not recover its former position. The basilica was built between c. 1025 and 1218. Its narthex has a second storey supported on columns with remarkable carved capitals; there are two sets of transepts, above which rises a square central tower. In the interior are the tomb of Philip I., stalls of the 15th century, and, in the crypt, a modern shrine containing the remains of St Benedict, which still attract many pilgrims.

**ST BERNARD PASSES**, two of the best-known passes across the main chain of the Alps, both traversed by carriage roads. The Great St Bernard (8111 ft.) leads (53 m.) from Martigny (anc. *Otidurum*) in the Rhone valley (Switzerland) to Aosta (anc. *Augusta Prætoria*) in Italy. It was known in Roman times. The hospice on the pass was founded (or perhaps re-founded) by St Bernard of Menthon (d. about 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother-house being at Martigny. Annually the servants of the canons, and the famous dogs, save many lives, especially of Italian workmen crossing the pass. In May 1800 Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St Bernard (7179 ft.) also was known in Roman times, and the hospice re-founded by St Bernard of Menthon, though it is now in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 m.) from Bourg St Maurice in the Isère valley (French department of Savoie) to Aosta, but is much less frequented by travellers than its neighbour opposite. (W. A. B. C.)

There is no certain mention of the road over the pass of the Great St Bernard (*Alpis Poenina*, *Poeninus Mons*) before 57 B.C. when Julius Caesar sent Servius Galba over it, "because he wished that the pass, by which traders had been accustomed to go at great risk and with very high transport charges, should be opened." But even in Strabo's time it was impassable for wheeled traffic; and we find that Augusta Prætoria originally had but two gates, one opening on the road towards the Little St Bernard (*Alpis Graia*), the other towards Eporodia (Ivrea), but none towards the *Alpis Poenina*. But the military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in A.D. 60. Remains of it cut in the rock, some 2½ ft. in width, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Penninus), remains of which were excavated in 1890-1893, though objects connected with it had long ago been found. The oldest of the votive-tablets which can be dated belongs to the time of Tiberius, and the temple may be attributed to the beginning of the empire; objects, however, of the first Iron age (4th or 5th century B.C.) were also found<sup>1</sup> and many Gaulish coins. Other buildings, probably belonging to the post station at the top of the pass, were also discovered. Many of the objects found then and in previous years, including

<sup>1</sup> So *Not. degli scavi* (1891), 81; but the statement is contradicted, *ibid.* (1894), 44.

many votive-tablets, are in the museum at the hospice of the Great St Bernard.

See *Notizie degli scavi, passim*, especially E. Ferrero (1890), 294; C. Promis, *Antichità di Aosta* (Turin, 1862).

The Little St Bernard was known to the Romans as Alps Graia. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to many modern scholars, Hannibal passed this way over the Alps, though the question has been much discussed (see art. HANNIBAL, and Partsch in Pauly-Wissowa, *Realencyklopädie* i., 1604). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the Alps Cottia (Mont Genève) was opened by Cn. Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See *Notizie degli scavi* (1883), 7 (1894), 46; and C. Promis, *Antichità di Aosta* (Turin, 1862), 115 sqq. (T. As.)

**ST BERTRAND-DE-COMMINGES**, a village of south-western France at the foot of the Pyrenees in the department of Haute-Garonne, about 70 m. S.W. of Toulouse by rail and road. St Bertrand stands about 1 m. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to a church begun about the end of the 11th century by Bishop Bertrand (1075-1123), afterwards canonized. The nave with its side chapels and the choir, in the Gothic style, date from the first half of the 14th century and were chiefly the work of Bertrand de Goth, bishop from 1205 to 1209 and afterwards Pope Clement V. The choir screen, rood-loft and altar, which form an enclosure within the church, are masterpieces of Renaissance wood-carving, as are also the choir stalls. The church contains several tombs, the most interesting of which are the fine white marble tomb of Bishop Hugh of Châtillon (d. 1352), and the mausoleum of St Bertrand (both of the 15th century), whose relics are preserved in the treasury. On the south side of the church there is a ruined cloister of Romanesque architecture.

St Bertrand-de-Comminges (Lugdunum Convenarum) was founded in 72 B.C., and before the end of the 5th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed towards the end of the 6th century by Guntrum, king of Burgundy, after it had served as a refuge to Gondowald, pretender to the crown of Aquitaine.

**SAINT-BON, SIMONE ARTURO** (1823-1892), Italian admiral, was born at Chambéry on the 20th of March 1823. Leaving the Naval Academy in 1847, he attained the rank of commander in 1860, and that of vice-admiral in 1867. He took part in the Crimean war, distinguished himself in 1860 at the siege of Ancona, and was decorated for valour at the siege of Gaeta. At the battle of Lissa, in 1866, his vessel, the "Formidabile," forced the entrance of the port of San Giorgio and silenced the Austrian batteries, for which exploit he received a gold medal. In 1873 he was elected deputy, and appointed by Minghetti to be minister of marine, in which position he revolutionized the Italian navy. Insisting upon the need for large battleships with high powers of attack and defence, and capable of fighting as single units, he introduced the colossal types of which the "Dulio" and the "Dandolo" were the earliest examples. Falling from power with the Right in 1876, he resumed active service, but in 1891 was again appointed minister of marine. He died on the 26th of November 1892, while still in office. He is remembered in Italy as the originator of the modern Italian fleet.

**ST BRIEUC**, a town of western France, capital of the department of Côtes-du-Nord, 63 m. N.W. of Rennes by the railway to Brest. Pop. (1906) town 15,270; commune 23,041. It stands 200 ft. above the sea, between 1 and 2 m. from the English Channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St Briec is the seat of a bishopric in the province of Rennes, and has a cathedral dating from the 13th century, but partially rebuilt in the 18th, and afterwards extensively restored. In the interior the tombs

of the bishops and a Renaissance organ-loft deserve mention. The oldest part of the episcopal palace date back to the 16th century. The hôtel-de-ville contains a museum and picture gallery. An Ursuline convent serves as barracks. There are numerous houses of the 15th and 16th centuries, in one of which James II., king of England, is said to have lodged in 1689. A colossal image of the Virgin looks down upon the town from an eminence on the north, and there is a statue of Du Guesclin. The industries include wool-spinning, timber-sawing, iron and steel-working, and the manufacture of brushes and agricultural implements.

St Briec owes its origin and its name to the missionary St Bricuc, who came from Wales in the 5th century, and whose tomb afterwards attracted crowds of pilgrims. The place was defended in 1375 by Olivier de Clisson against the duke of Brittany, and again attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges. In 1592 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St Briec. During the Reign of Terror Chouans and Republicans carried on a ruthless conflict with each other in the vicinity. The ancient fort of Péran, built of vitrified granite, is about 5 m. S. of St Briec.

**ST CATHARINES**, a city of Ontario, Canada, and the capital of Lincoln county, on the Welland Canal and the Grand Trunk, and St Catharines and Niagara Central railways, 35 m. S. of Toronto, with which it has steamer connexion. Pop. (1907) 9946. It is connected by electric tramways with the neighbouring towns and villages, and is in the midst of a fine fruit-growing district. Its excellent water-power provides motive force for numerous industries, among which are flour-mills and factories for the manufacture of edge tools and agricultural implements. Bishop Ridley College, under Anglican control, is an important residential school. There are mineral springs which are much visited by invalids.

**ST CHAMOND**, a manufacturing town of east-central France, in the department of Loire, 7½ m. E.N.E. of St Étienne, on the railway from St Étienne to Lyons. Pop. (1906) 14,147. The town lies in a small basin surrounded by mountains at the confluence of the Janon with the Gier, an affluent of the Rhone. It has coal-mines forming part of the Rive-de-Gier basin. The milling of raw silk, the manufacture of ribbons and laces of every kind, dyeing and the construction of naval and railway material are the foremost industries. There are also metal-foundries, manufactories of nails, heavy iron goods, looms and other industrial establishments.

St Chamond, founded in the 7th century by St Ennemond or Chamond, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling was introduced in the town in the middle of the 16th century by Gayotti, a native of Bologna. Remains are found at St Chamond of a Roman aqueduct, which conveyed the waters of the Janon along the valley of the Gier to Lyons.

**ST CHARLES**, a city and the county-seat of St Charles county, Missouri, U.S.A., situated on the N. bank of the Missouri river, about 20 m. above its mouth, and about 23 m. N.W. of St Louis. Pop. (1910) 9437. It is served by the Wabash and the Missouri, Kansas & Texas railway systems, and by an electric railway to St Louis. A great steel bridge, 6535 ft. long (built 1868-1871), crosses the river and gives entry to the Wabash railroad from St Louis. It has three spans of 305 to 321 ft., which at the time of their construction were the longest of their kind in the world. A highway bridge also crosses the river, and is the only wagon bridge between Jefferson City and the mouth of the river. At St Charles are a Presbyterian school for women (Lindenwood College); St Charles Military College (Methodist Episcopal, 1837); the Academy of the Sacred Heart (1818); St Joseph's Hospital, and the Emmaus Asylum for Epileptics. St Charles has important car works (among the largest in the United States), a large shoe factory, flour mills, brick and tile yards and breweries. St Charles county is very fertile, and its yield of wheat is especially large. At the sand works at Klondike, in the southern part of the county, large quantities of silica are blasted, crushed, bolted and shipped.

A French settlement was begun at St Charles in 1769, and soon

thereafter a Spanish official was placed in residence. St Charles was organized as a village under territorial law in 1809, and in 1849 was chartered as a city. It was the first capital of the state (1820-1826).

**SAINT CLAIR**, a borough of Schuylkill county, Pennsylvania, U.S.A., on Mill Creek, 3 m. N. of Pottsville, and about 40 m. by rail N.N.W. of Reading. Pop. (1910) 6455. Saint Clair is served by the Pennsylvania and the Philadelphia & Reading railways. It is engaged chiefly in the mining (very largely surface-stripping) and shipping of anthracite coal, and in the manufacture of miners' supplies. Saint Clair was settled in 1825 and was incorporated as a borough in 1850.

**ST CLAIR**, a lake and river of North America, forming part of the boundary between the state of Michigan, U.S.A., and the province of Ontario, Canada. The lake is 29 m. long and 20 broad. It contains numerous islands, receives from the Canadian side several rivers, the largest of which is the Thames, and is drained into Lake Erie by the Detroit river. At its foot are the cities of Detroit (Michigan) and Windsor (Ontario). On the north it receives the St Clair river, the outlet of Lake Huron. The shores of both lake and river are flat, and their waters shallow but, owing to the enormous traffic which passes through, they have been in great part canalized, and can accommodate the largest steamers.

**ST CLAUDE**, a town of eastern France, capital of an arrondissement in the department of Jura, 42 m. S.S.E. of Lons-le-Saunier by rail. Pop. (1906) 9558. The town is beautifully situated 1300 ft. above sea-level at the western base of Mont Bayard among the heights of the eastern Jura at the confluence of the Biemme and the Tacon. The latter river is crossed by a fine suspension bridge. The cathedral of St Pierre, once the abbey-church, a building of the 14th to the 18th centuries, contains fine 15th-century stalls and a retables of the Renaissance period. The town is the seat of a bishop, suffragan of Lyons, and of a sub-prefect. St Claude has been noted since the close of the middle ages for its fancy articles in horn, tortoise-shell, hardwood, ivory, &c., and there are manufactures of briar-root pipes. Diamond-cutting and lapidary work and the manufacture of measures are also prosperous industries.

The town derives its name from that of an archbishop of Besançon who died in the 7th century in the monastery founded here in the 5th century. This monastery subsequently acquired almost independent sovereignty in the locality, and held its retainers in a state of serfdom till the Revolution. Voltaire pleaded the cause of the serfs, though unsuccessfully, before the *parlement* of Besançon, and in memory of his services a statue was erected to him in 1887. St Claude was constituted a bishopric in 1762. The abbey-buildings and most of the town were destroyed by fire in 1799.

**ST CLOUD**, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 m. W. of the fortifications of Paris by road. Pop. (1906) 7316. Picturesquely built on a hill-slope, St Cloud overlooks the river, the Bois de Boulogne and Paris; and, lying amid the foliage of its magnificent park and numerous villa gardens, it is one of the favourite resorts of the Parisians. The palace of St Cloud, which had been a summer residence for Napoleon I., Louis XVIII., Charles X., Louis Philippe and Napoleon III., was burned by the Prussians in 1870 along with part of the village. In spite of the damage inflicted on the park at the same period its magnificent avenues and ornamental water still make it one of the pleasantest spots in the neighbourhood of Paris. Every year in September, at the time of the pilgrimage of St Cloud, a fair lasting four weeks is held in the park. Within its precincts are situated the national Sèvres porcelain manufactory and the Breteuil pavilion, the seat of the international commission on the metre. St Cloud possesses a modern church in the style of the 12th century with an elegant stone spire; and here, too, is established the higher training college for male teachers for the provincial training colleges of primary instruction.

Cloaldo or Cloud, grandson of Clovis, adopted the monastic life and left his name to the spot where his tomb was discovered

after the lapse of 1200 years, in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St Cloud Henry III. and the king of Navarre (Henry IV.) established their camp during the League for the siege of Paris; and there the former was assassinated by Jacques Clément. The castle was at that time a plain country house belonging to Pierre de Gondi, archbishop of Paris; in 1658 it was acquired by the duke of Orleans, who was the originator of the palace which perished in 1870. Peter the Great of Russia was received there in 1717 by the regent, whose grandson sold the palace to Marie Antoinette. It was at St Cloud that Bonaparte executed the *coup d'état* of 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris; and in 1830 from St Cloud Charles X. issued the orders which brought about his fall. Napoleon III. was there when he received the *senatusconsultum* which restored the empire in his favour (21st December 1852). Seized by the Prussians at the beginning of the investment of Paris in 1870, St Cloud was sacked during the siege.

**ST CLOUD**, a city in Stearns, Benton and Sherburne counties, Minnesota, U.S.A., and the county-seat of Stearns county, about 65 m. N.W. of Minneapolis, on both banks of the Mississippi river, and about 970 ft. above sea-level. Pop. (1900) 8663, of whom 1007 were foreign-born; (1910 U.S. census) 10,600. It is served by the Great Northern and the Northern Pacific railways. It is the seat of one of the State Normal Schools (1860), and of the Minnesota State Reformatory (1887). In the city are the Carnegie library, a Federal building, a Roman Catholic cathedral, St Raphael's Hospital (Roman Catholic), St Clotilda's Academy of Music and two business colleges. The Mississippi has a considerable fall here, and provides valuable water-power. Among the manufactures are flour, barrels, bricks, and foundry and machine-shop products—the Great Northern maintains extensive car and repair shops here. In 1905 the value of the city's factory product was \$1,994,476, an increase of 27.8% since 1900. There are large lumber yards, and excellent grey and red granites (St Cloud is called "the Granite City") from neighbouring quarries are exported. The city lies in a large grain-growing and stock-raising district. St Cloud was settled in 1852, platted in 1854, incorporated as a village in 1868, and chartered as a city in 1889. Until reached by the Great Northern railway, St Cloud was the Hudson's Bay Company's terminus for the unloading of furs from the wooden ox-carts ("Red river" carts).

**ST CROIX** or **SANTA CRUZ**, the largest island in the Danish West Indies. It lies 65 m. S.E. of Puerto Rico, in 17° 40' N. and 64° 14' W., is 22 m. long, varies in breadth from 1 m. to 6 m., and has an area of 84 sq. m. Pop. (1901) 18,590. Parallel with the western coast is a range of hills, culminating in Mount Eagle (1164 ft.). The narrower western part is also hilly, but on the S shore there are marshy tracts with lagoons of brackish water. Sugar is the staple product, and near Christianstæd there is a central factory conducted by the government. The planters are mostly English, and their language predominates. The capital, Christianstæd (locally known as "Bassin"), is situated at the head of an inlet on the N. coast, but its harbour is to a large extent choked with mud. It is a picturesque town, and the seat of the Danish governor during half the year. The only other town, Fredericksstæd, stands on an open roadstead on the W. coast. It is locally known as "West End," and part of the town, wrecked by the blacks in 1878, lies in ruins. The climate is healthy, the mean annual temperature being 74° F. and the average rainfall 45.7 in. per annum.

St Croix was discovered in 1493 by Columbus, and was owned in turn by the Dutch, British and Spanish. In 1651 it was taken by France, and two years later was given to the Knights of Malta by Louis XIV. In 1733 it was purchased by Denmark. Slavery was abolished in 1848 after a violent insurrection which had broken out among the slaves.

See Sir H. H. Johnston, *The Negro in the New World* (1910).

**SAINT-CYRAN**, a French Benedictine abbey in the province of Berry, now comprised in the department of the Loiret. From 1620 to 1643 it was held by the famous Jansenist reformer, Vergier (*q.v.*), who is consequently often spoken of by French writers as the Abbé de Saint-Cyran.

**ST CYR-L'ÉCOLE**, a town of northern France in the department of Seine-et-Oise, 3 m. W. of Versailles at the end of the old park of Louis XIV. Pop. (1906) 2696. Its importance is due to the famous military school (*école spéciale militaire*) in which officers for the cavalry and infantry are trained. It was established in 1808 in the convent which Madame de Maintenon founded for the education of noble young ladies in poor circumstances. Racine's *Esther* and *Athalie* were first acted here, having been written expressly for the pupils. Madame de Maintenon's tomb is still preserved in the chapel. The convent was suppressed at the Revolution, and the gardens are now partly transformed into parade-grounds.

**ST DAVIDS** (*Tyddewi*), a cathedral town of Pembrokeshire, Wales, situated near the sea to the S.E. of St David's Head, the most westerly promontory of South Wales. Pop. (1901) 1710. St Davids is 10 m. distant from the station of Letterston on the Great Western railway, and about 16 m. from Fishguard to the N.E., and 16 m. from Haverfordwest to the E. The little town, locally known as "the city," stands in a lofty position east of the Cathedral Close, and consists of five streets, which converge on an open space called the Cross Keys, formerly used as a market-place and distinguished by its High Cross, a single shaft erect on a square base of six steps, restored in 1873. From the cross a lane leads westward to the Tower Gate, flanked by two ancient towers in a ruinous condition. From this point is obtained a superb view of the close with the cathedral and ruined palace in the valley of the Alun below, to which the rocky outline of Carn Llidi forms an imposing background.

The cathedral church of SS. Andrew and David, in spite of centuries of neglect and ill-advised alterations, remains the largest and most interesting pile of ecclesiastical buildings in the Principality. It is largely built of a beautiful purple-hued sandstone, which is quarried locally. Its proportions are: length (exclusive of the Trinity and Lady chapels), 254½ ft.; breadth of nave and aisles, 51½ ft.; breadth of transepts including tower, 116 ft.; and height of central tower, 116 ft. In spite of the antiquity of its foundation, the earliest and main portion of the existing fabric was erected under Bishop Peter de Leia (1176-1198) in the transitional Norman-English style. Bishop David Martyn (1290-1328) built the Lady Chapel; Bishop Henry de Gower (1328-1347), one of the greatest of ecclesiastical builders in Wales, made many additions in the Decorated style, including the stone rood-screen and southern porch; and Bishop Edward Vaughan (1509-1522) erected the Trinity Chapel between the choir and Lady Chapel. Under the last-named prelate the magnificence of St Davids reached its height, but owing to the changes during the Reformation and the unscrupulous rapacity of Bishop William Barlow (1536-1548) the fabric suffered severely; nor was it spared later during the Civil Wars, when the Lady Chapel, the aisles of the presbytery, and even the transepts were unroofed and partially dismantled. In 1793 the cathedral was repaired by Thomas Nash, who rebuilt the western front in a debased Perpendicular style. The work of much-needed restoration was carried out throughout the latter half of the 19th century, especially between 1862 and 1869, when Sir Gilbert Scott strengthened the building at a cost of over £43,000. In 1873 Nash's incongruous work was replaced by a new façade intended to harmonize with the original design of Bishop de Leia, and at the beginning of the 20th century the Lady Chapel and Bishop Vaughan's chapel were restored in memory of Bishop Basil Jones (d. 1897) and of Deans Allen and Phillips. The interior of the nave, separated by six wide bays from the aisles, is singularly imposing with its triforium and clerestory windows. It possesses an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by Bishop Gower's fine stone screen, whilst the choir itself contains the richly carved stalls erected by Bishop Tully (1460-1481), the episcopal throne, and an elegant oaken screen that serves to separate choir and presbytery. The painted roof (freely restored) exhibits the coats-of-arms of Bishops Tully and Richard Martin, Treasurer Owen Pole and other benefactors. The eastern wall of the choir has been greatly altered by the addition of modern Venetian mosaic designs in the original lower triplet of lights, and by the insertion of lancet windows in place of a large Perpendicular window of the 15th century. Bishop Vaughan's chapel contains fine Tudor fan vaulting, and the Lady Chapel good decorated sedilia. The cathedral, before the Reformation, was remarkably rich in sculptured tombs and monuments, but many

of these have perished and all the brasses have disappeared. In the presbytery stands prominent the altar tomb with modern brasses inserted of Edmund Tudor, earl of Richmond (d. 1456), father of King Henry VIII. Amongst the other surviving monuments, all more or less injured and decayed, are the tombs of Bishop Gower and of several bishops of St Davids; the canopied effigies popularly but erroneously attributed to Prince Rhys (d. 1196) and his son Rhys; the stone base of the destroyed shrine of St David; a priest's effigy formerly believed to be that of the celebrated Giraldus Cambrensis; and the large Jacobean monument of Treasurer Thomas Lloyd (d. 1612). To the north of the cathedral is to be seen the ruined shell of the beautiful chapel with an adjoining tower, forming part of the college of St Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377.

On the west bank of the Alun stands the splendid and indeed unique ruin of the episcopal palace erected by Bishop Gower (c. 1342). Built for the purpose of culture and entertainment rather than for defence, Bishop Gower's ecclesiastical mansion is "essentially a palace and not a castle; and it is hardly too much to affirm that it is altogether unsurpassed by any existing English edifice of its kind." Built upon vaulted cellars, the palace occupies three sides of a quadrangle 120 ft. square, and though roofless and deserted for nearly three hundred years it retains most of its principal features. The great hall, 96 ft. by 33 ft., possesses a traceried wheel-window; the chief portal is still imposing; and the chapel retains its curious bell-turret; while the peculiar but singularly graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (c. 1540) the half-ruined palace was occasionally occupied by succeeding bishops prior to the Civil Wars, and in 1633 a chapter was held within its walls under Bishop Field.

The Close, 18 acres in extent and extra-parochial, contains the deanery and other residences of the cathedral clergy, mostly occupying the sites of ancient buildings. It formerly owned four gateways, of which the South or Tower Gate alone remains. The whole of the wild and bleak but picturesque neighbourhood of St Davids teems with legendary and historical associations, and crumbling and ruined chapels are numerous, amongst the latter the chapels of St Justinian (Capel Stinan) and St Non being the most remarkable.

*History.*—At some unknown period in the 6th century the celebrated patron saint of Wales, Dewi or David, removed the chief seat of South Welsh ecclesiastical life to Menevia or Menapia (Mynwy), which is traditionally reported to have been the saint's birthplace. The site chosen for this new foundation was the marshy valley of the Alun—the *Vallis Rosina* of medieval historians—and this spot became known henceforth as Tyddewi or St Davids. The dread of an imminent Anglo-Saxon invasion of Gwent, the determination to remove his monastic clergy from court influence, and the desire of opening closer communication with the sister Churches of Ireland, are among the various reasons suggested for David's remarkable policy, which made St Davids the leading religious centre in South Wales for nearly a thousand years. From the 7th to the 11th centuries the successors of St David occasionally ventured to exercise metropolitan rights over South Wales, and even over all land west of the Severn, and the character and extent of these ancient claims have frequently been made the subject of speculation or controversy among historians, some of whom have not hesitated to designate the early Celtic holders of the see by the title of "archbishop." These ill-defined claims were destroyed by St Anselme's forcible appointment of the Norman monk Bernard to the bishopric in 1115, from which date to the present time St Davids has ranked as a suffragan see of Canterbury; nor has its ancient independence ever been seriously asserted, save by the intrepid Gerald de Barri (Giraldus Cambrensis), who vainly strove from 1199 to 1203 to induce Pope Innocent III. to acknowledge the power of the cathedral chapter to elect its own bishops without reference to English king or primate. St Davids early became popular as a place of pilgrimage, and amongst the many suppliants who visited St David's shrine were William the Conqueror, Henry II. and Edward I. with Queen Eleanor. Probably with a view to conciliate the native clergy for Anselme's unpopular policy in Wales, Henry I. obtained from Pope Calixtus II. the canonization of St David about 1120, and in local esteem two pilgrimages to St Davids were vulgarly supposed to be equivalent to one journey to Rome itself: a sentiment preserved in the curious monkish hexameter:

"Roma semel quantum bis dat Menevia tantum."

From 1115 to the Reformation the see was held by prelates

(many of them natives of Wales) who did much to enrich and beautify the vast group of ecclesiastical buildings in the Close. But with the partial destruction of the palace and the removal of the episcopal residence to Abergwili, it was not long before St Davids sank into the mere monument of its former splendour and importance. In 1539 Bishop Barlow even petitioned Thomas Cromwell for permission to remove the see itself to Carmarthen, a request which tradition declares Henry VIII. refused to grant solely out of respect for the memory of his grandfather Edmund Tudor, whose tomb had recently been taken from the suppressed priory of Grey Friars at Carmarthen and set up before the high altar of the cathedral. During the 17th and 18th centuries all the ancient buildings of the Close, except the cathedral (which served also as a parish church for the village of St Davids), were allowed to fall into hopeless ruin. Amongst the 119 bishops who have held the see since its foundation by St David may be mentioned Asser, the friend of King Alfred (d. 906); Samson (10th century), honoured by the Welsh chroniclers with the proud title of "Archbishop of the Isle of Britain"; Rhyddmarch (d. 1096), the first biographer of St David; Henry de Gower (d. 1347), the magnificent patron of art; Robert Ferrar, burned at Carmarthen in 1555 under Queen Mary; Richard Davies (d. 1581), patriot and translator of the Welsh Book of Common Prayer; Archbishop William Laud, bishop of the see between 1621 and 1627; George Bull, divine (d. 1710); and Connop Thirlwall, scholar and historian (d. 1875). The official title of the bishops of St Davids is *Episcopus Menevensis*. (H.M.V.)

**ST DENIS**, an industrial town of northern France, capital of an arrondissement in the department of Seine, 5 m. N. of Paris. Pop. (1906) 62,323. St Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is here joined by the canal of St Denis. It has numerous metallurgical works, where railway material, naval engines and the like are constructed, distilleries of spirits, glass-works, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I. on the spot where St Denis, the apostle of Paris, was interred. The abbey buildings, occupied by a school for daughters of members of the Legion of Honour, founded by Napoleon I., date from the 18th century.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, and its spire was carried to a height of 280 ft., but it was struck by lightning in 1837 and reconstructed in so clumsy a manner that it had to be reduced to the level of the roof of the nave. The rose window, now occupied by a clock face, dates from the 13th century. Under one of the three rows of arches above the main entrance runs an inscription recording the erection of the church by Abbot Suger (q.v.), minister of Louis VI., with abbatial funds and its consecration in 1140. The porch formed by the first three bays of the church contains some remains of the basilica of Pippin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St. Louis. The secondary apse (*vondpoint*) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine façades, the north of the 12th, the south of the 13th century, each with two unfinished towers; if the plan had been fully carried out there would have been six towers besides a central spire in lead. The church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII. and Anne of Brittany, executed from 1516 to 1532; of Henry II. and Catherine de' Medici, a masterpiece by Germain Pilon (1564-1583); of Louis of Orleans and Valentine of Milan, from the old church of the Celestines at Paris (1502-1515); of Francis I. and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550-1560); and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of medieval (13th-century) works of art. In the apse some stained glass of the time of Suger remains. The crypt dates partly from the 10th or 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to its final resting-place. It is at present occupied by the coffin of Louis XVIII., the last sovereign whose body was borne to St Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposited the remains of Louis XVI. and Marie Antoinette.

St Denis, the ancient *Catulliacum*, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It was held during the later middle ages by the French kings and vassals of the abbey, and to this fact is due their adoption of the oriflamme or red banner of St Denis as the royal standard. St Louis caused mausoleums to be erected with figures of the princes already buried in the abbey; and from his time to that of Henry II. every monarch in succession had his monument. Louis XIV. reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Two years later all the remains that could be recovered were placed in the museum of the Petits Augustins at Paris; but the bronze tombs had been melted down, the stained-glass windows shattered, and large numbers of interesting objects stolen or lost. Louis XVIII. caused all the articles belonging to St Denis to be brought back to their original site, and added numerous other monuments from the suppressed abbeys. But it was not till after 1848 that, under the direction of Viollet le Duc, the basilica recovered its original appearance. St Denis, which was the key of Paris on the north, was more than once pillaged in the Hundred Years' War, suffering especially in 1358 and 1406. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood on the 10th of November 1567.

See F. de Guilhaume, *Monographie de l'église royale de St Denis* (Paris, 1848).

**ST DIÉ**, a town of eastern France, capital of an arrondissement in the department of Vosges, 38 m. N.E. of Epinal by rail. Pop. (1906) town, 16,783; commune, 22,136. St Dié is situated on the Meurthe in a basin surrounded by well-wooded hills. The town, part of which was laid out in a uniform style after the fire of 1757, is built largely of red sandstone. Its cathedral has a Romanesque nave (12th century) and a Gothic choir; the portal of red stone dates from the 18th century. A fine cloister (13th century), containing a stone pulpit, communicates with the Petite-Église or Notre-Dame, a well-preserved specimen of Romanesque architecture (12th century). The hôtel-de-ville contains a theatre, a library with some valuable manuscripts, and a museum of antiquities. There is a monument by Mercier to Jules Ferry, born in the town in 1832. St Dié is the seat of a bishop and of a sub-prefect. The town benefited from the immigration of Alsatians after the Franco-German War of 1870-71, and its industries include the spinning and weaving of cotton, bleaching, wire-drawing, metal-founding, and the manufacture of hosiery, woodwork of various kinds, machinery, iron goods and wire-gauge.

St Dié (*Deodatum*, *Theodata*, S. *Deodati Fensum*) grew up round a monastery founded in the 7th century by St Deodatus of Nevers, who gave up his episcopal functions to retire to this place. In the 10th century the community became a chapter of canons; among those who subsequently held the rank of provost or dean were Giovanni de' Medici, afterwards Pope Leo X., and several princes of the house of Lorraine. Among the extensive privileges enjoyed by them was that of coining money. Though they co-operated in building the town walls, the canons and the dukes of Lorraine soon became rivals for the authority over St Dié. Towards the end of the 15th century one of the earliest printing-presses of Lorraine was founded at St Dié. The institution of a town council in 1628, and the establishment in 1777 of a bishopric which appropriated part of their spiritual jurisdiction, contributed greatly to diminish the influence of the canons; and with the Revolution they were completely swept away. During the wars of the 15th, 16th and 17th centuries the town was repeatedly sacked. It was also partially destroyed by fire in 1605, 1135, 1554 and 1757. Funds for the rebuilding of the portion of the town destroyed by the last fire were supplied by Stanislas, last duke of Lorraine.

**ST DIZIER**, a town of north-eastern France, in the department of Haute-Marne, 45 m. N.N.W. of Chaumont by rail, on the Marne and the Haute-Marne canal. Pop. (1906) town, 20,316; commune, 14,661. The town is a very important centre of the iron trade, with foundries, forges and engineering

works, and has trade in grain and timber. It dates from the 3rd century, when the relics of Bishop St Didier (whence the name of the town) were brought thither after the destruction of Langres by the Germans. It sustained a memorable siege against Charles V. in 1544.

**STE ANNE DE BEAUPRÉ**, a post-village of Montmorency county, Quebec, Canada, at the junction of the Ste Anne river with the St Lawrence, and on the Quebec, Montmorency & Charlevoix railway, 22 m. below the city of Quebec. It stands in a rolling agricultural country, with hills in the background; and near by, on the Ste Anne river, are beautiful falls and excellent fishing. For over two centuries Ste Anne has been known as a Roman Catholic place of pilgrimage, and many miracles are still said to be performed through the intercession of the saint, the mother of the Virgin. In the basilica, an over-ornate building, are ever-increasing piles of crutches and other aids, cast aside by the cured. The resident population is about 1500, chiefly composed of hotel-keepers and members of religious orders, but throughout the year many pilgrimages are made, and on such days as the feast day of Ste Anne (26th of July) 30,000 people are often present. The total number of pilgrims in 1905 was 170,000. In addition to the basilica the village contains numerous religious edifices, the chief being the Scilla Santa, built in imitation of the Holy Stairs at Rome.

**SAINTE-BEUVE, CHARLES AUGUSTIN** (1804-1869), French critic, was born at Boulogne-sur-Mer (No. 16 Rue du Pot d'Étain) on the 23rd of December 1804. He was a posthumous child, his father, a native of Picardy, and controller of town-dues at Boulogne, having married in this same year, at the age of fifty-two. The father was a man of literary tastes, and used to read, like his son, pencil in hand; his copy of the Elzevir edition of Virgil, covered with his notes, was in his son's possession, and is mentioned by him in one of his poems. Sainte-Beuve's mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. The little Charles Augustin was brought up by his mother, who never remarried, and an aunt, his father's sister, who lived with her. They were poor, but the boy, having learnt all he could at his first school at Boulogne, persuaded his mother to send him, when he was near the age of fourteen, to finish his education at Paris. He boarded with a M. Landry, and had for a fellow-boarder and intimate friend Charles Neate, afterwards fellow of Oriel College and member of parliament for the city of Oxford. From Landry's boarding-house he attended the classes, first of the Collège Charlemagne, and then of the Collège Bourbon, winning the head prize for history at the first, and for Latin verse at the second. In 1823 he began to study medicine, attending lectures on anatomy and physiology and walking the hospitals. But meanwhile a Liberal newspaper, the *Globe*, was founded in 1827 by Paul François Dubois, one of Sainte-Beuve's old teachers at the Collège Charlemagne. Dubois called to his aid his former pupil, who, now quitting the study of medicine, contributed historical and literary articles to the *Globe*, among them two, which attracted the notice of Goethe, on Victor Hugo's *Odes et ballades*. These articles led to a friendship with Victor Hugo and to Sainte-Beuve's connexion with the romantic school of poets, a school never entirely suited to his nature. In the *Globe* appeared also his interesting articles on the French poetry of the 16th century, which in 1828 were collected and published,<sup>1</sup> and followed by a second volume containing selections from Ronsard. In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student," as Guizot called him, was the Sainte-Beuve of those days himself. About the same time was founded the *Revue de Paris*, and Sainte-Beuve contributed the opening article, with Boileau for its subject. In 1830 came his second volume of poems, the *Consolations*, a work on which Sainte-Beuve looked back in later life with a special affection. To himself it marked and expressed, he said, that epoch of his

life to which he could with most pleasure return, and at which he could like best that others should see him. But the critic in him grew to prevail more and more and pushed out the poet.<sup>2</sup> In 1831 the *Revue des deux mondes* was founded in rivalry with the *Revue de Paris*, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'aôût*, in 1837. He himself thought that the activity which he had in the meanwhile exercised as a critic, and the offence which in some quarters his criticism had given, were the cause of the less favourable reception which this volume received. He had long meditated a book on Port-Royal. At the end of 1837 he quitted France, accepting an invitation from the academy of Lausanne, where in a series of lectures his work on Port-Royal came into its first form of being. In the summer of the next year he returned to Paris to revise and give the final shape to his work, which, however, was not completed for twenty years.<sup>3</sup> In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin Library, an appointment which gave him rooms at the library, and, with the money earned by his pen, made him for the first time in his life easy in his circumstances, so that, as he afterwards used to say, he had to buy rare books in order to spend his income. A more important consequence of his easier circumstances was that he could study freely and largely. He returned to Greek, of which a French schoolboy brings from his *lycée* no great store. With a Greek teacher, M. Pantasides, he read and re-read the poets in the original, and thus acquired, not, perhaps, a philological scholar's knowledge of them, but a genuine and invaluable acquaintance with them as literature. His activity in the *Revue des deux mondes* continued, and articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager were fruits of his new Greek studies. He wrote also a very good article in 1844 on the Italian poet Leopardi; but in general his subjects were taken from the great literature which he knew best, that of his own country—its literature both in the past and in the contemporary present. Seven volumes of *Portraits*, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value.<sup>4</sup> In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

From this settled and prosperous condition the revolution of February 1848 dislodged him. In March of that year was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The smallness of the sum would hardly seem to suggest corruption; it appears probable that the money was given to cure a smoky chimney in his room at the Mazarin Library, and was wrongly entered as secret-service money. But Sainte-Beuve, who piqued himself on his independence and on a punctilious delicacy in money matters, was indignant at the entry, and thought the proceedings of the minister of public instruction and his officials, when he demanded to have the matter sifted, tardy and equivocal. He resigned his post at the Mazarin and accepted an offer from the Belgian government of a chair of French literature in the university of Liège. There he gave the series of lectures on Chateaubriand and his contemporaries which was afterwards (in 1860) published in two volumes.<sup>5</sup> He liked Liège, and the Belgians would have been glad to keep him; but the attraction of Paris carried

<sup>1</sup> Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time a coldness grew up between him and Victor Hugo. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834. [Ed.]

<sup>2</sup> *Port-Royal* (1840-1848, 5 vols.; 3rd and revised ed., 1866; 5th ed. with index, 1888-1891).

<sup>3</sup> He was a friend of Madame Récamier, at whose house he met Chateaubriand. He became an especially close friend of Louis Mathieu, Comte Molé, for whose niece, Mme d'Arbouville, he conceived a lasting attachment. [Ed.]

<sup>4</sup> *Chateaubriand et son groupe littéraire sous l'Empire*.

<sup>1</sup> *Tableaux historique et critique de la poésie française au XVI<sup>e</sup> siècle* (2nd ed., 1842).

him back there in the autumn of 1849. Louis Napoleon was then president. Disturbance was ceasing; a time of settled government, which lasted twenty years and corresponds with the second stage of Sainte-Beuve's literary activity, was beginning. Dr Véron, the editor of the *Constitutionnel*, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the *Causeries du lundi* were started. They at once succeeded, and "gave the signal," as Sainte-Beuve himself says with truth, "for the return of letters." Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel*; then he passed, with a similar engagement, to the *Moniteur*. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in fifteen volumes; they afterwards were resumed under the title of *Nouveaux lundis*, which now make a collection of thirteen volumes more. In 1854 he was nominated to the chair of Latin poetry at the college of France. His first lecture there (in 1855) was received with interruptions and marks of disapprobation by many of the students, displeased at his adherence to the empire; at a second lecture the interruption was renewed. Sainte-Beuve had no taste for public speaking and lecturing; his *frontis mollities*, he said, unfitted him for it. He was not going to carry on a war with a party of turbulent students; he proposed to resign, and when the minister would not accept his resignation of his professorship he resigned its emoluments. The *Étude sur Virgile*, a volume published in 1857, contains what he had meant to be his first course of lectures. He was still a titular official of public instruction; and in 1858 his services were called for by Gustave Rouland, then minister of public instruction, as a lecturer (*maître de conférences*) on French literature at the École Normale Supérieure. This work he discharged with assiduity and success for four years. In 1859 he was made commander of the Legion of Honour, having twice previously to 1848 refused the cross. During the years of his official engagement his Monday contributions to the *Moniteur* had no longer been continuous; but in 1862 an arrangement was proposed by which he was to return to the *Constitutionnel* and again supply an article there every Monday. He consented, at the age of fifty-seven, to try this last pull, as he called it, this "dernier coup de collier"; he resigned his office at the École Normale and began the series of his *Nouveaux lundis*. They show no falling off in vigour and resource from the *Causeries*. But the strain upon him of his weekly labour was great. "I am not a *monsieur* nor a gentleman," he writes in 1864, "but a workman by the piece and by the hour." "I look upon myself as a player forced to go on acting at an age when he ought to retire, and who can see no term to his engagement." He had reason to hope for relief. Except himself, the foremost literary men in France had stood aloof from the empire and treated it with a hostility more or less bitter. He had not been hostile to it: he had accepted it with satisfaction, and had bestowed on its official journal, the *Moniteur*, the lustre of his literature. The prince Napoleon and the princess Mathilde were his warm friends. A senatorship was mentioned; its income of £1600 a year would give him opulence and freedom. But its coming was delayed, and when at last in April 1865 he was made senator, his health was seriously compromised. The disease of which he died, but of which the doctors did not ascertain the presence until his body was opened after his death—the stone—began to distress and disable him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—provoked the indignation of the great majority in that conservative assembly. It delighted, however, all who "belonged," to use his own phrase, "to the diocese of free thought"; and he gave further pleasure in this diocese by

leaving the *Moniteur* at the beginning of 1869, and contributing to a Liberal journal, the *Temps*.<sup>1</sup> His literary activity suffered little abatement, but pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on the 13th of October 1869.

The work of Sainte-Beuve divides itself into three portions—his poetry, his criticism before 1848 and his criticism after that year. His novel of *Volupté* may properly go with his poetry.

We have seen his tender feeling for his poetry, and he always maintained that, when the "integrating molecule," the foundation of him as a man of letters, was reached, it would be found to have a poetic character. And yet he declares, too, that it is never without a sort of surprise and confusion that he sees his verses detached from their context and quoted in public and in open day. They do not seem made for it, he says. This admirable critic knew, indeed, the radical inadequacy of French poetry. It is to English poetry that he resorts in order to find his term of comparison, and to award the praise which to French poetry he refuses.

"Since you are fond of the poets," he writes to a friend, "I should like to see you read and look for poets in another language, in English for instance. There you will find the most rich, the most dulcet and the most new poetical literature. Our French poets are too soon read; they are too slight, too mixed, too corrupted for the most part, too poor in ideas even when they have the talent for strophe and line, to hold and occupy for long a serious mind."

But, even as French poetry, Sainte-Beuve's poetry had faults of its own. Critics who found much in it to praise yet pronounced it a poetry "narrow, puny and stifled," and its style "slowly dragging and laborious." Here we touch on a want which must no doubt be recognized in him, which he recognized in himself, and whereby he is separated from the spirits who succeed in uttering their most highly inspired note and in giving their full measure—some want of flame, of breath, of pinion. Perhaps we may look for the cause in a confession of his own: "I have my weaknesses; they are those which gave to King Solomon his disgust with everything and his satiety with life. I may have regretted sometimes that I was thus extinguishing my fire, but I did not ever pervert my heart." It is enough for us to take his confession that he extinguished or impaired his fire.

Yet his poetry is characterized by merits which make it readable still and readable by foreigners. So far as it exhibits the endeavour of the romantic school in France to enlarge the vocabulary of poetry and to give greater freedom and variety to the alexandrine, it has interest chiefly for readers of his own nation. But it exhibits more than this. It exhibits already the genuine Sainte-Beuve, the author who, as M. Duvergier de Hauranne said in the *Globe* at the time, "sent à sa manière, écrit comme il sent," the man who, even in the forms of an artificial poetry, remains always "un penseur et un homme d'esprit." That his Joseph Delorme was not the Werther of romance, but a Werther in the shape of Jacobin and medical student, the only Werther whom Sainte-Beuve by his own practical experience really knew, was a novelty in French poetical literature, but was entirely characteristic of Sainte-Beuve. All his poetry has this stamp of direct dealing with common things, of plain unpretending reality and sincerity; and this stamp at that time made it, as Béranger said, "a kind of poetry absolutely new in France."

It has been the fashion to disparage the criticism of the *Critiques et portraits littéraires*, the criticism anterior to 1848, and to sacrifice it, in fact, to the criticism posterior to that date. Sainte-Beuve has himself indicated what considerations ought to be present with us in reading the *Critiques et portraits*, with what reserves we should read them. They are to be considered, he says, "rather as a dependency of the elegiac and romanesque part of my work than as express criticisms." They have the copiousness and enthusiasm of youth; they have also its exuberance. He judged in later life Chateaubriand, Lamartine, Victor Hugo more coolly, judged them differently. But the *Critiques et portraits* contain a number of articles on personages, other than contemporary French poets and romance-writers, which have much of the soundness of his later work, and, in addition, an abundance and fervour of their own which are not without their attraction. Many of these are delightful reading. The articles on the Greek poets and on Leopardi had been already mentioned. Those on Boileau, Molière, Pierre Daunou and Charles Claude Fauriel, on Madame de la Fayette and Mademoiselle Aïssé may be taken as samples of a whole group which will be found to support perfectly the test of reading, even after we have accustomed ourselves to the later work of the master. Nay, his soberness and tact show themselves even in this earlier stage of his criticism, and even in treating the objects of his too fervid youthful enthusiasm. A special object of this was Victor Hugo, and in the first article on him in the *Portraits contemporains* we have certainly plenty of enthusiasm, plenty of exuberance. We have the epithets "adorable," "sublime," "supreme," given to Victor Hugo's poetry; we are told of "the majesty of its high and sombre philosophy." But the article next

<sup>1</sup> This course of action definitely separated him from the Bonapartists and led to a quarrel with Princess Mathilde.—[Ed.]

following this, and written only four years later, in 1835, is the article of a critic, and takes the points of objection, seizes the weak side of Victor Hugo's poetry, how much it has of what is "creux," "sonore," "artificial," "voulu," "théâtral," "violent," as distinctly as the author of the *Causeries* could seize it. "The Frank, energetic and subtle, who has mastered to perfection the technical and rhetorical resources of the Latin literature of the decadence," is a description never to be forgotten of Victor Hugo as a poet, and Sainte-Beuve launches it in this article, written when he was but thirty years old, and still a painter of "portraits de jeunesse" only.

He had thus been steadily working and growing; nevertheless, 1848 is an epoch which divides two critics in him of very unequal value. When, after that year of revolution and his stage of seclusion and labour at Liège, he came back to Paris in the autumn of 1849 and commenced in the *Constitutionnel* the *Causeries du lundi*, he was astonishingly matured. Something of fervour, enthusiasm, poetry, he may have lost, but he had become a perfect critic—a critic of measure, not exuberant; of the centre, not provincial; of keen industry and curiosity, with "Truth" (the word engraved in English on his seal) for his motto; moreover, with gay and amiable temper, his manner as good as his matter—the "critique souriant," as, in Charles Monselet's dedication to him, he is called.

The root of everything in his criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port-Royal*) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michelets and Quinets, but I cannot hold out my hand to the Veuillots."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week, and to write one of them as he wrote it was indeed a week's work. The "irresponsible indolent reviewer" who should read his notes to his friend and provider with books, M. Paul Chéron of the National Library. Here is a note dated the 2nd of January 1853: "Good-day and a happy New Year. To-day I set to work on Grimm. A little dry; but after St. François de Sales" (his Monday article just finished) "one requires a little relief from roses. I have of Grimm the edition of his *Correspondance* by M. Taschereau. I have also the *Memoirs* of Madame d'Épinay, where there are many letters of his. But it is possible that there may be notices of him mentioned in the bibliographical book of that German whose name I have forgotten. I should like, too, to have the first editions of his *Correspondance*; they came out in successive parts." Thus he prepared himself, not for a grand review article once a quarter, but for a newspaper review once a week.

His adhesion to the empire caused him to be represented by the Orleanists and Republicans as without character and patriotism, and to be charged with baseness and corruption. The Orleanists had, in a great degree, possession of the higher press in France and of English opinion—of Liberal English opinion more especially. And with English Liberals his indifference to parliamentary government was indeed a grievous fault in him; "you Whigs," as Croker happily says, "are like quack doctors, who have but one specific for all constitutions." To him either the doctrine of English Liberals, or the doctrine of Republicanism, applied absolutely, was what he called a "fiction," one of those fictions which "always end by obscuring the truth." Not even on M. de Tocqueville's authority would he consent to receive "les hypothèses dites les plus hono-

ables"—"the suppositions which pass for the most respectable." All suppositions he demanded to sift, to see them at work, to know the place and time and men to which they were to be applied. For the France before his eyes in 1849 he thought that something "solid and stable"—*un mur*, "a wall," as he said—was requisite, and that the government of Louis Napoleon supplied this wall. But no one judged the empire more independently than he did, no one saw and denounced its faults more clearly; he described himself as being, in his own single person, "the *gache* of the empire," and the description was just.

To these merits of mental independence, industry, measure, lucidity, his criticism adds the merit of happy temper and disposition. Goethe long ago noticed that, whereas Germans reviewed one another as enemies whom they hated, the critics of the *Globe* reviewed one another as gentlemen. This arose from the higher social development of France and from the closer relations of literature with life there. But Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen: he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté*, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had the moderate, gracious, amiably human instincts of the true poetic nature. "Let me beg of you," he says in thanking a reviewer who praised him, "to alter one or two expressions at any rate. I cannot bear to have it said that I am the first in anything whatever, as a writer least of all; it is not a thing which can be admitted, and these ways of classing people give offence." Literary man and loyal to the French Academy as he was, he can yet write to an old friend after his election: "All these academies, between you and me are pieces of childishness; at any rate the French Academy is. Our last quarter of an hour of solitary reverie or of serious talk, yours and mine, in our youth, was better employed; but, as one gets old, one falls back into the power of these nothings; only it is well to know that nothings they are."

Perhaps the best way to get a sense of the value and extent of the work done in the last twenty years of his life by the critic thus excellently endowed is to take a single volume of the *causeries du lundi*, to look through its list of subjects, and to remember that with the qualities above mentioned all these subjects are treated. Any volume will serve; let us take the fourth. This volume consists of articles on twenty-four subjects. Twenty of these are the following: Mirabeau and Sophie, Montaigne, Mirabeau and Comte de la Marck, Mademoiselle de Scudéry, André Chénier as politician, Saint-Evremond and Ninon, Joseph de Maistre, Madame de Lambert, Madame Necker, the Abbé Maury, the Duc de Laurun of Louis XVI.'s reign, Marie Antoinette, Buffon, Madame de Maintenon, De Bonald Amyot, Mallet du Pan, Marmontel, Chamfort, Rulhière. Almost every personage is French, it is true; Sainte-Beuve had a maxim that the critic should prefer subjects which he possesses familiarly. The great place of France in the world is very much due to her eminent gift for social life and development; and this gift French literature has accompanied, fashioned, perfected, and continues to reflect. And nowhere shall we find such interest more completely and charmingly brought out than in Sainte-Beuve's *Causeries du lundi* and the *Nouveaux lundis*. As a guide to bring us to a knowledge of the French genius and literature he is unrivalled. (M. A.)

**AUTHORITIES.**—See his "Ma Biographie" in *Nouveaux lundis*, xiii., *Lettres à la princesse* (1873); *Correspondance* (1877-1878) and *Nouvelles Correspondances* (1880); the Vicomte d'Haussonville's *Sainte-Beuve* (1875), Scherer, *Études sur la littérature contemporaine*, iv.; G. Michaut, *Sainte-Beuve avant les Lundis* (1903). Sainte-Beuve's centenary was celebrated in various ways; for centenary criticism see the *Edinburgh Review* (April 1905) ("Sainte-Beuve and the Romantics"); *Monthly Review* (April 1905) (by F. Brunetiere); *Revue des Deux Mondes* (March 1905) (by Victor Giraud). In the *Œuvres choisies de Juste Olivier* (1879) are some "Souvenirs"; and in 1903 the *Revue des Deux Mondes* published several interesting articles on a correspondence of Sainte-Beuve with Olivier.
